RODNEY, George Brydges Rodney, Lord, English admiral, born February 13, 1718, was second son of Captain Rodney of the Royal Marines. He was taken from Harrow School at the early age of twelve, and sent to sea. He became lieutenant in 1739; post-captain, 1742; and commander of the Newfoundland station in 1748, with the rank of commodore. In 1752, he returned home, and was elected M.P. for Saltash. He afterwards commanded the *Fougueux*, the *Prince George*, and the *Dublin* men-of-war. In 1759, after 28 years' active service, he was made rear-admiral; and in July he bombarded Havre for two or three days, destroying the town and fortifications so effectually, that it has never recovered its former importance as an arsenal for ships-of-war. In 1761, he took Martinique, Grenada, and Santa Lucia. In 1762, he became vice-admiral, and in 1764 was made a baronet. In 1779, Spain joined France in the war against England, and their united fleets appeared in the Channel in overwhelming force. The siege of Gibraltar was undertaken by the Spaniards; and R., who was sent out with 22 sail of the line and 8 frigates to the West Indian station, was ordered to relieve Gibraltar *en route*. After capturing seven Spanish ships of war, he fell in, January 16, 1780, with Admiral Langara, off Cape St Vincent, 'that promontory which has witnessed more of our battles and triumphs than any other headland in the world.' Of the Spanish fleet, five were captured, and two destroyed. Having accomplished the relief of Gibraltar and Minorca, he quitted the Mediterranean, and crossed the Atlantic to the station of his command. On the 17th April he defeated, near Martinique, the French fleet, under the Count de Guichen. Being ill-supported by his captains on this occasion, he complained to the Admiralty. The naval administration of the day was, however, so corrupt and rotten, that the Admiralty suppressed the criminatory passages of his dispatches, and only one of the accused was brought to trial, the others being allowed to escape from the difficulty of finding a sufficient number of non-delinquent officers to try them. R. took Eustatia from the Dutch, with 250 ships and other booty, estimated at three millions sterling. Demerara and Essequibo next surrendered. On the 12th April 1782, R., in conjunction with Hood and Drake, encountered the French fleet under De Grasse off Dominica, April 12, 1782. Each fleet consisted of upwards of 30 ships of the line. The battle was more obstinately contested than any engagement that ever took place between the two nations, being kept up without intermission for nearly 12 hours. De Grasse was totally defeated, and R. lost

seven ships of the line and two frigates. Owing to the French vessels being crowded with troops, they are said to have lost 3000 killed and 6000 wounded; while the English loss did not exceed 600. On board the *Ville de Paris* were 36 chests of money, to pay the soldiers; and the whole train of artillery was on board the other captured ships. Count de Grasse was himself taken prisoner. His flag-ship, the *Ville de Paris*, of 112 guns, was the only first-rate man-of-war that, up to that date, had ever been taken and carried into port; and De Grasse, when he landed at Portsmouth, was stated to be the first commander-in-chief of a French fleet or army who had been prisoner in England since the capture of Marshal Tallard in Queen Anne's wars. In this action, R. successfully executed the nautical manœuvre of breaking the French line, and placing the enemy between two fires, which had fallen into disuse since the Commonwealth. R.'s victory saved Jamaica, ruined the naval power of France and Spain, and gave the finishing blow to the war. The news arrived in England just after an order had been despatched for the recall of R., whose politics differed from those of the new ministry. He was now elevated to the peerage as Baron Rodney, and received a pension of £2000 per annum for himself and his successors. He lived in retirement for the rest of his life. He died May 21, 1792, leaving behind him the fame of one of the most distinguished commanders in the naval annals of Great Britain. A monument was erected to his memory in St Paul's Cathedral; and his portrait, by Sir Joshua Reynolds, is among the treasures of Greenwich Hospital.

RODOSTO, a town of European Turkey, in the eyalet of Adrianople, stands on the north shore of the Sea of Marmora, 77 miles west of Constantinople. It is surrounded by beautiful gardens, contains many mosques, and sends large quantities of fruits and vegetables to the capital of the empire. Pop. 18,000.

ROE (*Cervus capreolus*, or *Capreolus dorcas*), a species of Deer (q. v.), inhabiting Europe and some parts of Asia, chiefly in hilly or mountainous regions, either covered with forests or with scattered bushes and heath. It is seldom found in the higher and

Roebuck (*Cervus capreolus*).

more naked mountain tracts, the haunt of the stag or red deer. It was once plentiful in Wales and in the hilly parts of England, as well as in the south of Scotland, but is scarcely now to be seen in any part of Britain south of Perthshire. It is not long since it was pretty common in some of the wilder parts of the north of England. The R. is about 2 feet 3 inches in height at the shoulder. Its weight is about 50 or 60 pounds. Its colour is a shining tawny-brown in summer, more dull and grizzled in winter, the lower parts and part around the tail white. There is considerable variety in the shade of colour. The hair is longer than in many deer. The tail is very short, concealed among the hair. The horns, which are peculiar to the male (the *Roebuck*), are 8 or 9 inches long, erect, round, very rough, longitudinally furrowed; having, in mature animals, two tines or branches, which, as well as the tip of the horn, are sharp-pointed, so that the horns of the R. become very dangerous weapons when used for offence. The ears are large. The habits of the R. somewhat approach to those of the goat, or even the chamois. It keeps its footing on rocks with great security, bounds very actively, and takes great leaps. Its usual pace, when not very hard pressed, is, however, a kind of canter. It is not gregarious; more than a buck and doe with one or two fawns are not usually seen together. Contrary to what is usual among deer, the male and female R. remain attached during life. The voice of the R., resembling that of a sheep, but shorter and more barking, is often heard through the night, in regions where it is plentiful. The browsing of the R. is very injurious to young woods, a circumstance which has led to its extirpation in places where it would otherwise have been cherished. It feeds much on the tender shoots of trees and bushes, as well as on herbage. The venison is superior to that of the stag, but not equal to that of the fallow-deer. The horns are used for handles of carving-knives, &c. The R. is never very thoroughly tamed, and, when partially so, is apt to become mischievous, and the male dangerous.—Another species of R. (*Cervus* or *Capreolus pygargus*), rather larger than the common R., is found in Tartary.

ROEBUCK, JOHN ARTHUR, English politician, was born at Madras in 1801, but passed his youth in Canada. At the age of 23, he went to England, and was called to the bar at the Inner Temple in 1831. He challenged the suffrages of the electors of Bath as a Radical reformer in 1832, and represented that city until 1837. He was again elected in 1841, and held his seat until the general election (1847). In May, 1849, he was returned for Sheffield, which he continued to represent until he was defeated in 1868. In 1835, when the executive government of Canada and the House of Assembly of Lower Canada were at variance, the latter body appointed R. their paid agent in England—a position which involved him in a serious quarrel with the press. He was next the central figure of a parliamentary 'scene,' on the occasion of a too plentiful crop of election petitions and election compromises subsequent upon a general election. He made out such a case that, in defiance alike of Whigs and Tories, he obtained a committee to inquire into election compromises. His next great appearance was at the meeting of parliament in January, 1855, when he gave notice of a motion for inquiring into the condition of the army before Sebastopol. To the undisguised joy of the nation, R. carried his motion by an immense majority, and the administration of the Earl of Aberdeen was shattered to pieces. The Sebastopol Committee sat, and the inquiry exercised great influence in the subsequent reconstruction of the War department, and the reorganisation of the military, commissariat, and medical systems. In 1855, he became a candidate for the chairmanship of the Metropolitan Board of Works, with a salary of £1500 per annum, but was only third on the poll. On the annexation of Savoy and Nice in 1860, R. indulged in the sharpest invective against the Emperor Napoleon. He became a director of the Galway Steam-packet Company, and offended his constituents by defending a contract which they regarded as savouring of a political job. He went

to Vienna to obtain some commercial concessions for a company with which he was connected, and returned with strong pro-Austrian sympathies, volunteering a defence of Austrian rule in Venetia, which jarred upon public feeling. During the civil war in America, he displayed a strong leaning towards the cause of the Confederates. In the debate on the war between Germany and Denmark, R. declared (1864) that the English fleet ought to have been sent to defend Denmark. R. is fearless and unmeasured in attack, not too charitable in his judgments, fond of personalities, sending his taunts home by the frequent use of the upraised arm and the pointed index-finger, but is regarded nevertheless as in the main an honest and true-hearted Englishman. He is the author of a work on the *Colonies of England*, the *History of the Whig Ministry of* 1830 *to the passing of the Reform Bill*, and in his earlier years contributed much to the *Westminster* and *Edinburgh Reviews*.

ROERMOND (Fr. Ruremonde, called also by old writers Godswaard [i. e., God's Island] op de Maas), an old but lively town in the Netherlands, province of Limburg, at the junction of the Roer and the Maas. A suburb called St Jacob is connected with R. by a beautiful stone bridge over the Roer. The cathedral is one of the handsomest churches in the Netherlands. Pop. 9313, of whom about 300 are Protestant, 100 Jews, the remainder Roman Catholics. Principal industries are weaving woollen cloths, cottons, making paper, pipes, wax and tallow candles, cotton-spinning, calico-printing, refining salt, &c. R. is said by some authorities to have been the birthplace of the celebrated Mercator, others claiming the honour for Rupelmonde in East Flanders. It has often endured the horrors of being besieged and taken.

ROE-STONE, a name locally given to those limestones which are formed of small globules like the roe of fishes. It has been translated into the scientific term *oolite*, and this is applied to that period in the earth's geological history in which the limestones with this structure chiefly occur.

ROGA'TION-DAYS (Lat. *Feriæ Rogationum*), the Monday, Tuesday, and Wednesday before Ascension-day, so called because on these days the Litanies (q. v.) are appointed to be sung or recited by the clergy and people in public procession. The practice of public supplications on occasion of public danger or calamity is traceable very early in Christian use; but the fixing of the days before Ascension for the purpose is ascribed to Mamercus, Bishop of Vienne, in the middle of the 5th c., who, on occasion of a threatened earthquake or other public peril in his city, ordered a public procession and prayer, for the purpose of averting the Divine anger. The usage being in harmony with the spirit of the times, became general and permanent, and the form of prayer employed is that known as the *Litany of the Saints*. In England, after the Reformation, the recitation of the Litanies upon these days was discontinued; but a memorial of the old practice long survived in the so-called Perambulation of Parishes (q. v.).

ROGER I., Count of Sicily and Calabria, and the founder of the Norman dynasty in these countries, was the youngest of the twelve valiant sons of Tancred de Hauteville, and was born in Normandy about 1031. Hearing of the wondrous success of his brothers (see GUISCARD), who had some time before departed to follow their fortunes, and had by this time gained possession of the greater part of Southern Italy, R. set out in 1058 to join them. On his arrival, he was deputed by his brother Robert to conquer Calabria, an achievement which was speedily executed. In 1060 he set out on an expedition against Sicily, then ruled by a number of Saracen chiefs; but he confined himself in this and the following expedition to predatory attacks on Messina and its neighbourhood. He then took and fortified Messina, making it the base of his future operations, and being joined by Robert, the two, at the head of their small band, performed a variety of almost miraculous exploits. They were gradually joined by the Christian inhabitants, especially when their success had given the latter room to hope for freedom from their Moslem masters; and in 1072, Palermo, the capital and chief stronghold of the Saracens, was yielded to the invaders. R. was then invested by his brother with the crown of Sicily, under the title of Count; but it was not till 19 years afterwards that he succeeded in thoroughly supplanting the Saracens, owing to the repeated reinforcements they received from Africa. R. had previously divided the country into fiefs, which he now distributed among his chief barons, whose relations to their subjects were regulated by him with justice and moderation. He had, in 1062, received from Robert his fair share of Calabria, to which, on the death of the latter, he added (1085) a number of towns, wrested from Roger and Bohemond, Robert's two sons. He was now the chief of the Hauteville family; and the fame of his exploits, and the greatness of his power, made his alliance be courted by the first princes of Europe. It was at this time he took the title of 'Grand Count,' to distinguish him from his vassals; and in 1098, he received from Pope Urban II., in recompense for his fidelity to the holy see, the privileges of refusing at his pleasure papal legates admission to his territory, and of appointing bishops. The last acts of his life were the building and endowing of churches and monasteries, among others the cathedral of Messina (1097). He died at Mileto in Calabria, 11th July 1101.

ROGER II., king of Sicily, second son of the preceding, was born in 1097, four years before the death of his father. His elder brother Simon having died in 1102, he became the heir to the Sicilian throne; and during his minority, the government was administered by his mother, a princess of Montferrat. When R. had taken the supreme authority into his own hands, his first care was to extend his estates. He compelled his cousin William to yield up the portions of Calabria and of the town of Palermo which Robert Guiscard had withheld from his father; and after the death of William (1127), he took possession of Apulia itself, obtaining his investiture in these new possessions (which were fiefs of the holy see) in the following year from Honorius II., who added to them that of the duchy of Naples. Ambitious of the title of king, he supported the faction of Pope Anacletus, his wife's brother, and received from him the title of king of Sicily, with rights of suzerainty over the duchies of Naples and Capua—the former being a Lombardo-Italian, and the latter a Norman principality. In return, R. established Anacletus on the pontifical throne in 1130; but the dispossessed pope, Innocent II., and the exiled princes of Capua and Naples, applied to the Emperor Lothar, who stripped R. of many of his acquisitions—the latter, however, recovering them almost the moment the German army had retired. At last, his bitter enemy, Innocent II., fell into his hands in 1139, and was compelled to withdraw the excommunications he had pronounced against R., and to consent to his retaining the territories he had acquired (excepting Naples), obtaining by these means not only his liberty, but the firm attachment of R. to the holy see, and his own recognition as lawful pope. In 1141, he received from Pope Lucius II. the right of

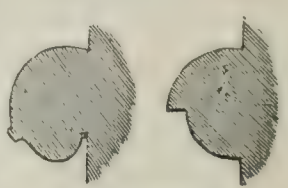
using the staff, ring, tunic, mitre, and other symbols of ecclesiastical dignity and power. In 1146, he revenged himself on the Greek emperor, who had been of the league with the pope and the emperor against him, by capturing Corfu, and pillaging Cephalonia, Negropont, Corinth, and Athens, returning to Sicily with an immense booty, including a number of workers in silk, by whom the silk-manufacture was first introduced into Sicily. He followed up these successes by the taking of Tripoli and other places on the African coast, and afterwards attacking the Zeirides—leaving, at his death, an African dependency which stretched from Morocco to Kairwan. He died at Palermo 26th February 1154. R. was, like his father, prudent and resolute, skilful both in the cabinet and on the field; but he had neither the fine deportment nor the generous soul of the first Roger. His mind was capable of great scope and untiring energy, so that the real interests of his states were never overlooked, and the orderly system of taxation and government was a pattern to the rest of Europe. He cared nothing for the religion of his subjects—they might be heathens if they chose; but obedience to himself and respect to the laws were rigorously demanded and enforced. His fleet was supreme on the seas, and his court surpassed in magnificence that of every other prince in Europe. He spent many of his later years in rearing religious edifices on a scale of extreme magnificence, of some of which remains still exist.

ROGERS, Samuel, an English poet, was born in London on the 30th July 1763. His father was a banker and member of a dissenting body. After having been carefully educated, R. was placed in his father's bank. His taste for literature and the company of literary men awoke at an early period, and he, accompanied by a friend, went one day to call on Dr Johnson, who was then living at Bolt Court, but his courage failed him when his hand was on the knocker. In 1786, he published his first book, entitled *An Ode to Superstition, and some other Poems.* In 1792, he published his *Pleasures of Memory*—the work on which his fame most securely rests. For a considerable period after this, he was silent. Meanwhile, he had retired from business, and in the possession of ample wealth, in his house in St James's Place, he employed himself with his Muse, his cook, the company of the literary celebrities of his time, and the collecting of pictures and articles of virtù. Then, and during the whole period of his subsequent life, his breakfasts were more famous than his poems. Critics might find fault with the one, but not with the other.

In 1812, he published *Columbus*, a not very striking poetical fragment. In 1814, *Jacqueline* appeared in the same volume with Lord Byron's *Lara.* In 1819, he issued *Human Life;* and in 1822, *Italy.* An edition of the last work, illustrated by the best artists, at the cost, it is said, of £10,000, appeared in 1836. After this date, he published nothing—his time being mainly devoted to taste, dining, epigram, and anecdote. Although aged, he was a greater gadder about than any man of his years in London. He rode or strolled in the parks, he haunted picture galleries, he was a constant attender at the opera. He was by far the oldest English poet. An accident in the street at last confined him to his room; and on the 18th December 1855, he died, aged 93. He read Goldsmith's *Traveller* when it was published, and he might have read Tennyson's *Maud.* He published his first book before Burns's first volume appeared at Kilmarnock.

As a poet, R. has much of the sweetness of Goldsmith, and much of the neatness and point of Pope; but he lacks entirely the splendour and richness which distinguished so many of his later compeers, and belonged more to the era of Goldsmith than to that of Wordsworth and Shelley. And as in poetry, so was it in the other intellectual fields in which he exercised himself. He was an eighteenth-century man who had lived in the nineteenth. See *Recollections of the Table-Talk of S. Rogers*, 1856, and H. Martineau's *Biographical Sketches.*

RO'GUE-MONEY is, in Scotland, an ancient assessment which the freeholders of every county at any of the head courts directed annually to be made in such sums as they judged necessary for defraying the expense of apprehending offenders, subsisting them in jail, and prosecuting them. The functions of the freeholder in the matter were transferred to the Commissioners of Supply by 2 and 3 Will. IV. c. 65, s. 44. The tax was first appointed by a statute of 11 Geo. II. c. 28. The raising and application of the tax are not uniform in the various counties.



ROHILCU'ND, an extensive district in the Bengal Presidency, India, bounded on the W. and S.-W. by the Ganges, and on the E. by the kingdom of Oude. It derives its name from the Rohillas, an Afghan tribe which migrated hither in the 18th century. It comprises the five British districts of Bijnur, Moradabad, Bareilly, Budaon, and Shahjehanpur, and the protected state of Rampur.

RO'LAND, the hero of one of the most ancient and popular epics of early French or Frankish literature, was, according to tradition, the favourite nephew and captain of the Emperor Charlemagne. All that history tells us of him is simply this: In 778, when Charlemagne was busily engaged at Paderborn in organising the government of the recently-subjugated pagan Saxons, and superintending their collective baptism and formal admission into the Christian church, he was visited by a Saracen chief, who, being unwilling to recognise the supremacy of the Calif of Cordova, offered to put the Frankish sovereign in possession of several towns south of the Pyrenees which were under his rule. Charlemagne, accepting the offer, marched with a numerous army through the territory of Gascony, whose duke, Loup, he constrained to do him homage, and took Pampelona and Saragossa. Finding, however, that his Saracen ally gave him but little aid, he turned back to return to France; and it was during this retreat, while the Christian army was slowly threading its way through the narrow valley of Roncevaux or Roncevalles (q. v.), that R., commander of the Marches of Bretagne, who commanded the rear-guard, was suddenly attacked by a large body of Vascons, lying in ambush in the surrounding woods, and slain while fighting gallantly. Beyond these meagre details, all that we read of R. is traditional. The oldest version of the *Song of Roland*, forming part of the *Chansons de Geste*, which treat of the achievements of Charlemagne and his paladins, belongs to the 11th c., although it is probable that the original compositions are not much later than the period to which they refer. Throughout the middle ages, the *Song of Roland* was the most popular of the many heroic poems current, and William of Normandy, when on his way to conquer England, had it sung at the head of his troops, to encourage them on their march; while at the present day, the traditionary memory of the heroic paladin is still held in honour by the hardy mountaineers of the Pyrenees, amongst whose dangerous defiles the scene of his exploits and death is laid. According to the poem, Charlemagne had been six years in Spain, when, resolving to return to France, he, by the advice of R., sent his captain, Ganelon, on

an embassy to the pagan king, Marsilius of Saragossa, to receive the homage which he had pledged himself to perform. The mission was a dangerous one, as all other ambassadors to the king had been slain, and Ganelon, wishing to revenge himself on R., proved a traitor and betrayed to Marsilius the route which the Christian army were to take. The consequence was, that after Charlemagne had safely crossed the mountains with the main part of his forces, R., who commanded a rear-guard of 20,000 men, was surprised within the narrow valley of Roncevalles, by a terrible army of all the pagan nations of the world. R., who possessed an enchanted horn, which could have been heard far beyond the mountains, might have recalled his uncle, but despising such pusillanimity, he fought on till 100,000 Saracens lay slain around him and the 50 warriors who alone remained alive to aid him. Another army of 50,000 men of Carthage, Ethiopia, and Candia now pours down upon him. At length he blows his horn, which is heard by Charlemagne, who, however, does not return, as Ganelon persuades him once, twice, and thrice that R. is only hunting the deer; and not until the veins of R.'s neck have burst with the violence of the blast, does the emperor retrace his steps. In the meanwhile, R. has dragged his dying limbs to the foot of Mount Cisaire, above Roncevalles, where, after having sung his death-song, and thrown his trusty and enchanted sword Durandal into a poisoned stream, where it still remains, he dies exhausted from his many wounds. Charlemagne, who arrives too late to save him, avenges his death in a series of marvellous battles and bloody victories, whose delineation imparts a sufficiently dark colouring to the closing passages of this sombre epic.

ROLAND DE LA PLATIÈRE, Jean Marie, a French minister of the revolutionary period, was born at Mizy, near Villefranche (Beaujolais), 18th February 1734. His first independent appointment was that of inspector-ordinary at Amiens. In 1775, at the house of a friend in Amiens named Sophie Cannet, he met Marie Jeanne Phlipon, a young woman of brilliant genius and fascinating beauty, and after a courtship of four years, they were married, 4th February 1780. When the Revolution broke out in 1789, R., as well as his wife, became a decided partisan of the movement. In 1791, he was sent to Paris, by the municipality of Lyon, to represent to the Constituent Assembly the deplorable condition of the Lyonnese weavers. After the dissolution of the Constituent Assembly, he founded at Lyon, the *Club Central*, the members of which, marked by their attachment to constitutional liberty, received the name of *Rolandins*. Towards the close of 1791, he fixed himself at Paris, and soon became one of the heads of the Girondist or moderate section of the Republicans. In March 1792, he was appointed Minister of the Interior, a situation which he held till January 1793, when he resigned it, despairing of seeing moderate counsels adopted. After placing his accounts in the hands of the Assembly, he asked permission to withdraw from Paris, but it was refused, and an illegal attempt was made to arrest him, which failed. Immediately after, he fled, and concealed himself in Rouen. When news reached him of the execution of his wife, he committed suicide at a small village in the environs of Rouen, 15th November 1793. R. wrote and published several memoirs and disquisitions on branches of industry, besides 6 vols. of *Letters* addressed to his wife before their marriage, from Switzerland, Italy, Sicily, and Malta.

ROLAND, Madame (*née* Marie Jeanne Phlipon), wife of the preceding, was the daughter of Pierre Gratien Phlipon, an engraver, and was born at Paris, 17th March 1754. The precocity of her intelligence was remarkable. At the age of four, she had quite a passion for reading; at seven, she learned by heart a treatise on heraldry; at eight, she used to carry Plutarch with her to church, while the *Jerusalem Delivered* of Tasso, and the *Telemaque* of Fenelon fired her childish imagination. At the same time, an ardent piety began to develop itself, and when only eleven, she entered the *Maison des Dames de la Congrégation*, in the Faubourg Saint-Marcel. Here she formed a close friendship with two young girls from Amiens, Henriette and Sophie Cannet, particularly with the latter, which was fruitful in consequences. On her return to her father's house after the lapse of two years, 'a change came o'er the spirit of her dream.' She no longer cared for the so-called 'religious' writers—the defenders of the Bible and the Church. Her faith was slowly changing from the dogmatic creed of Bossuet to the 'naturalism' of the Encyclopédists and 'Philosophes.' In ethics, now as ever, her preference for the Stoical system was marked. Shortly after the death of her mother in 1773, she read for the first time *La Nouvelle Heloïse*, which seemed to her (as it has to many another young impassioned soul) a veritable revelation. Greatly distressed by the imprudent conduct of her father, she again withdrew, at the age of 25, to the *Maison des Dames de la Congrégation*, and once more attempted an 'austere' life; but M. Roland (q. v.), who had already known her for five years, now came forward, and rescued her from a career which must ultimately have proved equally unsatisfactory to her reason and conscience, by offering her his hand. She was 25, and he 45. There was certainly something unpoetical in the disparity of their years, but then, Mademoiselle Phlipon knew that 'ideal' matches were made only in heaven, and so she accepted calmly the inspector of manufactures. Their marriage was celebrated 4th February 1780. It is unnecessary to follow the remainder of her career, which was of course identical with her husband's until his flight from Paris 31st May 1793. The same night, she was herself arrested, and imprisoned in the Abbaye. A more dauntless and intrepid spirit never entered its walls! Released on the 24th of June, she was instantly rearrested by the very commissaries who had set her at liberty, without the shadow of a tangible accusation, and confined in Saint-Pelagie. Madame R. spent the period of her imprisonment in study, in the composition of her political *Mémoires*. Summoned before the Revolutionary Tribunal in the beginning of November, she was condemned, and on the 9th was guillotined, amid the shoutings of an insensate mob. It is said that while standing on the scaffold, she asked for a pen and paper that she might 'write down the strange thoughts that were passing through her head.' Only a genuine child of the French Republic could have been so ostentatiously speculative at such a moment. Still more celebrated is her apostrophe to the statue of Liberty, at the foot of which the scaffold was erected: 'O Liberty, what crimes are committed in thy name!' or, according to another version: 'Liberty, how they have played with thy name!'—See *La Correspondance de Madame Roland avec les Demoiselles Cannet* (2 vols., Paris, 1841); *Lettres Autographes de Madame Roland, adressées à Bancal des Issarts* (Paris, 1835).

Roll Moulding.

ROLL, a round moulding much used in Gothic

architecture. It is also modified by the introduction of a fillet, and is then called the roll-and-fillet-moulding.

ROLL OF ARMS, a heraldic record of arms, either verbally blazoned or illuminated, or both, on a long strip of vellum, rolled up, instead of being folded into leaves. Rolls of arms are the most important and most authentic materials for the history of early heraldry. In England, they go back to the reign of Henry III., the oldest being a copy of a roll of that reign, containing a list of the arms borne by the sovereign, the princes of the blood, and the principal barons and knights between 1216 and 1272, verbally blazoned without drawings. The original has been lost, but the copy, which, having been made by Glover, Somerset herald, in 1586, is called 'Glover's Roll,' is in the English College of Arms. This roll exhibits heraldry as at that early period already consolidated into a system. In the British Museum (Harl. Coll., 6589) is a copy of another roll of the middle of the 13th c., containing 700 coats tricked, that is, drawn in pen and ink. The *Roll of Caerlaverock* is a heraldic poem in Norman-French, reciting the names and arms of the knights present at the siege of Caerlaverock in 1300. It has been published with notes by Sir N. H. Nicolas. Copies exist of rolls of the knights who were with Edward I. at the battle of Falkirk.

ROLLER (*Coracias*), a genus of birds very generally referred to the Crow family (*Corvidæ*), but by many naturalists to the Bee-eater family (*Meropidæ*), with which they regard the habits and colours of the species as indicating a closer alliance. The bill is moderately large, compressed towards the point, straight, the upper mandible curved downwards at the point, the sides bristled at the base, the gape wide; the legs short and strong; the wings long. The colours are in general very brilliant. Mr Swainson says of the BLUE-BODIED R. (*C. cyanogaster*) of Western Africa, that 'no effort of art can possibly do justice to those inimitably rich lines of ultramarine, beryl colour, and changeable fawn, with which it is ornamented; for there are no tints hitherto

Roller (*Coracias garrula*).

discovered, either mineral or vegetable, which will enable the painter to produce their successful imitation.' The species are pretty numerous, all natives of the Old World, and mostly of the warmer parts of it. One only is found in Europe, the COMMON R. (*C. garrula*), a bird nearly equal in size to a jay; with head, neck, and wing-coverts greenish-blue, other shades of blue strongly marked in the wings. This bird is abundant in the north of Africa, and in some parts of Asia; it is partially migratory, and is rare in Britain. It tosses its food, which consists of insects or parts of plants, into the air before eating it, swallowing it when it falls in a proper direction for entering the throat. The name R. is derived from its habit of tumbling in the air like a tumbler-pigeon. It is an inhabitant of woods. It is a very shy bird, and the sportsman always finds it difficult to approach. In the countries where it is abundant, as in some islands of the Mediterranean, it is in high esteem for the table.

ROLLER, an agricultural implement which has been long in use, consisting of a cylinder of wood, stone, or iron, placed in a frame, so as to revolve like a wheel, and drawn over the land by a horse. The weight of the roller is greater or less according to the purpose for which it is intended: the breaking of stiff clay clods, the consolidating of very light soils after frost, the hardening of the surface of the ground to check evaporation, the levelling of an uneven surface before harvest operations, &c. For these and such purposes, the roller is in constant use. The introduction of hollow cylinders of iron, instead of solid ones of wood or stone, is an improvement of no remote date, and was the first change on the old simple implement, which was afterwards further modified by dividing the cylinder into two parts, to give greater facility in turning, and to diminish its injurious action in scraping the soil before it while turning; and this process of division being carried further, with other modifications, giving each part or wheel a more independent action, and breaking up the uniformity of surface by giving a raised wedge-like edge to the circumference of each wheel, the result is a *clod-crusher*.

ROLLER, used as part of the inking apparatus in letter-press printing, is of modern invention. In the old process of applying the ink to the surface of types, stuffed leather balls were made use of, which were not only difficult to keep in proper order, but were inapplicable to cylinder-printing. The first improvement on the stuffed balls consisted in covering them with a soft and elastic composition, such as was employed in the Staffordshire potteries. Catching at this idea, the inventors of cylinder printing-machines made rollers by coating longitudinal and rounded pieces of wood with the composition, by means of casting in a mould. This invention came generally into use between 1814 and 1818, everywhere superseding balls, and rendering printing machinery practicable.

The method of making inking-rollers is very simple. A roller may be of any length, to suit work of different kinds; for hand-presses it is usually about 30 inches long, but longer for machines, according to their dimensions. The thickness is about 3 inches, of which the composition on the wood is probably three-quarters of an inch all round. The wooden centre being fixed upright in an iron mould, the composition is poured in when in a hot liquid state, and then left to cool. When cold, the mould, which is in halves, finely-jointed and held together, is opened, and the roller taken out: by a little trimming, it is ready for use. The composition consists of a due proportion of fine glue and treacle or molasses, boiled together, and thoroughly blended—the result being a substance resembling soft india-rubber. The proportions of the two ingredients depend on the state of the atmosphere. In summer, one pound of glue to one pound of treacle may form a suitable mixture; but in winter, it may be requisite to give three pounds of treacle to one pound of glue, in order to insure the proper elasticity. Rollers, in time, shrivel and waste by use, and the composition may then be remelted, along with some small addition of new materials. In all cases, the rollers require to be kept very clean, and suspended in a rack when not in use. The manufacture and supply of rollers for printers constitute a distinct business in London;

but elsewhere, as far as we know, every printing establishment of any consequence possesses means of fabricating rollers for itself.

ROLLIN, CHARLES, a French historian, who formerly enjoyed, if he did not merit, an extensive popularity, was the son of a cutler, and was born in Paris, January 30, 1661. He studied at the Collége du Plessis, where, in 1683, he became assistant to the Professor of Rhetoric, and four years later obtained the chair for himself. In 1688, he was called to the chair of Eloquence at the Collége Royal de France, and for some ten years he discharged the duties of his office with remarkable zeal and success. In 1694, he was chosen rector of the university of Paris, a dignity which he held for two years, and signalised his brief tenure of office by many useful reforms, both in regard to discipline and study, and by his warm defence of the privileges of the university. His efforts to revive the study of Greek, then falling back into neglect, were particularly creditable to him, and altogether his career as rector constitutes perhaps his best claim to the regard of posterity, and has certainly left a more permanent impression than his writings, for its influence is perceptible even to the present day. In 1699, he was appointed coadjutor to the principal of the College of Beauvais; but was removed from this situation in 1712, through the machinations of the Jesuits, for R. was a strenuous Jansenist. For the next three years he devoted himself exclusively to learned study, the fruit of which was his edition of Quintilian (Paris, 2 vols. 1715). In 1720, he was re-elected rector of the university and in 1726 published his *Traité des Etudes*, which M. Villemain has pronounced 'a monument of good sense and taste,' and which is justly regarded as his best literary performance, for his *Histoire Ancienne* (Paris, 12 vols. 1730—1738), though long prodigiously popular, and translated into several languages (the English among others), is feeble in its philosophy, jejune in its criticism, and often inaccurate in its narrative. Nevertheless, to multitudes, both in this country and in France, it has formed the introduction to the study of ancient history. Frederick the Great, then the Prince-royal, of Prussia, among other princely notabilities, wrote to compliment the author, and opened up a correspondence with him. In 1738, R. published his *Histoire Romaine* (Paris, 9 vols.), a much inferior work, now almost forgotten. He died September 14, 1741.

ROLLING-MILL, one of the most important of modern inventions for the working of metals. It was first introduced practically by Mr Corb in 1784, and since then has gradually become more and more useful, as its capabilities have been developed. Under the article IRON (q. v.), there is a figure of the iron rolling-mill, by means of which bars of iron are rolled or drawn out, and it will be at once seen that the same machine will do for other metals; moreover, the rolls may be engraved so as to impress a pattern on the bar as it passes through; this is done by the brass-workers to a great extent; and tubes of brass, copper, tin, &c., are also operated on in a similar way, a mandrel or rod of iron being fitted inside the tube, to sustain the pressure of the rollers.

ROLLS, MASTER OF. See MASTER OF THE ROLLS.

ROLLS OF COURT, in Scotch Law, mean the lists of causes depending in the Court of Session.

ROMAGNA. See PAPAL STATES.

ROMAINE, REV. WILLIAM, an English divine of the last century, noted for the ardour with which he preached 'evangelical' and Calvinistic doctrines in an age of religious apathy, was the son of a corn-dealer in Hartlepool, and was born there, September 25, 1714. His father was a French Protestant refugee. Young R. was educated at the grammar-school of Houghton. He was ordained a priest in 1738, and immediately obtained a curacy near Epsom. In 1739, he published a sermon preached before the university of Oxford, in which he attempted to shew, in opposition to the view maintained by Warburton in his *Divine Legation of Moses*, that the doctrine of a future state is 'expressly mentioned,' and even 'insisted on,' in the Pentateuch. This led to a controversy with Warburton. In 1747, he published the first volume of a new edition of Calasio's *Hebrew Concordance and Lexicon*, the fruit of seven years' labour. The only thing in connection with R.'s edition that now calls for notice is the fact, that he took extraordinary liberties with the original, omitting, for example, the author's account of the word which is usually rendered 'God,' and substituting his own in the body of the work! In 1748, he was chosen lecturer of St Botolph's, in London, and, in the following year, lecturer of St Dunstan's-in-the West. Two years later, he was appointed assistant morning-preacher at St George's; but was afterwards deprived of the situation by the rector, Dr Trebeck, who was jealous of his popularity, and averse to the 'plainness' of his preaching. His 'evangelicalism' grew with his years; and at length, in 1757, in a sermon on *The Lord Our Righteousness*, it became so offensive to the torpid dons of Oxford that the university pulpit was in future closed against him. Some years before this, R. had been appointed to the professorship of astronomy in Gresham College, for which he was not fit, and which he did not retain. His intellect was anything but scientific in its character, as will readily be understood when we state that he allowed his 'zeal' for Hutchinsonian speculations to lead him into opposition to the Newtonian philosophy. In 1756, he became curate and morning-preacher at St Olave's, Southwark, a situation which he exchanged in the course of a year for a preachership at St Bartholomew the Great, near West Smithfield. In 1766, he was chosen by the parishioners rector of St Andrew, Wardrobe, and St Anne, Blackfriars, an office which he held till his death, July 26, 1795. Besides what has been already mentioned, R. published *Twelve Sermons upon Solomon's Song* (1759); *Twelve Discourses upon the Law and the Gospel* (1760); *The Life of Faith* (1763); *The Scripture Doctrine of the Sacrament of the Lord's Supper* (1765); *The Walk of Faith* (1771); *An Essay on Psalmody* (1775); *The Triumph of Faith* (1795). His works were republished in a collected form, in 8 vols., in 1796, by the Hon. and Rev. W. B. Cadogan, who prefaced them with a life of their author.

ROMAN ALUM. See ROCH ALUM.

ROMAN ARCHITECTURE. Of the early architecture of Rome and the other Latin cities, comparatively little is known. With the conquest of Carthage, Greece, and Egypt, the Romans became acquainted with the arts of those countries, and began to endeavour to use them for the embellishment of the imperial city. Besides, Rome under the empire was the capital of the world, and attracted artists from every country. The result was that the architecture of Rome became a mixed style. It was all imported, and partook of the character of the importers. The great interest of Roman architecture is, that it is a mixture and amalgamation of all ancient styles, and the starting-point for all modern styles. It is thus the

connecting link between ancient and modern art; the whole history of Roman architecture being that of a transition, slow but steady, from the external architecture of the Greeks to the internal architecture of the Christians. Rome borrowed from Greece the oblong peristylar temple, with its horizontal construction and decoration, and the various 'orders.' See COLUMN, GRECIAN ARCHITECTURE. From the Tuscans, probably, were derived the circular form of temple and the circular arch, which became leading features in the development of the future Roman style.

The *Orders* imported from Greece were the Doric, Ionic, and Corinthian (q. v.). These were all used in Rome, but with some modifications; the Doric, for example, being never used as in Greece, but without fluting, and with the capital and entablature altered, and a base added, so as to make the style more similar to the others, with which it was often associated. The Ionic had the volutes turned out angularwise, so as to present a similar face in each direction. The favourite 'order' of the Romans, however, was the Corinthian. It was invented in Greece, but more fully developed in Rome, where it suited the desire which existed for richness and luxuriance in architecture. Many fine examples of

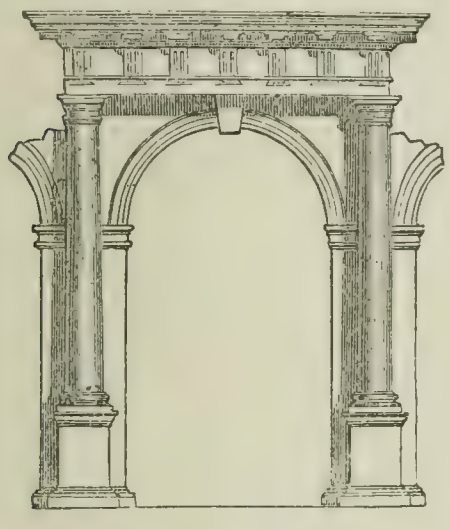


Fig. 1.—Doric Arcade.

this style exist in Rome (as the Pantheon, Jupiter Stator, &c.), and in the provinces (as the Maison Quarrée at Nimes, Baalbec, &c.), the capitals, wherever found, being designed in endless variety. The composite order was an invention of the Romans, and is sometimes called *the Roman order*. It is a combination of the Ionic and Corinthian. All these orders were used by the Romans, but in a manner peculiar to themselves; they combined with the Greek orders the arch. They placed the columns (fig. 1) at wide intervals, and set them on pedestals, to give them and the entablature a proper proportion; whilst behind the columns they placed square piers, and from them threw arches which supported the wall. This was the favourite Roman style, and may be seen in all their important works (amphitheatres, arches, baths, &c.). They piled one order above another, marking each story with the entablature. As the style proceeded, vaulting and arching became more common, especially in internal construction, but the horizontal ornamentation was never entirely abandoned. Arches of this construction were thrown from pillar to pillar behind the entablature, and gradually the pier was omitted, and the arch openly thrown from pillar to pillar, the architrave bent round it, and the cornice continued horizontally above.

Fig. 2.—Courtyard at Spalatro.
(From Sir Gardner Wilkinson's *Dalmatia*.)

The buildings executed by the Romans are very varied in their character, but the same style was used for temples, baths, amphitheatres, triumphal arches, tombs, &c. The earliest temples of which remains now exist are those of Jupiter Stator in the Forum, Jupiter Tonans, and Mars Ultor, all of the Augustan epoch, and each with only three columns left. These are supposed to have been nearly peripteral, and it is worthy of notice that the cells are all large, and one of them has an apse.

One of the most interesting temples of Rome is the Pantheon. The portico is of the age of Augustus, but the rotunda is probably considerably later. The dome of the interior is a splendid example of the progress of Roman architecture in developing the use of the arch, and transferring the decoration from the exterior to the interior. The former is in this case totally sacrificed to the latter; but the interior has not yet been surpassed for boldness of construction or simplicity and sublimity of effect. Other examples of circular temples, on a small scale, are found at Tivoli and in Rome, both dedicated to Vesta.

The greatest works of the Romans, however, were not their temples. The Basilicas (q. v.), Amphitheatres (q. v.) and Baths (q. v.) are far more numerous and more stupendous as works of art, and

Fig. 3.—Transverse Section of Basilica of Maxentius.
(From Fergusson's *Hand-book of Architecture*.)

all shew how well the Romans had succeeded in producing an internal architecture, which at a later period became so useful as a model for Christian buildings. The Basilica of Trajan is a type of the Christian wooden-roofed churches; while that

of Maxentius (fig. 3), with its great intersecting vaults, its vaulted aisles, and buttresses, contains the germs of the greatest Christian cathedrals. The Roman Amphitheatres (q. v.) have never been surpassed for size and grandeur, or for suitability to their purpose. And of the Baths (q. v.), sufficient remains still exist, although much decayed, from the perishable nature of the brick and stucco employed in their construction, to prove that the scarcely credible descriptions of contemporaries were surpassed by the magnificence of the buildings themselves.

Among the other varied public works of the Romans are their Aqueducts (q. v.) and bridges, Triumphal Arches (q. v.), pillars of victory, and tombs. Of the tombs of the Romans, the earliest and best specimen is that of Cæcilia Metella (wife of Crassus), on the Appian Way (fig. 4). It consists

Fig. 4.—Tomb of Cæcilia Metella.
(From Fergusson's *Hand-book*.

(like most Roman tombs) of a round drum placed on a square basement, and was probably surmounted by a conical roof. The tomb of Augustus was similar, on a very large scale, and the sloping roof was broken into terraces planted with trees. That of Adrian (now the castle of St Angelo in Rome) is another enormous example. The tombs were generally ranged along the ways leading to the gates of cities.

The later tombs of Rome are well worthy of study, as they contain many specimens of the

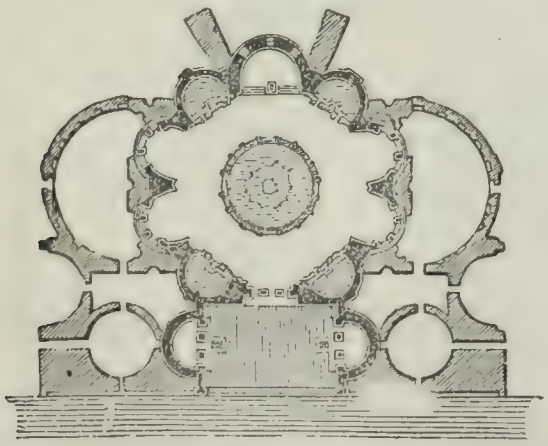

Fig. 5.—Plan of the Temple of Minerva Medica at Rome.

transition towards the Christian style. They are generally vaulted, frequently with domes, as, for instance, the tombs of St Helena and Sta Costanza. Mr Fergusson also places the so-called 'Temple of Minerva Medica' (fig. 5) amongst the tombs. It is a beautifully arranged building with ten sides, all containing deep niches (except the side with the door), surmounted by a clear-story, with ten well-proportioned windows. The vault is polygonal inside and outside; and the pendentives, ribs, buttresses, &c., which played so important a part in the Christian architecture both of the East and West, are distinctly used in its construction.

Of the domestic architecture of the Romans, we have many wonderfully preserved specimens in Herculaneum and Pompeii, shewing both the arrangements and decorations of the dwellings of all classes. Of the great palaces and villas, however, none remain except the palace of Diocletian, at Spalatro, in Dalmatia. It is an important building, as it shews many steps in the progress of the style.

ROMAN CATHOLIC CHURCH, the community of Christians throughout the world who recognise the spiritual supremacy of the Pope or Bishop of Rome, and are united together by the profession of the same faith, and the participation of the same sacraments. The subject will be most conveniently treated by considering under separate heads the history of this great Christian community; its doctrinal and disciplinary system; and finally, its organisation and constitutional forms.

Although a few other points of doctrinal difference separate the creed of the Roman Church from that of the Greek, Russian, and oriental communions, yet it may truly be said that the most striking and palpable ground of division between Rome on the one side, and all the rest of the communions named above upon the other, lies in the claim of supremacy in spiritual jurisdiction on the part of the Roman bishop. This history of the Roman Church, therefore, in relation to the ancient oriental churches, is, in fact, the history of the claim to supremacy. Without entering into the merits of the question, we shall merely indicate in a brief outline the history and the nature of the claim as it is held in the Roman Catholic communion. In the minds of Roman Catholics, the claim of supremacy on the part of the Bishop of Rome rests on the belief, that Christ conferred on Peter a 'primacy of jurisdiction' over his church; that Peter fixed his see at Rome, and died bishop of that church (a position which some Protestant historians have called into question altogether); and thus, that the bishops of Rome, as successors of Peter, have also succeeded to his prerogatives of supremacy. In this light, Catholic historians read the facts of the early history of the church—and they trace to this acknowledged superiority of the see of Peter numerous references to Rome on matters of doctrine or discipline; appeals from other churches, even from the great churches of Alexandria, Antioch, and Constantinople; depositions or nominations of bishops, examination and condemnation of heresies, of which the first five centuries, especially the 4th and 5th, present examples, but in which Protestant historians only recognise the natural result of the political and social superiority of Rome as the capital of the Roman empire. The letters of Pope Leo the Great, in the commencement of the 5th c., shew beyond question that the bishops of Rome, from whatever cause, claimed to speak and act with authority in the affairs of the church; and the first direct challenge to this claim was made by the patriarch of Constantinople, in the person of Acacius, and led to a schism of many years, which, however, terminated in the humiliation of the younger see. It was a powerful argument for the claims of Rome, that in all the controversies upon the Incarnation—

the Arian, the Nestorian, the Eutychian, the Monothelite—not only was her orthodoxy never impeached, but, on the contrary, she even supplied at every crisis a rallying point for the orthodox of every church and of every country. It was so, again, in the Iconoclast controversy; and although Constantinople more than once, in the time of Gregory the Great, and still more in that of Nicholas I., renewed the struggle for supremacy, or even equality, the position of Rome continued to be recognised. The separation of the Greek Church and her dependencies, under the patriarch Michael Cerularius in the year 1054, was but the withdrawal of a certain space from the extent of her territorial jurisdiction. If it had any effect upon her position within that portion of the church which remained faithful, it was rather to enhance the dignity of Rome, and to widen her prerogatives. The abandonment of Italy by the emperors to its fate under the invasion of the barbarians, led to the establishment of the temporal sovereignty of the popes. The total disruption of the Western Empire, and the consequent social disorganisation of Europe, combined with the spiritual authority of the Roman bishop to bring about the general recognition of his authority throughout the kingdoms of Europe as an arbiter in the temporal relations of sovereigns with their subjects, and of sovereigns towards each other. This extraordinary temporal authority was at once the consequence of his acknowledged spiritual power, and tended to heighten and to consolidate the very power in which it had its origin; and even Protestants must recognise the Roman Church of the medieval period as absorbing in itself almost the whole of European Christendom, and as the only public (even though they believe it degenerate and corrupt) representative of the church in the West. The temporary withdrawal of the papal residence from Rome to Avignon brought with it, from various causes, not the least of which was the weakening of the prestige of the 'see of Peter,' a notable diminution of the at least temporal power of the popes, which was still further weakened by the long western schism, by the conflicts of the rival pontiffs, and the scandals which arose therefrom; and the origin and progress of the modern political institutions which then began to break upon the world, so modified the public relations of church and state, as by degrees to undo the condition of society in which the temporal power had its foundation. The great revolution of the 16th c. completed the process; and when the popes seriously addressed themselves to the defence of the doctrinal system, which was the foundation of their authority, it was no longer in the character of arbiters of the temporal destinies of the world, but of simple disputants in the arena of theological science, in which their adversaries could command equally with themselves the means of appealing to the intelligence and to the religious sympathies of men.

Nor was the revolution with which the popes thus found themselves face to face without its influence in the external history of the Roman Church. The defections consequent on the Reformation, and at first numerous and formidable, received a check. The great Council of Trent—one of the necessities of self-defence which the rude assault of the Reformers entailed—did more to systematise, to define, and to present in popular form the doctrinal belief of Rome, than had been accomplished by the united efforts of the schoolmen of the three centuries which preceded the Reformation; while the decrees of Reformation which it enacted, and still more the schemes of local and individual reform which it originated, and to which it gave the impulse as well as the example, tended to bring about, by the natural process of self-purification, those ameliorations in the struggle towards which the first efforts at reform had their foundation. The latter half of the 16th c. was a period of new life in the Roman Church. The celebration of local synods, the establishment of episcopal seminaries, the organisation of schools, and other provision for religious instruction, above all, the foundation of religious orders of both sexes, in all which this active work of the church was one of the striking and prominent characteristics, had the effect of arresting in many countries the progress of Protestantism, at first rapid and decisive; and Lord Macaulay has traced out with curious minuteness the line which marks in the several countries the origin and the progress of this religious reaction.

From the end of the 16th c., therefore, the position of the R. C. Church, especially in her external relations, may be regarded as settled. The local distribution of the rival churches in the world has not been materially altered since that time. But in her relation to the state, the Roman Church has since passed through a long and critical struggle, which is detailed under the heads GALLICAN CHURCH, FEBRONIANISM, INNOCENT XI. The new theories to which the French Revolution gave currency have still further modified these relations; but in most of the European kingdoms they have been regulated either by concordat or by some similar mutual agreement. Many conflicting claims, however, on either side still exist; but the policy of the R. C. Church in the conflict with the state has generally been to record her protest against any violation of right, but the protest having been made, to submit under protest, unless in what are considered the essentials of faith or of discipline.

The details of the doctrinal system of the R. C. Church may be best explained from her latest authentic creed, that commonly called of Pius V., drawn up as a summary of all the authoritative teaching up to that time, including the decrees of the Council of Trent. It is only necessary to premise that, while in the view of Catholics (see RULE OF FAITH) the doctrine must be based on the Word of God, written or unwritten, the church is the only authoritative judge of that Rule of Faith. The tribunals which are held to represent this teaching, as well as the subjects to which the privilege extends, and the limits within which it is held to be exercised infallibly, have all been explained under the head INFALLIBILITY (q. v.). But Catholics hold, that while the church has authority, when doubts or difficulties arise, to propound authoritatively new definitions of faith, nevertheless these new definitions must not be regarded as additions to the original faith of the church, or to the original deposit of divine teaching, but only as expositions of former articles, or at most as developments of what already existed in the germ, and has but been evolved by controversy, or brought into practical action by the progress of time, and the change of the external relations of the church. The creed of Pius V. is as follows:

'I, N. N., with a firm faith believe and profess all and every one of those things which are contained in that creed which the holy Roman Church maketh use of. To wit: I believe in one God, the Father Almighty, Maker of heaven and earth, of all things visible and invisible, and in one Lord Jesus Christ, the only begotten Son of God, born of the Father before all ages; God of God; Light of Light; true God of the true God; begotten, not made; consubstantial with the Father, by whom all things were made. Who for us men, and for our salvation, came down from heaven, and was incarnate by the Holy Ghost of the Virgin Mary, and

was made man. He was crucified also for us under Pontius Pilate, suffered, and was buried. And the third day he rose again according to the Scriptures: he ascended into heaven, sitteth at the right hand of the Father, and shall come again with glory to judge the living and the dead; of whose kingdom there shall be no end. I believe in the Holy Ghost, the Lord and life-giver, who proceedeth from the Father and the Son; who, together with the Father and the Son, is adored and glorified; who spake by the prophets. And in one holy, Catholic, and Apostolic Church. I confess one baptism for the remission of sins; and I look for the resurrection of the dead, and the life of the world to come. Amen.

'I most steadfastly admit and embrace the apostolical and ecclesiastical traditions, and all other observances and constitutions of the same church.

'I also admit the holy Scriptures, according to that sense which our holy mother the Church hath held and doth hold; to whom it belongeth to judge of the true sense and interpretation of the Scriptures; neither will I ever take and interpret them otherwise than according to the unanimous consent of the Fathers.

'I also profess that there are truly and properly seven sacraments of the new law, instituted by Jesus Christ, our Lord, and necessary for the salvation of mankind, though not all for every one: to wit—Baptism, Confirmation, the Eucharist, Penance, Extreme Unction, Order, and Matrimony; and that they confer grace; and that of these, Baptism, Confirmation, and Order cannot be repeated without sacrilege. I also receive and admit the received and approved ceremonies of the Catholic Church, used in the solemn administration of the aforesaid sacraments.

'I embrace and receive all and every one of the things which have been defined and declared in the holy Council of Trent concerning original sin and justification.

'I profess, likewise, that in the Mass there is offered to God a true, proper, and propitiatory sacrifice for the living and the dead; and that in the most holy sacrament of the Eucharist there is truly, really, and substantially the Body and Blood, together with the soul and divinity of our Lord Jesus Christ; and that there is made a conversion of the whole substance of the bread into the Body, and of the whole substance of the wine into the Blood; which conversion the Catholic Church calleth Transubstantiation. I also confess that under either kind alone Christ is received whole and entire, and a true sacrament.

'I constantly hold that there is a Purgatory, and that the souls therein detained are helped by the suffrages of the faithful.

Likewise, that the saints reigning together with Christ are to be honoured and invocated, and that they offer prayers to God for us, and that their relics are to be had in veneration.

'I most firmly assert that the Images of Christ, of the Mother of God, ever Virgin, and also of other saints, ought to be had and retained, and that due honour and veneration are to be given them.

'I also affirm that the power of indulgences was left by Christ in the church, and that the use of them is most wholesome to Christian people.

'I acknowledge the holy Catholic, Apostolic, Roman Church for the mother and mistress of all churches; and I promise true obedience to the Bishop of Rome, successor of St Peter, Prince of the Apostles, and Vicar of Jesus Christ.

'I likewise undoubtingly receive and profess all other things delivered, defined, and declared, particularly by the holy Council of Trent; and I condemn, reject, and anathematise all things contrary thereto, and all heresies which the church hath condemned, rejected, and anathematised.

'I, N. N., do at this present freely profess, and sincerely hold this true Catholic faith, out of which no one can be saved; and I promise most constantly to retain and confess the same entire and inviolate, by God's assistance, to the end of my life.'

In addition to these articles, the R. C. Church has since the compilation of the creed of Pius V. defined certain further articles in the controversy on grace, which arose from the teaching of JANSENIUS (q. v.), and still more recently that of the IMMACULATE CONCEPTION OF THE BLESSED VIRGIN MARY (q. v.), and INFALLIBILITY OF THE POPE.

The details of the discipline of the R. C. Church would be out of place here. But it may be observed that the R. C. Church leans towards asceticism, as regards the practice of fasting, with less rigour than the Greek and oriental communions; while on the contrary, as to the celibacy of the Clergy (q. v.), her law is much more stringent; all the clergy of the R. C. Church in the greater orders, including sub-deacons, being so strictly bound to celibacy, that a marriage contracted after ordination is invalid by the church law. See ORDERS. In all that regards the general discipline of the whole church, only the pope or a general council is considered to have power to legislate; national or provincial synods for a kingdom or province, and bishops for their own dioceses.

The constitution of the R. C. Church has been in great part explained in the article HIERARCHY. It may be necessary to add that, under the generic name Roman Catholics are comprised all those Christians who acknowledge the supremacy of the Roman pontiff, even though they be not of the Roman or Latin RITE (q. v.). Not a few individuals and churches of other rites are included under this designation, Greeks, Slavonians, Ruthenians, Syrians (including Maronites), Copts, and Armenians; and these communities are permitted to retain their own national liturgy and language; and for the most part, their established discipline and usages. The most remarkable examples of the diversity of discipline thus introduced under the common rule of the Roman pontiff are the retention of the use of the cup for the laity, and the permission of the marriage of the clergy.

As regards its organisation for the purposes of ecclesiastical government, the normal territorial distribution of the R. C. Church of the several rites in the various countries where it exists is into provinces, which are subject to archbishops, and are subdivided into bishoprics, each governed by its own bishop. The total number of archbishops of the several rites in communion with Rome in 1863 was 158, of whom 12 bear the title of patriarch. The number of bishops in the same year was 694, making in all 852. But in certain parts of the world, where the population and government are Protestant or unbelieving, the spiritual affairs of the Catholic Church are directed, not by bishops with local titles, but by bishops IN PARTIBUS INFIDELIUM (q. v.), who are styled vicars of the pope, or vicars apostolic. Of these, the number in 1863 was 125.

The statistics of the R. C. Church, as contained in the *Orbe Cattolico*, published at Rome, give us the total number of Catholics of all nations as 185,000,000. This number nearly corresponds with the total of Roman Catholics as given in the article on Religion (q. v.). In order to avoid unnecessary repetition, we refer to that article for the details of the distribution of Roman Catholics in the several countries; and for the number of those subjects of the pope who follow a rite different from that of

Rome, see GREEK CHURCH, RUSSIAN CHURCH, SYRIA, MARONITES.

ROMAN CATHOLIC EMANCIPATION OR RELIEF ACTS. After the Reformation, both in England and in Scotland, R. Catholics were subjected to many penal regulations and restrictions. As late as 1780, the law of England which, however, was not always rigidly enforced—made it felony in a foreign R. Catholic priest, and high treason in one who was a native of the kingdom to teach the doctrines or perform divine service according to the rites of his church. R. Catholics were debarred from acquiring land by purchase. Persons educated abroad in the R. Catholic faith were declared incapable of succeeding to real property, and their estates were forfeited to the next Protestant heir. A son or other nearest relation being a Protestant, was empowered to take possession of the estate of his R. Catholic father or other kinsman during his life. A R. Catholic was disqualified from undertaking the guardianship even of R. Catholic children. R. Catholics were excluded from the legal profession, and it was presumed that a Protestant lawyer who married a R. Catholic had adopted the faith of his wife. It was a capital offence for a R. Catholic priest to celebrate a marriage between a Protestant and R. Catholic. Such was the state of the law, not only in England but in Ireland, where the large majority of the population adhered to the old faith. In Scotland, also, R. Catholics were prohibited from purchasing or taking by succession landed property. The inexpediency and irrationality of imposing fetters of this description on persons not suspected of disloyalty, and from whom danger was no longer apprehended, began about 1778 to occupy the attention of liberal-minded statesmen; and in 1780, Sir George Saville introduced a bill for the repeal of some of the most severe disqualifications in the case of such R. Catholics as would submit to a proposed test. This test included an oath of allegiance to the sovereign, and abjuration of the Pretender, a declaration of disbelief in the several doctrines, that it is lawful to put individuals to death on pretence of their being heretics; that no faith is to be kept with heretics; that princes excommunicated may be deposed or put to death; and that the pope is entitled to any temporal jurisdiction within the realm. The bill, from the operation of which Scotland was exempted, eventually passed into law. An attempt which had been made at the same time to obtain a like measure of relief for the R. Catholics of Scotland, was defeated by an outburst of religious fanaticism. The populace of Edinburgh, stirred up by a body called 'The Committee for the Protestant Interest,' attacked and set fire to the R. Catholic churches, and the houses of the clergy and of such persons as were suspected to be favourable to R. Catholic relief. The frenzy spread to England, where a 'Protestant Association' had been formed to oppose the resolutions of the legislature. See GORDON, LORD GEORGE. In 1791, a bill was passed affording further relief to such R. Catholics as would sign a protest against the temporal power of the pope, and his authority to release from civil obligations; and in the following year, by the statute 33 Geo. III. c. 44, the most highly penal of the restrictions bearing on the Scottish R. Catholics were removed without opposition, a form of oath and declaration being prescribed, on taking which they could freely purchase or inherit landed property.

Endeavours were made at the same time by the Irish parliament to get rid of the more important disqualifications, and place Ireland on an equality in point of religious freedom with England. In 1780, Grattan carried his resolution that the king and parliament of Ireland could alone make laws that would bind the Irish, and separation from England was urged as the alternative with repeal of the disqualifying statutes. The agitation culminated in the Irish rebellion of 1798; the union of 1800 followed, which was partly carried by means of pledges, not redeemed, regarding the removal of the disabilities in question. Meantime, in England, R. Catholics continued subject to many minor disabilities, which the above-mentioned acts failed to remove. They were excluded from sitting and voting in parliament, and from enjoying numerous offices, franchises, and civil rights, by the requirement of signing the declaration against transubstantiation, the invocation of saints, and the sacrifice of the mass. In the early part of this century, many measures were proposed for the removal of these disqualifications, and in 1813 and succeeding years, one bill for this end after another was thrown out. Meanwhile, the agitation on the subject among the R. Catholics themselves greatly increased, and in 1824 it assumed an organised shape by the formation of the 'R. Catholic Association' in Ireland, with its systematic collections for the 'Catholic rent.' The Duke of Wellington, who, for a long time, felt great repugnance to admit the R. Catholic claims, was at last brought to the conviction, that the security of the empire would be imperilled by further resisting them, and in 1829 a measure was introduced by the duke's ministry for Catholic emancipation. An act having been first passed for the suppression of the R. Catholic Association—which had already voted its own dissolution—the celebrated R. Catholic Relief Bill was introduced by Mr Peel in the House of Commons on the 5th of March, and after passing both Houses, received the royal assent on the 13th April. By this act (10 Geo. IV. c. 7), an oath is substituted for the oaths of allegiance, supremacy, and abjuration, on taking which R. Catholics may sit or vote in either House of Parliament, and be admitted to most other offices from which they were before excluded. They, however, continue to be excluded from the offices of Guardian and Justice or Regent of the United Kingdom, Lord Chancellor, Lord Keeper, or Lord Commissioner of the Great Seal of Great Britain or Ireland, and Lord High Commissioner to the General Assembly of the Church of Scotland. As members of corporations, they cannot vote in the disposal of church property or patronage. Ecclesiastics or other members of the R. Catholic persuasion, either wearing the habit of their order, or officiating in any place which is not their usual place of worship, or a private house, forfeit £50. Jesuits, and members of orders bound by monastic or religious vows, must register themselves with the clerk of the peace of their county, under a penalty of £50 for every month that they remain in the kingdom unregistered. Jesuits not natural-born subjects, who have come into the country since the passing of the act, are liable to be banished. Persons admitting others to such societies within the United Kingdom, are liable to fine and imprisonment, and those who have been so admitted are liable to be banished.

Restrictions which existed on R. Catholic bequests were removed by 2 and 3 Will. IV. c. 115, as regards Great Britain, and by 7 and 8 Vict. c. 60, with relation to Ireland. Acts 7 and 8 Vict. c. 102, and 9 and 10 Vict. c. 59, abolished a few minor R. Catholic disabilities. For the statutory prohibition against the assumption of ecclesiastical titles in respect of places in the United Kingdom, see ECCLESIASTICAL TITLES ASSUMPTION ACT.

ROMAN CEMENT. See CEMENTS.

ROMAN RELIGION, ANCIENT, a conglomeration of the most widely-different theological or rather mythological elements, introduced by the various strata of immigrations that flowed into the different parts of Italy at different pre-historic times. It was chiefly under Greek influence that it assumed that most characteristic and systematic form, under which it was known during the classical times of Rome, and as which it generally represents itself to our minds. Numa Pompilius (q. v.), that mythic successor of Romulus, is by the primitive legend mentioned as the founder of the Roman religion, or rather ceremonial law. He is probably the type of the period when the religious notions of the Sabines were first joined to the primitive elements of legendary belief of the early settlers. Among the vast number of the different and obscure component elements, the Pelasgian, Sabellian, Oscan, Gallic, &c., out of which grew the recognised state religion, we can, with a comparative amount of clearness, distinguish chiefly three—the Etruscan, the Sabine, and the Latin. The religion of the Etruscans—as distinct from the Pelasgians (q. v.)—has been characterised in our article on that nation. Of the gods of the Latins, many are closely related to those of the Greeks (see GREEK RELIGION), a circumstance easily accounted for by their common eastern origin (see ROME, HISTORY OF); others, however, seem indigenous. Their principal deities are Tellus (q. v.) (the earth) Saturn (q. v.) (god of seeds), and his wife Ops (goddess of earth and plenty), who are somewhat akin to Kronos and Rhea; Jupiter (q. v.), with Juno (q. v.), givers of light. Deities more peculiar to the Latins are Janus (q. v.), and Diana (q. v.). Faunus and Fauna are prophesying wood-deities, and were allied to Lupercus, in whose honour the Lupercalia (q. v.) were celebrated; Picus and Pilumnus, who preside in some way over agriculture and the fruits of the field; Vesta (q. v.); Fortuna (q. v.); Ferentina, the goddess of leagues. A certain number of agrarian deities (Anna Perenna, Venus, &c.) make up, with those mentioned, the bulk of 'native' Latin numina. Of chiefly Sabine deities, we name Feronia, the Ferentina of the Latins, a goddess of the soil, who was worshipped with gifts of flowers and fruits; and the two war-gods, Mars and Quirinus—the former a deity at first worshipped under the symbol of shield and spear, and of high importance for colonisations, to whom every animal and every human being born in a certain year was sacred; the former being doomed to be sacrificed, and the latter at the age of twenty to emigrate, and to found new settlements: Quirinus, a deity of strife, closely connected with the myth of Romulus. Sabine deities were also Sol, the sun, Luna, the moon, &c.

Having thus traced some of the principal gods and goddesses (of the greater part of whom fuller information will be found in special articles in the course of this work) to the respective nationality that first introduced them into Italy, we shall now take a brief glance at the Roman Pantheon as it appeared when it had embodied systematically these acclimatised primeval idealisations. For it was as characteristic of the Roman gods to appear in sets, as it was for the more personal gods of the Hellenes to appear singly. The Romans, as it were, made them fall rationally into rank and file, each with a distinct mission of its own, and thus filled with them, as with authorities over special departments, the whole visible and invisible world—above, below, and around. The first rank of all is taken by the three Capitoline deities, the personifications of highest power, highest womanliness, and highest wisdom—Jupiter (q. v.); Juno (q. v.), the Queen of Heaven, and the tutelary deity of women; and Minerva (q. v.). The stars also had three foremost representatives—Sol, the sun, Luna, the moon, and Tellus, the earth. The supreme deities of the Infernal Regions were Orcus, Dis (Dives, Consus?), and his wife, the Queen of the Empire of the Shadows, Libitina. The element of the water was presided over by Neptune (q. v.); that of the fire by Vulcan (q. v.), the god of the smithies, and Vesta, the goddess of the domestic hearth and its pure flame. Agriculture and rearing cattle were sacred to the ancient Latin king Saturnus, whose wife, Ops—the riches therefrom accruing—had, like Demeter, her seat in the soil. Ceres, Liber, and Libera, the three Greek deities of agricultural pursuits, were superadded about 500 B. C. Pales, the special protector of the flocks, and his festival (the Palilia) were celebrated on the foundation-day of Rome. Mars himself was the supreme deity of the Romans next to Jupiter. Deities of Oracles are Faunus, a deified king, who gave his obscure decisions either in dreams or in strange voices, and his female relative—wife, daughter, or sister—Fauna (Bona Dea), who attends only to the female sex; and the Camenæ, prophesying nymphs, of whose number was Egeria, Numa Pompilius's inspirer. The Apollo worship was but of late growth in Rome. The Parcæ represented the unchangeable fate of the individual. Fortuna was, on the contrary, the uncertain chance of destiny, the 'luck' to be invoked at all important junctures. Salus, Pax, Concordia, Libertas, Felicitas, Pietas, Virtus, Honos, Spes, and a host of other abstract notions, explain themselves. Venus first became important when identified with Aphrodite; in the same way as Amor, Cupido, and Voluptas were Greek importations, brought into prominence by the poets chiefly. Life, death, and life after death are made concrete, by the Genii, the Lares, Manes, and Penates. See LARES.

Like the Greeks, the early Romans had no 'mediators,' but addressed their prayers and supplications directly to the individual god. The priesthood, we find, in the classical period, had arisen originally from the 'kindlers (*flamines*) of Mars,' or those who presented burnt-offerings to the early Italian war-god Mars, and the twelve dancers (*Salii*) who in March performed war-dances in his honour. To these came the 'Field Brethren,' the 'Wolf-repellers,' &c.; and thus by degrees an endless and most powerful hierarchy came to be built up. By the side of it, but not identical with it, were certain sacred colleges, who kept the sacred traditions alive, and who were the supreme authority on religious observances. These were the colleges of Pontifices (q. v.) or Bridge-builders, of Augurs (see AUGURIES and AUSPICES), the keepers of the Sibylline Books (see SIBYL); the twenty Fetiales or state heralds, the supreme—advising, not executing—authorities on international law; the Vestal virgins, on whom devolved the guardianship of the Palladium and of the sacred fire; the Salii (see above), and others. Priests, in the stricter sense of the word, in the service of special deities, were the Flamens (q. v.); while the Dea Dia, the goddess of fields (Tellus, Ceres, Ops, Flora), had the special brotherhood of the twelve Arvalian brothers, with their numerous followers. The state sacrifice, before the expulsion of the mythical kings supposed to have been offered up by these, was offered by a special *Rex Sacrorum* or *Rex Sacrificulus*.

The mode of worship was analogous to that of the Greeks. Votive offerings, prayers, vows, sacrifices, libations, purifications, banquets, lays, songs, dances and games made up the sum of their divine service. The sacred places were either *fana*, *delubra*—mere hallowed spots on hills and in groves—or *templa*.

ædes, special buildings dedicated to a special deity. The latter contained two altars—the *ara*, for libations and oblations; and the *altare*, for burnt-offerings chiefly. Frugality, as it pervaded, in the classical period, the domestic life, so it also prevented all extravagance of offerings to the deity, and all excess of rejoicing before it. Sober and dull, as the Roman religion undoubtedly was—for it never once expanded into the joyful extravagances of fancy with which the Greek religion was fraught throughout—it at the same time kept free from the abominations that are the natural offspring of that unbounded sway of fancy. Human sacrifices, as far as they are to be met with, grew out of the idea of substitution, and were chiefly enthusiastic voluntary acts of men who threw themselves into the breach; or they carried out decrees of civil tribunals, who had convicted the 'victim' of a deadly offence. In their dealings with the gods, the Romans were pure merchants, carrying out their promises with strict literalness, and thus often fraudulently, against the patent inner meaning of their promise; but the gods were not to them the all-pervading essences, but rather creditors, strict and powerful, yet unable to exact more than was agreed upon outwardly.

A code of moral and ethical rules, furthering and preserving civil order, and the pious relations within the state and family, were the palpable results of this religion, which, in its barrenness of metaphysical notions, did next to nothing for the furtherance of art.

And here we must enter somewhat more fully into that peculiar phenomenon of the utter dissimilarity in the characters of the Greek and Roman religion, at which we have hinted already—a dissimilarity all the more surprising, as the self-same symbolical and allegorical views of nature, filtered through however different channels, form the foundation of both. Both also—especially in their later stages—offer a general analogy not only of deities and spirits, but even of holy places and their mode of worship. But the fact is, that they each took the original common stock of notions and conceptions, clad more or less in mythical garb, and utterly transformed it, superadding to it from time to time according to their own distinct nationality. It is here, however, that their characteristic traits come out in as forcible a contrast as they do in every other relation of life, in their art and culture, in their states and families. While to the Hellenes the individual was the chief end of all things, and the state existed for the citizen, and the ideal was the *Kalokagathia*, the beautiful, good, the Romans imposed, as the highest duty, submission to authority—the son to the father, the citizen to the ruler, and all to the gods. To them, only that which was useful appeared good. Idleness was not to be tolerated in a community where every single member only existed as far as it contributed to the greatness and aggrandisement of the commonwealth. Hence, with them, a rational thoughtfulness, and a grand and awful austerity in their relations to men and gods; while the Greeks treated both with joyful serenity. The Greek invested his gods with human attributes, and then surrounded them with a halo of highest splendour and most glorious divine beauty; but he constantly modelled and remodelled them, until they reached the acme of beautiful perfection, as would the painter and the sculptor with their work. The Roman, on the other hand, cared nothing for the outward form of his idealised notions—the notions themselves, mere fundamental ideas, were his sole object of veneration. The Greeks made everything concrete, corporeal, and individual; the Romans, abstract and general. The Greeks could only worship allegories; the Romans, abstractions. Hence, also, their utter discarding of many of the myths common to the whole Indo-Germanic stock, the unmarried and childless state of their gods, who, moreover, wanted no food, and did not wander about among men, as did the Indian and the Hellenic. As in the late Midrash, which has partly found its way into Christianity, there is a heavenly Jerusalem right over the earthly Jerusalem, in which all things below were reproduced in an exact but most ideal and divine manner. Thus, the Roman Pantheon was the precise counterpart of the Roman world as it existed in reality. Every man, and thing, and event, and act had a corresponding tutelary deity, that came and went with the special individual, phenomenon, or event, and eternal gods were those only that represented certain great unchanging laws of nature. The angels of the legendary lore of later Judaism and early Christianity, that protect special nations, were with the Romans the gods of these nations, and entered, as their special numina, the divine commonwealth of the Romans simultaneously with the admission of these nations into their own pale or freedom.

As long as the grand old Roman simplicity of manners, the frugality of domestic life, the indefatigable pursuit of agriculture, trade, and commerce lasted—and all of these were well characterised by the deep reverence paid to gods (albeit not in the highest scale of divine order), who presided over the house, the field, the forest, mercantile enterprise, and the like, Vesta, the Penates, the Silvani, the Lares or Lases, Hercules or Herculus (a native Italian deity, the god of the enclosed homestead [compare Jupiter *herceus*] apparently distinct from the Greek Heracles) as the god of property and gain, whose altar, as god of faith (*Deus fidius*), was as frequently to be met with as those of the goddess of chance (Fors, Fortuna), and the god of traffic (Mercury)—so long did Roman religion, properly so called, retain its firm hold over the people's minds, and its influence cannot well be overrated. But when the antique austerity, the olden spirit of grand independence, the unceasing hard work that steeled body and soul, had given way to the lazy, luxurious ease of later times—then Roman religion ceased to exist in reality, and over its ruins rose a mad jumble of unbelief, Hellenism, sectarianism, and oriental creeds. The ancient *religio*, the binding faith, which had excited the admiration and astonishment of the Greeks, had waned, and in proportion with the unbelief rose the pomp, and stateliness, and luxury of public worship. To the hierarchy of augurs, oracle-keepers, and pontifices were superadded special banquet-masters for the divine banquets. The priests more and more freed themselves from taxes and other public burdens, and the custom of perpetual endowments for religious objects crept in, as their influence waxed stronger and stronger. 'Pious services' became as much an item of domestic expenditure as the cook's and nurse's wages. Penny collections for the 'mother of God' were gathered on certain fixed days by the sound of fife and drum played by priests in oriental garb, headed by a eunuch, from house to house, and the whole substance of Roman faith was transformed into an unwieldy mass of dark, grovelling mysticism and shameless profligacy, presided over by wretched gangs of uneducated and unprincipled priests. How this state of things favoured the gradual introduction of Judaism and Christianity into the dying days of imperial Rome, has been briefly sketched in GNOSTICS (q. v.). Constantine the Great abolished the last outward trace of Roman religion by proclaiming Christianity as the state religion.—For the greater

part of the gods and goddesses mentioned, see special articles. See also GREEK RELIGION, ETRURIA, PELASGIANS, &c. For a fuller account of the whole subject, the reader is referred to Mommsen's *History of Rome* (Eng. transl. Lond. 1864).

ROMANE'SQUE ARCHITECTURE, the debased style which succeeded Roman architecture, from about the time of Constantine (350 A. D.) to that of Charlemagne (800 A. D.). It is impossible to fix the date of the style definitely, because Roman Architecture (q. v.) was itself a transitional style, and the one fades gradually into the other. When Constantine proclaimed Christianity the religion of the empire, he gave the Christians freedom of action. They could worship in public, and consequently desired buildings for their service; hence the impetus which gave architecture a new start. As explained under APSE and BASILICA, the Christians adopted the Roman hall of justice for their church or place of assembly, and erected many noble basilicas in Rome, Ravenna, and all over the empire. These consisted of three or five aisled halls—the aisles separated by rows of columns. In Rome, the columns, entablatures, and other ornaments were frequently taken from the ruins of ancient buildings which abounded there. The new style is therefore closely allied to the ancient one in the imperial city; but in Ravenna, Jerusalem, Provence, and the remoter districts, where few ancient remains exist, a simpler and ruder copy of the ancient work is found. There is always, however, a certain resemblance to the old forms which distinguishes the Romanesque from the round-arched Gothic which succeeded it. The piers along the aisles are always single columns, generally with caps intended to be Corinthian, and wide arches; the aisles are wide, with open wooden roof; and there are remnants of entablatures, mouldings, &c., which recall the ancient Roman work. The early Christians also derived their round churches from the Romans. They were probably originally tombs, copied from such buildings as the Minerva Medica (see ROMAN ARCHITECTURE), and were the most sacred places, where the burial-service was said, and the sacraments administered. Hence they afterwards became Baptisteries (q. v.), and were finally absorbed into the church (see RHENISH ARCHITECTURE), which then contained within itself everything connected with the Christian service.

In Rome there are still some thirty basilicas, and

Romanesque Interior.

the Romanesque style may be said never to have died out there. As we recede from the centre, we find its influence gradually weaken, and succumb to the Northern Gothic style. Thus, in Lombardy and Provence, it was superseded by the Lombard (q. v.) and Romance styles in the 11th and 12th centuries; while in Byzantium and the East, it gave way to the Byzantian style about the time of Justinian. Amongst the finest examples remaining are St Paul's (see BASILICA) and Sta Maria Maggiore at Rome, and at Ravenna, St Apollinare; the interior decoration of which last (see fig.) is very beautiful. The mosaics of the apse, the painted walls, and the inlaid pavements of the Romanesque churches, are amongst their finest features. In colour, they always excel.

In Tuscany, there is a late form of Romanesque, of which the cathedrals at Pisa and Lucca, San Miniato at Florence, and many churches in those cities, are examples. They are intermediate specimens, built during the 11th c., when the cities became prosperous, and have a certain amount of Gothic feeling; but although beautiful in coloured decoration, they have not the simple grandeur of the early basilicas; and although more decorated externally than these, they have not the bold and purpose-like appearance of Gothic elevations.

ROMA'NIC LANGUAGES, a general name for those modern languages that are the immediate descendants of the language of ancient Rome. In those parts of the empire in which the Roman dominion and civil institutions had been most completely established, the native languages were speedily and completely supplanted by that of the conquerors—the Latin. This was the case in Italy itself, in the Spanish peninsula, in Gaul or France, including parts of Switzerland, and in Dacia (see WALLACHIAN LANGUAGE). When the Roman empire was broken up by the irruptions of the northern nations (in the 5th and 6th centuries), the intruding tribes stood to the Romanised inhabitants in the relation of a ruling caste to a subject population. The dominant Germans continued for several centuries to use their native tongue among themselves; but from the first they seem to have acknowledged the supremacy of the Latin for civil and ecclesiastical purposes, and at last the language of the rulers was merged in that of their subjects; not, however, without leaving decided traces of the struggle—traces chiefly visible in the intrusion of numerous German words, and in the mutilation of the grammatical forms or inflections of the ancient Latin, and the substitution therefor of prepositions and auxiliary verbs. It is also to be borne in mind that the language which underwent this change was not the classical Latin of literature, but a popular Roman language (*Lingua Romana rustica*) which had been used by the side of the classical, and differed from it—not to the extent of being radically and grammatically another tongue, as some writers unwarrantably conclude—but chiefly by slovenly pronunciation, the neglect or misuse of grammatical forms, and the use of 'low' and unusual words and idioms. As distinguished from the old *lingua Latina*, the language of the church, the school, and the law, this newly-formed language of ordinary intercourse, in its various dialects, was known as the *Lingua Romana;* and from this name, probably through the adverb Romanicé, came the term Romance (Prov. and O. Fr. *romans*, Sp. *romance*, It. *romanzo*), applied both to the language and to the popular poetry written in it, more especially to the dialect and productions of the troubadours in the south of France.

According to the theory of Raynouard (q. v.), the new language that sprang out of the corruption of the Latin was at first essentially the same over all the countries in which Latin had been spoken, and is preserved to us in a pure state in the Provençal, or language of the troubadours; and it was from this as a common ground, and not from the original

Latin, that the several Neo-Latin tongues diverged into the different forms which they now present. This theory is not accepted by more recent inquirers; its groundlessness has been demonstrated by Sir G. Cornewall Lewis in his elaborate *Essay on the Origin and Formation of the Romance Languages* (2d ed. Lond. 1862). It is beyond doubt that the several daughters of the mother Latin had their characteristic differences from the very first, as, indeed, was inevitable. The original Latin spoken in the several provinces of the Roman empire must have had very different degrees of purity, and the corruptions in one region must have differed from those in another according to the nature of the superseded tongues. To these differences in the fundamental Latin must be added those of the superadded German element, consisting chiefly in the variety of dialects spoken by the invading nations and the different proportions of the conquering population to the conquered. French, e. g., as was to be expected, is richer in German words than any other member of the family, having 450 not found in the others. Italian is next to French in this respect. There are about 900 in the Romanic languages altogether, of which about 300 are common to them all. A great many of these words are terms relating to warfare.

The varieties of speech originating in the way now described (which first received the general name of Romanic* languages in recent times from German scholars—*Romanische Sprachen*) are divided by Diez into six jurisdictions:

1. The Italian, preserving, as was to be expected, the traits of the mother Latin in more recognisable form than any of the sister tongues. It presents a variety of strongly marked dialects.

2. The Walachian (see WALLACHIAN LANGUAGE).

3. The Spanish, which is characterised by copiousness and etymological obscurity, arising from the establishment of so many different nations on the soil. For one element of difference, it contains a large number of Arabic words—as many as 500 terms have been enumerated. Of the various dialects, the Castilian is considered the standard.

4. The Portuguese, including both the language of Portugal and of Galicia; it is nearly akin to the Spanish, but differs too much in some points of grammar to be reckoned a mere dialect.

5. Provençal, the language of the south of France, extending on the one side into Spain over Catalonia, Valencia, and the Balearic Isles; and on the other over Savoy and part of Switzerland, about the Lake of Geneva. The line of division between the Provençal and the northern idiom which has now become the literary language of the whole of France, is usually drawn through Dauphiné, Lyonnais, Auvergne, Limousin, Perigord, and Saintonge. From the use of the affirmative *oc* (= yes), the Provençal was known as the Langue d'oc, as the northern French was called the Langue d'oil, from *oïl*, modern French *oui* (see LANGUEDOC).† The Provençal was at an early period a cultivated language, with a regular system of grammar, and in the 12th and 13th centuries, produced a rich poetical literature (see TROUBADOURS).

6. French, extending over the northern half of France, and parts of Belgium and Switzerland. Diez conceives that at first northern French may have been little different from Provençal, but, beginning with the 9th c., it has been more and more distinguished by the greater wearing away of the original grammatical forms. See FRENCH LANGUAGE AND LITERATURE.

The language of the canton of the Grisons (q. v.), anciently *Rhætia*, though sufficiently distinct from Italian and French, is not considered by Diez to have attained sufficient fixity or independence to deserve being ranked along with the others as a seventh Romanic tongue. It is called by the Germans Cur-wälsch, by the people themselves Rumonsh. There are two chief dialects, the Oberland, about the sources of the Rhine, and that spoken in the Engadine (q. v.), called the Ladin.

The chief authorities on this subject are the two great works of Diez (q. v.), the Grammar and the Dictionary of the Romanic Languages. The Dictionary and the Introduction to the Grammar have been translated into English.

ROMANOFF, THE HOUSE OF, of which the present imperial family of Russia is the chief representative, is said to have derived its origin from a Lithuanian prince of the 4th c.; but however this may be, it is certain that the family did not make its appearance in Russia till the 14th c., when Andrew Kobyla emigrated from Prussia to Moscow in 1341, and entered the service of the then grand-duke, Simeon the Fierce. Andrew's descendants became bojars early in the 15th c., their territorities lying in the government of Vladimir, and district of Jurief-Polskoi. The bojar *Roman Jurievitch*, the fifth in direct descent from Andrew, died in 1543, leaving a son and daughter; the latter of whom became czarina by her marriage with Ivan the Terrible; while the former, *Nikita Romanovitch Jurief*, by his nuptials with the Princess of Susdal (a direct descendant from a brother of St Alexander Nevskoi), was also allied to the royal race of Rurik. Nikita was one of the regency during the minority of Feodor I.; and his eldest son Feodor, under the name of *Philarete*, was elevated to the rank of archimandrite and metropolitan of Rostof during the reign of the false Dmitri. The Romanoffs supported that party who tendered the Russian crown to the Polish prince, and Philarete had gone with that view to Poland, when a sudden outburst of national sentiment put a stop to these negotiations, and the unlucky envoy was in consequence thrown into prison by the enraged Poles. The national party now proceeded to the election of a native sovereign, who should be as closely allied as possible by blood to the race of Rurik; and after much hesitation and many rejections, they chose MIKAIL FEODOROVITCH ROMANOFF, the son of the imprisoned metropolitan, and the representative, through his grandmother, of the royal house of Rurik, 21st February 1613. This selection, which had been made by the higher nobility and the clergy, was rapturously applauded by the people; and though the new czar was not quite seventeen years of age, the general desire of all classes to conform to his ordinances rendered the cares of government comparatively light. He was succeeded by his eldest son, *Alexei Mikailovitch* (1648—1676), an able prince, who carried on war with varied success against the Swedes and Poles, and acquired a great reputation as a legislator. Alexei was twice married, and left by his first wife two sons, Feodor and Ivan, and many daughters, and by his second wife, one son, Peter. His eldest son, *Feodor* (1676—1682), was a

* *Romanic* seems preferable to *Romance*, the term employed by many English writers, both as being more in analogy with *Italic*, *Arabic*, &c., and as avoiding the association with a particular kind of literature, and the special Neo-Latin tongue in which that literature was originally written—viz., the Provençal.

† Instead of the etymologies of *oc* and *oïl* given in the article referred to, Diez derives *oc* from Lat. *hoc*, this (equivalent to Eng. *so*, Ital. and Fr. *si*, which are only other forms of the Pronoun [q. v.] *sa* or *ta*); in the north, *oc* was first shortened into *o*, and then compounded with *il* (Lat. *hoc illud*).

prince of much talent and foresight, and laboured with success to reduce the power of the aristocracy; but being of a very weak constitution, he died at the age of twenty-five without posterity, leaving the throne by his will to his half-brother, Peter, as his full brother, Ivan, was an imbecile. However, it was not till seven years after this that *Peter* (see PETER THE GREAT) succeeded in obtaining possession of the throne. It is worthy of remark, that hitherto all the czars of the House of R. had mounted the throne before attaining twenty years of age. Peter (see PETER THE GREAT) was twice married; by his first marriage, he had a son, Alexis (q. v.), who died during his father's lifetime, leaving one son, Peter, afterwards Peter II.; and by his second marriage with *Catharine I.* (q. v.) (1725—1727) he had two daughters, Anne and Elizabeth. Catharine I. left the throne to her step-grandson, *Peter II.* (1727—1730), the last of the male line of R.; and on his death without heirs, the succession reverted to the female line. Ivan, Peter the Great's half-brother, had also left daughters, and their claims to the crown being preferable, one of them, *Anna Ivanovna* (1730—1740), was placed upon the throne, and was succeeded by her grand-nephew, *Ivan IV.* (1740—1741); but then a revolution drove Ivan's family from the throne, of which the cadet female line in the person of *Elizabeth* (1741—1761), the daughter of Peter the Great and Catharine, obtained possession. Failing heirs of Elizabeth, her nephew, Peter, the son of her elder sister, Anna Petrovna, who had married the Duke of Holstein-Gottorp (a cadet of the family of Oldenburg), and died in 1728, was the heir-presumptive; and accordingly, on her death in 1761, he mounted the throne as *Peter III.* (1761—1762), founding a new dynasty, that of ROMANOFF-OLDENBURG; but his brief tenure of power was put an end to by his assassination, at the instigation of his wife, the princess Sophia-Augusta of Anhalt-Zerbst, who, as *Catharine II.* (1762—1796), wielded the sceptre of this mighty empire for the long period of thirty-four years. She was succeeded by *Paul I.* (q. v.) (1796—1801), her only son by Peter III.; and Paul, after a brief reign, was also assassinated, leaving several sons, the eldest of whom was *Alexander I.* (1801—1825); but as he left no issue, the crown at his death devolved by right upon his next brother, Constantine. Constantine had, however, in compliance with the wish of his elder brother, previously relinquished his claims to the supreme power, and the third brother, *Nicholas I.* (1825—1855), in consequence ascended the throne. Nicholas left at his death four sons and several daughters, and his eldest son, *Alexander II.* (1855) is the present czar.

ROMANS, a town of France, in the dep. of Drome, stands on the right bank of the Isère, 14 miles north-east of Valence. A bridge, founded in the 9th c., connects R. with the small town of Peage on the left bank of the river. R. owes its origin to an important abbey, founded in the 9th c. by Saint Bernard, Archbishop of Vienne, and by a nobleman named Romain, who gave his name to the town. Silk and woollen fabrics are largely manufactured, and a very active general trade is carried on. Pop. 11,814.

ROMANS, EPISTLE TO THE, in a doctrinal point of view, the most profound and elaborate composition of St Paul. That it proceeded from the pen of the great apostle of the Gentiles, has never been seriously doubted by any competent scholar. Much discussion has taken place regarding the *composition* of the church at Rome, and—connected therewith—the design or object of the epistle. Were the members of the church Jewish or Gentile Christians? The general opinion of commentators is, that the church was a mixed congregation, the majority of members being probably of pure Gentile descent, and the minority, Jewish Christians, who perhaps formed the original nucleus of the church. Dr Jowett, in his *Epistles of St Paul to the Romans, Galatians, and Thessalonians*, suggests that the phenomena of the text—for example, the frequent appeals to the authority of the 'law' addressed to Gentiles—may be best explained on the hypothesis that the apostle is speaking to a Gentile congregation which had passed through a phase of Jewish proselytism. The great value of the Epistle to the Romans consists in this, that it exhibits what may be called the *rationale* of Christianity. The immediate object of the apostle was probably nothing more than to prevent an outbreak in the church at Rome of those violent antipathies of religious sentiment which had shewn themselves elsewhere (for instance, at Corinth), and had produced such disastrous consequences; but with a view to the more complete accomplishment of this object, he takes a broad *ethical* view of human nature, and finds all men—Jews and Gentiles alike—to be estranged from God, and in need of pardon and reconciliation. He does not underrate the advantages which his Jewish countrymen possessed—nay, he extols them; but he points out at the same time that the 'oracles' or 'law' could not make the Jews holy: they could only condemn them for being unholy. The Gentiles were declared guilty not less decisively by their own consciences—the law was plainly enough 'written in their hearts.' Hence Paul's grand argument, that if men are to stand as 'righteous' in the sight of God, it cannot be by their 'works,' but in virtue of a divine justification graciously vouchsafed to them; and received into their hearts by an act of faith. This leads him to unfold the purpose and significance of Christ's work, to dilate on the 'freeness' of God's grace towards 'sinners.' He concludes by predicting the conversion of his 'kinsmen according to the flesh,' exhorting the Gentiles to humility, charity, mutual forbearance, and the practice of all the Christian virtues. The Epistle is believed to have been written from Corinth during Paul's third missionary journey, about 58 A. D. The commentaries upon it, or upon special chapters, are innumerable; and almost all the great doctrinal controversies that have agitated Christendom owe their origin to it.

ROMA'NTIC SCHOOL, the name first assumed in Germany, about the beginning of the present century, by a number of young poets and critics, A. W. and Fr. Schlegel, Novalis, Ludwig Tieck, Wackenroder, &c., who wished to indicate by the designation that they sought the essence of art and poetry in the wonderful and fantastic—elements that pre-eminently characterised the Romance literature of the middle ages. Their efforts were directed to the overthrow of the artificial rhetoric and unimaginative pedantry of the French school of poetry, even then influential, and to the restoration of a belief in the mystery and wonder that envelop the existence of man—a belief that had been rudely assailed and mocked by the prevailing materialism in all departments of thought. Thus, their purpose was twofold—it was in part æsthetic, and in part religious. As poetical reformers, the Romantic School in Germany unquestionably exercised a most beneficial influence; but as religionists—though their aim was intrinsically high and noble—they more or less consciously subserved the designs of a reactionary government, and so came to be hated and distrusted by the liberal politicians and thinkers of Germany.—See Eichendorff's *Ueber die ethische und religiöse Bedeutung der neuern Romantischen*

Poesie (Leip. 1847); H. Heine's *Zur Geschichte der neuern schönen Literatur in Deutschland* (Hamb. 1833); and Hettner's *Die Romantische Schule in ihrem innern Zusammenhang mit Goethe und Schiller* (Bruns. 1850.)—Between twenty and thirty years later, a similar school arose in France, and had a long struggle for supremacy with the older Classic School. It was victorious, but not wise, and, except in a few instances—such as Lamartine and Victor Hugo—it has rushed into excesses of caprice both literary and moral, which have stamped it with a revolutionary rather than a reformatory character. —See Huber's *Die Romantische Poesie in Frankreich* (1832): Michiel's *Histoire des Idées Littéraires* (2 vols., Par. 1841); and Tenint's *Prosodie de l'École Moderne* (Par. 1844.)

ROME. The design of this article is to furnish the reader with a brief outline of the ETHNOLOGY and HISTORY of ancient Italy, in so far as these are not already discussed or described under particular heads, to which reference will be made. As the Roman state gradually conquered and incorporated with itself the other states and territories of the Italian peninsula, and as these (in general) figure separately in history only during the process of this subjugation, it will be most convenient to consider them here.

Ethnology.—In the earliest times we find in Italy *five* distinct races; three of which (IAPYGIANS, ETRUSCANS, and ITALIANS) may, in a restricted sense, be termed 'native,' inasmuch as we do not meet with them elsewhere; and two, GREEKS and GAULS, 'foreign;' inasmuch as their chief settlements were not in Italy, but in Greece and Gallia. But, ethnologically, this distinction is arbitrary. There is no reason for believing that the first three races were indigenous, and the last two, immigrant; the analysis of their languages, or of such fragments of their languages as survive, leads strongly to the conclusion that all were alike immigrant, and that in this respect the only difference between them is one of *time.*—1. *The Iapygians.*—This race, monuments of which in a peculiar language (as yet undeciphered), have been found in the south-east corner of Italy—the Messapian or Calabrian peninsula—is in all probability the oldest.—2. *Etruscans.*—The origin of this mysterious people is certainly one of the most interesting, if also one of the most insoluble problems in history. It is not, however, necessary to say anything about them here, as their history, character, and civilisation are handled at length in the article ETRURIA. —3. *Italians.*—At what period the earliest immigrations into Italy of the so-called 'Italian' races—the Latins and Umbro-Sabellians, took place, it is wholly impossible to tell; but it was undoubtedly long before the Etruscans had settled in Etruria. They were by far the most important of the various races that inhabited the peninsula; in fact, the entire historical significance of Italy depends upon them; and therefore it is fortunate that their ethnological origin and affinities are capable of the most certain demonstration. An investigation of their language, subdivided indeed into numerous dialects, often widely differing but fundamentally the same, has resulted in the discovery that they belong to the great Aryan or Indo-Germanic family (see ARYAN RACE and ARYAN LANGUAGES), and are in particular closely allied to the Hellenes. We are therefore warranted in affirming that at some very remote period a race migrated from the East, embracing the ancestors of both Greeks and Italians. By what route they proceeded, or at what point they diverged, we can only conjecture, for the problem is not yet solved whether the Hellenes reached Greece by way of Asia Minor or from the regions of the Danube; but, at any rate, Mommsen's statement that 'the Italians, like the Indians, immigrated into their peninsula from the north,' may be regarded as certain. There is ground for believing that the Latins were the first members of the Italian family to enter Italy, and that having crossed the Apennines, they spread themselves to the south along the western coast, driving the Iapygians before them, and finally cooping them up in the Calabrian peninsula—the heel of the boot. But this conquest belongs to prehistoric ages, and the original Latins of Campania, Lucania, Bruttium,* perhaps even Sicily (i. e., the races spoken of in classic legend, as the Itali, from whom the peninsula received its name, the Margetes, Ausones, Siculi, &c.), were themselves in the course of time so thoroughly Hellenised by the influence of the rich and powerful Greek colonies planted on their coasts (see MAGNA GRÆCIA), or so overwhelmed by the successive invasions of Samnite hordes, that nearly every trace of a primitive Latin nationality has disappeared, and only here and there a solitary linguistic or legendary relic survives to indicate faintly the path which conjecture should pursue. It was only in Latium Proper, where no Greek colonies were founded, and where the fortune of war was in its favour, that the Latin branch of the Italian race firmly rooted itself. There, however, it did flourish, and petty as the district might seem—not more in all than 700 square miles—it was incomparably the most important in the peninsula, for within its limits rose those seven hills on which a city was to be built that was destined to subdue and govern the world. The other branch of the 'Italian' stock—the Umbro-Sabellian, must have entered Italy at a later period than the Latin. Its advance along the central mountain-ridge—the Apennines—from north to south can still be traced; and its last phases—i. e., the conquest of Campania and the other southern districts of the peninsula by the Samnite highlanders—belong to purely historical times. The oldest members of this branch are probably the Sabines (q. v.), who seem to have fixed themselves in the mountainous region to the north-east of Rome, and are regarded as the progenitors of that multitude of tribes which we find occupying the central portion of Italy—the Picentes, Peligni, Marsi, Æqui, Vestini, Marrucini, Frentani, Samnites —perhaps also the Volsci and Hernici.—4. *Gauls.*— To a period considerably later and comparatively historical, belong the settlement of the Gauls in the north, and of the Greeks in the south of Italy The former, a branch of the Celtic race, itself now ascertained to be also a member of the great Aryan family (see CELTIC NATIONS), and therefore allied, however distantly, to the other Italian races, had for ages before history begins fixed themselves in the region now known as France. Finding further progress westward barred by the waves of the Atlantic, and being of a restless and excitable disposition, they turned their steps east and south-east, broke over the Alps (according to the legend in Livy, by the Little St Bernard) some time during the 3d c. after the founding of Rome, and poured down into the plains of the Po. The first Gallic tribe that made its appearance on the soil of the peninsula is said to have been the Insubres, whose capital was Mediolanum (Milan); then followed the Cenomani, whose headquarters were Brixia (Brescia) and Verona, and afterwards numerous kindred hordes, among the latest and most powerful of which were the Boii (q. v.) and Senones, who forced their

* The name 'Bruttium' given to the country of the Bruttii by modern writers on classical geography, is not found in any ancient author.

way across the Po, and effected a lodgment in the modern Romagna, occupying (besides an inland district) the coast of the Adriatic as far south as Ancona. Hence, in ancient times, the whole of Northern Italy was for a long period known as Gallia Cisalpina (Gaul on *this*, i. e., the Italian side of the Alps), to distinguish it from Gaul Proper, which was called Gallia Transalpina. Gallia Cisalpina was again subdivided into two parts by the river Padus (Po); the northern being named Gallia Transpadana, and the southern (the country of the Boii and the Senones), Gallia Cispadana. Various other tribes or peoples are found in the north of Italy, such as the Ligurians (along the Gulf of Genoa) and the Veneti (in modern Venetia), regarding whose origin—in the absence of all linguistic and other memorials—we are utterly in the dark.

5. *Greeks.*—The other people which we have distinguished as 'foreign,' was the Greek. There is, however, this distinction to be observed, that the Greeks were not (like the Gauls) barbarians; they did not swoop down upon the southern shores of Italy (like the Norse pirates on the coasts of England and France) to plunder and devastate; nor did they force their way into the interior and dispossess the native inhabitants; they merely colonised the coasts, built cities, and carried on commerce. Through them it is probable the Romans acquired their earliest notions of the Greek literature, philosophy, and cultus. For further information concerning them, we refer the reader to the article Magna Græcia, and to such of their cities as have received separate treatment.

Primitive Social Condition of the Latins.—With this brief introductory sketch of the various races that inhabited Italy in historical or pre-historical times, we may now revert to the Latins, with whom we have at present more particularly to do. What was the extent of their civilisation, or how far their social organisation had proceeded when they finally settled in the 'broad plain' (*Lătium*, connected probably with *lātus*, broad; *lătus*, a side; Gr. *platus;* Eng. *flat*) that stretches westward from the Alban Hills to the sea, may be conjectured, but cannot be positively ascertained. We know, indeed, that long before they had set foot in Italy, before even they had branched off from their Hellenic brethren, they had ceased to be *mere* nomades, or wandering shepherds. The evidence of this fact lies in their language. Not only do the names of the oldest Latin nations, as the *siculi*, ('the sickle-bearers' or 'reapers'), and the *osci*, or *opsci* ('field-labourers'), clearly prove the antiquity of Italian husbandry; but the oldest agricultural terms are actually common to both Latins and Greeks (e. g., Lat. *ager*, Gr. *agros;* Lat. *aro*, *aratrum*, Gr. *aroō*, *arotron;* Lat. *ligo* (a hoe), Gr. *lachaino;* Lat. *hortus*, Gr. *chortos;* Lat. *milium*, Gr. *melinē;* Lat. *rapa*, Gr. *raphanis;* Lat. *malva*, Gr. *malachē;* Lat. *vinum*, Gr. *oînos*). Moreover, the form of the plough was the same among both peoples, as also their mode of cutting and preparing the grain; many of the usages of social life; the oldest methods of measuring the land; and the style of their national dress—the Latin *tunica* corresponding exactly with the Greek *chiton*, while the Latin *toga* is only a fuller *himation*. Their method of building was also the same. Such evidence (and it could easily be extended) must be regarded as conclusively shewing that before the Latino-Italians entered Italy, they had been accustomed to till the ground, to make wine, to keep gardens, to build houses, and to decently clothe themselves. As to their social organisation, less can be said. It appears, however—judging from the general bearing of the most ancient traditions, as also from the features exhibited in historical times—that at a very early period, and from causes of which we are now absolutely ignorant, they had begun to develop the germs of what may be called 'state-life.' As among their Hellenic brethren, the original foundation of their social constitution was 'households' (Gr. *oikiai*, Lat. *vici* or *pagi*, from *pangere*, to 'fix' or 'drive in;' hence 'to build'): these, either by ties of blood, or by nearness of locality, were aggregated into clans, and their dwellings formed clan-villages (thus *pagus*, which probably meant at first only a single 'household,' came, by a natural transition, to denote a collection of households—a hamlet, or a village). Such clan-villages were, however, not regarded as independent societies, but as parts of a political canton or community—the *civitas* or *populus*. Each canton or *civitas* possessed a local centre or place of assembly, where justice was administered at regular intervals, where markets and sports were held, and religious rites celebrated, and which was besides fortified to serve as an asylum or place of refuge for the inhabitants of the open hamlets and their cattle in time of war. Such a centre was termed the *capitolium*, i. e., 'the height,' from being originally fixed on a height or hill-top, and corresponded to the *akra* of the Greeks. Round this stronghold of the canton, which formed the nucleus or beginning of the earliest Latin towns, houses gradually sprung up, which in their turn were surrounded by the *oppidum* ('work,' from *opus*), or the *urbs* ('ring-wall,' connected with *urvus*, *curvus*, *orbis*); hence, in later times, *oppidum* and *urbs* became, naturally enough, the recognised designations of town and city. Evidence is not wanting to justify this view of the genesis of the Latin towns. In the ruder and more mountainous districts of Central Italy, occupied by the Marsi, Æquicoli, &c., the system of living only in open villages prevailed down even to the close of the Empire, and there the Roman antiquarians found, to their inexplicable surprise, those solitary strongholds with their mysterious ring-walls, which, on the soil of Latium Proper, expanded into towns, but in the recesses of the Apennines never advanced beyond their original design.

The sites of the oldest of these cantonal-centres or primitive towns in Latium are to be sought for on the slopes of the Alban hills, where the springs are freshest, the air most wholesome, and the position most secure. Tradition (which makes Alba Longa the oldest seat of a Latin community) is here in accordance with natural probability.* On the same slopes lay Lanuvium, Aricia, and Tusculum, to the great antiquity of which ancient tradition bears testimony in many ways; on the offshoots of the Sabine range, in the east of Latium, stood Tibur and Praeneste; in the plain between the Sabine and Alban ranges, Gabii, Labici, and Nomentum; on or near the coast, Laurentum and Lavinium; and on the isolated hills overlooking the Tiber (the boundary between Latium and Etruria), the frontier town of Rome. How many cantons were originally in Latium, it is neither possible nor important to know. Tradition mentions 30 sovereign or politically independent communities (with Alba Longa at their head), which formed the famous Latin league. The historical order of their constitution is a point regarding which we are equally ignorant, but there is reason to believe that the Roman canton, or at least its capital, the town of R., was among the latest

* It is perhaps hardly necessary to remark that the story of the foundation of *Alba Longa* by Ascanius, the son of Æneas, and the introduction of a Tyrrheno-Trojan element into the primitive history of Latium, is an utterly worthless fable.

political organisations of the Latins. The history and fortunes of this canton we now proceed briefly to trace.

History of R. during the Earliest or Regal Period.—According to the myth of Romulus, R. was an offshoot from Alba Longa, and to the biography of that hero we refer the reader for an outline of the ancient legend; but the most rational view of the city's origin is that which is suggested by a consideration of its site. It probably sprang into existence as a frontier-defence against the Etruscans, and as an emporium for the river-traffic of the country; but whether it was founded by a common resolve of the Latin confederacy, or by the enterprise of an individual chief, is beyond the reach even of conjecture. The date fixed upon for the commencement of the city, by the formation of the *Pomœrium*, viz., 21st April 753 B.C., is, of course, perfectly valueless in its precision. We know and can know nothing whatever on the point. The three 'tribes,' Ramnians, Tities, and Luceres, who appear in the Romuleian legend, as the constituent parts of the primitive commonwealth, suggest the idea that R. (like Athens) arose out of a *synoikismos* or amalgamation of three separate cantons; but Mommsen rejects as 'irrational' the common opinion that these cantons represent different races, and that the Romans were a 'mongrel people,' made up of Latins, Sabines, and Etruscans, with perhaps a dash of Hellenic and imaginary 'Pelasgic' blood in their veins! The existence of a Sabine element, represented by the Tities, is indeed admitted; but its introduction is thrown back to a period long anterior to the foundation of the city, when the Roman clans were still living in their open villages, and nothing of R. existed but its 'stronghold' on the Palatine. Nor is there anything to indicate that it materially affected the Latin character, language, polity, or religion of the commonwealth which was subsequently formed.

The motives which probably led to the building of R., also led to its rapid development, so that the great peculiarity of the Roman, as compared with the other Latin cantons, is the prominence which its urban life assumed in the earliest period. No doubt the Roman continued to manage his farm in the cantonal territory, but the insalubrity of the Campagna, as well as the advantages of river-traffic, and the necessity for watchfulness imposed upon all frontier towns in rude ages, must ever have acted as an inducement to him to take up his residence as much as possible in the city. The consequence was that the Roman became essentially a 'citizen,' while the other Latins remained essentially 'rustics.' So markedly is this the case, that the beginnings of Roman history—if the ancient legend may be so designated—are mainly records of its urban expansion and political growth. That the Palatine Hill was the oldest portion of the city is attested by a variety of circumstances. Not only does it hold that rank in the Romuleian legend, but on it were situated the oldest civil and religious institutions. The Romuleian myth of the establishment of an asylum on the Capitoline (see CAPITOL) for homicides and runaway slaves, with all its famous consequences—the *Rape of the Sabine Women*, the wars with the Latins of Cænina, Antemnæ, and Crustumerium, but especially with the Sabines of Cures under their king Titus Tatius, the tragic fate of Tarpeia, and the fine feminine valour of the ravished maidens, who had learned to love their captors, is historically worthless; except, perhaps, so far as it shews us how from the beginning the Roman burghers were engaged in constant feuds with their neighbours for the aggrandisement of their power. The entire history of the 'regal period,' in fact, has come down to us in so mythical and legendary a form, that we cannot feel absolutely certain of the reality of a single incident. That such personages as Numa Pompilius, Tullus Hostilius, Ancus Martius, Lucius Tarquinius Priscus, Servius Tullius, and Lucius Tarquinius Superbus, ever existed, or, if they did, that the circumstances of their lives, their institutions, their conquests, their reforms, were as the ancient narrative describes them, are things which no critical scholar can believe. The destruction of the city records by the Gauls, when they captured and burned R. in the 4th c. B.C., deprived the subsequent chroniclers of authentic information in regard to the past, and forced them to rely upon treacherous reminiscences, on oral tradition, on ballads, and on all the multifarious fabrications of a patriotic fancy, that would naturally seek compensation for political disaster in the splendour with which it would invest its primeval history. The utmost reach, therefore, to which our knowledge can attain, is to form some general idea—mainly by inference from the institutions that we find existing in later times—of the course that social and political progress followed in the Roman commonwealth.

From the very beginning of the city—and probably long before—the inhabitants were divided into two orders (exclusive of 'slaves')—viz., householders and their dependents, better known perhaps as 'patricians' (from *pater*, a father) and 'clients' (i. e., 'listeners,' from *cluere*, 'to listen'). The former alone possessed political—i. e., burgess—rights. It was they who exclusively constituted the *populus* ('the people'); while the clients had no political existence whatever. How this latter class originated we do not know, but 'superiors' and 'inferiors' exist everywhere, and there is really nothing wonderful in the phenomenon, except the rigour of their political subjection. In a thriving community like the Roman, which seems to have always held a somewhat isolated and antagonistic position to the other Latin cantons, new-comers, such as refugees and the like, would be frequent; and these alien settlers, it is clear, never obtained (except under very special circumstances) the privileges of the original Roman families. That the clients formed a body essentially different from the *plebs*, is not true, and seems based merely on the mythical account of what followed the destruction of Alba Longa by Tullus Hostilius. The name plebs (i. e., 'the multitude,' from the same root as *pleo*, I fill, *plenus*, full; with which is perhaps connected the other Latin word *vulgus*, Eng. *folk*), is doubtless, as its signification indicates, of later origin than *clientes;* but both are applicable to the same persons, who were called 'listeners,' in reference to their being dependents on the different burgess-households, and the 'multitude,' in reference to their want of political rights. The constitution of the state was simple. All the burgesses were politically on a footing of equality. From their own ranks was chosen the king or 'leader' (*rex*), who was therefore nothing more than an ordinary burgess—a husbandman, a trader, a warrior, set over his fellows. But it must at the same time be observed, that his authority was great, for the Roman state was based on the Roman household, and something of the absoluteness of the *patria potestas* appears in the uncircumscribed nature of the regal powers. The *rex* held his office for life; he consulted the national gods; he appointed the priests and priestesses; he called out the *populus* for war, and led the army in person; his command (*imperium*) was not to be gainsaid, on which account on all official occasions he was preceded by 'messengers' or 'summoners' (*lictores*, from *liccre*, 'to summon,' though commonly

given from *ligo*, 'to bind'), bearing the 'fasces' (axes and rods tied up together), the symbols of power and punishment; he had the keys of the public chest, and he was supreme judge in all civil and criminal suits. The Roman religious or *cultus* was from the first thoroughly subordinate to the authority of the state; and all that we can infer from the myth of Numa is that R. perhaps owed its colleges of augurs and pontiff to the wisdom of some enlightened sovereign who felt himself at times embarrassed in his decisions on matters of religious and public law, and recognised how valuable might be the aid afforded him by a body of sacred experts. We may rest certain that originally the sole power was the regal, and that the subordinate magistracies found at a later time arose from a delegation of regal authority, rendered necessary by the ceaseless increase of state-business. 'All the officials of the earliest period,' says Mommsen (who has expounded this view with admirable sagacity in his chapter on the "Original Constitution of Rome"), 'the extraordinary city-warden (*præfectus urbi*, who doubtless governed in the absence of the *rex*), as well as those who were probably nominated regularly, the "trackers of foul murder" (*quæstores parricidii*), and the "leaders of division" (*tribuni*, from *tribus*, part) of the infantry (*milites*), and of the cavalry (*celeres*), were mere royal commissioners, and not magistrates in the subsequent sense of the term.' On the other hand, we may believe that the *senatus*, or Council of the Elders, from its very nature, was as old an institution as the monarchy itself. Among the very first things the 'citizen-king' would do, would be to choose out of the ranks of his fellow-burgesses a number of experienced men to assist him with their counsel; but it is to be observed that this body possessed no coercive or constraining powers. They gave their advice when the *rex* chose to ask it; that was all. Yet as the tenure of their office was for life, they necessarily possessed great *moral* authority; and it was only when the king, the senate, and the community were at one in regard to any important matter—a war, for example—that it was held to be righteous, and likely to be favoured by the gods. The burgesses, or householders, were divided into *curiæ*—i. e., 'wardships,' connected probably with *cura* and *curare*, 'to care for,' rather than with *quiris*, and the Sabine *cures*, as Varro thinks. Ten households formed a *gens* (a 'clan' or 'family'); 10 clans, or 100 households, formed a *curia*, or wardship; and 10 wardships, or 100 clans, or 1000 households, formed the *populus*, *civitas*, or community. But as Rome was a *synoikismos* of three cantons, the actual number of wards was 30, of clans 300, and of households 3000. Every household had to furnish one foot-soldier (hence the name *mil-es*, the 'thousandth walker,' from *mil*, and *so* (?) 'to go'), and every clan a horseman and a senator. Each ward was under the 'care' of a special warden (the *curio*), had a priest of its own (the *flamen curialis*), and celebrated its own festivals. None but burgesses could bear arms in defence of the state (hence their designation, *populus*, 'the warrior body,' connected with *populari*, 'to lay waste,' and *popa*, 'the priest, or priest's assistant, who felled the victim at the altar—the sacred butcher'). In the old litanies the blessing of Mars is invoked upon the *pilumnus poplus* ('the spear-armed warrior-body'), and when the *rex* addressed them, it was by the name of *quirites* ('lancemen,' from *quiris*, or *curis*, a 'lance,' and *eo*, 'to go'). The original Roman army, or *legio* (i. e., 'the gathering'), was composed of three 'hundreds' (*centuriæ*) of horsemen (*celeres*—i. e., 'the swift,' or *flexuntes*, 'the wheelers'), under their divisional leaders (*tribuni celerum*); and three 'thousands' of footmen (*milites*), also under divisional leaders (*tribuni militum*); to whom were added a number of light-armed skirmishers (*velites*), especially 'archers' (*arquites*). The *rex*, as we have said, was usually the general, but as the cavalry force had a colonel of its own (*magister equitum*), it is probable that he placed himself at the head of the infantry. Military service was no doubt the prime duty of the Roman burgesses, but the king could impose upon them any labours that he reckoned necessary or advantageous to the welfare of the state, such as the erection of public edifices, the tilling of the royal demesnes, the execution of royal commissions, or the building of the city walls.

The 'foreign policy' of R. seems to have been aggressive from the first, and this character it retained as long as the aggrandisement of the state was possible. We have, it is true, no certain knowledge of the primitive struggles in which the enterprising and ambitious Roman burghers were engaged, but it appears from the legend that at a very early period the neighbouring Latin communities of Antemnæ, Crustumerium, Ficulnea, Medullia, Cænina, Corniculum, Cameria, Collatia, were subjugated. The crisis of the Latin War, however, was undoubtedly the contest with Alba Longa, in which that 'sacred metropolis' of Latium was destroyed, and its leadership passed to the conqueror. How deadly the struggle between the two was, may be inferred from the tragic details in which the legend abounds. As a rule, on the subjugation of a canton, the conquered inhabitants were allowed to remain in their open hamlets, but their *capitolium* was razed, their weekly market, their justice-court, their gods—everything, in short, strictly national—were removed to R., while they themselves were enrolled among the clients or plebs. But sometimes the inhabitants themselves, in whole or part, were transferred to R., and individuals or clans were even received into the ranks of the Roman burgesses, as in the case of Alba Longa. Some of the famous Roman *gentes* claimed to be of Alban descent—the Julii, Servilii, Quinctilii, Cloelii, Geganii, Curiatii, and Metilii. The wars with the Etruscans of Fidenæ and Veii—assigned, like the destruction of Alba Longa, to the reign of Tullus Hostilius—were apparently indecisive; those with the Rutuli and Volsci, however were probably more fortunate; but uncertainty hangs like a thick mist over the ancient narrative. Even the story of the Tarquins, though it belongs to the later period of the monarchy, is in many of its details far from credible. Both Niebuhr and Mommsen consider 'Tarquin the Proud' a historical personage, and without accepting literally all the circumstances of the tradition, believe the general outline—his character, his exactions, his expulsion, and his desperate efforts for the recovery of the throne—to be trustworthy. The memory of such a monarch was likely to be preserved by the very strength of the hatred he excited, and an act so daring as his expulsion (which was at the same time the death-knell of a system of government that had prevailed for ages) could hardly be a mere invention, though it might be overlapped with fold upon fold of picturesque fiction. The view taken by Napoleon III. (see *Histoire de Jules César*, vol. i.), that the primitive monarchy had served its purpose, and had consequently to disappear, is perhaps not so erroneous as the oracular language of the imperial author would lead us to suppose. The aristocracy or *populus* had become so much more powerful than the individual *rex*, that they wished to possess *de jure* as well as *de facto* the supreme authority. The pride and tyranny of a Tarquin

may very well have aided in furthering their designs.

Meanwhile a great internal change had taken place in Rome. This is usually designated the Servian 'Reform of the Constitution,' although the expression is calculated to mislead. There was nothing directly political in the 'reform.' It was only a reform in the burgess-levy—i. e., in the mode of raising the army. Formerly, as we have seen, none but burgesses could bear arms in defence of the state; but the increase of the general population, caused partly by the annexation of the conquered Latin communities, and partly by time, had totally altered the relation in which the non-burgesses, or *plebs*, originally stood to their political superiors. The *plebs* could, of course, acquire property and wealth, and could bequeath it just as legally as the *populus;* moreover, such of the Latin settlers as were wealthy and distinguished in their own communities, did not cease to be so when they were amalgamated with the Roman 'multitude.' It was therefore felt to be no longer judicious to let the military burdens fall exclusively upon the old burgesses, while the rights of property were equally shared by the non-burgesses. Hence the new arrangement, known in Roman history as the formation of the *Comitia Centuriata.* When or with whom the change originated, it is impossible to say. The legend assigns it to Servius Tullius, predecessor of Tarquin the Proud; and it was in all probability the work of some kingly ruler who saw the necessity of reorganising the national forces. That it cannot be regarded as a change brought about by party-zeal, is obvious when we reflect that it conferred no rights, but only imposed duties on the plebeians. Its details were briefly as follows: Every Roman freeholder from the age of 17 to 60, whether patrician or plebeian, was made liable to serve in the army; but he took his place according to the amount of his property. The freeholders were distributed into five *classes* (i. e., 'summonings,' from *calare*, to 'summon' or 'call out'), and these *classes*, all of whom were infantry, were again subdivided into *centuriæ* ('hundreds'). The *first* class, which required to possess property valued at 100,000 ases, or an entire hide of land, furnished 82 'hundreds;' the second, property valued at 75,000 ases, or ¾ths of a hide of land, furnished 20 'hundreds;' the third, property valued at 50,000 ases, or ½ hide of land, furnished 20 'hundreds;' the fourth, property valued at 25,000 ases, or ¼th hide of land, furnished 20 'hundreds;' and the fifth, property valued at 12,500 ases, or ⅛th hide of land, furnished 32 'hundreds.' A single 'hundred' was, moreover, added from the ranks of the non-freeholders, or *proletarii* (mere 'children-begetters'), although it is possible that from the same order came the two 'hundreds' of 'horn-blowers' (*cornicines*), and 'trumpeters' (*tibicines*), attached to the fifth class. Thus the infantry 'hundreds' amounted to 175, that is, 17,500 men, besides whom were 18 'hundreds' of *equites* ('horsemen') chosen from the wealthiest burgesses and non-burgesses; so that the Roman army now numbered in all nearly 20,000 men. We have stated that the original design of this new arrangement was merely military, but it is easy to see that it would soon produce political results. Duties and rights are correlative. The former suggest the latter, and create a desire for their attainment. Hence the Servian military reform paved the way for the grand political struggle between the patricians and the plebeians, which commenced with the first year of the Republic, and only terminated with its dissolution.

The Roman Republic from its Institution to the Abolition of the Decemvirate.—1. *Internal History.*—According to the legend, the expulsion of the Tarquins was mainly the work of their cousins, Junius Brutus and Tarquinius Collatinus, in revenge for the outrage on the honour of Lucretia, and was followed by the abolition of the monarchy. The date usually assigned to this event is 509 B.C. The story is intensely tragical, and if we must consider it poetry rather than fact, yet it may safely be taken as evidence that it was an unbridled lust of power and self-gratification that brought ruin on the Romano-Tuscan dynasty. Of course, we can make nothing definite out of the early years of the republic. Dates and names, and even events, must go for very little. Valerius Publicola or Poplicola, Sp. Lucretius, M. Horatius, Lars Porsenna (q. v.) of Clusium, Aulus Postumius, with the glorious stories of Horatius Cocles and the battle of Lake Regillus, will not bear to be scrutinised. We must content ourselves with the knowledge of historical tendencies and general results. The change from 'kings' to 'consuls' (*consules*, 'those who leap together'—more generally, those who *act* together) was not intended to diminish the administrative power of the supreme rulers, but only to deprive them of the opportunity of doing harm—of becoming Tarquins; and this it effectually succeeded in doing, by limiting their tenure of office to a year, and by numerous other restrictions. (For an account of their original functions, and of the subsequent modifications which these underwent, see CONSUL.) It is believed to have been about this time, and in consequence of the new political changes, that the old assessors of the king, such as the *quæstores parricidii*, formally became standing magistrates instead of mere honorary counsellors, and also that the priesthood became a more self-governing and exclusive body. During the regal period the priests were appointed by the king, but now the colleges of augurs and pontiffs began to fill up the vacancies in their ranks themselves, while the vestals and separate 'flamens' were nominated by the pontifical college, which chose a president (*pontifex maximus*) for the purpose. The lapse of years ever increasing the quantity of sacred lore, also increased its importance, and the importance of those who specially studied it; and nothing comes out more clearly in the early history of the republic than the fact, that the opinions of the augurs and pontiffs became more and more legally binding. This is to be connected with the fact, that in every possible way the patricians or old burgesses—now rapidly becoming a mere *noblesse*—were seeking to rise on the ruins of the monarchy, and to preserve separate institutions for the benefit of their own order, when they could with difficulty longer exclude the *plebs* from participation in common civic privileges. In the details given us of the 'Servian Reform,' we can easily discern a spirit of compromise, the concessions made to the plebeians in the constitution and powers of the *Comitia Centuriata* being partially counterbalanced by the new powers conferred on the old burgess body, the *Comitia Curiata*—viz., the right of confirming or rejecting the measures passed in the Lower Assembly. Towards the new assembly, therefore, it stood somewhat in the relation in which the House of Lords stands to the House of Commons, but the analogy must not be pushed too far; it is only general. The character of the senate altered under the action of the same influences. Although it never had been formally a patrician body—although admission to it under the kings was obtainable simply by the exercise of the royal prerogative, yet, practically, 299 out of the 300 senators had always been patricians; but after the institution of the republic, we are told

that the blanks in the senate were filled up *en masse* from the ranks of the plebeians, so that of the 300 members less than half were *patres* ('full burgesses'), while 164 were *conscripti* ('added to the roll'), hence the official designation of the senators *patres et conscripti* ('full burgesses and enrolled').

As yet, however, it is to be observed the plebeians were rigorously excluded from the magistracies. They could vote—i. e., they could exercise legislative powers—but they had no share in the administration. None but patricians were eligible for the consulship, for the office of quæstor, or for any other executive function, while the priestly colleges rigidly closed their doors against the new burgesses. The struggle, therefore, between the two orders went on with ever-increasing violence. One point comes out very clearly from the narrative, however dubious we may be of the particular details, viz., that the establishment of the republic and the reconstitution of the burgess body, instead of allaying discontent, only fostered it. Power virtually passed into the hands of the capitalists, and though some of these were plebeians, yet they would seem to have preferred their personal money-interests to the interests of their order, and to have co-operated with the patricians. The abuse by these capitalists of the *Ager Publicus*—that is, such portion of the land of a conquered people as had been taken from them, annexed to the Roman state, and let out originally to the patricians at a fixed rent (see AGRARIAN LAW), together with the frightful severity of the law of debtor and creditor, the effect of which was all but to ruin the small plebeian 'farmers,' who constituted, perhaps, the most numerous section of the burgesses—finally led to a great revolt of the plebs, known as the 'Secession to the Sacred Hill,' the date assigned to which is 494 B.C. On that occasion the plebeian farmer-soldiers, who had just returned from a campaign against the Volscians, marched in military order out of Rome, under their plebeian officers, to a mount near the confluence of the Anio with the Tiber, and threatened to found there a new city, if the patricians did not grant them magistrates from their own order; the result was, the institution of the famous plebeian tribunate (see TRIBUNE)—a sort of rival power to the patrician *consulate*, by means of which the plebeians, at least, hoped to be shielded from the high-handed oppressions of the wealthy. To the same period belongs the institution of the ÆDILES (q. v.). A little later, the *Comitia Tributa* emerged into political prominence. This was really the same body of burgesses as formed the *Comitia Centuriata*, but with the important difference, that the number of votes was not in proportion to a property classification. The poor plebeian was on a footing of equality with the rich patrician; each gave his vote, and nothing more. Hence the *Comitia Tributa* virtually became a plebeian assembly, and when the *plebiscita* ('Resolutions of the plebs' carried at these *comitia*) acquired (as they did by the Valerian Laws passed after the abolition of the Decemvirate) a legally binding character, the victory of the 'multitude' in the sphere of legislation was complete. From this time the term *populus* practically, though not formally, loses its exclusive significance; and when we speak of the Roman citizens, we mean indifferently patricians and plebeians. The semi-historical traditions of this period—for we are now (5th c. B. C.) beginning to emerge out of the mythical era—unmistakably shew that the institution of the tribunate led to something very like a civil war between the two orders. Such is the real significance of the legends of Caius Marcus, surnamed *Coriolanus* (q. v.); the surprise of the Capitol by the Sabine marauder, Appius Herdonius, at the head of a motley force of political outlaws, refugees, and slaves; the migrations of numerous Roman burgesses with their families to more peaceful communities; the street-fights; the assassinations of plebeian magistrates; the annihilation by the Etruscans of the Fabian *gens*, who had left R. to escape the vengeance of their order for having passed over to the side of the plebeians; and the atrocious judicial murder of Spurius Cassius, an eminent patrician, who had also incurred the deadly hatred of his order, by proposing an agrarian law that would have checked the pernicious prosperity of the capitalists and overgrown landholders. Finally, 462 B.C., a measure was brought forward by the tribune C. Terentillius Ursa, to appoint a commission of ten men to draw up a code of laws for the purpose of protecting the plebeians against the arbitrary decisions of the patrician magistrates. A fierce, even a frantic opposition was offered by the patricians, and the ten years that followed were literally a period of organised anarchy in Rome. At length the nobles gave way, and the result was the drawing up of the famous code known as the *Twelve Tables*—at first *Ten*, to which two were afterwards added—the appointment of the DECEMVIRI (q. v.), and the abolition of all the ordinary magistrates, both patrician and plebeian. The government by decemvirs, however, lasted only two years; according to tradition, the occasion of its overthrow was the attempt of the principal decemvir, Appius Claudius (q. v.) to possess himself by violence of the beautiful daughter of Virginius, a Roman centurion; but the real cause was doubtless political, though the cruel lust of a Claudius may have afforded the occasion; the result of which was the restoration of the pre-decemviral state of things—the patrician consulate and the plebeian tribunate.

2. *External History.*—The external history of R., from the establishment of the republic to the abolition of the decemvirate, is, it need hardly be said, purely military. The Romans fought incessantly with their neighbours. Long before the close of the regal period they had acquired, as we have seen, the leadership of Latium, and in all the early wars of the republic they were assisted by their allies and kinsmen; sometimes also by other nations—as, for example, the Hernicans, between whom and the Romans and Latins a league was formed by Spurius Cassius in the beginning of the 5th c. B.C. The most important of these wars were those with the southern Etruscans, especially the Veientines, in which, however, the Romans made no way, and even suffered terrible disasters, of which the legend concerning the destruction of the Fabian *gens* on the Cremera (477 B.C.) may be taken as a distorted representation; the contemporaneous wars with the Volscians, in which Coriolanus is the most distinguished figure; and those with the Æqui (458 B.C.), to which belongs the fine legend of Cincinnatus (q. v.).

From the Abolition of the Decemvirate to the Defeat of the Samnites, and the Subjugation of all the 'Italians' (449—265).—1. *Internal History.*—The leading political features of this period are the equalisation of the two orders, and the growth of the new aristocracy of capitalists. After the abolition of the decemvirate, it would seem—judging from the course of events—that the whole of the plebeian aristocracy, senators and capitalists (from motives of selfish aggrandisement), combined with the 'masses' of their order to make a series of grand attacks on the privileges of the old Roman *noblesse*. The struggle lasted for 100 years; and ended, as it could only end, by the removal of all the social and

political disabilities under which the plebeians had laboured—though the stratagems and artifices to which the old aristocracy had recourse, proved the reluctance with which they succumbed to fate. First in 445 B. C., only four years after the fall of the decemvirs was carried, the *Lex Canuleia*, by which it was enacted that marriage between a patrician and plebeian should be legally valid. At the same time, a compromise was effected with respect to the consulship. Instead of two patrician consuls, it was agreed that the supreme power should be intrusted to new officers termed 'Military Tribunes with Consular Power,' who might be chosen equally from the patricians or plebeians. Ten years later (435 B. C.), the patricians tried to render the new office of less consequence by the transference of several of the functions hitherto exercised by consuls to two special patrician officers named *Censors* (q. v.). The 'censorship,' Mommsen remarks, 'gradually became the palladium of the aristocratic party, less on account of its financial influence, than for the sake of the right annexed to it of filling up vacancies in the senate and in the equites.' In 421 B. C., the quæstorship (see QUÆSTOR) was thrown open to the plebeians; in 368 B. C., the mastership of the horse; in 356 B. C., the dictatorship (see DICTATOR); in 351 B. C., the censorship; in 337 B. C., the prætorship (see PRÆTOR); and in 300 B. C., the pontifical and augurial colleges. These victories were not all won without the shedding of blood. How great was the exasperation of the patricians may be estimated from the story of Spurius Maelius, the rich plebeian, who was murdered simply because in a season of famine he sold corn at a very low price to the poor.

The only effect, it is to be observed, of these political changes was to increase the power of the rich plebeians; and consequently, the social distress continued to shew itself as before. No genuine national concord was possible so long as *that* remained unmitigated. Efforts were repeatedly made by individuals to remedy the evil, but without success. Such were the attempts of the tribunes Spurius Maecilius and Spurius Metilius (417 B. C.) to revive the agrarian law of Spurius Cassius; and of the noble and patriotic patrician, Marcus Manlius, who, though he had saved the Capitol during the terrible Gallic siege, was hurled from the Tarpeian Rock (384 B. C.), on the customary charge, as groundless in his case as it was base, of aspiring to the monarchy; but at length (367 B. C.), after a furious struggle of eleven years, the famous Licinian Rogations (see AGRARIAN LAW) were carried, by means of which it was hoped that an end had been put to the disastrous dissensions of the orders. Thus, at least, we interpret the act of the dictator Camillus, who raised a temple to the goddess *Concord*, at the foot of the Capitol.

That these laws operated beneficially on the class in whose interest they were passed, viz., the plebeian-farmers or middle-class of the Roman state, is unquestionable; but events proved that they were inadequate to remedy the evil, and after a time they ceased to be strictly enforced. On the other hand, there can be as little doubt that, owing partly to these changes, and still more to the splendid and far-reaching conquests achieved in Italy during this period of internal strife by the Roman arms, the position of the plebeian farmer was decidedly raised. Not only were the 'general coffers filled' by the revenue drawn directly or indirectly from the subjugated lands, so that a *tributum* (a forced loan) seldom required to be enforced at home, but the numerous colonies which R. now began to send forth to secure her new acquisitions, consisted entirely of the poorer plebeians, who always received a portion of the land in the district where they were settled. The long struggle between the two orders was thus virtually at an end; but the date usually assigned to the termination of the strife is 286 B. C., when the *Lex Hortensia* was passed which confirmed the Publilian Laws of 339 B. C., and definitely gave to the *Plebiscita* passed at the Comitia of the Tribes, the full power of laws binding on the whole nation. Gradually, however, by steps which we have not room to trace, the importance of the popular assemblies declined, and that of the senate rose. This was owing mainly to the ever-increasing magnitude of the Roman state, and to the consequent necessity of a powerful governing body. The senate, it will be remembered, originally possessed no administrative power at all, but now it commenced a series of vast usurpations of which the best defence is that they excited no opposition among the community. Every matter of general importance—war, peace, alliances, the founding of colonies, the assignation of lands, building, the whole system of finance—came under its supervision and authority. Nor, on the whole, did it prove itself the unworthy arbiter of a nation's destinies. It was not a self-elected oligarchy, but was rather composed of the ablest representatives of both orders.

2. *External History.*—We have said that the military successes of R. during this period of internal strife were great; but we can only briefly allude to them. The irruption of the Gauls into sub-Apennine Italy (391 B. C.), though accompanied by frightful devastations, was barren of results, and did not materially affect the progress of Roman conquest. No doubt the battle on the Allia, and the capture and burning of R. (390 B. C.), were great disasters, but the injury was temporary. The vigilance of Manlius saved the Capitol, and the heroism of Camillus revived the courage and spirit of the citizens. Again and again in the course of the 4th C. B. C., the Gallic hordes repeated their incursions into Central Italy, but never again returned victorious. In 367 B. C., Camillus defeated them at Alba; in 360 B. C., they were routed at the Colline Gate; in 358 B. C., by the dictator, G. Sulpicius Peticus; and in 350 B. C., by Lucius Furius Camillus. Meanwhile, aided by their allies, the Latins and the Hernicans, the Romans carried on the long and desperate struggle with the Æquians, Volscians, and Etruscans. Finally, but not till after they had sustained repeated defeats, the Romans triumphed. The causes that led to the decline of the Etruscan power, which, at the close of the regal period in R., and during the infancy of the republic, had been enormous, both by sea and land, cannot be considered at length here. Suffice it to say, that the terrible irruption of the Gallic barbarians into Etruria, and the victories of the Samnites in Campania, where also the Etruscans had established themselves, as well as the miserable jealousies of the different cities, combined to paralyse the power of this people, and paved the way for the final triumph of Rome. But even before the Gauls had crossed the Apennines, the fate of Etruria was virtually sealed. The fall of Veii (q. v.), 396 B. C., was really the death-knell of Etruscan independence. Although the story has undoubtedly descended to us in a mythical dress, the siege of Veii is by no means to be placed in the same category with the siege of Troy, albeit, like it, it is said to have lasted ten years. Falerii, Capena, and Volsinii—all sovereign cities of Etruria—hastened soon after to make peace, and by the middle of the 4th C. B. C., the whole of Southern Etruria had submitted to the supremacy of R., was kept in check by Roman garrisons, and denationalised

by the influx of Roman colonists. In the land of the Volsci, likewise, a series of Roman fortresses were erected to overawe the native inhabitants; Velitrae, on the borders of Latium, as far back as 492 B. C., Suessa Pometia (442 B. C.), Circeii (393 B. C.), Satricum (385 B. C.), and Setia (382 B. C.): besides the whole Volscian district, known as the Pontine Marshes (q. v.), was distributed into farm-allotments among the plebeian soldiery. Becoming alarmed, however, at the increasing power of Rome, the Latins and Hernicans withdrew from the league, and a severe and protracted struggle took place between them and their former ally. Nearly thirty years elapsed before the Romans succeeded in crushing the malcontents, and restoring the league of Spurius Cassius. In the course of this war, the old Latin confederacy of the 'Thirty Cities' was broken up (384 B. C.), probably as being dangerous to the hegemony (now rapidly becoming a supremacy) of R., and their constitutions were more and more assimilated to the Roman. The terms of the treaty made by the Romans (348 B. C.) with the Carthaginians shew how very dependent was the position of the Latin cities. Meanwhile, the Romans had pushed their garrisons as far south as the Liris, the northern boundary of Campania. Here they came into contact with the Samnites (q. v.), a people as heroic as themselves, their equals in everything but unity of political organisation; perhaps their superiors in magnanimity.

The Samnites had long been extending their conquests in the south of Italy, just as R. had in the centre and in Etruria. Descending from their native mountains between the plains of Apulia and Campania, they had overrun the lower part of the peninsula, and under the name of Lucanians, Bruttians, &c., had firmly established themselves, threatening everywhere the prosperity of the Greek and Etruscan possessions in those regions. But it was the dwellers in the original mountain territory who properly bore the name of Samnites, and between them and the Romans now commenced a tremendous struggle; the former fighting heroically for the preservation of their national freedom—the latter warring with superb valour for dominion. We cannot afford space to recount the circumstances that brought about the collision, further than to state that the Samnite colonies had in the course of time become so detached in sympathy, and so changed in character and interests from the parent stock, as almost to forget their original unity. Hence, hostilities were common between them; and the forays of the Samnite Highlanders in the rich lowlands of Campania were dreaded above all things by their more polished but degenerate kinsmen of Capua, who had acquired the luxurious habits of the Greeks and Etruscans. It was really to save themselves from these destructive forays that the Campanians offered to place themselves under the supremacy of R.; and thus Romans and Samnites were thrown into a position of direct antagonism. The Samnite Wars, of which three are reckoned, extended over 53 years (343—290 B. C.). The second, generally known as the 'Great Samnite War,' lasted 22 years (326—304 B. C.). At first, the success was mainly on the side of the Samnites; and after the disaster at the *Caudine Forks* (q. v.), it seemed as if Samnium and not R. was destined to become the ruler of Italy, but the military genius of the Roman consul, Quintus Fabius Rullianus (see FABIUS), triumphed over every danger, and rendered all the heroism of Caius Pontius, the Samnite leader, unavailing. In 304 B. C., Bovianum, the capital of Samnium, was stormed, and the hardy Highlanders were compelled to acknowledge the supremacy of the republic. The third war (298—290 B. C.) was conducted with all the sanguinary energy of despair; but though the Etruscans and Umbrians now joined the Samnites against the Romans, their help came too late. The victory of Rullianus and of P. Decius Mus, at Sentinum (295 B. C.), virtually ended the struggle, and placed the whole of the Italian peninsula at the mercy of the victor. It only remains to be mentioned here that at the close of the first Samnite War, which was quite indecisive, an insurrection burst out among the Latins and Volscians, and spread over the whole territory of these two nations; but the defeat inflicted on the insurgents at Trifanum (340 B. C.) by the Roman consul, Titus Manlius Imperiosus Torquatus, almost instantly crushed it, and in two years the last spark of rebellion was extinguished. The famous Latin league was now dissolved; many of the towns lost their independence, and became Roman *municipia;* new colonies were planted both on the coast and in the interior of the Latino-Volscian region; and finally, so numerous were the farm-allotments to Roman burgesses, that two additional tribes had to be constituted.

From the Close of the Samnite to the Commencement of the Punic Wars.—The war with Pyrrhus (q. v.), king of Epirus, which led to the complete subjugation of Peninsular Italy, is a sort of pendant to the great Samnite struggle. It was brought about in this way. The Lucanians and Bruttians, who had aided the Romans in the Samnite Wars, considering themselves cheated of their portion of the spoil, entered into negotiations with the enemies of their former associate throughout the peninsula. A mighty coalition was immediately formed against R., consisting of Etruscans, Umbrians, and Gauls in the north, and of Lucanians, Bruttians, and Samnites in the south, with a sort of tacit understanding on the part of the Tarentines that they would render assistance by and by. The rapidity with which it took shape shews alike the fear and the hatred inspired by the Roman name. In the course of a single year, the whole north was in arms, and once more the power, and even the existence of R., were in deadly peril. An entire Roman army of 13,000 men was annihilated at Arretium (284 B. C.) by the Senonian Gauls, but that dauntless spirit which the republic never failed to display in the crisis of its fortunes, and which gives a sublime dignity to its worst ambition, now shone out in the fulness of its splendour. Publius Cornelius Dolabella marched into the country of the Senones at the head of a large force, and literally extirpated the whole nation, which henceforth disappears from history. Shortly afterwards, the bloody overthrow of the Etrusco-Boian horde at Lake Vadimo (283 B. C.) shattered to pieces the northern confederacy, and left the Romans free to deal with their adversaries in the south. The Lucanians were quickly overpowered (282 B. C.); Samnium, broken by its long and luckless struggle, and overawed by the proximity of a Roman army, could do nothing. A rash and unprovoked attack on a small Roman fleet now brought down on the Tarentines the vengeance of R., at the very moment R. was free to exert all her terrible power. Awaking to a sense of their danger, the Tarentines invited Pyrrhus (q. v.), over from Epirus, and appointed him commander of their mercenaries. This royal adventurer, a man of the most brilliant, but also of the most volatile genius, resembling no modern general so much as Charles Mordaunt, Earl of Peterborough, arrived in Italy (280 B. C.) with a small army of his own, and a vague notion in his head of founding a Hellenic empire in the west, that should rival that created

in the east by his kinsman, Alexander the Great. It is not necessary to narrate here the varying fortunes of the struggle between Pyrrhus and the Romans, which lasted only six years, and ended in his being obliged to return to Epirus without accomplishing anything.

After Pyrrhus, baffled in his attempts to check the progress of R., had withdrawn to Greece, the Lucanians and Samnites, whom his reputation and original successes had induced to rise once more against the dreaded foe, continued the unequal struggle, but 'even the bravery of despair,' as it has been said, 'comes to an end; the sword and the gibbet at length (269 B. C.) carried peace even into the mountains of Samnium.' Tarentum had surrendered three years earlier; and now from the Macra and the Rubicon to the Straits of Messana, there was not a nation in Italy that did not acknowledge the supremacy of Rome. Distant kingdoms began to feel that a new power had risen in the world; and when Ptolemy Philadelphus, sovereign of Egypt, heard of the overthrow of the famous Epirote warrior, he sent an embassy to R. (273 B. C.), and concluded a treaty with the republic. To secure their new acquisitions, the Romans established in the south military colonies at Pæstum and Cosa, in Lucania (273 B. C.); at Beneventum (268 B. C.), and at Æsernia (263 B. C.), to overawe the Samnites; and in the north, as out-posts against the Gauls, Ariminum (268 B. C.), Firmum in Picenum (264 B. C.), and the burgess colony of Castrum Novum. Preparations were also made to carry the great Appian highway as far as Brundisium, on the Adriatic, and for the colonisation of the latter city as a rival emporium to Tarentum.

The political changes were almost as important as the military. The whole population of Peninsular Italy was divided into three classes—1. *Cives Romani*, or such as enjoyed the full burgess privileges of Roman citizens; 2. *Nomen Latinum*—that is, such as possessed the same privileges as had been enjoyed by the members of the quondam Latin league—viz., an equality with the Roman burgesses in matters of trade and inheritance, the privilege of self-government, but no participation in the Roman franchise, and consequently no power to modify the foreign policy of the state; 3. *Socii*, or 'Allies,' to some of whom were conceded most liberal privileges, while others were governed in an almost despotic fashion. The *Cives Romani* no longer embraced merely the inhabitants of the old Roman community, the well-known 'tribes' (of whom there were now thirty-three), but all the old burgess-colonies planted in Etruria and Campania, besides such Sabine, Volscian, and other communities as had been received into the burgess body on account of their proved fidelity in times of trial, together with individual Roman emigrants or families of such, scattered among the *municipia*, or living in villages by themselves. The cities possessing the *Latinum Nomen* included most of the 'colonies' sent out by R. in later times, not only in Italy, but even beyond it; the members of which, if they had previously possessed the Roman franchise, voluntarily surrendered it in lieu of an allotment of land. But any 'Latin' burgess who had held a magistracy in his native town, might return to R., be enrolled in one of the tribes, and vote like any other citizen. The *Socii* comprised all the rest of Italy, as the Hernicans, the Lucanians, Bruttians, the Greek cities, &c. All national or cantonal confederacies and alliances among the Italians were broken up, and no means were left unemployed by the victors to prevent their restoration.

The Punic Wars.—The origin of Carthage, and the steps by which she rose to power, are sketched in the article CARTHAGE. At the time when she came into collision with R. she was indisputably the first maritime empire in the world, ruling as absolutely in the central and western Mediterranean seas as R. in the Italian peninsula. Between the Carthaginians and the Romans there had long existed a nominal alliance—the oldest treaty dating as far back as the 6th c. B. C. But this alliance had never possessed any real significance, and latterly the two nations had come to regard each other with considerable distrust. The incident that occasioned the outbreak was quite trivial, and need not be recorded. Suffice it to say that in 264 B. C., war was formally declared between the two nations, and incomparably the most terrible contest in which R. was ever engaged, began.

We do not propose to follow minutely the course of the famous Punic Wars—the details of which are narrated at sufficient length under the heads CARTHAGE, HAMILCAR, HANNIBAL, HASDRUBAL, HIERO, REGULUS, METELLUS, FABIUS, MARCELLUS, SCIPIO, and NUMIDIA, to which we refer the reader, but we may briefly indicate their character and result. The wars with Carthage, like those with Samnium, were three in number. The *first* lasted 23 years (B. C. 264—241), and was waged mainly for the possession of Sicily. Its leading feature was the creation of a Roman navy, which, after repeated and tremendous misfortune, finally wrested from Carthage the sovereignty of the seas. R., indeed, had never been a merely agricultural state, as may be inferred from a variety of particulars—e. g., the antiquity of the galley in the city arms, of the port-dues on the exports and imports of Ostia, and of commercial treaties with transmarine states—but events had hindered it from engaging to any large extent in maritime enterprise; and its shipping, or at least its fleet, was still quite insignificant, although it had become master of nearly all the Italian seaboard. The necessity for a navy now began to shew itself. Not only was there a difficulty felt in transporting troops to Sicily, but the shores of the mainland were completely exposed to the ravages of Carthaginian squadrons. So energetically did the senate set to work, that (we are told) in sixty days from the time the trees were felled, 120 ships were launched, and soon after the consul Caius Duilius gained a brilliant success (260 B. C.) over the Carthaginians off Mylae, on the north-east coast of Sicily. The exultation of the Romans knew no bounds; and the 'triumph' which Duilius received on his return to the city, had more the aspect of a carnival than of a noble ceremony. The *Columna Rostrata* ('Beaked Column') in the Forum preserved for ages the memory of the 'glorious victory.' Subsequent events, however, were less favourable. An invasion of Africa by Regulus (q. v.) ended in disaster, and the war, which was henceforth confined to Sicily, miserably languished. Thrice was the Roman navy annihilated by storms at sea (255 B. C., 253 B. C., and 249 B. C.); and in spite of a series of unimportant successes by land, the Romans long found it impossible to make any impression on the great Carthaginian strongholds of Lilybæum and Drepanum, mainly on account of the brilliant strategy with which they were held in check by Hamilcar Barca, the father of Hannibal. At last, however, a great sea-fight took place off the Ægates isles (242 B. C.), in which a Roman fleet, commanded by the consul Lutatius Catulus, obtained a magnificent victory. The Carthaginian government, whose treasury was empty, and who had in vain tried to raise a state-loan in Egypt, could—for the present—continue the struggle no longer, and the whole of Sicily, except the territory of Hiero of Syracuse,

who had been a firm ally of the Romans, passed into the hands of the victors, who constituted it a Roman province, and placed it under the government of a prætor.—A lapse of 23 years occurred before the second Punic War began, but during that interval neither Romans nor Carthaginians had been idle. The former, with worse than 'Punic faith,' had bullied their weak and exhausted rival into surrendering Sardinia and Corsica, which, like Sicily, were transformed into a Roman province. In addition, they had carried on a series of Gallic wars in Northern Italy (231—222 B. C.), the result of which was the complete humiliation of the barbarian Boii, Insubres, &c., and the extension of Italy to its natural boundary—the Alps. On the eastern coast of the Adriatic also, the Romans made their power felt, by the vigour with which they suppressed Illyrian piracy (219 B. C.). Meanwhile, the descent of Hamilcar on the Spanish coast was followed, after some ineffectual opposition on the part of the natives, by the establishment of a new Carthaginian empire, or at least a protectorate, in the west; and thus, almost before the Romans were aware of it, their hated rival had made good her losses again, and was even able to renew the struggle in a more daring fashion than before. How confident the bearing of the Carthaginians had now become, may be seen from the fearless spirit in which they accepted the Roman challenge, and entered on the *second* Punic—or (as the Romans called it) the *Hannibalic* —War, the grand events of which were the crossing of the Alps by Hannibal, the terrible disasters of the Romans at Lake Trasimene (q. v.) and Cannæ (q. v.), and the final overthrow of Hannibal at Zama (q. v.), 202 B. C., by Scipio, which once more compelled the Carthaginians to sue for peace. It was with Carthage as with Samnium. The *second* war virtually sealed her fate, and the *third* displayed only the frantic heroism of despair. Her Spanish possessions, like her Sicilian, passed to the Romans (who formed out of them the provinces of *Hispania Citerior* and *Hispania Ulterior*); so did her protectorate over the Numidian sheiks. She was forced to surrender her whole navy (excepting ten triremes), and all her elephants, and to solemnly swear never to make war either in Africa or abroad, except with the consent of her vanquisher. In a word, the imperial supremacy of R. was now as unconditional in the western Mediterranean as on the mainland of Italy. Her relations, indeed, to the conquered Italian nationalities became much harsher than they had formerly been, for, after the first victories of Hannibal, these had risen against her. The Picentes, Bruttii, Apulians, and Samnites, were deprived either of the whole or the greater part of their lands—some communities were actually turned into serfs—the Greek cities in Lower Italy, most of which had also sided with Hannibal, became the seats of burgess-colonies. But the loss of life and of vital prosperity was frightful. 'Numbers of flourishing townships,' says Mommsen, '400 it was reckoned, were destroyed and ruined.' Slaves and desperadoes associated themselves in robber-bands, of the dangers of which an idea may be formed from the fact that in a single year (185 B. C.) 7000 men had to be condemned for robbery in Apulia alone; the extension of the pastures with their half-savage slave-herdsmen, favoured this mischievous barbarising of the land. But the exultation of victory closed the eyes and the ears of the Romans against every omen, and the perilous work of conquest and subjugation went on. During 201—196 B. C., the Celts in the valley of the Po, who, with the fiery unwisdom of their race, had recommenced hostilities at the very moment R. was freed from her embarrassments, were thoroughly subjugated; their territory was Latinised, but they themselves were declared incapable of ever acquiring Roman citizenship; and so rapidly did their nationality dissolve, that when Polybius, only 30 years later, visited the country, nearly all traces of Celtic characteristics had disappeared. The Boii were finally extirpated about 193 B. C.; the Ligurians were subdued 180—177 B. C.; and the interior of Corsica and Sardinia about the same time. The wars in Spain were troublesome and of longer duration, but they were not at all serious. The natives were indeed perpetually in arms, and the Romans suffered frequent defeats from their sudden and impetuous insurrections; but in the end the superior discipline of the legions always prevailed, and the fiery and chivalrous tribes had of course to make ignominious submission. So little reliance, however, could be placed on these forced submissions, that the Romans felt it necessary to hold Spain by military occupation, and hence arose the first Roman standing armies. Forty thousand troops were maintained in the Spanish peninsula year after year. The most distinguished successes were those achieved by Scipio himself, by Quintus Minucius (197—196 B. C.), by Marcus Cato (195 B. C.), by Lucius Æmilius Paullus (189 B. C.), by Caius Calpurnius (185 B. C.), by Quintus Fulvius Flaccus (181 B. C.), and by Tiberius Gracchus (179 —178 B. C.).

Macedonian and Greek Wars.—The causes that led to the interference of R. in the politics of the East are too complicated to be given here, but the *Macedonian Wars* were owing immediately to the alliance formed by Philip V. of Macedon with Hannibal after the battle of Cannæ. Like the Samnite and Punic, the Macedonian Wars were three in number. The *first* (214—205 B. C.) was barren of results, mainly because the whole energies of R. were directed to Spain and Lower Italy; but the *second* (200—197 B. C.), though it lasted only a third of the time occupied by the first, taught Philip that another and not he must rule in Greece. The battle of *Cynoscephalæ* ('Dogs' Heads' Hills, a range in Thessaly) was followed by a treaty which compelled him to withdraw his garrisons from the Greek cities, to surrender his fleet, and to pay 1000 talents towards the expenses of the war. Philip was thoroughly quelled, and during the remaining 18 years of his life, he adhered (like old Hiero of Syracuse, though less sincerely) to his Roman alliance. But the miserable Ætolians, who had formed an alliance with R. against Philip, with even more stupidity than insolence, quarrelled in wanton jealousy with their powerful 'friends,' and persuaded Antiochus (q. v.) of Syria to come over seas to Thessaly, and fight them. A similar fate befell him to what had befallen Philip. After a war of three years, he found himself obliged to surrender all his possessions in Europe and Asia Minor, all his elephants and ships, and to pay 15,000 Euboic talents (£3,660,000) within 12 years. Next year the Ætolians were crushed, and a little later, the despicable quarrels between the Achaians and Spartans led to a general Roman protectorate over the whole of Greece.

Philip of Macedon dying (179 B. C.), was succeeded on the throne by his eldest son Perseus (q. v.), who resolved once more to try the fortune of war with the Romans; and in 172 B. C., the *third* and *last* Macedonian War began, the result of which, after four years of fighting, was the utter destruction of the Macedonian army at Pydna (168 B. C.) by the Roman consul Lucius Æmilius Paullus (q. v.), the capture of the king, who adorned the triumph of the conqueror, and the dismemberment of the Macedonian empire, which was broken up

into four oligarchic republics, the members of which were subjected to severe disqualifications; while in Greece itself, trials and executions for implication in the war of Perseus spread terror everywhere; the conspicuous 'patriots'—i. e., all who had made themselves notorious by their anti-Roman and Macedonian policy—were deported to Italy; further, the imperial republic stopped Antiochus Epiphanes in his career of Egyptian conquest, ordered him instantly to abandon his acquisitions, and accepted the protectorate of Egypt, which the grateful and frightened monarch offered her (168 B. C.). Even the allies of Rome—the Pergamese, the Rhodians, &c.—were treated with shocking harshness and injustice. We may here, for the sake of connection, anticipate the course of history, and mention the last *Greek* and *Punic* Wars. Both of these came to an end in the same year (146 B.C.). The former was caused by an expiring outburst of pseudo-patriotism in the Achaian League, consequent on the return of the exiles from Rome, and was virtually closed on the destruction of Corinth (q. v.) by the consul Mummius (q. v.). The latter was not so much a war as a bloody sacrifice to the genius of Roman ambition. After Hannibal's death, his party in Carthage seems to have recovered the ascendency, and as coincident therewith, the commercial prosperity of the city began to revive, a bolder front was shewn in resisting the encroachments of Masinissa, the Numidian ruler, whom the Roman senate protected and encouraged in his aggressions. This was enough. Fierce old Cato only expressed the instinctive sentiment of the Roman burgesses, when he came to utter incessantly *Delenda est Carthago*, and in 149 B.C., the senate adopted his barbarous conviction. After a siege of three years, in which the inhabitants displayed superhuman energy and heroism, Carthage was stormed by Scipio Africanus Minor, and the Carthaginian empire vanished for ever from the earth.

Position of Rome at the close of the Punic Wars, and sketch of its subsequent Social Condition to the termination of the Republic.—'Polybius dates from the battle of Pydna the full establishment of the universal empire of Rome. It was in fact the last battle in which a civilised state confronted Rome in the field on a footing of equality with her as a great power; all subsequent struggles were rebellions or wars with peoples beyond the pale of the Romano-Greek civilisation—the barbarians, as they were called. The whole civilised world thenceforth recognised in the Roman senate the supreme tribunal, whose commissioners decided in the last resort between kings and nations; and, to acquire its language and manners, foreign princes and noble youths resided in Rome.' But contemporaneous with this enormous extension of power and authority in foreign lands, the national character underwent a complete and fatal alteration. The simplicity and stern integrity of life, the religious gravity of deportment, and the fidelity with which common civic and household duties were discharged—well expressed in the saying of Cato, that it was 'better to be a good husband than a great senator'—which in early times nobly distinguished the Roman burgess, had now all but disappeared. Those hardy virtues—frugality, temperance, justice, and rectitude—which, combined with courage and energy, had given the strength to the nation that made it great, required for their permanence the social conditions out of which they sprang. But the class of peasant proprietors who had laid the foundations of Roman greatness were either extinct or no longer what they once had been. The original causes of their social degradation have been already noticed, and here it is only necessary to say that the victories of R. abroad furthered rather than retarded that degradation. The long and distant wars made it more and more impossible for the soldier to be a good citizen or a successful farmer. The freedom and licentiousness of camp-life, the sweets of pillage and rapine, ever grew more pleasant to the Italian burgess and colonist; thus indolence, inaptitude, and spendthrift habits aided the greedy designs of the capitalists, and in most cases the paternal acres gradually slipped into the possession of the great landlords, who found it more profitable to turn them into pasture or cultivate them by gangs of slaves. The rise of the slave-system—though an inevitable result of foreign conquest—was, indeed, the most horrible curse that ever fell on ancient R., and the atrocities inflicted on its unhappy victims are far beyond the possibility of description; Mommsen does not exaggerate when he considers it probable that, 'compared with the sufferings of the Roman slaves, the sum of all negro suffering is but a drop.' If the Italian farmer honourably strove to retain his small farm, he was exposed to the competition of the capitalists who shipped immense quantities of corn from Egypt and other granaries, where slave-labour rendered its production cheap, and of course he failed in the unequal struggle. Not less pernicious was the change that passed over the character of the rich. We have already shewn how the old Roman patricians lost their exclusive privileges, how the plebeians gradually acquired a full equality with them, and how the germs of a new social aristocracy originated, based on wealth rather than pedigree, and comprising both plebeians and patricians. During the 4th and 3d centuries B.C., the political power of this order immensely increased. In fact, the whole government of the state passed into their hands. They became an oligarchy, and while it is not to be denied that they displayed extraordinary ability in the conduct of foreign affairs, the vices inseparable from oligarchic rule—selfishness, nepotism, and arrogance, of which Scipio is a striking example—gradually became rampant. Regarding themselves as the Roman community *par excellence*, and the poor burgesses as a mere *canaille*, whose wishes and interests were unworthy of a moment's consideration, they virtually relapsed into the exclusiveness of the ancient *populus*, with this difference for the worse, that their wealth, influence, and pride were a thousandfold greater than those of Coriolanus or Camillus. But far worse than even the nepotism and selfishness of the nobles was their ever-increasing luxury and immorality. When R. had conquered Greece, and Syria, and Asia Minor, the days of her true greatness were ended. The wealth that poured into the state coffers, thence to be (really if not formally) distributed among the clique of nobles, the treasures which victorious generals acquired, enabled them to gratify to the full the morbid appetites for pleasure engendered by exposure to the voluptuousness of the East. Such results were, it is true, not brought about in a day, nor without a resolute protest on the part of individual Romans. The attitude of Cato Major towards the Hellenising tendencies of his brother nobles was doubtless patriotic, and posterity has been generous in its laudation of his antique virtue; but Cato Major was nevertheless only a political fanatic and incarnate anachronism. So long as R. chose to subdue foreign nations, and to hold them by the demoralising tenure of conquest—i. e., as mere *provinces*, whose inhabitants, held in check by a fierce and unscrupulous soldiery (like the Kabyles of Algeria by the French, or, until recently, the Hindus by the British), neither possessed

political privileges nor dared cherish the hope of them—it was morally impossible for the citizens, either at home or abroad, to resume the simple and frugal habits of their forefathers. After Cato's time, things grew worse instead of better, nor from this period down to the final dissolution of the empire, was a single *radical* reform ever permanently effected. The momentary success of Tiberius, and of his far abler brother, Caius Gracchus (q. v.), in their desperate and revolutionary attempts to prevent the social ruin of the state, by breaking down the powers of the senate, redistributing the domain lands, reorganising the administration, and partially restoring the legislative authority of the popular assemblies, hardly survived their death; and the reaction that ensued proved that the senate, like the Bourbons, could learn nothing from adversity, and that the rabble of the city were incapable of elevation or generosity of political sentiment. Henceforth, the malversation of the public money by prætors and quæstors became chronic, and the moral debauchery of the mob of the capital by the largesses of ambitious politicians and the vile flattery of demagogues, complete. The old Roman faith, so deep, and strong, and stern, disappeared from the heart. The priests became Pharisees, the nobles 'philosophers' (i. e., unbelievers), their wives practisers of oriental abominations under the name of 'mysteries;' while the poor looked on with unmeaning, yet superstitious wonder at the hollow but pompous ceremonies of religion. It would serve no useful purpose to dwell longer on these aspects of Roman society, and we now turn to sketch in a few words the course of outward events to the close of the republic.

From the Destruction of Carthage to the Termination of the Republic.—We have already alluded to the wars waged in Spain during the first half of the 2d c. B.C. The humane and conciliatory policy pursued towards the natives by Tiberius Sempronius Gracchus, father of the ill-fated tribunes, brought about a peace, 179 B.C., that lasted 25 years; but in 153 B.C., a general rising of the Celtiberians took place, followed by another on the part of the Lusitanians of Portugal. The struggle maintained by these gallant barbarians against their mighty oppressor lasted, with intervals of peace, for the space of 20 years, but ended, in spite of gleams of brilliant success, as such contests invariably do, in the final overthrow of the undisciplined and uncivilised combatant. All the valour of the shepherd-warrior, Viriathus (q. v.), even if the assassin's steel had spared his life, would not have prevented the annexation of Lusitania to the Roman empire, nor did the unsurpassable heroism of the besieged Numantines avail to baffle the military skill of the younger Scipio.

Towards the conclusion of the Numantine War occurred the first of those horrible social outbreaks known as 'servile' or 'slave' wars, which marked the later ages of the republic. The condition of the slaves has been already referred to; but what aggravated the wretchedness of their lot was the fact that most of them had been originally freemen—not inferior in knowledge, skill, or accomplishments to their masters, but only in force of character and military prowess. The first slave insurrection broke out in Sicily, 134 B.C., where the system was seen at its worst. Its leader was one Eunus, a Syrian, who, mimicking his native monarch, took the title of King Antiochus. The suddenness and barbaric fury of the revolt for a time rendered all opposition impossible. The slaves overran the island, like demoniacs let loose; and routed one Roman army after another. But a slave insurrection has no aim beyond immediate revenge, and when the first wild paroxysms of ferocity are over, it becomes powerless, more even from a moral than a physical exhaustion, and can be quelled with ease. In 132 B.C., the consul Publius Rupilius restored 'order' in the island. In the East, fortune continued to smile upon the Roman arms. Attalus III., Philometer, a villainous despot of the true oriental stamp, who massacred or poisoned every one that ventured to give him advice, dying 133 B.C., bequeathed his client-kingdom of Pergamus to its protector—R.; and after a fierce struggle with an ambitious pretender called Aristonicus, the Romans obtained possession of the splendid bequest, and formed it into the province of Asia, 129 B.C.

We may here enumerate the different provinces into which the Roman senate divided its foreign conquests, in the order of their organisation. 1. Sicily, 241 B.C.; 2. Sardinia and Corsica, 238 B.C.; 3. Hispania Citerior, and 4. Hispania Ulterior, 205 B.C.; 5. Gallia Cisalpina, 191 B.C.; 6. Macedonia, 146 B.C.; 7. Illyricum, *circa* 146 B.C.; 8. Achaia (or Southern Greece), *circa* 146 B.C.; 9. Africa (i. e. the Carthaginian territory), 146 B.C.; 10. Asia (kingdom of Pergamus), 129 B.C. A few years later, 118 B.C., an 11th was added by the conquest of the southern part of Transalpine Gaul, and was commonly called, to distinguish it from the rest of the country, 'the Province;' hence the modern *Provence*.

In Africa, the overthrow of Jugurtha (q. v.), 104 B.C., by the consul Marius, added yet further to the military renown and strength of the republic. Meanwhile, from a new quarter of the world, a gigantic and unforeseen danger threatened the Roman state. North of the Alps there had long been roaming in the region of the Middle Danube an unsettled people called the CIMBRI (q. v.), whose original home was probably the north-west of Germany. They first came into collision with the Romans in Noricum, 113 B.C.; after which they turned westward, and poured through the Helvetian valleys into Gaul, where they overwhelmed alike the native tribes and the Roman armies. At Arausio (Orange) on the Rhône, 105 B.C., a Roman army of 80,000 was annihilated; but instead of invading Italy, the barbarians blindly rushed through the passes of the Pyrenees, wasted precious months in contests with native tribes of Spain as valiant and hardy as themselves, and gave the Romans time to recover from the effects of their terrible defeat. Marius, who had just returned from his Numidian victories, was reappointed consul; and at Aqua-Sextiæ (Aix, in Dauphiny), he literally exterminated the dreaded foe, 102 B.C. Next year, near Milan, the same doom befell another northern horde—the Teutones, who had accompanied the Cimbri in their irruption into Spain; but on their withdrawal, had parted from their associates in Gaul, forced their way back through Switzerland, and descended into Italy by the Tyrolese valleys. In the same year a second insurrection of the slaves in Sicily, which had reached an alarming height, was suppressed by the consul Marcius Aquillius.

For the next 10 years the internal history of R. is a scene of wild confusion and discord. Marius, an admirable soldier, but otherwise a man of mediocre talents, and utterly unfit to play the part of a statesman, was the idol of the poor citizens, who urged him to save the state from the rapacious misgovernment of the rich. His attempts were pitiable failures; the brave honest soldier fell into the hands of unscrupulous demagogues like Glaucia and Saturninus, and sullied the laurels he had won in war by associating with men who did not hesitate to assassinate a political opponent. Not less fruitless was the wise and patriotic effort of Livius

Drusus—'the Gracchus of the aristocracy'—to effect a compromise between the privileges of the rich and the claims of the poor. The oligarchic party among the former, i. e. the senate, were enraged by his proposition to double their numbers by the introduction of 300 equites; the latter by his offer to the 'Latins' and 'Allied Italians' of the Roman franchise. Drusus fell 91 B. C., by the steel of a hired bravo. Hardly a year elapsed before the whole of the subject 'Italians'—i. e., the Marsians, Pelignians, Marrucinians, Vestinians, Picentines, Samnites, Apulians and Lucanians—were up in wild and furious revolt against R.; and, though the rebellion was crushed in less than two years by the superior generalship of Marius, Sulla, and Pompeius Strabo (father of the 'great' Pompey), the insurgents virtually triumphed; for the promise which Drusus had held out to them of the 'Roman franchise,' was made good by the *Lex Plautia Papiria* 89 B. C. Yet the cost was terrible. It is calculated that 300,000 men—the flower of R. and Italy, perished in the struggle; nor was even this tremendous holocaust sufficient to appease the Fates. The jealousy that had long existed on the part of Marius towards his younger and more gifted rival, Sulla (q. v.), kindled into a flame of hate when the latter was elected consul 88 B. C., and received the command of the Mithridatic War—an honour which Marius coveted for himself. Then followed the fearful years of the 'civil wars' between the two chiefs, 88—82 B. C., when blood was spilt like water; and proscriptions and massacres were the order of the day. It was a 'Reign of Terror'—surpassing even the excesses of the French Revolutionists. Sulla, the leader of the aristocracy, which was nominally the party of order, triumphed, but the ferocious energy displayed by the revolutionists convinced him that the 'Roman franchise' could never again be safely withdrawn from the 'Italians;' and Roman citizens, therefore, they remained till the dissolution of the empire; but, on the other hand, his whole legislation was directed towards the destruction of the political power of the burgesses, and to the restoration to the senatorial aristocracy and priesthood of the authority and influence they had possessed in the times of the Punic Wars. That his design was to build up a strong and vigorous executive cannot admit of doubt, but the rottenness of Roman society was beyond the reach of cure by any human policy. It would be hopeless in our limits to attempt even the most superficial sketch of the complicated history of this period, which, besides, will be found given with considerable fulness of detail in the biographies of its leading personages, SERTORIUS, LUCULLUS, CRASSUS, POMPEY, MITHRIDATES, CÆSAR, CICERO, CATILINE, MARK ANTONY, LEPIDUS, CLEOPATRA, CLODIUS, BRUTUS, CASSIUS, CATO, and AUGUSTUS. The very utmost we can attempt is to enumerate results.

Abroad the Roman army continued as before to prove irresistible. About 13 years after the extermination of the northern barbarians, the Cimbri and Teutones, or in 88 B.C., broke out in the far east the first of the 'Mithridatic Wars,' which, like the Samnite, Punic, and Macedonian Wars, were three in number. Begun by Sulla, 88 B. C., they were brought to a successful close by Pompey, 65 B. C., although the general that had really broken the power of Mithridates was Lucullus. The result was the annexation of the sultanate of Pontus, as a new province of the Roman republic. Next year, Pompey marched southward with his army, deposed Antiochus Asiaticus, king of Syria, and transformed his kingdom also into a Roman province, while in the following year (63 B. C.) he reduced to a state of dependence Phœnicia, Cœle-Syria, and Palestine, storming Jerusalem, and, to the horror of the Jews, violating their Holy of Holies. But what a terrible commentary it is upon these glittering triumphs to remember that during the same year there was hatched at R. the Conspiracy of Catiline (q.v.), which, if it had not been crushed by an extraordinary display of decision on the part of the consul Cicero, would have placed at least the city of R. at the mercy of a crew of aristocratic desperadoes and cutthroats. One thing now becomes particularly noticeable, viz., the paralysis of the senate—that 'governing board' as Mommsen calls it, that had once been the mightiest power in the world. In spite of all that Sulla did to make it once more the governing body in the state, the power passed out of its hands. Torn by wretched jealousies, spites, piques (personal and partisan), it could do nothing but squabble or feebly attempt to frustrate the purpose of men whom it considered formidable. Henceforth the interest as well as the importance of Roman history attaches to individuals, and the senate sinks deeper and deeper into insignificance, until at last it becomes merely the obsequious council of the emperors. The famous coalition of Crassus, Pompey, and Cæsar (known as the *First Triumvirate*), which dates from the year 60 B. C., proves how weak the government and how powerful individuals had become; and the same fact is even more dismally brought out by the lawless and bloody tribunates of Clodius and Milo (58—57 B. C.), when R. was for a while at the mercy of bravos and gladiators. The campaigns of Cæsar in Gaul (58—50 B. C.), by which the whole of that country was reduced to subjection; his rupture with Pompey; his defiance of the senate; the civil wars; his victory, dictatorship, and assassination; the restoration of the senatorial oligarchy; the second triumvirate, composed of Antony, Lepidus, and Octavian; the overthrow of the oligarchy at Philippi; the struggle between Antony and Octavian; the triumph of the latter, and his investment with absolute power for life (29 B. C.), which put an end at least to the civil dissensions that had raged so long (and was therefore so far a blessing to the state), are described in the biographical articles already referred to.

THE ROMAN EMPIRE.—When Augustus had gathered up into himself all the civil and military powers of the state, its political life was at an end; henceforth the voices of the citizens are dumb, and only the rude clamour of the legions or the Prætorians (q. v.) is heard, as emperors rise and fall. It is, indeed, amazing to consider how long brute force managed to keep under the elements of anarchy and dissolution in the empire; but it must be remembered that it was the East that ruined R., and not R. the East. Even in the worst days of the republic, the Roman administrators of the provinces were acknowledged to be less unjust, ravenous, tyrannical, and cruel than the native princes and sultans; and the servile myriads of Asia Minor and Syria witnessed the deposition of their dynasts without a shadow of regret—sometimes even with a cry of joy. The Romans had therefore comparatively little difficulty in retaining and even increasing their eastern conquests, while the superior discipline of their well-trained soldiery enabled them to repel and subdue even the intrepid barbarians of the North, though singly these were probably more gallant men than the rank and file of the imperial legions. But no military prowess, however great, will, beyond a certain time, serve to keep a nation alive that is otherwise moribund; and even Christianity, with all its antiseptic and revivifying influences, came

too late to reanimate the national life of the empire. When Augustus died (14 A. D.), the Roman empire was separated in the north from Germany by the Rhine, but it also included both Holland and Friesland; from about the Lake of Constance it ran along the Danube to Lower Mœsia, though the imperial authority was far from being firmly established there. In the east, the boundary-line was, in general, the Euphrates; in the south, Egypt, Libya, and, in fact, the whole of Northern Africa, as far west as Morocco, and as far inland as Fezzan and the Sahara, acknowledged Roman authority. The Roman franchise was extended to transmarine communities, and in the western provinces especially it became quite common. To keep this enormous territory, containing so many different races, quiet, an army of 47 legions and as many cohorts was maintained, most of whom were levied among the newly-admitted burgesses of the western provinces. The reigns of Tiberius (q. v.), Caligula (q. v.), Claudius (q. v.), Nero (q. v.), Galba (q. v.), Otho (q. v.), and Vitellius (q. v.), present little of any moment in a general survey of the external history of the empire, though the chronicle of their lives—those of Galba and Otho, perhaps, excepted—has all the horrible and revolting interest that attaches to records of conspiracy, assassinations, poisonings, massacres, lust, debauchery, and delirious madness. The most notable incident of this period is probably the concentration of the Prætorian Guards in the vicinity of R. during the reign of Tiberius, which Niebuhr even pronounces 'the most momentous event in the history of the emperors;' and not without reason, for, until their dissolution by Diocletian, they were the real sovereigns of the empire. In Nero's time, Armenia was wrested from the Parthians, and only restored to them on condition of their holding it as a 'fief' of the empire; the Roman authority in England was likewise extended as far north as the Trent; and a great rebellion in Gaul (not, however, against R., but only against Nero), headed by Julius Vindex, a noble Aquitanian and a Roman senator, was crushed by T. Virginius Rufus, the commander of the Germanic legions. During the profound peace that the empire had enjoyed everywhere, except on its frontiers—since the usurpation of the imperial authority—its material prosperity had greatly increased. The population was more than doubled; the towns became filled with inhabitants, and the wastes were peopled, wherever, at least, the Publicani (q. v.) or farmers-general had not got the land into their rapacious hands; but the immorality of the rich, especially among the females, became yet worse than before, and virtuous men actually preferred concubinage with a slave, to marriage with a free-born Roman lady.

With the accession of Vespasian (q. v.) a better era commenced, which, if we except the reign of Domitian, continued uninterrupted for a space of 100 years, comprising the reigns, besides those mentioned, of Titus (q. v.), Nerva (q. v.), Trajan (q. v.), Hadrian (q. v.), Antoninus Pius (q. v.), and Marcus Aurelius (q. v.). These were all men of fine and honourable character—some, as e. g., Trajan, Hadrian, and Marcus Aurelius, were really illustrious rulers, worthy of the best days of Rome. Under all of them the provinces were better governed, the finances better administered, and public morals wonderfully improved. Nothing, indeed, is more clear than that, after the time of Vespasian, that *restaurator rei publicæ*, as he has been justly called, the worst days of Rome (in a moral point of view) were over. Never again did she give way to the horrible sensuality, gluttony, and profligacy of the 1st century. Bad emperors she had as well as good, but they did not again succeed in corrupting their age. Blood, indeed, was shed freely enough, hostilities on the frontiers were as frequent as ever, and the violence and selfishness of military ambition were things that paganism did not seek, and had not the power, to quell; but the wild abyss of anarchy into which the empire latterly fell is less dreadful than the saturnalia of vice that filled the soul of Juvenal with indignation in the days of Domitian. How far the change was due to the influence of the ever-extending Christian religion, it is impossible to tell, but that Christianity did send a reinvigorating breath of new life through the old decaying body of the state is beyond all dispute, and is written on the very face of the history of the first centuries. The chief military events, from the days of Vespasian to those of Marcus Aurelius, are the final conquest of Britain by Agricola (q. v.), the final conquest of the Dacian monarchy, the victorious invasion of Parthia and of Northern Arabia; and the conquest of the valley of the Nile as far south as Upper Nubia, by Trajan; the chastisement of the Marcomanni, Quadi, Chatti, &c., by Marcus Aurelius. Hadrian's long rule of 21 years was peaceful, but is memorable as the most splendid era of Roman architecture. The reigns of Commodus (q. v.), Pertinax (q. v.), and Didius Julianus (q. v.) were insignificant, except in so far as they shew us the wretched confusion into which the administration of affairs inevitably fell when bad, or hated, or feeble rulers were invested with the purple. Able generals, respectable jurists, honourable senators are not wanting, but their influence is personal and local. The reign of Septimius Severus (193—211 A.D.) is memorable as marking the first real change in the attitude of the emperors towards Christianity. The new religion was beginning to make itself felt in the state; and Severus, who was a Carthaginian, while his wife was a Syrian, may have felt a special interest in a faith that like themselves was of Semitic origin. At all events it was taken under the imperial protection, and began to make rapid way. Caracalla (q. v.) and Elagabalus (q. v.) are perhaps the worst of all the emperors in point of criminality; but the mad brutality of the one and the monstrous debauchery of the other were purely personal affairs, and were regarded with horror by the citizens of the empire. The reign of Alexander Severus is marked by the downfall of the Parthian dynasty of Persian kings, and the rise of the native Sassanidæ (q. v.), which, as Niebuhr observes, 'was one of the unluckiest things that could have happened to the Roman empire,' for the latter proved far more formidable enemies than the Parthian rulers. After the assassination of Severus (235 B.C.) followed a period of confusion, bloodshed, and general mismanagement. The names of Maximin (q. v.), Maximus (q. v.), Balbinus (q. v.), Gordianus (q. v.), and Philip (q. v.), recall nothing but wretched quarrels, often ending in assassination. Then followed 'the beginning of the end.' The whole of Europe beyond the Roman frontier—the mysterious North—began to ferment. The Franks shewed themselves on the Lower Rhine, the Swabians on the Maine; while the Goths burst through Dacia, routed the forces of Decius (q. v.), and slew the emperor himself at Mount Haemus, crossed the Euxine, and ravaged the whole northern coast of Asia Minor. A little later—during the reigns of Valerian (q. v.), Gallienus, and the so-called *Thirty Tyrants*—the empire is nothing but a wild distracted chaos, Franks, Alemanni, Goths, and Persians rushing in from their respective quarters, like vultures scenting prey. The Goths swept over the whole of Achaia, pillaging and burning

the most famous cities—Athens, Corinth, Argos, &c.; while the Asiatic hordes of Sapor committed even greater havoc in Syria and Asia Minor; and but for the courage and skill of Odenathus, husband of Zenobia (q. v.), who had built up a strong independent kingdom in the Syrian desert, with Palmyra for its capital, might have permanently possessed themselves of the regions which they merely devastated. With Claudius Gothicus (268—270 B. C.), the fortunes of the empire once more begin to brighten. By him, and his successors Aurelian (q. v.), Probus (q. v.), and Carus, the barbarians of the north and north-west, as well as the Persians in the east, were severely chastised. Nay, when Diocletian obtained the purple (284 A. D.), it seemed as if the worst were over, and the empire might still be rescued from destruction; but his division of the empire into East and West, with separate *Augusti* and assistant *Cæsars*—though it sprang from a clear perception of the impossibility of one man administering successfully the affairs of so vast a state—led to those labyrinthine confusions and civil wars, in which figure the names of Maximian (q. v.), Constantius (q. v.), Galerius (q. v.), Maxentius (q. v.), Maximin (q. v.), Licinius (q. v.), and Constantine (q. v.), and which were only brought to a close by the surpassing genius of the last-mentioned. Under Constantine (324—337 A.D.) as all the world knows, occurred the greatest revolution in Roman history since the birth of Christ—viz., the establishment of Christianity as the religion of the state. He also transferred the seat of government from R. to Byzantium on the Bosporus, where he founded a new city, and named it after himself. But no sooner was the great statesman dead than the mutinous discords that he had kept under by the vigour of his rule, broke loose; the empire underwent a triple division among his sons; and though Constantius (q. v.), the youngest, ere long became sole ruler, he failed to display the genius of his father, and in his repeated campaigns against the Persians reaped nothing but disaster and disgrace. But the political fortunes of the empire now possess only a secondary interest; it is the struggles of the Christian sects and the rise of the Catholic Church that mainly attract the attention of the historian. There, at least, we behold the signs of new life—a zeal, enthusiasm, and inward strength of soul that no barbarism could destroy. Christianity came too late to save the ancient civilisation, but it enabled the Roman world to endure three centuries of utter barbarism, and afterwards to recover a portion of the inheritance of culture that it once seemed to have lost for ever. Julian's attempt to revive paganism was a lamentable anachronism, but his efforts, when governor of Gaul under his kinsman Constantius, to repel the incessant incursions of the Franks and Alemanni, displayed a fine valour and generalship, and were crowned with success. The judgment of the poet Prudentius on the apostate is that of posterity: *Perfidus ille Deo, sed non et perfidus orbi.* But after the death of Julian, the signs of the approaching dissolution of the empire became more unmistakable. Yet the great state was, if we may so speak, loath to die; and again and again in her death-agony, she put forth a momentary strength that amazed her foes, and taught them that even the expiring struggles of a giant were to be feared. Valentinian (q. v.), Gratian (q. v.), and Theodosius (q. v.) were rulers worthy of better times. The last-mentioned is even known to history as the 'Great.' But they fought against destiny, and their labour was in vain. Already swarms of ferocious Huns (q. v.) from the east had driven the Goths out of Dacia, where they had long been settled, and forced them to cross the Danube into the Roman territory, where the cruelty and oppression of the imperial officers goaded the refugees into insurrection; and in their fury, they devastated the whole east from the Adriatic to the Euxine. Theodosius indeed subdued and even disarmed them; but he could not prevent them from drawing nearer to the heart of the empire, and already they are found scattered over all Mœsia, Servia, and Northern Illyricum. Hardly was Theodosius dead when they rose again, under their chief, Alaric (q. v.), against Honorius, emperor of the West. R. was saved (for the moment) only by the splendid bravery and skill of Stilicho (q. v.), the imperial general; but after his assassination, the barbarians returned, sacked the city (410 B. C.), and ravaged the peninsula. Three years earlier, hordes of Suevi, Burgundians, Alemanni, Vandals, and Alans burst into Gaul (where the native Celts had long been largely Romanised in language and habits), overran the whole, and then penetrated into Spain, where a Vandal empire was rapidly set up. It is utterly impossible (within our limits) to explain the chaotic imbroglio that followed in the West—the struggles between Visigoths and Vandals in Spain, between Romans and both, between usurpers of the purple and loyal generals in Gaul—the fatal rivalries of those otherwise noble and gifted men—Boniface, governor (*comes*) of Africa, and Aetius, governor of Gaul—which led to the invasion of Africa by Genseric (q. v.), and its devastation from the Straits of Gibraltar to Carthage (429 A. D.). While such was the state of affairs in the West, things were not a whit better in the East. There the Huns, from mere love of havoc, had reduced vast regions to an utter desert; for nearly 50 years, indeed, the little ferocious demons had rioted in destruction. At last, a trivial quarrel sent them into Gaul; but somewhere in Champagne, they were routed with great slaughter (451 A. D.) by a combined force of Visigoths, Burgundians, Franks, and Roman mercenaries, under Aetius and Theodoric, king of the Goths; and in spite of their successful invasion of Italy in the following year, their strength was permanently broken, and henceforth they play an insignificant part in history. But Aetius, the only man who could have decently propped up the wretched ruin, called the Western Empire, was assassinated by his contemptible sovereign Valentinian, whose own outrages led to his murder too; while his widow, Eudoxia, to be revenged on his murderer and successor, Petronius Maximus, invited Genseric, the 'scourge of God,' over from Africa, and exposed R. to the horrors of pillage for 14 days. Ricimer, a Sueve, next figures as a sort of governor of the city, and what relics of empire it still possessed, for Gaul, Britain, Spain, Western Africa, and the islands in the Mediterranean, had all been wrested from it. While Majorian—the last able emperor—lived, Ricimer's position was a subordinate one, but, thenceforth, the western emperor merely was an emperor in name—a *roi fainéant*—while the real sovereignty was exercised by this Suevic *Maire du Palais*, who was succeeded in his functions by the Burgundian King Eunobald, and the latter again by Orestes, in whose time the final catastrophe happened, when Odoacer (q. v.), placing himself at the head of the barbarian mercenaries of the empire, overthrew the last, and the most ridiculous, occupant of the throne of the Cæsars (476 A.D.), who, by a curious coincidence, bore the same name as the mythical founder of the city—Romulus. See, besides the ancient histories of Polybius, Livy, Sallust, Tacitus, &c., the modern histories of Gibbon, Niebuhr, Arnold, Merivale, and Mommsen.

ROME, the capital of ancient Italy, stood on the left bank of the Tiber, about 16 miles from the sea. The legend of its origin belongs to Roman history, and is discussed partly under that heading, and partly in the article ROMULUS. It was built at first in the form of a square (*Roma Quadrata*), and gradually extended, until, in the reign of Servius Tullius, it embraced one after another the famous seven hills—viz., the Palatine, Capitoline, Quirinal, Cælian, Aventine, Viminal, and Esquiline. Servius Tullius (according to the legend) so extended the *pomœrium* as to make the sacred enclosure of the city identical with its walls. After its first destruction in 390 B. C. by the Gauls, it was hastily rebuilt without respect to order, and with narrow irregular streets. At the close of the wars against Carthage, Macedonia, and Syria, public buildings and private houses of great architectural beauty were added; and under Augustus, improvements of a similar kind were made, while the mean and narrow streets were allowed to stand. In the reign of Nero, 64 A. D., two-thirds of the city were destroyed by fire, a catastrophe which furnished that emperor with the opportunity of gratifying his architectural predilections, in widening and straightening the streets, and in restricting the height of the houses, of which a certain part was built of fireproof stone from Gabii and Alba. Although it had long outgrown the limits prescribed by Servius Tullius, still the walls of that king marked the extent of R. properly so called down to the 3d C. A. D. Under Aurelian, however, the need of fortifications led to the construction of new walls, which took in the city of Servius Tullius with all the suburbs, such as the Mons Janiculus on the right of the Tiber, and the Pincian on the left. These walls, begun 271 A. D., were completed by the next emperor, Probus, were eleven miles in circumference, and were afterwards restored by Honorius, and partially rebuilt by Belisarius.

Extent and Population of Rome.—Under Servius Tullius, the walls were seven miles in circumference, but the space which they comprised was not entirely occupied by buildings. Under Aurelian, the new walls were 11 miles in circumference, and the city went on extending until it reached a circumference of 13 miles under Vespasian. The population at any given period cannot be exactly determined. According to the *Monumentum Ancyranum*, the *plebs urbana* under Augustus amounted to 320,000; with the addition of women, senators, and knights, the inhabitants must have numbered about 650,000; while the slaves, who cannot have been less numerous than the free population, must have given an aggregate of at least 1,300,000. Considering the enlargement of the city under Vespasian, we may safely set its population down at not less than two millions in his reign.

The Walls and Gates.—The first wall, that attributed to Romulus, embraced merely the Palatine, and was pierced by three gates. The larger wall of Servius Tullius does not appear to have been continuous, but only to have connected the seven hills by fortifications drawn across the narrow valleys intervening. According to Pliny, there were 37 gates in this wall. Subsequent to the walls of Servius were those of Aurelian, which, with the exception of the part beyond the Tiber, are the same as those which surround the modern city. They were divided by 14 gates. The Tiber was crossed by eight bridges.

In the interior of the city were several open spaces of ground, paved with stones, which were used as places of business or as market-places, and were called *fora* (see FORUM.) Besides these, there were other open spaces of much larger extent, which were grass-grown, and set with trees and works of art. Of these, which were called *campi*, and were used by the people in their exercises and amusements, the chief was the Campus Martius. Surrounding these fora and campi were the private and public buildings of R., which were arranged in streets and districts. The chief street was the celebrated Via Sacra, remains of which are still to be seen in the Forum of modern Rome.—R. contained no fewer than 400 temples, the oldest being the temple of the Feretrian Jupiter, on the Capitoline, which was built, according to tradition, by Romulus, and restored by Augustus. The most famous in history, and the most magnificent in architecture, was the Capitolium, placed on the summit of the Capitoline (see CAPITOL). The only other temple requiring special mention was the Pantheon (q. v.), built by Agrippa, 57 B. C. It is still standing.—For other striking features of the ancient city, see CIRCUS, AMPHITHEATRE, BATH, BASILICA.

R. also abounded in covered walks, supported by columns, and open on one side. These were known as *porticus*, and were frequented for the purposes of recreation, or of transaction of business. They were in many cases adorned with paintings and other works of art, and furnished with libraries.—More peculiar to ancient Rome, however, were the triumphal arches. See ARCH, TRIUMPHAL.—The great prison of R. was the Carcer Mamertinus, built by Ancus Martius on the slope of the Capitoline, which overhangs the Forum. Servius Tullius added to it a subterranean dungeon, 12 feet underground, walled and arched over with masonry.—In addition to the prisons, we may mention the barracks (*castra*), such as the Castra Prætoria, built by the Emperor Tiberius for the imperial guards; and the Castra Peregrina, where the foreign troops were quartered; the aqueducts (see AQUEDUCT); and the sewers (see CLOACA MAXIMA).

R. also abounded in palaces (*palatia*). Of these, the Palatium, or imperial palace, fronting the Forum, was so enlarged by Augustus, that from being the private house of Hortensius the orator, it became the imperial residence. Nero built two still more splendid palaces, one which covered the whole Palatine Hill and part of the Esquiline, and was burned down in the great fire; and one which replaced the other. Many of the private palaces were also on a magnificent scale.—On the hills around the city were laid out *horti*, or parks and gardens, and were adorned with handsome building and works of art.—R. was also rich in sepulchral monuments. See ROMAN ARCHITECTURE.—In addition to these imperial or private mausolea, columns were also erected to the more illustrious of the Romans, such as the Columna Rostrata, in honour of the consul C. Duilius for his victory over the Carthaginian fleet; the Columna Trajani, in the Forum; and the Columna Antonini Pii, in the Campus Martius.—Obelisks (q. v.), mostly transported from Egypt, occupied prominent parts of the city, the largest being that transferred from Heliopolis to Alexandria by Constantine, and thence to R. by his son Constantius, and placed by him in the Campus Martius.

Modern Rome occupies the plain on each side of the Tiber and the slopes of the seven hills. Its geographical position at the Observatory of the Collegio Romano is lat. 41° 53′ 52″ N., long. 12° 28′ 40″ E. of Greenwich, and its height above the level of the sea, on the Tiber, under the Ælian Bridge, is 20 feet. Its pop. in 1865 was 207,338, exclusive of strangers. In 1863 the number of priests—including 34 cardinals and 36 bishops—and friars was 4463, and

of nuns 2031. It contains 4490 Jewish residents, who are still compelled to inhabit a particular quarter, called the Ghetto. Resident Protestants number only 311.

The city is built on marshy ground, and is divided by the Tiber into two very unequal parts, that on the left bank being R. Proper, and that on the right bank being the Leonine city, or Trastevere. Its walls, 12 miles in circuit, and containing 16 gates, of which 4 are built up, enclose a space of which little more than one-third is inhabited, the greater part to the south of the Capitol being cultivated as gardens or vineyards. The site of the ancient Campus Martius constitutes the lower and most densely populated part of the town, in which all the trade is carried on. Its central part is crossed by the Corso, a street about one mile long, and running from the Piazza del Popolo, or great northern entrance of R., to the Palazzo di Venezia, at the foot of the Capitol. From the Piazza del Popolo, a handsome open space, with an obelisk from the Temple of the Sun at Heliopolis in the middle, branch out to the right and left of the Corso, the Piazza di Spagna, the favourite quarter of foreigners, and the Ripetta. More than half-way up the Corso, and to the right, runs the wide street or Strada del Gesù, leading to the noble church and convent of that name, the chief residence of the order of the Jesuits. On either side of the Corso, the buildings are regular and substantial, and consist of palaces, such as the Borghese, the Ruspoli, the Ghigi, and others, besides many churches. Between the Corso and the Tiber, to the west, the streets are irregular, densely peopled with inferior tradesmen, and consisting mainly of market-places, shops, and dwellings of a low class. In this quarter is the University La Sapienza, between which and the Corso is the Rotunda or Pantheon. South of Ponte Sisto, on the left bank of the Tiber, and winding round the western base of the Capitol to the foot of the Palatine, is the Ghetto, or Jews' Quarter, consisting of narrow dirty alleys, with rows of high old houses. Still further south, and on the left bank of the Tiber, runs a series of narrow streets as far as the Palatine, containing some of the oldest churches in R., such as the Santa Maria in Cosmedin, built in the 3d century. Beyond this extend to the south-east the Aventine, Palatine, and Cælian hills, which are covered with gardens, vineyards, and orchards, besides churches, convents, and ruins. At the eastern extremity of the Cælian stands the magnificent Basilica of San Giovanni in Laterano. To the south of the Aventine, and between it, the river, and the walls, are the Prati del Popolo Romano, forming part of a large space of low-lying cultivated ground. Near the Prati lies the Protestant Cemetery.

On the slope of the Pincian and Quirinal hills, and covering part of the plateau which joins all the eastern hills of R., lies the upper town, consisting mainly of palaces, villas, churches, convents, and other buildings on a large scale. It abounds with ample courts and gardens, and is crossed by two long streets, which intersect each other at right angles on the crest of the Quirinal. The Pincian is laid out in fine walks, which are the favourite promenade of the Romans; while between the Pincian and the Quirinal stands the great Barberini Palace. On the summit of the Quirinal is the famous pontifical palace and garden; and in the square before the palace are the two colossal statues of Castor and Pollux, with their horses, whence the hill receives its other name of Monte Cavallo. On the Esquiline, which here joins the Quirinal, and forms the eastern extremity of the city, stands the magnificent church of St Maria Maggiore; beyond it to the north, east, and south, the Esquiline is entirely covered with gardens, villas, and fields, with here and there a church. The principal buildings on the Capitol are three palaces, the work of Michael Angelo, which forms three sides of a square, in the centre of which stands the equestrian statue of M. Aurelius Antoninus. One of the palaces is the Capitoline Museum, one of the finest collections of statuary and sculpture in Italy.

The third great division of the modern city lies on the right bank of the river, and is subdivided into two parts—the Vatican (otherwise called Il Borgo) and the Trastevere. Divided from the latter by an inner wall, the Borgo or Leonine city occupies the space between the bridge of St Angelo and the Piazza of St Peter's. Its chief buildings are the palace of the Vatican (q. v.), and the Basilica of St Peter's (q. v.). Besides the Vatican and St Peter's, the Leonine city contains the great hospital of the Santo Spirito, which accommodates annually 13,500 patients, labouring under all diseases, whether mental or bodily. The Castle of St Angelo, with massive circular tower, called from its founder the 'Mole of Hadrian,' is surrounded with ramparts, ditches, and bastions, mounted with cannon, and forms the citadel of Rome.

To the south of the Borgo, and between the Janiculum and the Tiber, is the Trastevere, properly so called. The Janiculum, a straight ridge, about a mile and a half long from north to south, rises about 300 feet above the level of the river. The northern half of its length is occupied by the long street called the Lungara, running closely parallel to the Tiber, which, at the southern extremity of the Lungara, makes a bend to the east, and bounds the greater part of the Trastevere district. On the Janiculum is the Villa Spada, near the gate, outside of which is the Villa Pamfili, a favourite promenade of the Roman youth. On the same hill, the fountain called L'Acqua Paola, the largest in Rome, occupies a commanding site, and, as seen from a distance, resembles a triple triumphal arch, through which streams of water rush.

The churches, of which there are upwards of 300, form a notable feature in R., from their architecture, their paintings, and other decorations. So also are the palaces of the aristocracy, which are often of great magnitude, with vast courts and spacious apartments. Of even better style as residences are the villas, both within and without the walls; while the handsome fountains, of which there are at least 12 principal ones, impart a cheerful and refreshing aspect to the city. There are three modern aqueducts, which keep R. supplied with abundance of water: the Acqua Vergine, the Acqua Felice (the ancient Acqua Marcia and Claudia), and the Acqua Paola (the ancient Alsietina).

R. is, on the whole, a healthy city, except at the close of summer and the beginning of autumn, when the malaria is prevalent. The Trastevere is its most uniformly healthy district, the inhabitants of which are superior in physical development to those of the other parts. The neighbourhoods of the Pincian and the Quirinal, particularly the former, are most frequented by Englishmen. The trade of the city is insignificant, consisting of a few trivial manufactures of hats, silk scarfs, gloves, artificial feathers, false pearls, mosaic trinkets, &c., and of such articles as artists need and visitors fancy. The only great manufacture, if it can be called so, is that of pictures, original and copied; for the painting of these, R. offers not only the advantage of numerous galleries of art, but purity of sky, and a steady light daily over nearly the whole year. The worst feature of R. is its dirtiness, arising

from defective sanitary and police regulations; but in this respect the town was improved while occupied by the French garrison.

ROME, a township and village of New York, U. S., on the Mohawk River, Erie Canal, Black River Canal, and New York Central Railway, 100 miles north-west of Albany. It contains a U. S. arsenal, court-house, jail, academy, 17 churches, 2 newspapers, and numerous manufactories. Pop. (1860) of the village, 6246; township about 10,000; of village in 1870, 11,000.

RO'MFORD, a market-town in the county of Essex, stands on the river Bourne, or Rom, 12 miles from London, on the Great Eastern line. The annual horse-fair commences on Midsummer Day, and lasts three days. There are extensive breweries of the famous 'Romford ale.' Agricultural implements are largely manufactured. Pop. (1861) 4361.

ROMILLY, Sir Samuel, English lawyer and law reformer, born March 1, 1757, was descended from a family of French Protestants, who, after the revocation of the Edict of Nantes, emigrated to England. At the age of 16, R. was articled to Mr Lally, one of the sworn clerks in Chancery; and at 21 he entered himself at Gray's Inn. At first he made little progress in his profession; but after a time he began to apply himself to the study of criminal law; and in 1789, entertaining, like many other English Liberals, a sanguine expectation of the happy effects of the French Revolution, he published a short pamphlet on the subject. In 1792, and again in 1795, he declined Lord Lansdowne's offer of a seat for Calne. In 1806, he was, at the instance of Mr Fox, appointed Solicitor-general in the Grenville administration. He unwillingly received the honour of knighthood; but the king having, for the last twenty years, knighted all his Attorneys and Solicitors-General on their appointment, would take no refusal. He was afterwards returned for Queenborough, was one of the managers of Lord Melville's trial, and passed a bill to amend the bankrupt laws. In 1807, he went out of office, and was elected for Horsham, but being unseated, was returned for Wareham. He now devoted himself to ameliorate the severity of the criminal law, and proposed the abolition of the punishment of death in various cases of theft. He also published a pamphlet *On the Criminal Law as it relates to Capital Punishments.* His bills were, session after session, opposed by the government of the day, the judges, and many of the bishops, as dangerous innovations; but R. nevertheless persevered, and lost no opportunity of protesting against the severity and frequency of capital punishments. The measures he proposed for mitigating the severity of the criminal law were, for the most part, carried by others; but he framed an act for rendering the punishment of high treason less barbarous, and another for taking away corruption of blood, as a consequence of attainder of felony. He took an active part in the anti-slavery agitation, and in opposing the suspension of the Habeas Corpus Act, the spy system, and the despotic acts of the government. In 1818, he was spontaneously chosen by the electors of Westminster as their representative. The death of his wife, following upon prolonged mental exertion, preyed upon his mind, and three days afterwards (November 2, 1818) he died by his own hand. He had at this time attained the foremost rank at the Chancery bar, and his professional gains were said to average £14,000 a year. His death excited profound sympathy, and was considered a public calamity. His *Speeches in Parliament* have been published in two vols.; and his Autobiography, with a selection from his Correspondence, admirably edited by his sons, has also been published in 2 vols. —His second son, Sir John Romilly, educated at Trinity College, and called to the bar at Gray's Inn, 1827, was made Solicitor-general in 1848, Attorney-general in 1850, and Master of the Rolls in 1851. In this high office he has incidentally rendered great services to his country by superintending the publication of public records tending to throw much light upon English history and events. He was raised to the peerage as Baron Romilly in 1866.

ROMORANTIN, a small town of France, in the dep. of Loir-et-Cher, 25 miles south-east of Blois. At the siege of this town by the Black Prince in 1356, artillery is said to have been first used. Various woollen fabrics are manufactured. Pop. (1862) 7642.

Rompu.

RO'MPU, in Heraldry, a term applied to a cheveron when the upper part is taken off, and remains above it in the field.

RO'MULUS, the mythical founder of the city of Rome. His name is only a lengthened form of Romus, and he is therefore to be regarded rather as a symbolical representation of the Roman people than as an actual individual, like Æolus, Dorus, and Ion, the eponymous ancestors of the Æolians, Dorians, and Ionians. But though the legend of R. cannot be accepted as history in its details or its outlines, it is nevertheless interesting to know how, after the lapse of years, when Rome had become a place of importance, its inhabitants tried to conceive a probable origin for it. We will therefore relate the story of R. as it is usually given. At Alba Longa, in Latium, there had ruled for some centuries a line of kings descended from the Trojan prince, Æneas. One of the latest of these, at his death, left the kingdom to his eldest son, Numitor. Amulius, a younger brother of Numitor, who was ambitious, deprived the latter of the sovereignty, murdered his only son, and compelled his only daughter, Silvia (generally, but incorrectly, called Rhea Silvia), to become a vestal virgin, thereby hoping to secure immunity for his crime. But Silvia having become the mother of twins by the god Mars, his fears were aroused, and he resolved to drown all the three. A cradle containing the babes was thrown into the Anio, whence it was carried into the Tiber. That stream was then in flood, and had overspread its banks far and wide. The cradle was stranded at the foot of the Palatine, and the infants thus wonderfully saved from death by drowning, were no less wonderfully saved from death by hunger. A she-wolf carried them into her den, near at hand, and suckled them, while a woodpecker brought them whatever other food they wanted. This marvellous spectacle was at length beheld by Faustulus, the king's shepherd, who bore the infants home to his wife, Acca Larentia, and had them brought up with his own children. A strife having one day arisen between them and the herdsmen of Numitor, who stalled their cattle on the Aventine, Remus, one of the twins, was taken prisoner, and carried off to Numitor. When the latter looked on the youth, he could not help thinking of his grandsons; and the story of the miraculous preservation of the twins, strengthened the suspicions that were beginning to form in his mind. R. now made his appearance, accompanied by his foster-father; an *éclaircissement* took place; Numitor acknowledged the boys as the sons of his daughter Silvia, and they immediately proceeded to avenge the family wrongs, by slaying Amulius, and placing their grandfather on the throne. But,

continues the legend, R. and his brother did not care to remain in Alba Longa; they loved their old abode on the banks of the Tiber, and resolved to build a city there. The Palatine was chosen (by augury) for the site, and R., yoking a bullock and a heifer to a ploughshare, marked out the *pomœrium*, or boundary, on which he proceeded to build a wall. Remus laughed at the idea of keeping off enemies by such means, and to shew its inefficiency, scornfully leaped over it, whereupon R. slew him, but was immediately struck with remorse, and could obtain no rest till he had appeased the shade of his brother by instituting the *Lemuria*, or festival for the souls of the departed. The next thing which R. did was to erect a 'sanctuary' on the Capitoline for runaway slaves and homicides, and by this means he soon increased the number of his followers; but as wives were much wanted, R. tried to obtain them legally from the neighbouring states. His efforts, however, failed: a 'runaway slave' not being considered a desirable match for his daughter by a Latin or Sabine paterfamilias, and he was compelled to have recourse to stratagem. This led to the celebrated *Rape of the Sabine Women*, the incidents of which are too familiar to require narration. The consequence of this wholesale abduction of virgins was a series of wars, in which, however, R. was invariably victorious, until Titus Tatius, at the head of a large army of Sabines, drove him from the open fields, and forced him to take refuge in his city on the Palatine. R. had also garrisoned the Capitoline, but the treachery of Tarpeia, a daughter of the lieutenant of the fort, placed it in the hands of his adversaries. Next day, a battle took place in the valley between the two hills. It was long and fiercely contested. Sabines and Romans fought till they were exhausted, when the Sabine women rushed in between their husbands and fathers, and implored them to be reconciled. This was agreed to, and henceforth they resolved to unite and to form only one people—the followers of R. dwelling on the Palatine, those of Titus Tatius on the Capitoline and Quirinal. On the death of Titus Tatius, who was murdered at a festival held at Lavinium, R. became sole sovereign, and subsequently—according to a later legend—made successful war against the Etruscan cities of Fidenæ and Veii. The political organisation of the Roman *populus* ascribed to R. is given under ROME. After a reign of 37 years, R. was miraculously removed from earth. While he was standing near the 'Goat's Pool,' in the Campus Martius, reviewing his militia, the sun was eclipsed, and a dark storm swept over the plain and hills. When it had passed, the people looked round for their king, but he was gone. His father, Mars, had carried him up to heaven (like the prophet Elijah) in a chariot of fire. Some time after, he reappeared in a glorified form to Proculus Julius, announced the future glory of the Roman people, and told him that henceforth he would watch over them as their guardian god, under the name of Quirinus. The festival of the Quirinalia (17th February) was instituted in his honour; but the nones of Quintilis (7th July) was the day on which he was believed to have departed from earth.

RO'MULUS AUGU'STULUS. See ODOACER.

RO'NALDSHAY, NORTH AND SOUTH, two of the Orkney Islands (q. v.). *North R.*, situated at the north extremity of the Orkneys, has an area of 4 sq. miles. It is partly under tillage, and partly in pasture. Sea-birds in great variety frequent the coasts, and lobsters and cod are fished. Pop. (1861) 532.—*South R.*, washed on the south by the Pentland Firth, has an area of about 18 sq. miles. St Margaret's Hope, on the north coast, is a safe and convenient harbour. The inhabitants derive their subsistence for the most part from fishing for cod and herrings. Pop. (1861) 2551.

RONCESVALLES, one of the valleys in Navarre, on the southern side of the Pyrenees, about 20 miles north-north-east of Pampluna, has been rendered famous in poem and story as the scene of a defeat sustained by the army of Charlemagne at the hands of a combined force of Arabs, Navarrese, and French Gascons in 778. Charlemagne, allured by the promise of the feudal supremacy of Catalonia, opened a campaign in aid of the viceroy of that province against the Mohammedans. With a powerful army he passed the Pyrenees, penetrated into Navarre, took Pampluna, the capital, and levelled the walls of the city with the ground. Clearly this was not part of his programme as the champion of the Christian religion in Spain; for Pampluna was the capital of a Christian state, and it is even asserted that prior to 870 A.D. Moors had not been admitted within its walls. Pressing onward, Charlemagne subdued a great part of the country between the Pyrenees and the Ebro; but on his return northward, while threading the defiles of the mountains near R., his rear-guard was furiously assailed and annihilated by a mixed force, of which a body of Navarrese, enraged at the destruction of their capital, formed an important section. Eginhard, the secretary of the emperor, tells us that the whole rear-guard, including many generals and chief nobles, was totally destroyed, and that the spoil of the campaign, together with the whole baggage of the army, fell into the hands of the victors. In this action fell Roland (q. v.), the famous Paladin, and the hero of a hundred romances. The older poets found abundant material in the battle of R., in which, on the one side, ranked the most distinguished chivalry of that time, and on the other the patriotic, high-spirited, mountaineers of Navarre; and in recent times the incident has contributed a spirited allusion to Sir Walter Scott's *Marmion:*

> 'Oh, for a blast of that dread horn,
> On Fontarabian echoes borne,
> That to King Charles did come,
> When Roland brave, and Olivier,
> And every paladin and peer,
> On Roncesvalles died!'

RONCIGLIO'NE, a city of Central Italy, in the province of Viterbo, and 12 miles south-south-east of the city of that name. Pop. 4700. It has a fine cathedral, a Gothic castle, and several fine old palaces. Hats, cloth, and cotton goods are manufactured, and iron, brass, and copper works are in operation. In the neighbourhood of the city there are sepulchral vaults, hollowed out in the porous rock (*tufo*), and several sulphureous springs.

RO'NDA, a picturesque Moorish town of Spain, in the modern province of Malaga, on the Guadiaro, 50 miles north-north-east of Gibraltar. Situated at a considerable elevation, the climate of R. is unusually salubrious, and the town is a favourite summer retreat for the wealthy of Seville, Ecija, and Malaga. The great annual fair takes place in May, at which time R., its bulls and bravoes, are seen to the greatest advantage. On such occasions, the small but active horses of the town are sold in large numbers to officers from Gibraltar; and leather, saddlery, embroidered gaiters, garters, and mantas, are also sold. Pop. 14,100.

RO'NDO (Ital.), or **RONDEAU** (Fr.), originally a little poem of 13 lines, divided into three unequal strophes; the two or three first words of the first line serve as the burden, and recur after the 8th and 13th line. Thence, in music, the term has come

to denote a light air, consisting of three or more strains, the first terminating in the original key, and each of the others so constructed as to conduct the ear back to a repetition of the first strain. In a more general sense, the name rondo is also often applied to any light lively tune which ends with the first strain repeated.

RONGE, JOHANN. See GERMAN CATHOLICS.

RONSARD, PIERRE DE, a celebrated French poet and reformer of French poetry, was born at the Château de la Poissonnière, in Vendômois, September 11, 1524. At the age of nine, he was sent to the Collége de Navarre, but was soon removed, and shortly after entered the service of the Dauphin as page. Handsome, well-made, and excelling in all bodily accomplishments, he soon became a general favourite. When his master died (1536), he became attached to the household of the Duc d'Orléans, second son of the king, accompanied James V. of Scotland back to his kingdom, with his new bride, Marie de Lorraine, in 1538; and after a stay of nearly three years at the Scottish, and six months at the English court, he returned to France, and re-entered the service of the duke. A little later, however, on recovering from a serious illness, he found himself afflicted with a deafness, which led him to resign the pursuits of arms for those of letters. With this view, he took up his residence in the Collége de Coqueret, and studied hard for five years. He had previously acquired a knowledge of Latin and of several European languages. His own language, as a vehicle of literary instruction, was a subject of continual meditation with him. Familiar now with the masterpieces of Greece and Rome, he wished (like a true child of the Renaissance, as he was) to invest the national poetry with a classic dignity and grace. Several of his fellow-students shared his opinions and enthusiasm; and in 1549, one of these, Joachim du Bellay, published what may be called the first manifesto of the new school, the *Illustration de la Langue Françoise*. Without denying the necessity or the value of the change thus begun by R. and his friends, we may just remark in passing that the most intelligent French critics now admit that it was too radical, too absolute: it broke abruptly with the national traditions and tendencies, and more than anything else helped to fix that pseudo-classicism of style which was subsequently brought to disastrous perfection in the *splendida vitia* of Corneille and Racine. In 1550, R. himself appeared in the field with his *Amours* and *Quatre Livres d'Odes*. The volume excited the most violent opposition among the adherents of the older national school, and it cannot be said that their antipathy was altogether unreasonable. Rabelais (q. v.) was conspicuous among the adversaries of the new school, and made R. the subject of some bitter sarcasms. But on the whole, the classic party had the best of it. Its efforts were in harmony with the general intellectual tendencies of the time, and, besides, R. was just the man to make powerful friends. Marguerite, sister of Henry II., granted him a pension; the illustrious Chancellor De l'Hôpital warmly encouraged him to persevere in his course; and both Henry II. and Francis II. covered him with honours and pensions. In 1553, a new edition of the *Amours* was published; in 1555, the first, in 1556, the second, volume of his *Hymnes;* and finally, in 1560, an edition of his whole works up to this period, in four volumes. The admiration of his contemporaries intoxicated him; and he did not shrink from conferring on himself a sort of anticipatory apotheosis. During the religious wars that devastated France, R. made himself noted by the violence of his attacks on the Calvinists or Huguenots. Twenty days after the massacre of St Bartholomew, he published *La Franciade*, an epic fragment. He meant that it should comprise 24 books, but he only finished 4, having, perhaps, discovered that the subject was not happily chosen, and that epic poetry was a touch above him; yet such was the belief in his genius, that not a few of his contemporaries did not hesitate to prefer it to the *Æneid*. Charles IX. could only express *his* delight by conferring on the lucky bard additional favours. He gave R. the abbeys of Croix-Val and Bellozane, and the priories of Saint-Cosme, of Evailles, &c. But the 'disorders' of what his countrymen call his 'joyous' youth, now began to tell upon him, and, afflicted with premature infirmities, he retired to the abbey of Croix-Val, where he spent most of his remaining years in lettered ease, honoured with the attentions of the great to the last. Queen Elizabeth of England sent him a set of diamonds, and Mary Stewart, from her prison, a set of plate worth 2000 crowns, with the inscription:

A' Ronsard, l'Apollon de la Source des Muses.

In 1584, he collected and republished his whole works in one volume, and died on December 27 of the year following.—See Sainte-Beuve's *Œuvres Choisies de P. Ronsard, avec Notice, Notes et Commentaires* (Paris, 1828).

ROOD, a measure of surface, the fourth part of an acre, and containing 40 square poles or perches. It is quite different from the rood used in estimating mason-work, for which see ROD.

ROOD (Anglo-Sax. *rod*, a cross), a figure of the cross, and generally of the crucifix. The word is also applied to the actual cross on which our Lord suffered, although, when used to signify the relics of the true cross, it is commonly found with the prefix Holy, from which Holyrood at Edinburgh derives its name; but in its most ordinary signification it is applied to the large and striking crucifix which was placed at the entrance of the chancel in most medieval churches. On either side of the cross most commonly were placed figures of the Blessed Virgin and St John, in allusion to John xix. 26. The manner of placing the rood differed in different churches; most commonly it stood upon a gallery or screen at the entrance of the chancel, which was called the ROOD-LOFT or Rood-screen. In England, after the Reformation, the rood of course was, as a rule, removed from all churches; but in a few country churches it still remains in a more or less perfect form. A very perfect foreign example of the rood is in the great church of Louvain.

ROOF. The coverings of houses vary in every climate and every age. In warm countries, such as India, flat roofs, covered with cement, are almost invariably used. The frequent allusions in the Bible to the house-top shew that the roofs of Palestine were flat in ancient times as they are now. Those of Egypt and Assyria (q. v.) were also flat, and were composed of wooden beams, covered with thick layers of earth, forming an impenetrable protection from the fierce heat of the sun. In countries where the climate is milder, and rain more abundant, roofs sloping from a central ridge are the usual form. The Greeks and Romans constructed their roofs in this way. Those of Greece were, in important works, covered with marble slabs, carefully grooved together, so as most effectually to protect the interior from rain. In the common buildings of Greece and Rome, roofing-tiles are used.

In the rainy climate north of the Alps, roofs of a much steeper pitch are employed, so as the more

readily to throw off rain and snow. The angle at the ridge is not uncommonly a right angle; and roofs slated in the usual way should never be less than ⅛ of the span (or width between supports) in height. When large slates are used, ¼ of the span in height will suffice.

When roofs are well constructed, they serve to bind the walls together, and thus to strengthen the building. In order to do this effectually, they must not be made of too great weight, otherwise they crush the walls. The actual covering of the roof and its supports are therefore made as light as possible, and the strength concentrated in principals or trusses. The following are the commonest forms of these

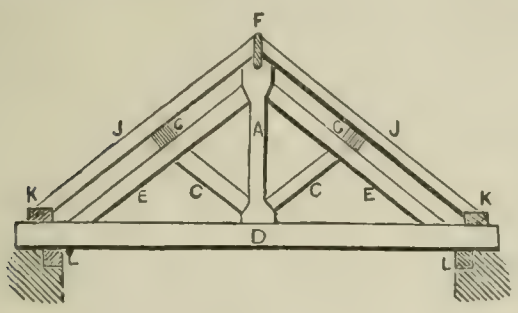

Fig. 1.

trusses: Fig. 1 represents what is called a king-post roof (A being the king-post), and fig. 2 a queen-post roof (B, B being the queen-posts). The latter is

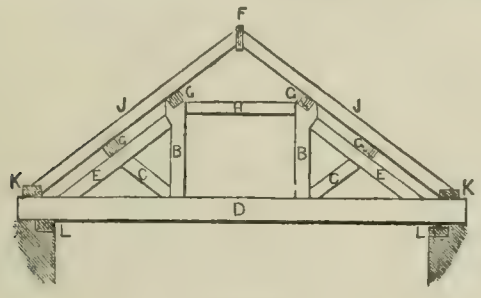

Fig. 2.

used for wider spans than the former, and has the advantage of leaving the centre of the roof clear of timbers, so that attic rooms may be introduced. The other members of the truss are named as follows: C, C, C, C, braces or struts; D, D, tie-beams; E, E, E, E, principal rafters; F, F, ridge-pieces; G, G, &c. purlins; these and the ridge-piece are laid across from truss to truss, and carry the common rafters, J, J. H is a collar. K, K the pole-plates, and L, L the wall-plates, are laid along at the wall-head, to bind the wall and feet of rafters together.

The above system of construction has been used from a very early time to the present day. The early Christian, and probably the Roman basilicas, had exactly such roofs. In early Gothic times, roofs of this kind were made ornamental by carving the king-post, and moulding the tie-beam. During the Decorated style, an arch, or a series of cants (A, A) was introduced, as shewn in figs. 3, 4, and 5. As the style progressed, curved braces were placed under the tie-beam, to support it; these were carved, and rested on elegant corbels, the spandrels between the braces and the wall being filled with tracery. In the Perpendicular style, the central part of the tie-beam is cut away, and the beautiful Hammer-beam (q. v.) roofs of the period become usual (see fig. 6.) The roof of Westminster Hall is one of the finest examples of this kind of roof. These open timber-roofs are used both in churches and halls, but chiefly in the latter, as the church roofs were frequently vaulted.

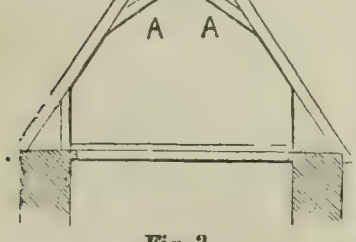

Fig. 3.

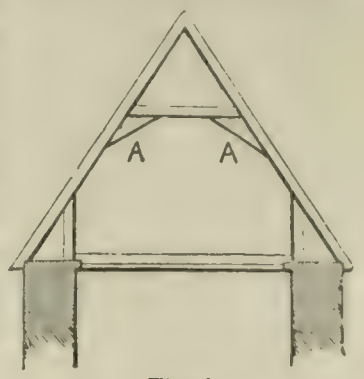

Fig. 4.

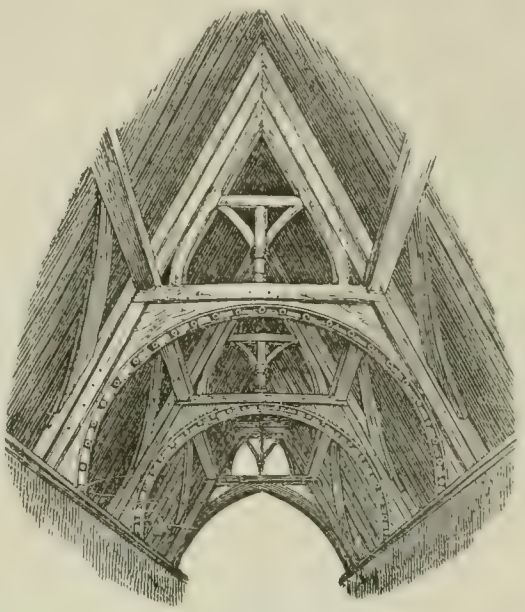

Fig. 5.

See VAULTING. In modern times, when great spans have to be roofed over, combinations similar to

Fig. 6.

those used in Lattice Bridges (q. v.) are required. Recently, iron has been introduced, and by means

of it, spaces of almost any width can be roofed over.

ROOK (*Corvus frugilegus*), a species of Crow (q. v.), very common in the southern parts of Britain, and found in many parts of Europe and Asia, even to Japan; about the same size with the common or carrion crow, but easily distinguished from it, even at a distance, by its colour, which is a glossy, deep-blue black, in certain aspects grayish. On a nearer view, a more notable distinction is found in the naked warty skin at the base of the bill, extending back rather beyond the eyes, and pretty far down on the throat. Still more different are the habits of the birds, the common crow frequenting lonely situations, and preying much on carrion; the R. choosing rather the neighbourhood of human habitations, and seeking its food, both animal and vegetable, chiefly in cultivated fields. Moreover, whilst the common crow is solitary, the R. is gregarious; and very large companies often assemble in *rookeries*, making their nests in close proximity, generally in tall trees, the same tree often sustaining many nests. So far are they from disliking the companionship of man, that it is not uncommon for rooks to build their nests in the trees which grow in the midst of great cities. A tree even in Cheapside has been occupied by rooks' nests. Few cities or large towns in Britain are without rookeries, sometimes of considerable magnitude. The smoke seems to be disregarded by the birds. The R. is nowhere more abundant than in England and the south of Scotland, but it becomes rare in the northern parts of Scotland, and is not to be seen in Orkney and Shetland; probably, however, not on account of climate, but from want of trees. Sometimes, indeed, rooks have been known to make their nests in steeples, vanes, &c., but rarely. They have been observed to avoid with peculiar caution trees which are decaying and likely soon to be blown over—perhaps, however, on account of the state of their twigs—and trees that are marked on the trunk for cutting down. They are notable for the care with which they guard against the approach of danger, when they are feeding in fields, a few solitary rooks perched on trees, palings, or the like, being ready to give the *caw* of alarm to the often very numerous flock. They are also notable for their dread of a gun, the danger of which they seem to know; so that a man without a gun may approach them much more nearly than a man who carries a gun, and even a stick lifted up is apt to excite their alarm. It is also commonly believed in some districts that they know Sunday, and are less timid of the approach of man on that day than on other days of the week. A gig or carriage may approach them much more nearly than a man on foot, and they are very indifferent about the passage of a railway train. It is interesting also to observe how soon they become familiarly acquainted with scarecrows. The nests of rooks are formed of twigs, lined with grass and fibrous roots; generally containing four or five eggs, of a pale greenish colour, blotched with dark greenish-brown. During the nest-making time, rooks rob each other in a remarkable manner, and prodigious quarrels arise in rookeries on this account. Any pair attempting to found a separate colony on a tree far apart, are apt to be assailed by the whole force of the rookery, and the nest pulled to pieces, its materials of course being carried off.

Rookeries are sometimes of great size, and immense flocks of rooks are often to be seen feeding together in fields, or darkening the sky in their outward or homeward flight. Farmers very often complain of them for rooting up grass and young corn, and for injury to young potatoes, turnips, &c.; but on the other hand, it is urged that they are of very great use by eating up wire-worms, cock-chafer grubs, and other insect larvæ, slugs, &c., and that the grass pulled by them is very often that of which larvæ have already devoured the roots. The truth appears to be that rooks in moderate numbers are very useful; but that it is possible to protect them too much, until their multitudes become a nuisance in a neighbourhood, the insufficient quantity of their favourite food compelling them to other resources not so agreeable to the farmer; and at least in such circumstances they certainly devour large quantities of grain.

It has been supposed that the naked space at the base of the bill of the R. is in consequence of its habit of digging in the ground, and in support of this view it is urged that this space is feathered in the young bird; but it is found to become naked even in rooks caged from the beginning of their life, and there are numerous other arguments against the supposition. The naked space must be regarded as a natural peculiarity of the species.

The same rooks seem to take possession of their old nests year after year, repairing them, and not building new ones. The time of building and repairing nests is one of prodigious clamour in the rookery, and begins early in spring. The male R. feeds the female assiduously during incubation, and sometimes takes her place on the nest. Both parents bring food to their young ones.

The R. is capable of being tamed, and tame rooks have been known to exhibit something of the imitative power of voice possessed by several other birds of the same family.

White, cream-coloured, and pied rooks are now and then seen. These peculiarities of plumage probably arise from a more or less diseased condition.

ROOKERIES, in Law. Though rooks are often encouraged to breed in and to frequent the trees of an estate, yet they are not protected in any way by laws resembling the Game Laws, which inflict penalties for illegally trespassing to take or kill them. The rooks, while frequenting the rookery, whether it is an ancient or a newly-made rookery, are in the ordinary category of wild animals, and the owner of the estate or ground where the trees grow has no more property in them than any other person. The owner of a rookery once brought an action against a neighbour for shooting at the rooks as they were flying over the neighbour's estate towards the rookery; but the English courts held that no such action was maintainable, for every person may shoot and catch a wild animal upon his own lands, if he pleases. The law is the same in Ireland and Scotland. No person can be given into custody, or fined, or punished by justices of the peace for trespassing in order to shoot at rooks; nevertheless, the owner or occupier of the ground trespassed upon may bring an action of damages against the trespasser.

ROOKE, SIR GEORGE, a distinguished British admiral, was born in the year 1650, near Canterbury, at the country-seat of his father, Sir William Rooke. Having entered the navy, he found himself, at the age of 30, a post-captain; and in 1689, he was promoted to the rank of rear-admiral. He was engaged in the action off Beachy Head between the Earl of Torrington and the French admiral De Tourville; and in 1692, he took part in the memorable battle of La Hogue, fought between the French fleet and the combined English and Dutch force under Admiral Russell. On this occasion, his services were of the most brilliant and dashing character, and in acknowledgment of them, he received the rank of vice-admiral of the red, the honour of knighthood, and a pension of £1000 a year,

His next important service was the destruction of a Spanish plate-fleet in the port of Vigo; and in July 1704, in conjunction with Sir Cloudesley Shovel, he accomplished the capture of Gibraltar. Such was the vigour of the operations, that a single week sufficed for the reduction of a fortress, which, as having defied the most formidable, elaborate, and prolonged attack, has since been reputed impregnable. On the 9th August of the same year, he engaged off Malaga a French fleet of much superior force, under the Comte de Toulouse, and fought one of the bloodiest of our naval battles, the honours of which fairly remained with the English, though the escape of the enemy's force rendered it by comparison a barren triumph. The struggle lasted through nearly a whole day; the French loss was upwards of 3000, the English upwards of 2000 men. On the return of Sir George to England, he was received with marked distinction by Queen Anne; but finding the hostility of the government directed against him on the merely partisan ground of his having previously, as member for Portsmouth, allied himself with the opposition, he resigned his employments, and along with them his seat in parliament; and till his death, which took place on the 24th January 1709, led the life of a quiet country gentleman on the family property in Kent. He was thrice married, and left behind him one son by his second wife.

ROOT, in Botany, sometimes designated the *descending axis* of a plant, that part by which it is fixed to the soil and derives nourishment from the soil. The root is developed in the germination of the seed, at or about the same time with the stem, and forces its way downwards as the stem grows upwards. The root differs from the stem in the irregularity of its ramifications, in the want of a central pith, in the want of buds, in the want of scales or of scars to indicate their former presence, and in the want of stomata. The axis of the root giving off branches, these finally subdivide into *fibrils*, which are little bundles of annular ducts, or sometimes of spiral vessels encased in woody fibre, and covered with a lax cellular integument. The apex of each fibril is sometimes called the *spongiole:* it consists of extremely lax cellular tissue, and has the property of absorbing fluids with great rapidity, thus subserving the nourishment of the plant. See ENDOSMOSE.—Aërial roots occur in some plants, as in some *Epiphytes*, the Banyan, Mangroves, &c.; by which nourishment is derived from the air, in addition to that obtained through the leaves and bark, or by which the branches seek to connect themselves anew with the ground, for support and nourishment; and many plants, as Willows, produce adventitious roots very readily, when any portion of the stem or branch is imbedded in moist soil, of which advantage is taken for their artificial propagation.—The central axis of many roots goes deep into the ground in a tapering manner, forming what is called a *tap-root;* other roots have the descending axis very short, and are called *fibrous.* The roots of some plants spread very widely; those of others occupy a very limited space. The roots of coniferous trees and palms are very small when compared with the appearance of the tree above ground.—Tap roots sometimes assume a conical form, as in the carrot; others are variously developed in thickness at the upper part, as in the turnip and radish. TUBERS (q. v.), BULBS (q. v.) and CORMS (q. v.) are peculiar developments, evidently intended to secure a store of nourishment for the plant, but which also are very frequently available for the use of man.—Esculent roots are numerous, and many roots also contain secretions either peculiar to themselves, or more abundant than in the other parts of the plant, and become therefore useful in medicine or in the arts, while some are very poisonous. The roots used for food, besides the tubers, bulbs, and corms above mentioned, are generally those which are thick and fleshy. The plants to which they belong are of very different genera and orders—some of the natural order *Cruciferæ*, as the Turnip and others of the genus *Brassica*—some of the order *Chenopodiaceæ*, as Beet and Mangold Wurzel—some of the order *Umbelliferæ*, as the Carrot, Parsnip, &c.—some of the order *Leguminosæ*, as the *Pachyrhizos angulatus*, which is cultivated in all parts of the East Indies, and *P. trilobus*, which is cultivated in Cochin China. In many of the lower classes of plants, particularly the Algæ, there is no root whatever, although the plant is often attached by a base.

ROOT, in Philology, is that part which is common to a group of allied words—the germ out of which they have all sprung. It is arrived at by taking away the formative parts—the suffixes and affixes, and reversing any change that their presence may have caused. Thus, in co-in-*cid*-ence, the root-syllable is *cid*, the primary form of which in Lat. is *cad*, to fall. It is seldom that this analysis can be successfully performed with only one language; in order to get at the true root, the corresponding words in all the languages of the same family must be compared. Thus, in the Eng. words *story*, *history*, *historical*, *historically*, *histor* would seem to be the root; but by comparing the Greek with the Lat. and Sanscrit, we arrive at a syllable *vid*, meaning to see or know, of which the Eng. (to) *wit* (wist) is only another form. And even then we are not sure that we have arrived at the original and most simple form. Thus, Eng. *yoke*, Lat. *jugum*, come from the syllable *jug*, to join, seen in Lat. *ju(n)go*, Gr. *zeugo;* and this might be rested in as the root, were there not a simpler form, *ju*, preserved in Sans., and having the meaning of mingling or being together; this, which may be taken as the primary root, gives rise to the two secondary roots or modifications, *jug*, to join, and *yudh*, to fight (i. e., to join battle).

The roots of the Aryan languages are always monosyllabic, as *i*, to go; *ga*, to go; *ad*, to eat; *vak*, to speak; *star*, to strew. They are divisible into two classes, the one expressing some action or general property, as in the instances now given; the other indicating relative position, as *ma*, here or me; *ta*, there or that. The one class are called *predicative* roots; the other, *pronominal* (see PRONOUN, PREPOSITION). They all expressed primarily some physical notion or relation palpable to the senses; but from these the transition to the impalpable conceptions of the mind is natural and obvious; thus, *vid*, to see, served also for to know. The notion expressed by a root-word is always of a very general kind; but by a variety of expedients, such as lengthening the vowel, reduplication of the syllable, prefixing and affixing letters and syllables (many of which at least are evidently pronominal roots), and composition with other predicative roots, one germ gives rise to a whole group of words expressive of the specific applications of the generic idea. Thus, from the root *spac* or *spec* (in Gr. *skep*), to look, have sprung a numerous family of words in the English and other kindred tongues; *spy*, *despise* (to look down upon), *spite* (through Fr. *despit*), *respite*, *respectable*, *suspicion*, *prospect*, *inspect*, *auspices*, *speculum*, *species* (i. e., the appearance or individual form, as opposed to the kind or genus), *spices*, &c.

Roots, in the Aryan languages, never enter into speech in their pure and simple form; to make them words, they almost always take on the addition of a pronominal element. Thus, the reduplicate root *da-da*, having the sense of giving, becomes, by the

addition of *mi*, my, the word *da-dâ-mi*, I give; *vak*, to speak, by affixing *s* (for *sa*, that), becomes *vaks*, in Lat *vox* (*voks*), voice (i. e., that speaking). See INFLECTION.

It requires but a few germs to produce, by the processes above described, the most copious vocabulary. The 50,000 words of the Chinese dictionary are formed from 450 roots; those of Hebrew and of Sanscrit are reckoned at about 500; and there are probably not many more in English (see Max Müller's *Lectures*, 1st series, p. 252). The theories as to the origin of the roots themselves, and why a particular thing or notion should have become associated with a particular sound more than with any other, are noticed under PHILOLOGY and ONOMATOPŒIA.

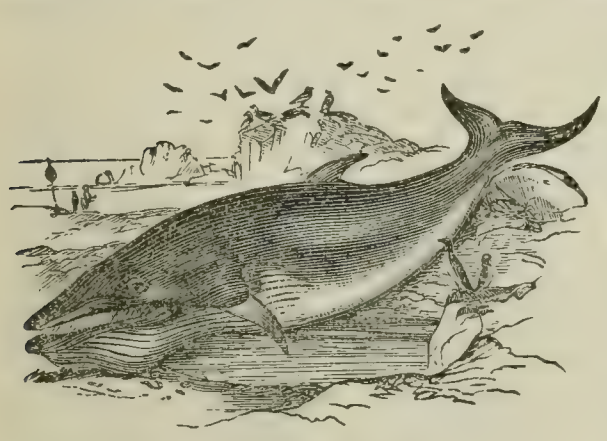
ROOT, in Algebra, denotes any value of the unknown quantity in an equation, which will render both sides of it identical. See EQUATION, INDETERMINATE PROBLEMS, IRREDUCIBLE CASE, &c. The determination of the roots of equations, either formally or actually, constitutes the greater portion of the science of Algebra, while the approximation to roots of those equations whose degree is still beyond a general solution (4th and upwards) forms almost a separate branch of itself. Roots are divided into various classes; they are *real* when they consist of numerical quantities positive or negative; and *imaginary* when they assume the form $a + b\sqrt{-1}$.

ROOT-MILDEW, a name given, not to any well-determined species of fungus, but to certain *mycelia*, which infest the roots of peaches, apples, roses, currants, &c., and cause their death. The tree or shrub is often very suddenly cut down, from apparently perfect health. The roots are found more or less decayed, and covered with filmy white threads. The *mycelium* is supposed to belong to species of *Polyporus*. In some plants, as roses, the state of the bark just above the soil is believed to be premonitory of the disease, which may perhaps then be arrested by washing with a solution of corrosive sublimate. But the mycelium is not easily destroyed, and a tree of the same kind should not be planted where it has proved fatal.

ROOT-PARASITES, plants which grow upon, and derive their nourishment from, the roots of other plants. Such are the Broom-rapes (*Orobancheæ*, q. v.), species of *Thesium*, &c., and the *Rafflesias* (q. v.), with other *Rhizantheæ* (q. v.).

ROOT-STOCK, or RHIZOME (*Rhizoma*), in Botany, a stem running along the surface of the ground, partially covered with soil; sending out roots from its lower side, and leaf-buds from its upper. The common yellow iris affords a very perfect example of it. Many ferns have root-stocks. The root-stock is often regarded as a creeping root; it is really however, not a root, but a stem.

ROPE AND ROPE-MAKING. Ropes are usually made of vegetable fibres, and differ only from twine in their much greater thickness. The fibre most commonly used in Britain is hemp; but large quantities of plantain fibre, called Manilla hemp, made from the leaf-stalks of *Musa textilis*, are also employed, especially for the large ropes used for various purposes on board ships. In other countries, many other fibres, and even cotton, are employed for this purpose. Ropes consist of many thicknesses of yarn, which is spun by hand in places called rope-walks. The spinner has a large bundle of the fibre loosely gathered round his waist, from which he pulls out a few fibres, and attaches them to a hook in the turning wheel or whirl, which is stationary, and is worked by an assistant. Experience teaches him what number of fibres to draw out, and how to twist them so as to hold firmly on to the hook. He then walks slowly backward down the rope-ground, gradually drawing out or regulating the pulling out of the fibres so as to make an equal yarn, which receives the necessary twist from the whirl. When he has got to the end of the walk, another spinner takes the yarn from the hook of the whirl, and fixes it to a reel, which is then set in motion; and he attaches a second portion of hemp from his own supply to the hook, and proceeds down the walk as the previous one had done. In the meantime, the first spinner gradually walks up the ground, carefully guiding his length of yarn as it is wound on the reel. When he reaches the reel, it stops, and he waits until the second spinner's length is completed. He then in his turn takes it off the hook, and twists it on to his own; and the reel being again started, receives the additional length from the second man, and so on until the full length required is made up. The next operation is called *warping*, and consists in stretching out the number of yarns required for a rope. These are all slightly twisted again separately, and stretched to an equal length. Then, if they are intended for tarred ropes, such as is used in rigging ships, each yarn is drawn separately, either lengthwise or in a hank, through a kettle of hot tar. The superfluous tar is removed by drawing it afterwards through a handful of loose oakum, or through a hole lined with oakum. In the next process, called *laying*, two or more yarns are attached to hooks on a whirl, so that when it is turned they will be twisted together the contrary way of the original twist they received in the first spinning. When this is done, it is called a strand. Then as many of these strands as are required for the rope are stretched at full length, and are attached at each end to whirls. One of the whirls has but one hook, to which all the strands are attached; the other has as many hooks as there are strands, one always being central, and a strand is attached to each. The whirls are then put in motion, but in opposite directions, and this causes the outer strands to be laid with great regularity and firmness around the central one. Such is the ordinary process of rope-making; but modern science has been brought to bear upon this as upon every other branch of industry with extraordinary effect; and machines have been invented which produce ropes with such mathematical precision that the strength of the rope may be calculated with great exactness. Captain Huddart has the merit of effecting these improvements; and very few applications of mechanism are more beautiful in their details than those which he has worked out. They, however, do not alter the principle of the manufacture, and their elaborate details are not within the scope of this work.



Large ropes are either what is called *cable-laid* or *hawser-laid*. The former consist of three large strands, each made up of three smaller strands. A cable-laid rope of eight inches' circumference is made up in this way of nine strands, each containing thirty-seven original yarns, or altogether 333 yarns. A hawser-laid rope consists of only three strands, each containing a sufficient number of yarns to make up the required thickness. The numerous lives and the vast property depending on the efficiency of ropes employed in shipping have caused a great amount of ingenuity and care to be brought to bear on the manufacture. One very great improvement of modern times has been the introduction of wire-ropes, which are now extensively used in rigging ships, and for other purposes. They are generally made of iron wire, sometimes but not always galvanised. The twisting is effected

in the same way as that in which the strands of a hempen rope are laid together.

ROQUE, ST, a popular saint of the Roman Catholic Church in France, who is especially considered the patron of those sick of the plague. Of his history, nevertheless, few particulars have been preserved. He was born of a noble family in Montpellier, early in the 14th, or at the end of the 13th c.; and having undertaken a pilgrimage to Rome, was surprised, upon his way through Italy, by an outbreak of the plague at Piacenza, where he devoted himself with generous zeal to the care of the victims of this pestilence. Falling sick of the plague himself, and abandoned by man, he contrived to drag himself to a neighbouring wood, where a dog used to lick his sores; and it pleased God to restore him to health. He returned to France; and after a life of great sanctity, died at Montpellier, probably in 1327.

RO′REE, RORI, or LOHRI, a decayed town of Sinde, stands on a picturesque rocky eminence, on the east bank of the Indus, in lat. 27° 38′ N. Steamers ply to and from Hyderabad. Cotton and silk fabrics, gold and silver wares, paper, and leather, are manufactured. Pop. about 8000.

RO′RQUAL (*Balænoptera*, or *Physalus*), a genus of Cetacea, of the same family (*Balænidæ*) to which the Greenland whale belongs, and distinguished by having a dorsal fin, which, however, is not large in comparison with the size of the animal, and is pointed, the point directed backward; and also by the form of the head, which, instead of having the upper jaw much arched, as in the Greenland whale, has it in the skeleton nearly straight, the plates of baleen or whalebone being therefore much shorter, whilst along the throat and belly are many longitudinal folds, allowing of the distention of the integuments so as to form a great pouch for the reception of water and prey, to be afterwards sifted by the plates of baleen. For a long time these folds of the throat and belly were a puzzle to naturalists, but their use seems now to be thoroughly ascertained. The form is more elongated than in the Greenland whale, and as the girth of the largest rorquals has been found equal to that of the largest Greenland whales, the rorquals appear to be the largest of the Cetacea, and indeed of all animals at present existing in the

Northern Rorqual.

world. The northern R. sometimes rather exceeds 100 feet in length. Concerning the species of this genus, there is great doubt and uncertainty. Some naturalists confidently assert the existence of several species in the northern seas, and a genus, *Physalus*, has been constituted distinct from *Balænoptera*, the largest species (*B. boops*, or *antiquorum*, fin-fish, or razor-back) being referred to the former; and a smaller one, said not to exceed 25 feet in length, and known as the *Pike Whale* (*Balænoptera rostrata*), from the resemblance of the mouth to that of a pike, being assigned to the latter. The northern R. is of a slate-gray colour, whitish beneath. It is found in the arctic seas, visiting also those of the northern temperate regions, and is not very unfrequent on the coasts of Britain. When it comes to the surface of the water to blow, it does not lie motionless, as the Greenland whale usually does, but swims at the rate of about five miles an hour, and in blowing, it makes a prodigious noise. Its speed, when harpooned, is very great. Scoresby mentions an instance of one carrying out 3000 feet of line in a minute. It is not easily captured; and whalers dislike it, because the Greenland whale is seldom found near it, whilst its own value is very inferior, owing to the comparative thinness of the blubber, and the shortness and inferior quality of the whalebone. It is, however, an important object of pursuit to the Laplanders and Greenlanders, who wear it out by assailing it with weapon after weapon, and finally divide the spoil. A large R. yields 4000 gallons of oil.—The R. does not feed so exclusively on small prey—acalephæ, molluscа, &c.—as the Greenland whale. Its gullet is much wider, and it preys much on fishes, the shoals of which it follows into bays and estuaries, devouring them in multitudes. The stomach of a R. has been found to contain 600 large cod, and a great quantity of pilchards. One which frequented the Firth of Forth for 20 years was well known to the fishermen there, and much detested by them. It was at last stranded at Abercorn in 1692. It was 78 feet long.—In the southern seas, another species of R. is found (*B. Australis*), which has a long dorsal fin, placed further forward than in the northern rorqual. It attains a large size. The Southern Sea whalers do not care to pursue it. Its range seems to extend to the northern hemisphere in the Pacific. In the N. Pacific the species *B. sulfureus* (the sulphur bottom) attains a length of 9 feet. *B. velifera* is also common. Another species is *B. sibbaldii* (the Atlantic sulphur bottom). A genus of R. s. distinguished by its double first rib is *Sibbaldius*. *S. tectirostris* is a larger, and *S. tuberosus* a smaller species, from the east American coast. *S. laticeps* occurs on the north-west coast of Europe: the Norwegians call it Häring Hval. *S. Schlegelii* is from Java. The largest whale known, the *S. borealis*, was stranded near Ostend; its length was 106 feet. On the Californian coasts a peculiar genus occurs, which is characterized by a smooth throat and lack of dorsal fin. It is the 'Gray Whale,' *Rhachianectes glaucus*, Cope.

ROSA, SALVATOR, was born at Renella, in the neighbourhood of Naples, in 1615. His first instructor was Francesco Francaziani, who had married his sister. Some of his landscapes attracted the notice of Lanfranco, who, purchasing them, enabled and encouraged the young artist to pursue his studies. He became a pupil of Aniello Falcone, a painter of battle-pieces, and afterwards of Spagnoletto. Having gone to Rome, he was employed to paint an altar-piece and some other works by the Neapolitan cardinal Brancacci, and he accompanied Prince Carlo de Medici to Florence, and executed several important works for him. He finally settled in Rome in 1638, and died there, March 15, 1673. Salvator has a great reputation as a painter, and he owes this mainly to his landscapes, which, though faulty in many respects, arrest attention by originality in subject and treatment, being generally representations of wild and savage scenes, executed with a freedom and decision remarkably appropriate. Salvator executed numerous etchings, highly characteristic of his peculiar style.

ROSA'CEA, known also as GUTTA ROSEA and ACNE ROSACEA, is a disease which usually first appears at or near the end of the nose; and in some cases it is confined to the nose, while in others it extends to the cheeks, forehead, chin, or even to the whole face. The skin in the part affected assumes a deep red colour, which usually disappears after a time, but returns either on no special provocation, or in consequence, apparently, of some gastric disturbance, and after a time becomes permanent; pustules of acne—a chronic pustular disease of the skin—now appear, and their yellowness contrasts strongly with the redness with which they are surrounded. The skin of the diseased part becomes irregularly swollen, and is marked with blue or red streaks, caused by congestion and enlargement of the capillaries; the whole surface, in a severe case, presenting a very disagreeable and repulsive appearance. This affection is no doubt often a result of intemperate living, but it may occur in persons of regular habits of life. Disorder of the digestive system is so often associated with it, as to exclude the idea that the combination is accidental, and the skin disease may often with great probability be referred to gastric disturbance as the exciting cause. The disease is confined almost exclusively to persons in middle or advanced life, and women are especially liable to it about the period in which what is popularly known as the 'change of life' occurs: moreover, it has occasionally been observed to be hereditary. The general treatment consists in the administration of the compounds of iodine and mercury (singly or conjoined) in alterative doses, and Donovan's Solution has been especially recommended; and a nourishing but bland and non-stimulating diet should be prescribed. In the early stages of the disease, the local treatment should be soothing. Emollient lotions, such as emulsion of bitter almonds, cream, glycerine, &c., may be occasionally used during the day, and in severe cases a bread poultice may be applied to the face at night. When the affection becomes indolent, the emollients should be gradually replaced by stimulating applications, such as Eau de Cologne, or a solution of corrosive sublimate in alcohol, in the proportion of from 1 to 2 grains in the pint; and at a still later stage, iodide of sulphur ointment, in the proportion of 15 grains or a scruple of the iodide to an ounce of lard, is well deserving of a trial. When the disease is of long standing, it sometimes defies all known remedies.

ROSACEÆ, a natural order of exogenous plants, containing many species of great usefulness, and many that are in the highest esteem for their beauty. It contains trees, shrubs, and herbaceous plants, natives chiefly of cold and temperate regions, and far more abundant in the northern than in the southern hemisphere. Within the tropics, they are chiefly but not exclusively found in elevated situations. The leaves are alternate, have stipules, and are either simple or compound. The flowers are generally hermaphrodite, but sometimes unisexual; the inflorescence various. The calyx is 4—5-lobed, generally 5-lobed; the petals as many as the divisions of the calyx, or occasionally wanting, perigynous. The stamens are few or many, arising from the throat of the calyx; the ovary sometimes solitary, sometimes there are several ovaries; each one-celled, with a lateral style; or a number of ovaries are united into a many-celled pistil; the ovules generally two or more. The fruit is sometimes a drupe; sometimes a pome; sometimes follicular; sometimes an achænium; sometimes a heap of achænia, or of one-seeded berries; sometimes a heap of achænia, covered with the fleshy tube of the calyx.—This natural order contains at least 1000 known species; but in some of the genera, as *Rosa* and *Rubus*, the determination of the species is attended with great difficulty, and varieties—sometimes reckoned species—are numerous.—The order, as generally received, is divided into a number of sub-orders, several of which have by some botanists been elevated to the rank of distinct orders, as *Amygdaleæ*, *Pomaceæ*, *Sanguisorbeæ*. See also ROSE, RUBUS, STRAWBERRY, POTENTILLA, TORMENTIL, AGRIMONY, GEUM, KERRIA, SPIRÆA, CUSSO, &c.

ROSARY OF THE BLESSED VIRGIN MARY (Lat. *rosarium*, a chaplet of roses), the name given to a very popular form of prayer in the Roman Catholic Church. The name rosary has been variously traced either to the title 'Mystical Rose,' one of the titles under which the Blessed Virgin is addressed in the Litany of Loretto (q. v.), or to St Rosalia's wreath of roses, well known in sacred art, or to the beads being originally made commonly of rosewood. The origin of the devotion itself is popularly traced to St Dominick (q. v.); but it is quite certain that its characteristic feature, the use of beads as a means of reckoning the number of repetitions of a certain prayer, is of far greater antiquity. See BEADS. Palladius tells of the Abbot Paul, whose daily practice it was to repeat the Paternoster 300 times, that he used a number of small pebbles to secure a correct enumeration, dropping one of these into his lap at each repetition. Later, a string of beads, worn round the neck, and called *Beltidum*, was substituted. As the same use of beads exists among the Mohammedans, some writers have traced the Roman Catholic practice to a Mohammedan origin; but it appears quite certain that the practice existed among Christians before the time of Mohammed. Originally, the prayer so repeated was the Lord's Prayer; but when, in the 11th and 12th centuries, the so-called angelical salutation: 'Hail, Mary!' &c., became a frequent form of prayer, it was added to the 'Our Father;' and it seems beyond all doubt that the rosary in its present form was, if not devised, at least fully introduced and propagated by St Dominick. The rosary, although called of the Blessed Virgin Mary, is a series of fifteen prayers, founded on the chief mysteries of the incarnation and passion of our Lord, interspersed with repetitions of the 'Our Father,' the 'Hail, Mary!' and the doxology. It consists of three parts, each of which contains five so-called mysteries, connected with our Lord's incarnation and public mission on earth, his passion and death, his resurrection and ascension, and the assumption of the Blessed Virgin Mary. Each of these parts thus contains five mysteries (called also 'decades' from the ten 'Hail, Maries') consisting of (1) a 'meditation,' briefly proposing the mystery which is to be meditated upon; (2), one 'Our Father;' (3), two 'Hail, Maries;' (4), one doxology; (5), a prayer begging for the special grace or fruit appropriate to the particular mystery. The whole rosary, therefore, consists of 15 mysteries or decades, and thus comprises 15 'Our Fathers' and 'Doxologies,' and 150 'Hail, Maries.' The devotion of the rosary takes several forms. The 'Greater Rosary' consists of the recitation of the whole fifteen mysteries or decades, with their component prayers. The 'Lesser Rosary' consists of one of the three parts, or of five mysteries or decades. The 'Living Rosary' is recited by an association of fifteen individuals, each of whom engages to say daily one mystery. When recited publicly, the prayers are repeated alternately by the priest or other person presiding at prayer, and by the congregation. There is a

form of the rosary common in foreign countries, especially Germany, in which the substance of each 'mystery' is condensed into a short prayer of three or four words, which are appended to the 'Hail, Mary!' and thus serve perpetually to recall the subject to the mind of the person praying vocally. The rosary has been sanctioned and recommended by numberless popes and other ecclesiastical authorities, and Indulgences (q. v.) have been granted to persons reciting it with proper dispositions. It is regarded by Roman Catholics as one of their most excellent forms of prayer, and as placing the devotion to the Blessed Virgin Mary on its true footing—that of a devotion to the incarnation and death of her Son, Jesus Christ. It is expressly recommended for the poor and the ignorant; and there are instructions specially designed for these classes, in order to enable them to combine prayer of the mind with prayer of the lips.

The mechanical instrument, so to speak, of this devotion is also called by the name rosary. It consists of a string of beads, equal in number to the 'Our Fathers' and 'Hail, Maries' which are recited in the rosary—the 'Our Father' beads being of a larger size—one of which is passed through the fingers at each recitation of the prayer, and thus secures the person praying from errors of memory. The beads are of various material—berries, wood, stone, ivory, metal, &c., and are often of costly workmanship, and of considerable intrinsic value. They are blessed for the use of the people by the pope, by bishops and superiors of religious orders, and by others having special power for the purpose.

ROSAS, Don Juan Manuel, ex-president of the Argentine Confederation, born at Buenos Ayres in 1793, is descended from an ancient family of the Asturias. He entered the army of Buenos Ayres, and in 1829 rose to be governor or captain-general of his native province, then in federal union with Entre Rios, Corrientes, and Santa Fé. He shewed great courage and capacity in subduing the disaffected Indians, and internal peace being thus secured, he turned his attention to the state of the confederation, which, in 1835, was falling to pieces by the feebleness of its governments. A single president was, upon his recommendation, elected for the whole Argentine Confederation, and the choice fell upon Rosas. His residence was to be Buenos Ayres, and to this state were intrusted the external relations of the Confederation, and the management of the more important functions of the executive. Intestine commotion subsided under his rule, the industrial resources of the country were developed, and foreign commerce rapidly increased. The other states, however, became jealous of the growth and power of Buenos Ayres, and R. was accused of a design to extend and uphold the undue predominance of his state, and to give his native city a monopoly of the trade of the River Plate. In the execution of this design, he sought to compel Paraguay to join the Confederation. This involved R. in a war with Brazil, in which his troops were outnumbered, yet he obstinately kept up the struggle for five years. An attack on Monte Video was also rendered necessary by his policy; but England and France interfering for the protection of that city, R. was again defeated; yet he managed to resist the allied forces from 1845 to 1850. His rule had by this time become so oppressive and intolerable, that the subject states revolted, and selected Don J. J. Urquiza as their president and general. A battle ensued at Monte Caseros, 3d February 1852, when R.'s forces were put to flight. Urquiza entered Buenos Ayres as president of the Confederation; and R., who was compelled to flee, obtained a refuge in England, in which country he has for the most part resided since the year 1852.

RO'SCIUS, Quintus, was born at Solonium, a village near Lanuvium, and rose to be the greatest comic actor in Rome. So much was he admired, that many of the Roman aristocracy befriended him, and the dictator Sulla, as a token of favour, presented him with a gold ring, the symbol of the equestrian order. Among his most admiring and affectionate patrons, R. also numbered Cicero, who, at the commencement of his career, received lessons in the art of elocution from the great comedian, and even in later life used to make trials of skill with his instructor as to which of them rendered a thought most clearly and effectively—the orator by his diction, or the comedian by his gesticulation. So sensible was R. of the distinction he enjoyed in sharing the intimacy, and even the friendly emulation of the great orator, that he came to look upon his art as one of no small importance and dignity, and wrote a treatise on the comparative methods and merits of eloquence and acting. Cicero's friendship was of use to him in another way, for on his being sued at law by C. Fannius Chærea for the sum of 50,000 sesterces, Cicero defended him before the judex Piso (probably 68 B.C.) in his extant oration, *Pro Q. Roscio Comœdo*. He died 62 B.C., having attained such perfection in his peculiar art, that to be a 'Roscius' became synonymous with pre-eminence in every profession, and leaving, like his famous contemporary, Æsopus the tragedian, an immense fortune, realised upon the stage.

ROSCOE, William, the eminent historian of Lorenzo dé Medici and Leo X., was born near Liverpool on the 8th of March, 1753. His father was a market-gardener, whose assistant in this business he became in his twelfth year, after receiving the rudiments of learning at a common school. In this occupation he continued for about three years, during which his fondness for reading developed itself; and in 1769, after making trial for a year of a bookseller's shop, he was articled to an attorney at Liverpool, where, in 1774, being admitted an attorney of the Court of King's Bench, he began to practise on his own account. During all this period, he assiduously cultivated his mental powers, turning his attention to the classics, and especially to the Italian language and literature. In 1773, he first appeared in print as the author of a poem; and in 1777, a collection of some of his earlier pieces was published, containing his first protest against the slave-trade, of which, throughout his life, he was a strenuous opponent. In 1796 was published the first volume of his *Life of Lorenzo de' Medici, called the Magnificent*, which had been begun many years before, and in the composition of which he was greatly aided by the collection for him of valuable materials in Italy, from sources in print and manuscript, by his friend Mr Clarke. The success of this work was extraordinary, and it at once established his literary reputation. The work was received with the highest approbation by those who were best able to appreciate its merits, both in England and on the continent, especially in Italy; it went through several editions, and was translated into German, French, and Italian. In 1805, appeared his second great work, the *Life and Pontificate of Leo X.*, for which, with the assistance of others, he had been collecting materials for many years. This work also, which, like the former, appeared successively in German, French, and Italian, was received with much commendation by the most impartial judges, though its tone and

spirit, especially with reference to the Reformation, was severely criticised by others.

R. at one time had thoughts of adopting the bar as a profession; but about the year 1800, he became partner in a Liverpool bank, a step which involved him eventually in great pecuniary embarrassment. In 1806, he was returned to parliament for Liverpool in the Whig interest, and had the gratification of taking part in the abolition of the slave-trade, but did not again come forward after the dissolution in 1807. He was, throughout, a consistent opponent of the war with France, against which he published several pamphlets, and was on all points the advocate of liberal opinions. He took an active part in founding the Liverpool Royal Institution, and was a zealous promoter of literature, and patron of the fine arts. R. died at Liverpool, June 30, 1831. During the latter years of his life, he devoted himself much to the study of botany, and in honour of him, a rare genus of Monandrian plants received in 1826 the name *Roscoea*.

ROSCO'MMON, an inland county of Ireland, in the east of the province of Connaught, and bounded on the east by the river Shannon, is 60 miles long from north to south, by 40 miles from east to west. Area, 607,691 acres, of which 440,522 are arable, and 142,900 were under crop in 1862. The population, in 1861, was 175,436, of whom 150,490 were Catholics, 5227 were Protestants of the Established Church, and the rest Protestants of other denominations. The surface of R., which belongs to the central plains of Ireland, is level, with undulations rising in the south into the Slieve Bawn range, the highest point of which is 867 feet in height; and on the north, into the Curlew Mountains, of which Slieve Curkagh attains a height of 1098 feet. Its principal rivers are the Shannon (q. v.) and the Suck. R. communicates by means of the Midland Great Western, the Southern and Western, and North-western railways, with all the extremities of the kingdom. In geological structure, it belongs to the central limestone formation, in some districts of which the sandstone protrudes. The soil in the central district is in general light, but fertile, and affords the finest sheep-pasture in Ireland—the celebrated 'Plain of Boyle.' Some portions also contain a rich and fertile loam, which produces good cereal crops; but the chief industry of the R. farming population is the feeding of sheep and cattle, especially the former.—The county can hardly be said to possess any manufacture worthy of mention. The chief towns are Roscommon (q. v.), Boyle, Castlerea, Elphin, Strokestown. Ballinasloe and Athlone lie upon the border, and are partly within this county. R., in the ante-English period, was the country of the septs of MacDermot, O'Daly, O'Kelly, and above all, O'Conor, of which there were two branches, that of the O'Conor Roe (red), and that of O'Conor Don or Dhun (brown). The present representative of the O'Conors, the O'Conor Don, is one of the very few Irish princes who have succeeded to the hereditary estates of their ancestors.

R. sends two members to the imperial parliament. It possesses a vast number of antiquities of the Celtic period, raths, &c.; a portion of a round tower at Oran, several remains of strong castles of the English period, and some fine ecclesiastical ruins, of which Boyle, Roscommon, Tulsk, and Clonshanville are the principal.

ROSCOMMON, the capital and assize town of the county of the same name, Ireland, in the middle of the county, 96 miles west-by-north from Dublin. The population, in 1861, was 2699, of whom 2406 were Catholics, 255 Protestants of the Established Church, and the rest Protestants of other denominations. R. dates from the 13th c., when it arose around a Dominican abbey, founded by the O'Conor in 1257, and a castle built soon after by Sir Robert de Ufford, the remains of both of which structures still exist. R. is a market-town, in which corn is the principal commodity. It has scarcely any manufacture, and little commercial enterprise of any kind. It returned two members to the Irish parliament, but was disfranchised at the Union.

ROSCREA', a market-town of the county of Tipperary, Ireland, 94 miles south-west-by-west from Dublin, with which it is connected by a branch from the Great Southern and Western Railway. The population, in 1861, was 3543, of whom 2907 were Catholics, 243 Protestants of the Established Church, with a few dissenters. R. is a very ancient town, dating back to the early Christian period, when a monastery was built upon this site in the beginning of the 7th century. The modern town is tolerably well built; the Roman Catholic Church is a handsome structure; and there are considerable remains of the ancient greatness of the place—a castle, a lofty round tower, 80 feet high, and ruins of two abbeys. The only manufacture is coarse woollen cloth, but there is a considerable market for agricultural produce. There are several schools, some with endowments of ancient date.

ROSE (*Rosa*), a genus of plants of the natural order *Rosaceæ*, consisting of shrubs, generally with prickly stems and pinnate leaves, the leaves terminating in a single leaflet; stipules at the base of the leaf-stalks; the calyx 5-fid, its tube contracted at the summit, and finally becoming fleshy, and forming a chief part of the fruit; the corolla of five petals; the stamens numerous; the styles springing from the narrowed throat of the calyx, free, or aggregated into a column. The flowers are generally of the red tint well known as *rose-colour*, but sometimes white, more rarely yellow, and sometimes striped. The fruit (*Hip* or *Hep*) consists of the enlarged and coloured tube of the calyx, within which are contained many *Achenia* (q. v.) amidst prickly hairs. The species are very numerous, even after allowance has been made for a great number of varieties elevated into species. There is no genus of plants in which the limits of species are more difficult to define, or in which varieties are more apt to be regarded as species. In Withering's *British Botany*, published near the end of last century, only five British species of R. are given; in Hooker and Arnott's *British Flora*, 19 species are recognised, whilst many forms, reckoned as species by some botanists, are noticed as mere varieties. Roses are natives of all the temperate parts of the northern hemisphere, and of its colder regions, even to Lapland and Hudson's Bay. They have long been among the chief favourites in flower-gardens, for the beauty and fragrance of their flowers; and, more than any other flower, emblems of everything beautiful and delightful. Countless varieties—single and double—have been produced by cultivation, which it is often extremely difficult to refer to their original species.—Amongst the ancients, the R. was sacred to Eros or Cupid, and Aphrodite or Venus, and was accounted the emblem of joy and love, and at the same time of prudence. Its opening buds are a favourite poetic image of innocence and purity.—Among the roses best known to the ancients was the HUNDRED-LEAVED R. (*R. centifolia*), excelled by no other species in beauty and fragrance. It is a native of the Caucasus, and has been cultivated in gardens from very ancient times. Amongst its numberless varieties are the Moss R., the calyx of

which sends forth branching excrescences, so that it seems overgrown with moss, the flower—which is only known as a double rose—being exquisitely beautiful and fragrant; the PROVENCE or CABBAGE R., one of the most common, and also one of the finest roses; the small-flowered BURGUNDY R., &c. —The FRENCH R. (*R. Gallica*) is a native of the south of Europe. Many varieties of it are cultivated, particularly very beautiful double ones. It is distinguished by its hard leaves, which have a peculiar dryness, and its much expanded petals. It has a fainter smell than *R. centifolia*, but its petals are more astringent, and are preferred for the preparation of *Vinegar of Roses* and *Conserve of Roses*.—The DAMASCUS or DAMASK R. (*R. Damascena*), a native of Syria, is much cultivated, and is sometimes called the MONTHLY R., which name, however, is more frequently given to the China Rose.—The MUSK R. (*R. moschata*) is a native of the north of Africa and the south of Spain. Its flowers have a strong and delightful fragrance; they are white, and disposed in rich corymbs. It has been cultivated in England since the end of the 16th century.—The DOG R. (*R. canina*) is common in Britain, and throughout Europe, also in North America, growing in thickets and hedges. It varies, even in a wild state, in the colour of its flowers, which are red, pale, or white. It has long straight shoots, which are often used as stocks for ornamental rose-trees, other kinds of R. being budded upon them. The bark of the root was formerly esteemed of peculiar virtue in preventing fatal consequences from the bite of a mad dog; whence the name of the species.—The VILLOUS R. (*R. villosa*), another common British species, has the fruit larger and more fleshy than the Dog Rose. The leaves are downy.—The FIELD R. (*R. arvensis*) is common in many parts of Britain, in woods and hedges. It has white flowers. It is remarkable for its trailing habit, and long climbing or pendulous twigs, on account of which it is frequently planted and trained to cover walls and trellises. It is often called the AYRSHIRE R., although that name is shared by another kind of similar habit, which is regarded as a deciduous variety of the EVERGREEN R. (*R. sempervirens*), a native of the south of Europe. These often make shoots of 20 feet in a season. Of the same habit also is the MANY-FLOWERED R. (*R. multiflora*), a native of China and Japan, a very fine species, but not sufficiently hardy for the colder parts of Britain.—Very different in habit is the SCOTCH R., or BURNET-LEAVED R. (*R. spinosissima*), a species common on heaths, sands, and chalk downs in many parts of Britain; a low compact bush, with very small leaves and flowers. It is occasionally found in unfertile situations, so dwarfed in size as not to measure more than three inches from the very tip of the root to the centre of the flower (which is undiminished in size). Many fine double varieties are now in cultivation.—The ALPINE R. (*R. Alpina*) is a beautiful ornament of the Alps and of other mountains of Central Europe, remarkable for its flower-stalks bending down in an arch after flowering.—The SWEET BRIER R. (*R. rubiginosa*) is a bushy species, with small leaves and flowers, a native of Britain, but more common in some parts of continental Europe, growing in open bushy places, and remarkable for the sweet balsamic smell of its leaves, on account of which it is much planted in hedges and shrubberies. A kindred species (*R. suaveolens*) is found in North America. —The YELLOW R. (*R. lutea*), a native of Germany, is chiefly remarkable for the colour of its flowers, which, however, have a disagreeable bug-like odour. A fine variety is much cultivated, with petals yellow externally, and bright red on the inside.—The INDIAN R., or CHINA R. (*R. Indica*), is a native of China, was thence carried to India, and is now also common in Europe, being a hardy plant, which does not suffer from the frosts of winter in any part of Britain, although it was at first introduced as a greenhouse plant. It is one of the most important additions recently made to our flower-gardens and shrubberies; flowering not only in the middle of summer, with the other roses, but throughout the year, even in winter, when the weather is mild. It is now very common throughout Europe. The name MONTHLY R. is often given to it from a notion that it flowers every month. The NOISETTE R., remarkable for its extremely rich corymbs, and the TEA R., of which the dried leaves have a fine fragrance, and are said to be used in China for flavouring tea, are regarded as varieties of it. The odour of the flower is much fainter than that of many other roses; and the bush is never large.

Some kinds of R., as the China R., are easily propagated by cuttings, the other kinds by layers. The finer varieties are budded on stocks of some common kind. Many of the kinds require much pruning and attention of the gardener. The old shoots are cut out, and the young wood thinned and shortened. The flowering of a rose-bush may be retarded by cutting it closely down late in spring, and it will blossom when other roses have disappeared. Roses grow well in all ordinary soils, but are very sensitive to atmospheric influences, and do not succeed amidst the smoke of towns.

The genus *Lowea* has been separated from *Rosa* by Lindley, chiefly on account of the simple leaves. The only known species is a native of Central Asia.

The fruit of roses is used in medicine. See HIP. A mildly astringent and agreeable syrup, and other preparations, are made from the rapidly dried petals and buds of the French rose. A syrup is similarly made from the petals of the Hundred-leaved R.; and water distilled from them, *Rose Water*, is employed for various purposes on account of its agreeable odour. *Rose Vinegar*, made by steeping rose petals in vinegar, is useful as an external application in headaches, for dissipating unpleasant smells in apartments, &c. *Conserve of Roses* is made of the petals of roses pounded with sugar, and is useful as an astringent in diarrhœa of children. Oil or Otto (q. v.) of Roses is one of the most valuable of perfumes.

Rose-bushes are often much injured by a species of Aphis (*A. rosæ*), a small green insect, which swarms upon the leaves. A reddish fungus, *Puccinia rosæ*, often covers the leaves in the latter part of summer.

ROSE, in Heraldry. The heraldic rose is drawn in a conventional form, as in the subjoined woodcut, and never with a stalk, except when expressly directed by the words of blazon. Being sometimes argent and sometimes gules, it cannot be designated proper; but when blazoned 'barbed and seeded proper,' it is meant that the barbs are to be green, and the seeds gold or yellow. The rose gules was the badge of the Plantagenets of the House of Lancaster, and the rose argent of that of York. The York rose was sometimes surrounded with rays as of the sun, and termed *rose en soleil*. As a mark of cadency, the rose has been used as the difference of the seventh son.

Rose.

ROSE, THE, a popular name for Erysipelas (q. v.), which is also known as St Anthony's Fire, *Ignis Sacer*, &c.

ROSE ACACIA. See ROBINIA.

ROSE APPLE. See EUGENIA.

ROSE BEETLE (*Cetonia aurata*), a coleopterous insect of the section *Pentamera*, of the tribe *Lamellicornes*, and not distantly allied to cockchafers and to the true beetles, or *Scarabæi*. It is a common British insect, about an inch long, of a shining green above, coppery red underneath, with white marks on the elytra. In its perfect state, it frequents flowers, particularly the rose; in its larva state, it inhabits rotten timber, the roots of vines, &c., and is often found in ants' nests, apparently feeding on the small particles of wood which the ants have collected. It remains about three years in the larva state, makes a cocoon of particles of wood, glued together by an excretion of its own; passes the winter as an inactive pupa, and appears in summer in its perfect form. It flies well, with a sort of humming noise, from flower to flower, feeding on honey, and in order to reach it, devouring the nectaries.—In North America, the name Rose-Bug is given to another coleopterous insect, the *Macrodactylus subspinosa*, about one-third of an inch in length. It is very injurious to gardens and nurseries in North America, its ravages extending to many plants besides the rose. These insects often appear suddenly in swarms, and disappear as suddenly.

ROSE-ENGINE. See TURNING.

ROSE'MARY (*Rosmarinus*), a genus of plants of the natural order *Labiatæ*, and nearly allied to Sage (*Salvia*), from which it differs in its filaments having an awl-shaped tooth, directed downwards a little above the base. Only one species is known, *R. officinalis*, an evergreen erect shrub of 4—8 feet high, with linear leaves, and pale bluish flowers, growing in sunny places, on rocks, old walls, &c., in the countries around the Mediterranean Sea, and generally cultivated, as an ornamental and aromatic

Rosemary (*Rosmarinus officinalis*).

shrub, throughout the rest of Europe. The leaves have a short whitish-gray down beneath, a penetrating camphor-like odour, and a pungent aromatic and bitter taste. They contain a large quantity of an essential oil, *Oil of R.* ($C_{45}H_{38}O_2$), which is not unfrequently used as a stimulating liniment, to promote the growth of the hair, and as a perfume. *Spirit of R.*, made by distillation of sprigs of R. with rectified spirit, is used to give a pleasant odour to lotions and liniments. R. has been advantageously administered internally in cases of chronic diarrhœa, and of a relaxed state of the system.—Oil of R. is a principal ingredient of the perfume called *Hungary Water*, or *Queen of Hungary's Water*.—The name Wild R. is given to *Ledum palustre*, a shrub with narcotic acrid properties.

ROSEN, FRIEDR. AUG., born in Hanover, September 2, 1805, entered Leipzig University in 1822, where he devoted himself to the study of the biblico-oriental languages, and went to Berlin in 1824, where he studied Sanscrit under Bopp, and published his first work, *Radices Sanscritæ* (Berl. 1827). Subsequently, he was called to London University as Professor of Oriental Literature, where he edited the oldest of the still extant Arabic handbooks of Algebra, by Mohammed ben Musa (Lond. 1831). In 1831, R. resigned his professorship. During the next few years, he wrote a portion of the oriental articles for the *Penny Cyclopædia*, undertook the revision of the Sanscrit Bengali Dictionary of Houghton (Lond. 1835), which may be considered entirely his own work, and compiled for the British Museum the catalogue of Syrian manuscripts, which was only published after his death (Lond. 1839). As secretary of the Asiatic Society, he conducted its entire foreign correspondence. Colebrooke intrusted to him the publication of his *Miscellaneous Essays* (2 vols., Lond. 1837). In 1836, he had begun the publication of the Collection of Hymns of the *Rigveda*, when he died September 12, 1837. His unfinished work on the Vedas was published by the Asiatic Society under the title *Rigveda-Sanhita, liber primus, Sanscrite et Latine* (Lond. 1838).—His younger brother, GEORG ROSEN, has also acquired a reputation as an oriental scholar.

ROSENAU, a mining and market town of Hungary on the Sajo, 105 miles north-east of Pesth. Iron, copper, antimony, and lead mines are in operation; linen-bleaching and the manufacture of pottery, leather, wax-tapers, and trade in honey and wax, are carried on. Pop. 5000.

ROSENMÜLLER, JOHANN GEORG, a German divine and professor of theology, was born at Ummerstädt in Hildburghausen, 18th December 1736. He was appointed Professor of Theology at Erlangen in 1773, Primarius Professor of Divinity at Giessen in 1783, and was called in 1785 to Leipsic, where he remained till his death in 1815. His chief writings are: *Morgen- und Abendandachten* (7th ed. Leip. 1820); *Betrachtungen über die vornehmsten Wahrheiten der Religion auf alle Tage des Jahres* (4 vols. Leip. 1801); *Auserlesenes Beicht- und Communionbuch* (12th ed. Nürnb. 1827); *Predigten über auserlesene Stellen der Heiligen Schrift* (3 vols. Leip. 1811—1813); *Beiträge zur Homiletik* (Leip. 1814); *Scholia in Novum Testamentum* (6 vols.; 6th edit. by his son, E. F. K. Rosenmüller, Leip. 1815—1831); and his *Historia Interpretationis Librorum Sacrorum in Ecclesia Christiana* (5 vols. Leip. 1795—1814). After his death appeared *Handbuch eines allgemeines fasslichen Unterrichts in der Christlichen Glaubens- und Sittenlehre* (2 vols. Leip. 1818—1819).—ERNST FRIEDRICH KARL ROSENMÜLLER, eldest son of the foregoing, distinguished himself as a biblical critic and orientalist. He was born at Hessberg in Hildburghausen, 10th December 1768, studied at Leipzig, became Extraordinary Professor of Oriental Literature in 1795, Ordinary Professor in 1813, and died 17th September 1835. He was a more accurate and solid scholar and a keener critic than his father. He shared the rationalism of his time, but never carried it to an extreme. His masterpiece, the *Scholia*

in Vetus Testamentum (11 vols. Leip. 1788—1835), is a most comprehensive and learned production, well worthy of consultation on any important point of biblical criticism. Other works of R.'s are: *Handbuch für die Literatur der biblischen Kritik und Exegese* (4 vols. Gött. 1797—1800); *Das alte und neue Morgenland oder Erläuterungen der Heiligen Schrift* (6 vols. Leip. 1818—1820); *Handbuch der biblischen Alterthumskunde* (4 vols. Leip. 1823—1831); *Institutiones ad Fundamenta Linguæ Arabicæ* (Leip. 1818); and *Analecta Arabica* (2 vols. Leip. 1825—1826).—A younger brother, JOHANN CHRISTIAN ROSENMÜLLER (b. 1771, d. 1820), also acquired a reputation as a writer on anatomy, &c.

ROSE-NOBLE (commonly called also *penny of gold*), an English gold coin, first struck by King Edward III. in 1334, and current at the value of 6*s.* 8*d.* sterling; half-nobles, *oboli*, or gold halfpence, and quarter-nobles, otherwise called *gold farthings* and *quadrantes*, were also coined soon after. The term 'rose-noble' was given to the coin because it was of the same value as the 'noble,' a money of account, and was stamped on one side with the figure of a rose. The Rose-noble and its halves and quarters ceased to be coined after 9 Henry V.; but the 'noble,' the money of account, was used till a much more recent period.—The noble also existed in the Scotch coinage, and was equivalent to one-twelfth of the English coin.

ROSE OF JERICHO (*Anastatica hierochuntica*), a plant of the natural order *Cruciferæ*, which grows in the sandy deserts of Arabia; and on rubbish, the roofs of houses, and other such situations, in Syria and other parts of the East. It is a small, bushy, herbaceous plant, seldom more than six inches high; with small white flowers; and after it has flowered, the leaves fall off, and the branches become incurved towards the centre, so that the plant assumes an almost globular form, and in this state it is often blown about by the wind in the desert. When it happens to be blown into water, the branches expand again, and the pods open and let out the seeds. Numerous superstitions are connected with this plant, which is called *Rosa Mariæ*, or *Rose of the Virgin*. If taken up before it is quite withered, the plant retains its hygrometric property of contracting in drought and expanding in moisture, for years.

ROSEO'LA is a common skin disease, included in the division *Rashes*, and sometimes described under the term *Scarlet Rash*. In some cases, it begins with slight febrile symptoms and gastric disturbance, which subside in two or three days, when the rash appears; in other cases, no preliminary fever occurs. The eruption first appears upon the face, neck, and chest, in specks or small patches, which have a tendency to coalesce; and in severe cases, the whole surface of the body assumes a uniformly red tint. The eruption is usually accompanied by itching of the affected parts, and by redness and slight soreness of the throat, and seldom lasts more than two or three days, when it gradually fades away; and its disappearance is not followed by the desquamation of epidermis, which is one of the natural *sequelæ* of scarlatina and certain other skin diseases. The rash differs considerably in appearance in different cases. The disease is never contagious, and one attack affords no immunity from a second.

Among the causes of roseola may be mentioned the irritation excited by dentition, gastric and intestinal irritation, excessive acidity of the stomach, the sudden checking of profuse perspiration, the drinking of cold water when the body is overheated, &c. It often precedes the distinctive eruptions of small-pox and varioloid; and is noticed to be of most frequent occurrence during the prevalence of measles and scarlatina. The diseases with which it may be confounded are erythema, measles, and scarlatina, and it is sometimes impossible to discriminate with certainty between roseola and mild cases of scarlatina, when the former is attended with sore throat. The treatment is very simple, as the disease would probably always terminate favourably if left entirely to itself. If there is a suspicion that the case should turn out to be one of scarlatina, an emetic of ipecacuanha should be given, and the bowels should be freely acted on. In ordinary cases, a few days' confinement to the house, a spare and non-stimulating diet, saline laxatives—such as Seidlitz powders—and an occasional warm bath, if there is much cutaneous irritation, or if the eruption has a tendency to recede too suddenly, constitute all the treatment that is expedient.

ROSES, WAR OF THE, a disastrous civil contest which desolated England during the 30 years from 1455 to 1485, sacrificing 80 princes of the blood, and the larger proportion of the ancient nobility of the country. It was so called because the two factions into which the country was divided upheld the two several claims to the throne of the Houses of York and Lancaster, whose badges were the white and the red rose respectively. After the House of Lancaster had possessed the throne for three generations (see PLANTAGENET), Richard, Duke of York, whose title to the throne was superior to that of Henry VI., began to advance, at first somewhat covertly, his claim to the throne. In 1454, he was appointed Protector of the realm during Henry's illness, and on the king's recovery, he declined to give up his power, and levied an army to maintain it. For an account of the Wars of the Roses, see EDWARD IV., EDWARD V., RICHARD III., and HENRY VII. The accession of Henry VII. may be said to have terminated the Wars of the Roses, although the reign of Henry was from time to time disturbed by the pretensions of Yorkist impostors.

ROSE'TTA, a city of Egypt, situated on the west bank of the old Bolbitic branch of the Nile, about 4 miles above the mouth, in 31° 25′ N. lat., and 30° 28′ 20″ E. long. The name is supposed to be an old Egyptian one, and to have been derived from *Rusat*, or the mouth of the plains. Here was discovered the so-called Rosetta Stone, or trilingual inscription in the hieroglyphic, demotic or enchorial, and Greek language, which was the key to the interpretation of the hieroglyphs. It is of black basalt, about 3 feet 7 inches in length, and 2 feet 6 inches in width, containing about one-third of the hieroglyphic, and nearly all the Greek and Roman portions, the upper part and portion of the side having been broken away. The contents of the inscription are a decree in honour of Ptolemy Epiphanes by the priests of Egypt assembled in a synod at Memphis, on account of his remission of arrears of taxes and dues owed by the sacerdotal body. It was set up 195 B. C., and is the only one of the numerous examples ordered to be placed which has been brought to light. This monument was discovered in 1799 by M. Boussard, a French officer of engineers, during the French occupation of Egypt, in an excavation made at Fort St Julien, near Rosetta. More recent excavations have shewn that it was found on the site of a temple dedicated by the Necho II. of the 26th dynasty to the solar god Atum, or Tum. By the Arabs, R. is called Rashid. It first rose into importance when the accumulation of mud had silted up the Damietta branch, and destroyed the importance of that city. It has been much praised for its verdure and charming gardens, which

present an agreeable contrast to the barren wastes by which it is surrounded. It contains a mixed population, supposed to be about 15,000 in number. The streets are narrow, running north and south. The river has a sandbar at the mouth, preventing the entrance of large ships-of-war. It was unsuccessfully attacked by the British in 1807.

ROSETTA WOOD is a furniture-wood of a lively orange-red colour, with very dark veins. It is imported from the East Indies in logs about a foot in diameter; but it is not known what tree produces it. It is little used, because, although extremely beautiful when first cut, the colours become dark by exposure.

ROSE QUARTZ, a variety of Quartz (q. v.), often crystallised in the form of Rock-crystal (q. v.), but also found massive or imperfectly crystallised. It differs from common quartz and rock-crystal chiefly in its colour, which is of a delicate pink or flesh colour, sometimes crimson or nearly so. The colour is due to the presence of manganese. R. Q. is valued as an ornamental stone, the larger masses being made into vases, &c., the smaller pieces into jewels, seals, &c. A bright red kind is known as *Bohemian Ruby*, and is sometimes fraudulently sold as ruby.

ROSE-WATER. See PERFUMES.

ROSE-WINDOW, a circular window with tracery.

RO'SEWOOD, a name given to the wood of a number of different trees, valued for beauty, and used for ornamental furniture.—The R. of commerce has been thought to be the produce of a species of *Mimosa*, a native of Brazil. It is also said that R. is the timber of several species of *Triptolomea* (natural order *Leguminosæ*, suborder *Papilionaceæ*); but the trees yielding R. are, in general, still doubtful to the botanist, although different kinds of R., imported from South America, are much used for veneering, in making furniture, musical instruments, &c. R. has for a long time been second only to mahogany as a furniture-wood in Europe. It has a dark blackish-brown colour, beautifully marked with streaks of dark red, and when being sawn or cut, yields an agreeable smell of roses, from which it receives its name. We receive it chiefly from Para and Maranham, in logs usually about ten feet in length; each log is only half the trunk, which is split in two to be sure it is sound. In the year 1867 the imports of this wood into Great Britain amounted to 558 tons, of the value of £5800. One valuable kind of R. is yielded by an East Indian tree, *Dalbergia latifolia*, also called *Blackwood*. It is found chiefly in Malabar, and grows to a height of about 50 feet, with handsome spreading branches and pinnate leaves. It is of the natural order *Leguminosæ*, suborder *Papilionaceæ*. The timber is very valuable. It is much used in Bombay for ornamental furniture. Planks of 4 feet in breadth are sometimes obtained, after the sapwood has been removed. The increasing value of the wood has led to the formation of new plantations, under the care of the government conservator of forests, in several parts of the Madras presidency.

ROSICRU'CIANS, the name of a secret society of the 17th c., which is involved in much mystery, and the history of which has led to a great deal of discussion. The name is explained by Mosheim and others, as derived from *ros*, dew, and *crux*, the cross. CRUX is supposed mystically to represent LUX or light, because the figure + exhibits the three letters LVX; and light, in the opinion of the Rosicrucians, is that which produces gold. Now dew (*ros*) is the greatest solvent of gold in the ancient science of alchemy. But without insisting on this very mysterious explanation of the name Rosicrucians, we must be content with an account of the association itself. The beginning of the 17th c. was a period which manifested an extraordinary tendency to mysticism in science as well as in religion; alchemy, astrology, and divination divided the public interest with Pietism in the Protestant world, and the Convulsionist mania in the Catholic community. A remarkable impulse was given to this tendency by the simultaneous appearance of two anonymous books, printed at Cassel in 1614, in German, entitled *Universal and General Reformation of the whole wide World;* together with the *Fama Fraternitatis, or Brotherhood of the Illustrious Order of the R. C. (Rosy Cross); to the Rulers, States, and Learned of Europe; printed at Cassel, by William Wessel.* The first of these books is a kind of mystic allegory. In the reign of Justinian, Apollo, finding the world full of every kind of corruption, resolves on effecting a reformation; and with this view, calls up the seven wise men of Greece, and three Roman philosophers, of whom Cato and Seneca are the chief advisers. Their deliberation forms the subject of the book, which is a satire at once on the philosophy and the political systems and governments of the age. The *Fama Fraternitatis* is the story of a certain holy and reverend Brother Christian Rosenkreuz (i. e., Rosy Cross), who is represented as living in the 14th century. This Father, a German of noble birth, having been educated in a monastery, conceives a design for the reformation of the world; and after learning at Jerusalem and Damascus all the science of the Arabians, spends three years at Fez, in Morocco, in the study of the magical science of the Moors, and returns to Germany, where he establishes, in a house under the title Sancti Spiritus, with the aid of seven monks from the convent where he had been educated, a fraternity, which is the original brotherhood of the Rosy Cross. These adepts having framed a system with secret symbols, and committed it to paper, sent forth Father Rosenkreuz to propagate the brotherhood, which was to be kept secret for 100 years, the members, however, meeting once each year in the mother-house of Sancti Spiritus. Rosenkreuz died at the age of 106, and the place of his burial was held secret by the adepts; but he ordered that an inscription should be placed on one of the doors of Sancti Spiritus: 'Post cxx. annos patebo.' In the following year, 1615, a third tract appeared, also in German, entitled *Confessio, or Confession of the Society and Brotherhood R. C.*, which purports to be a defence of the brotherhood from the false rumours in circulation regarding it. The mixture of absurdity with seeming fanaticism displayed in these books has long proved a literary puzzle, of which not the least plausible solution is that which regards them as simply a serio-comic satire on the philosophical follies of the time, written by Johann Valentine Andreä, of Herrenberg, as a mere exercise of humour, and without the intention or the expectation of their serious acceptance. Certain it is, that whatever was the secret of the Rosicrucians, if there really was any, it has been well kept. They are not heard of for the rest of the 17th c., and their supposed connection with the Illuminati of Weishaupt, at the close of the 18th c., is more than doubtful. Equally doubtful is the theory of their connection with the Templars. From a book entitled *Curious Things of the Outside World: Last Fire* (Lond. 1861), it would appear that the Brethren of the Rosy Cross are not yet extinct. See Buhle,

Ueber Ursprung und Schicksale des Ordens der Rosenkreuzer (Gött. 1803).

ROSIN, CHEMISTRY OF. See RESINS. When common Turpentine (q. v.), obtained from several species of Pine (q. v.) and Fir (q. v.), is distilled with water, it yields nearly one-fourth of its weight of essential oil, while the residue in the retort consists of *common rosin*, or colophony. There are two principal varieties of rosin, one of which is of a brown, and the other of a white colour. The brown variety is furnished by the Norway Spruce Fir, and is an amber-coloured brittle solid, consisting of two isomeric acids, the *sylvic* and *pinic*, having the common formula, $C_{20}H_{30}O_2$. Pinic acid, which is the more abundant of the two, is soluble in cold alcohol, from which it is obtained on evaporation as an amorphous mass. When heated to partial decomposition, it yields another isomeric acid, the *colophonic*. The white variety of rosin, known commercially as *Galipot*, is obtained from the turpentine yielded by *Pinus maritima* (see PINE), and consists almost entirely of an acid, isomeric with the preceding, and termed the *pimaric*. On evaporating its alcoholic solution, the acid is obtained in a semi-crystalline form; and on melting the mass thus obtained, and allowing it to cool, the resulting product is a colourless glass as clear as crystal.

Common rosin dissolves freely in alkaline solutions, and enters largely into the formation of yellow soap. The alkaline resinates are, in point of fact, true soaps, but are inferior in their cleansing properties to the stearates, oleates, and margarates. All the above described acids of rosin are monobasic, soluble in ether and hot alcohol, and insoluble in water.

ROSS, SIR JOHN, C.B., Arctic voyager, born June 24, 1777, at Balsarroch, Wigtonshire, was a son of the Rev. Andrew Ross of Inch. He entered the navy at the early age of 10, was 15 years a midshipman, 7 years a lieutenant, 7 years a commander, and became a post-captain in 1818. When lieutenant of the *Surinam*, he was wounded in cutting out a Spanish vessel from under the batteries of Bilbao, in 1806. During the war, he was in three different actions. His more important services were rendered in the Arctic regions, whither, in 1818, he proceeded with Sir W. G. Parry. See NORTH-WEST PASSAGE. He published the results of his investigations in 1819. In May 1829, he was employed on a fresh expedition to the Arctic regions (fitted out at his own expense by Sir Felix Booth), and discovered the peninsula of 'Boothia Felix.' R. received, on his return, the honour of knighthood, and was made C.B. He received the freedom of London and other cities, gold medals from the Geographical Societies of London and Paris, was made a knight of various foreign orders, and received other acknowledgments of his services. In 1838, he was appointed British consul at Stockholm, where he remained some years. He was author of *Letters to Young Sea-officers; Residence in Arctic Regions*, &c. (1829—1834), 4to; Appendix to same, 4to; *Memoirs and Correspondence of Admiral Lord de Saumarez*, 2 vols. 8vo; *Treatise on Navigation by Steam*, 4to. He became a rear-admiral in 1851, and died August 30, 1856, at his house in Gillingham Street, Pimlico.

ROSS, SIR JAMES CLARK, Arctic explorer (nephew of the preceding), third son of George Ross, Esq., of Balsarroch, Wigtonshire, was born in London in 1800 and died in 1862. He entered the navy in his 12th year, and served under his uncle in the Baltic, the White Sea, the coast of Scotland, and in all the naval expeditions for the discovery of the North-west Passage (q. v.) from 1818 to 1833. It was while accompanying his uncle in his second Arctic voyage that he discovered, 1831, the North magnetic pole, and on his return he was rewarded with a post-captaincy. Afterwards employed by the Admiralty in a magnetic survey of Great Britain and Ireland, he, in 1836, crossed the Atlantic to relieve the frozen whalers in Baffin's Bay; and in 1839 he was placed in command of an expedition to the Antarctic seas (see POLAR EXPEDITIONS), and approached within 160 miles of the South magnetic pole. On his return in 1843, he received the honour of knighthood; and in 1847 he published his *Voyage of Discovery in Southern Seas*, 1839—1843. In January 1848, he made a voyage in the *Enterprise* to Baffin's Bay, in search of Sir John Franklin, but without success. He received the 'Founder's gold medal' from the Geographical Society of London in 1841, and the gold medal of the Paris Society; and was made D.C.L. of Oxford in 1844.

ROSS, a Celtic word, meaning a headland, occurring as the name or part of the name of many places in the British Islands, and in other parts of Europe, as Roslin, Culross, Rossberg, Ross (in England), Montrose, Roxburgh, Ardrossan. There is another Welsh root, *rhos*, signifying a moor, which is found in Welsh and Cornish names, as Rossall, Rusholme. In Roseness, in Orkney, the equivalent Teutonic term *ness* has been superadded after the meaning of the Celtic *ross* had been lost.

ROSS, a thriving market-town in Herefordshire, is finely situated on the left bank of the Wye, 14 miles south-south-east of Hereford. In the parish church (date 1316) is buried John Kyrle, celebrated by Pope as the 'Man of Ross' (q. v.). The town is well furnished with schools, carries on a trade in cider, malt, and wool; is much visited by tourists, and contained, 1861, 3715 inhabitants.

ROSS AND CROMARTY, treated of in the 'Census of Scotland—1861,' as one Scottish county, is, as such, bounded on the N. by Sutherlandshire, E. by the German Ocean, S. by Inverness-shire, and W. by the Atlantic. Ross comprises the districts of Easter and Wester Ross, Ardmeanach, or the Black Isle, and the island of Lewis (q. v.). R. and C., in many parts, present a wild and mountainous aspect, intersected by beautiful glens, valleys, lakes, and rivers. Many of the mountains are of considerable altitude, the highest ranging from 3000 to 4000 feet, the most remarkable of which is Ben Wyvis. The high grounds afford excellent pasture for sheep and cattle, and the glens and low grounds, in the more favoured portions, are generally of a superior soil, which, with the fine climate, especially in Easter Ross, produce grain of a superior quality. There are numerous freshwater lakes and rivers. The principal loch is Maree (q. v.). There are several other lakes of considerable size, which altogether occupy an area of 90 sq. miles. There are numerous water-courses, the chief of which are the rivers Oikel and Conon, and several high waterfalls, the principal being Glomach, one of the finest in the kingdom. Limestone and ironstone are to be met with in abundance, as also granite and mica slate; and there are various mineral springs of note, the most famous of which is that of Strathpeffer. About the beginning of last century, the country in many places was nearly devoid of trees, but soon after, numerous plantations were formed, and many parts are now occupied by extensive forests. The lakes, rivers, and coast abound with fish, and the bays and sea-lochs being numerous, the fisheries are carried on extensively, occupying upwards of 22,000 persons.

The number of proprietors is 117, and occupants 865. The area of the two counties is 3157 sq. m., or

2,020,480 acres; of which, in 1857, there were under grass and hay 20,868; and under rotation of crops 72,851—viz.: In wheat 9715 acres, yielding 26 bushels 2¾ pecks per acre; barley 6435 acres, 32 bushels 3¼ pecks average; oats 16,256 acres, 33 bushels 1 peck average; bere 289 acres, 30 bushels 24 pecks average; turnips 12,228 acres, 12 tons 1 cwt. average; potatoes 4471 acres, 1 ton 19½ cwt. average. Of live stock there were horses 4759, cattle 17,610, sheep 304,444, swine 4568; total stock 331,381.

The population of the united shires in 1861 was 81,406; the inhabited houses, 15,728. The parliamentary constituency, which returns one member to parliament, is 945 in number. The chief towns are Dingwall (q. v.), Fortrose (q. v.), and Tain (q. v.).

ROSS, The Man of, a name given by Pope to John Kyrle, an English gentleman of great benevolence, who was born at Whitehouse, Gloucestershire, in the first half of the 17th century. Kyrle received his appellation from having resided during the greater part of his life in the small town of Ross, Herefordshire. He there spent his time and fortune in building churches and hospitals, which procured for him the love and veneration of his contemporaries. Kyrle may be considered the Howard of his age; and Warton, in his *Essay on the Writings and Genius of Pope*, has stated that he deserved to be celebrated beyond any of the heroes of Pindar.

Pope, during his visits at the old mansion of Holm Lacy, the seat of Viscount Scudamore, near Ross, heard so much of Kyrle's beneficence, that in his *Moral Essays* he celebrates his praises under the name of the Man of Ross:

> 'Behold the market-place with poor o'erspread!
> The Man of Ross divides the weekly bread:
> He feeds yon almshouse, neat, but void of state,
> Where age and want sit smiling at the gate:
> Him portioned maids, apprenticed orphans blessed,
> The young who labour, and the old who rest.'

We learn further, from the same poem, that the fortune of Kyrle was no more than £500 a year. Kyrle died in 1724, and was buried in the church of Ross.

ROSSA'NO, a city of Southern Italy, in the province of Calabria Citra, is situated at the foot of the Apennines, 2 miles from the Gulf of Taranto, on a high rocky hill, surrounded by steep precipices. It is walled and well-built, is defended by a castle, and contains a beautiful cathedral, inlaid with carved marbles. Its fields are very fertile, producing grapes and lemons. R. was laid waste by Totila, king of the Goths. Pop. 11,441.

RO'SSBACH, a village in Prussian Saxony, in the government of Merseburg, and 8 miles south-west of the city of that name, is celebrated in history for the victory here gained by the Prussians under Frederick the Great over the combined French and Imperialist armies on 5th November 1757. A short time previously, Frederick had been compelled to leave the bulk of his army in Silesia under the Duke of Brunswick-Bevern to check the Austrians on this side, and hastened with 22,000 men to oppose the invasion from the west. The Prince of Soubise (one of the 'amateur' French generals of the period), who was at the head of the confederate army of 60,000 men, thinking from Frederick's cautious manœuvres that he was terrified and desirous of retreating, at once charged forward with his cavalry, and left his columns at the mercy of General Seidlitz, who attacked them in front and flank with the whole of the Prussian cavalry and artillery. The confederates were speedily thrown into utter disorder, and, being charged in front by the Prussian infantry under Prince Henry, their rout was complete. The 'rout of Rossbach' was so utterly disgraceful that it remained for a long time proverbial in the French army. The Prussians lost (according to a French account) only 300 men, while the loss of the allies was more than 1200 slain, 6000 prisoners, among whom were 11 generals and 300 officers, and 72 cannon, with many other trophies.

ROSSE, William Parsons, third Earl of, a well-known practical astronomer, was born in York in 1800, and educated first at Trinity College, Dublin, and afterwards at Magdalen College, Oxford, where he graduated first-class in Mathematics in 1822. During the life of his father, he sat in the House of Commons as Lord Oxmantown, representing King's County from 1821 to 1831; he succeeded to the peerage in 1841, and was elected a representative peer for Ireland in 1845. At an early age R. had devoted much attention to the study of practical science, and especially to the improvement of the telescope, and had commenced as far back as 1826 to make experiments in the construction of fluid lenses (see *Philosophical Transactions* for 1840), but he subsequently relinquished those investigations, to engage himself with the problem of the best mode of constructing the speculum of the reflecting telescope. The two great defects which had hitherto baffled opticians were 'spherical aberration' and absorption of light by specula; and in the casting of these of large size, there was the apparent impossibility of preventing cracking and warping of the surface on cooling. However, by a long series of carefully conducted experiments, he succeeded in discovering a mode of operation by which the last defect was wholly obviated, and the two others greatly diminished in amount. The metal for the speculum of his great telescope (see Telescope), three tons' weight, was poured into the iron mould April 1842, the crucibles being lifted and emptied by means of cranes; and the mould was kept in an annealing oven for 16 weeks, so that the metal should cool equably. It was then polished and mounted in his park at Parsonstown, at a cost of £30,000, the adjustments consisting of a system of chains, pulleys, and counterpoising weights, so complete in all its parts, that the ponderous instrument of 12 tons' weight can be moved so as to point in any direction, and with almost as much precision as the ordinary equatorial of the observatory. The first addition to the body of astronomical knowledge made by this telescope was the resolution of certain nebulæ, which had defied Herschel's instrument, into groups of stars; next came the discovery of numerous binary and trinary stars, and a description of the moon's surface. The construction of this telescope, which was wholly effected under R.'s personal direction and superintendence, is fully described in the *Philosophical Transactions*. He died October, 1867.

ROSSETTI, Gabriele, a celebrated Italian author, was born at Vasto in 1783, and came to England as a political refugee in 1824. Two years afterwards he published the *Comento Analitico* on the *Divina Commedia* of Dante, in which he aimed to shew that in the middle ages all the poets used a jargon under which they veiled their hatred of the papacy, and concealed the true religion under the form of a woman beloved by them. In conducting this argument he displayed amazing erudition. His opinions naturally excited a great deal of hostile criticism. R. replied to his opponents with the work, *Sullo Spirito Antipapale che produsse la Riforma, e sulla influenza che esercitò nella letteratura di tutta l'Europa e principalmente d'Italia* (1830). But this book did not convince them

either, and then R. sought to reduce to method his system, and published *Il Mistero dell' Amor Platonico svelato* (1840); and *La Beatrice di Dante*. Whatever may be thought of R. he has at least founded a new school of interpretation of Dante, and his partisans are numerous in Italy. His name is well known in the peninsula for his national poems, which have gained for him the title of the Italian Tyrtæus. These are contained in the *Dio e l' Uomo* (1840); *Il Veggente in Solitudine* (1846); *L'Arpa Evangelica* (1852); *Poesie di Gabriele Rossetti* (1847). He was Professor of Italian Literature in King's College, London, and was honoured and esteemed by many of the most eminent public men in England. He died in London in 1854.

ROSSETTI, DANTÉ GABRIELE, son of the former, distinguished as a thoughtful and powerful painter, and as a faithful and elegant translator of early Italian poetry, was born in London in 1828, and educated at King's College, London. As a painter, he is more talked of than known, probably because his works are transferred into private collections as soon as they leave his studio, and without undergoing the publicity of exhibition. Although he has never exhibited at the 'Royal Academy,' his pictures are occasionally sent by their proprietors to various public picture-galleries. Of these, his 'Fair Rosamond,' a picture pervaded by earnest thought, and treated in a powerful, though strikingly unconventional manner, was exhibited in the galleries of the Royal Scottish Academy in 1860—1861, and may be taken as a good example of the artist's manner. Of his other pictures, the chief are 'Ecce Ancilla Domini,' and 'Beatrice Dead.' He contributed some fine drawings to an illustrated edition of Tennyson, which, although inadequately engraved, rank among the first of modern woodcuts. These, like everything this artist has produced, are strongly imbued with the spirit of the Romantic period. R.'s name was first brought prominently forward by his association with Millais and Holman Hunt in the 'Pre-Raphaelite Brotherhood.' In 1850, he was editor of *The Germ*, a magazine of poetry and art devoted to the furtherance of the views of the 'Brethren,' and to the inculcation of their fundamental principle, which was direct study from nature herself, unfettered by the conventionalities of the 'antique' and 'academies.' While time and experience have modified the practice of some of the original pre-Raphaelites, R.'s pictures still display the peculiarities of earlier days. As an author, R. is best known by his *Early Italian Poets from Ciullo d'Alcamo to Dante Alighieri* (1100—1200—1300); and a volume of *Original Poems* (1870). In the former work, the translator achieves the rare success of not only catching the spirit of Dante, but of rendering the great poet in his own metres, and with a marvellous fidelity of thought and phrase. In conjunction with his brother WILLIAM, he edited Gilchrist's *Life of William Blake, Pictor Ignotus* (Lond. 1863), left incomplete at the death of the original compiler.

R. is not only a painter and author, but a man of thorough acquaintance with and high accomplishment in applied and decorative art. He bears a distinguished part in the resuscitation of Gothic art in England, both ecclesiastical and domestic, and is intimately associated with the now well-known firm of Morris, Marshall, and Faulkner, which bears to *decorative* art an analogous position to that occupied by the pre-Raphaelite school in relation to pictorial art.—CHRISTINA GABRIELLA ROSSETTI, sister of the above, and born about 1835, is the authoress of *Goblin Market and other Poems* (Cambridge, 1862), to which work she owes a considerable literary reputation.

ROSSI, PELLEGRINO, was born of a noble family at Carrara in 1787. He carried on his studies at the university of Bologna. In 1812, being 25 years of age, he was appointed Professor of Law in that university. In 1815, King Murat having proclaimed Italian independence, R. sided with him. On the fall of Murat, R. was exiled. He took refuge at Geneva, where he was appointed Professor of the Science of Law. There he published *Le Droit Pénal*, a very learned work, which made him famous in France. In 1833, Louis-Philippe called him to Paris, and appointed him Professor of Political Economy. Then R. commenced the course *Du Droit Constitutionnel*, and the government, in order to reward the great publicist, naturalised him, and made him a member of the Chamber of Peers. Protected by Guizot, the prime minister, R. was sent to Rome as ambassador in 1845. There he witnessed all the events of 1848, and took part in them, having again become an Italian subject after the fall of Louis-Philippe. When called to the ministry by Pius IX., R. wished to oppose the party favourable to the House of Savoy, and devised an alliance with the king of Naples, which had for its object a confederation of Italian princes with the pope as their president. This roused the hatred of the Romans, and R. was stabbed by an unknown hand on the 15th November 1848. In 1860, Luigi Carlo Farini decreed the publication of all the writings of R., and that a bust of him should be given to the university of Bologna, where it was inaugurated with great solemnity on the 27th April 1862.—Besides the *Droit Pénal*, R. published the *Cours d'Economie Politique* (1840); the *Lettere d'un Dilettante Politico sull' Allemagna sulla Francia e sull' Italia* (Florence, 1848); and left many inedited writings, which are now being published in Paris at the expense of the Italian government.

ROSSINI, GIOACCHINO, the greatest composer of the present century for the Italian lyrical stage. He was born at Pesaro in 1792, the son of a horn-player in an orchestra of strolling players. At the age of fifteen, the Countess Perticari, discovering his talent, sent him to study at the lyceum of Bologna, where he received instructions in counterpoint from Padre Mattei. He was, however, principally self-taught, giving days and nights to the study of the great Italian and German masters. Passing over a few juvenile efforts, his first important opera was *Tancredi*, which was first performed in Venice in 1813, and excited an extraordinary sensation throughout the musical world, raising its composer at once to the summit of fame. It was followed in succession by *L'Italiana in Algeri* (1813), *Il Turco in Italia* (1814), and *Aureliano in Palmira* (1814), all inferior to *Tancredi*. In 1815, R. was appointed musical-director of the theatre of San Carlo at Naples; and while holding that position he continued to produce opera both at Naples and elsewhere. *Il Barbiere di Seviglia*, the most popular of all his works, was produced at Rome in 1816, and said to have been composed in twenty days; it was followed by *Otello* in the same year; and in 1817, appeared *La Cenerentola* at Rome, and *La Gazza ladra* at Naples. From this time to the close of R.'s engagement at Naples in 1823, he wrote the operas of *Mosè in Egitto*, *La Donna del Lago*, *Maometto Secondo* (otherwise known as *L'Assedio di Corinto*), and *Zelmira*. In 1823, he produced *Semiramide*, the most gorgeous of his operas, at Venice, and soon afterwards left Italy. He visited first Paris, and then London, where he was received with great enthusiasm. Returning to Paris, he received from Charles X. the appointment of director of the Italian Opera in Paris, and while there composed his *Guillaume Tell* (1829),

which, though ill-constructed as a drama, ranks musically as high as any of his works. When the revolution of 1830 broke out, R. lost the management of the Italian Opera, but continued to live for some time in Paris; in 1836, he returned to Italy, where, with the exception of a visit to Paris, he principally resided until 1855. With *Guillaume Tell* he may almost be said to have closed his career, having subsequently composed nothing of importance except his well-known *Stabat Mater*, a pretty and popular work more secular than sacred in its style of music. Large offers from the managers of opera-houses did not succeed in tempting him from his retirement. His statue was inaugurated at Pesaro in 1864, amid a large concourse of Italian statesmen and men of letters. In R.'s early works he developed with great felicity the type established by his Italian predecessors. These compositions are characterised by stirring melody, brilliant instrumentation, and a highly enjoyable vivacity. *Guillaume Tell*, though equally original, approaches far more nearly to the character of the German school. Much as R.'s music continues to be prized, only four of his forty operas, composed from 1810 to 1829, have kept the stage, *Il Barbiere*, *Otello*, *La Gazza ladra*, and *Semiramide*. He died at Paris in November, 1868.

ROSSO ANTICO, the technical name for the red porphyry of Egypt. It consists of a red felspathic base, in which are disseminated rose-coloured crystals of oligoclase with some plates of hornblende, and grains of oxidised iron ore.

RO'STER (corrupted from Register) is a fixed order preserved in military departments as the rotation in which individuals, companies, or larger bodies are called on to serve. Regiments proceed on foreign service according to the roster.

RO'STOCK, the most important town and seaport of the grand duchy of Mecklenburg-Schwerin, stands in a flat fruitful district on the Warnow, 9 miles from the mouth of that river in the Baltic, and 55 miles north-east of Schwerin by railway. It is surrounded by ramparts and walls pierced by 12 gates, and has still a medieval aspect. The university, founded in 1419, maintains 23 ordinary professors, and has a library of 90,000 volumes. In St Mary's Church, a large building dating from the 13th c., and possessing one of the finest organs in Germany, is the tomb of Grotius. St Peter's, dating from the 12th c., has a tower 420 feet high. There are several squares, of which Blucher's Square contains a colossal monument of the general of that name. Manufactures of linen and tobacco, and tanning, brewing, and distilling are carried on. In 1863, 582 vessels of 62,654 tons entered, and 548 vessels cleared the port. In the same year R. owned 387 vessels. The exports are chiefly wheat, barley, oil-cakes, and cattle-bones to Great Britain. The imports are coals, salt, iron, limestone, herrings and other provisions, timber, &c. At the mouth of the Warnow is Warnemünde, the port of R., at which all vessels drawing more than 10 feet load and unload. Pop. of R., 26,396.—R. is of Slavic origin, and a shadowy glimpse of it is got in the 11th or 12 c., but the progress of commerce and othe causes, chiefly political, rapidly Germanised it, and in 1218 it figures as wholly German. It was a member for centuries of the old Hanseatic League, long ranked in importance with Lübeck, and still enjoys to a wonderful extent its ancient privileges—the municipal constitution of the town being even yet almost wholly republican.

ROSTO'F, a town of European Russia, and one of the most ancient in the empire, in the government of Jaroslav, stands on the banks of Lake Nero or Rostofsky. An important fair is held here, and a flourishing commerce, which the railway from Jaroslav to Moscow promises to increase, is carried on. R. contains 20 factories, the chief manufacture being that of linen. Pop. 9253.

ROSTOF ON THE DON, a district town and ferry of South Russia, occupies an elevated position on the right bank of the Don, and at the head of the delta of that river. It owes its origin to the foundation of the fortress of St Dmetri here in 1749, since which time the progress of the town, owing to its advantageous situation, has been so great that it is now the centre of trade in South Russia. Its custom-house was erected in 1835, and in that year the customs' dues amounted to £150,000. In 1863, the whole exports amounted to £1,198,526, the principal articles being wheat, iron, tallow, and linseed. Manufactures are carried on with activity in 22 factories, the principal articles produced being cast-iron, bricks, ropes, tobacco, maccaroni, soap, and leather, amounting in value to £47,100. Pop. about 40,000.

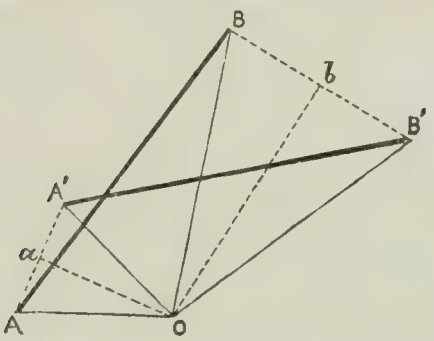
ROSTOPCHINE, Feodor Vassilevitch, Count, a Russian general, directly descended from Genghiz Khan, was born in the province of Orel, March 23, 1765; and, after having filled for some time the office of page to Catharine II., entered the Russian military service as a lieutenant in the Imperial Guard. In 1784 he set out on a course of foreign travel, returning to St Petersburg in 1792, and obtaining, through the powerful influence of some friends, the post of gentleman-of-the-chamber. Having the good fortune to be the first messenger to Paul of his accession to the throne, he was immediately (1796) created general, a rise in rank speedily followed by the successive appointments of grand-marshal of the court, minister of foreign affairs, count (1799), and chevalier of all the Russian orders. R. possessed extraordinary influence over the mind of the half-witted monarch, and succeeded in preventing his vagaries from seriously affecting the government or religion of the empire; but he was repeatedly banished from court and almost immediately recalled, and it was during the last of these banishments (to Moscow) that the czar was murdered. The Emperor Alexander seems to have disliked him, for R. remained in a state of banishment till May 1812, when, having need of the services of all his subjects, and knowing R.'s distinguished patriotism, Alexander appointed him governor of Moscow. On the approach of the French, R., by extraordinary exertions, raised an army of 122,000 men fully equipped, but to his great chagrin was ordered to evacuate Moscow. R. has been unanimously branded by the French writers as the burner of Moscow, and for a long time this was generally credited in the west, till, in 1823, he published in his own defence, *La Vérité sur l'Incendie de Moscow* (Paris, 1823), in which he rebuts the charge, affirming that this barbarous action was due in part to the fervid patriotism of a few of the inhabitants, and in part to the violence and negligence of the French. At the same time, he shewed that the damage done to Moscow was much less than the estimate given by French and English writers, and that the Kremlin, which the French had attempted to blow up, had been in reality little injured. R. certainly set fire to his own mansion-house in the neighbourhood, but no other act of incendiarism has been proved against him, the accusations published in the *British Monitor* (1822) having been triumphantly rebutted. He had succeeded in repairing much of the damage done to the city, and in re-collecting many of its former inhabitants, when, through a court intrigue, his dismissal from office was effected (August 30,

1814). R. accompanied the Emperor Alexander to the Congress of Vienna, and subsequently (1817) retired to Paris, where he occupied himself in literary pursuits, and in forming a fine collection of pictures and books. In 1825, he returned to Russia, and died January 30, 1826, at Moscow. His wife and one of his sons have made for themselves names in literature, and his daughter-in-law, the Countess EUDOXIA ROSTOPCHINE, is considered as one of the first poets of Russia. R.'s works, which include a number of historical memoirs, comedies, &c., in Russian and French, were collected and published at St Petersburg in 1853.

ROT is known in the south-western counties of England under the provincial names of bane, coa, or coathe. It consists in the maturation within the liver and biliary ducts of an entozoon, the *Distoma hepaticum*, or Fluke (q. v.). Although most frequent amongst sheep, it also occasionally attacks rabbits, hares, deer, and cattle. Until of late years, the annual losses amongst the flocks of Great Britain were estimated at a million; but in 1809, 1824, 1830, and 1833, this large mortality is believed to have been doubled. During the wet winter of 1852—1853, and again in the autumn of 1860, and early months of 1861, rot was extensively prevalent. Autumn and early winter are the periods of its most frequent occurrence. Close damp weather, inducing a rapid growth of soft, luxuriant herbage, favours its development. The rising of the Nile is said to rot annually 16,000 sheep. Low, damp, marshy situations, water-meadows, undrained lands, especially when of a clayey, retentive consistence, furnish a large proportion of cases. The hay from such localities induces rot almost as readily as the fresh grass. Sheep grazed even for a few hours upon land subject to rot, or taking a single draught from an infected stagnant pool, may contract the disorder, most probably by swallowing the young flukes. From 15 to 40 days usually elapse before any serious consequences follow from the presence of the parasite. At first, indeed, digestion appears to be stimulated, and the sheep thrive rather better than before; but by and by they rapidly waste, their wool becomes dry, and easily detached, their bowels irregular, their skin and mucous membranes yellow, as is usually conveniently observed by examining the eye and its pearly caruncle, which in rot loses the brilliancy of health, and exhibits a dingy yellow hue. The body, after death, is soft, flaccid, and indifferently nourished; watery effusions are discovered underneath the jaws and in other dependent parts; the small quantities of unabsorbed fat have a dirty yellow colour; the liver is soft and enlarged, and usually mottled with patches of congestion. In the thick and muddy bile, the flukes, with their myriads of spawn, float in variable numbers.

The treatment of rot is seldom very satisfactory; and if the animals, when first affected, are in tolerable condition, no time should be lost in having them slaughtered. If remedial measures are attempted, the sheep should be removed to a dry and sound situation, and liberally supplied with dry nutritive food. During the summer, allow corn or cake with the grass; during the winter, when cases are most frequent, supply clover-hay, pease, or split beans, a little bruised linseed cake, and a few roots: pieces of rock-salt should also be laid about the ground, for the patients to lick at. Medicines are seldom of much avail. Those most to be relied on are turpentine and powdered gentian in two-drachm doses, given daily, beat up with an egg and a little milk, or with some linseed gruel. The turpentine, besides acting beneficially as a stimulant, doubtless also exercises a poisonous action on the flukes, whilst the gentian imparts tone to the irritable and relaxed bowels. The prevention of rot is usually effected by removing from the land all superfluous moisture by deep and thorough drainage. The improvement of unsound herbage may subsequently be expedited by dressings of lime, salt, soil, or composts of farm-yard manure and earth. On all suspicious grazings, beans and oats should for a time be given in moderate quantity, and access allowed to rock-salt. The Arab and Bedouin shepherds have for centuries recognised the importance of such measures, for, when their flocks become rotten from depasturing on the rank herbage that shoots up after the risings of the Nile, they often prevent serious loss by promptly transferring them to the desert, where the dry forage-plants are very rich in saline matters. The Australian flock-master likewise checks the complaint by promptly removing his sheep, which have become tainted, from the deep alluvial soils to the poorer upland 'salt-brash' countries. In like manner, the salt marshes of Cheshire, and the saltings left along our coasts by the tides, have long enjoyed a well-deserved celebrity in the prevention, and even in early cases, in the cure of sheep-rot.

ROTANG. See RATTAN.



ROTA'TION (Lat. *rota*). There is, perhaps, no elementary idea which has been the subject of so much popular misconception as that of rotation. This is probably due to the vagueness of the definitions commonly given.

All motion that we can observe is *relative;* for instance, any fixed object on the earth's surface has a certain motion *relative* to the earth's axis, in consequence of the diurnal rotation; the earth itself has a certain motion *relative* to the sun, in consequence of its annual revolution; the sun has a certain motion *relative* to the so-called fixed stars; and it is possible that the whole stellar system may have a motion *relative* to something in space beyond its boundaries. Now, the motion of an object on the earth's surface differs according to the way it is measured: a passenger sitting in a railway-carriage is *at rest* if his motion *relative* to the carriage be considered; he has the same motion as the carriage, if it be measured *relative* to the rails; and if the carriage were running from east to west along a parallel of latitude, so as to complete the circuit in 24 hours, he would be at rest relative to the earth's axis. If, therefore, we wish to talk of *absolute* motion, it must be measured *relative* to FIXED points or directions; and in the violation of this obvious condition lies the error most commonly met with. Thus, to shew that the earth rotates about its axis, we may observe its motion relatively to the line joining it with the moon; and we observe that the moon comes to the meridian at intervals of (roughly) 25 hours. Does the earth rotate in 25 hours? We know that it does not, and the error consists in treating as an *absolute* rotation, a rotation measured relative to a line—that joining the earth and moon—which is itself turning. If we take the intervals of the sun's crossing the meridian, we find 24 hours—a much closer approximation; but still not exact, because our line of reference—that joining the earth and sun—is slowly turning. Would we have an absolute measure, we must choose a *fixed* line, or one so nearly fixed, that its motion is absolutely insensible. Such is the line joining any fixed star with the earth, and the time of the earth's *absolute* rotation about its axis is $23^h\ 56^m\ 4^s.09$—the interval between culminations of the same fixed star. The difference between absolute and relative rotation in any planet gives rise to the difference between

the *sidereal* and the *solar* day; and the planet's year contains just *one* more of the former than of the latter.

Now, suppose for a moment that the earth were to revolve only $\frac{1}{365}$th part as fast as it now does, there would be *one sidereal* day in the year, and there would be *no* solar day at all—in other words, there would be *no* rotation of the earth with reference to the line joining it with the sun; that is, the earth would turn always the same side to the sun; yet it would be *absolutely* rotating about its axis once in a year. This is the case which we observe in the moon's motion relative to the earth, and we see at once that the moon must rotate *absolutely*—that is, with reference to fixed directions in space—in the exact time in which she completes one revolution about the earth. Those who say the moon does not rotate on her axis, make precisely the same mistake as those who fancied that the earth is immovable, and that moon, sun, and stars revolve about it every day. There is a physical cause for this peculiarity in the moon's motion, which leads to very important consequences with reference to the future of the solar system. See TIDES.

Several elementary theorems regarding rotation may now be enunciated; but the proofs, though very simple, will be given merely in outline. Any displacement *whatever* given to a plane figure in its own plane—as to a sheet of paper lying on a table—is equivalent to a single rotation about a definite axis. Let A, B be any two points of the figure, and let them be displaced to A′, B′ respectively. Join AB, A′B′, and bisect them in a and b by perpendiculars meeting in O. Then, it is easy to shew that (1.) OA′ = OA, OB′ = OB, and therefore

O is the *same* point of the plane figure in its first and second positions. (2.) $\angle AOA' = \angle BOB'$, and is therefore the angle through which the whole has turned about the point O. If AA′ and BB′ are parallel, this construction fails; but in this case, if AB and A′B′ do *not* intersect, the motion is simply one of translation: if they *do* intersect, the point of intersection is the axis.

Any number of successive rotations about different points constitute, of course, a displacement, and are therefore reducible to one rotation.

Two equal and opposite rotations about different points give rise to a mere translation.

The first two of these propositions are true of figures on a sphere as well as on a plane surface; for the figure above has only to be drawn with great circles instead of straight lines, and the proof applies letter for letter. Only, here, the first case of exception cannot occur, because two great circles *must* intersect. Hence it follows, that if the centre of a sphere be fixed, any displacement whatever is equivalent to a rotation about some axis; that is, after any motion whatever of a rigid body, one point of which is fixed, there is always *one* line of particles which remains undisturbed. [This simple proposition has been found very hard to believe, even by men of considerable intelligence.] Hence rotations about any number of axes passing through the same fixed point may be compounded into one; and, generally, any motion whatever of a rigid body may be decomposed into two, one of which is a motion of translation of some chosen point, and the other rotation about some axis through that point. Thus, in the case of the moon, we have a motion of translation of its centre in its orbit, and one of rotation about its axis; or we may combine them into a single rotation in the period of a lunar month about a fixed axis passing through the earth's centre.

Again, any displacement of a plane figure in its plane, or of a spherical figure on a sphere, may be produced by the rolling of a curve fixed in the figure upon another fixed on the plane or sphere. Hence, the most general motion of a body with reference to one point, consists in the rolling of a cone fixed in the body upon another fixed in space, their vertices being at the chosen point. To this, when the cones in question are right circular cones, belong the *Precession* (q. v.) and *Nutation* (q. v.) of the earth and of a top, the evolutions of an ill-thrown quoit, &c.

ROTATION, MAGNETISM OF. This was discovered by Arago in the years 1824—1825. He observed that when a magnetic needle was made to oscillate immediately above a copper plate, it came sooner to rest than it did otherwise. The oscillations were made in the same time as when away from the plate, but they were less in extent; the plate seemed thus to act as a damper to the motions of the needle. This being the action of the plate at rest on the needle in motion, Arago reasoned that the needle at rest would be influenced by the plate in motion. Experiment confirmed his opinion. He made a copper disc revolve with great rapidity under a needle, resting on a bladder placed immediately above it, and quite unconnected with it, the middle of the needle being placed above the centre of the disc. As expected, the needle deflected in the direction of the motion of the disc. The deflection of the needle increased with the rapidity of the motion, and when it reached a sufficient amount, the needle no longer remained in a fixed position, but turned round after the disc. This action of the revolving disc was attributed to what was then called the 'Magnetism of Rotation,' and the name has been since retained.

The explanation of this phenomenon was first made by Faraday (1832). He found it to arise from the reaction of currents, induced in the plate in motion by the magnet. The accompanying figure illustrates the electrical condition of the plate. PP is the plate, rotating in the direction indicated by the arrow; NS, is the needle; and the lines with the arrow-heads indicate the general direction of the currents induced by rotation under the magnet in the plate. There are two complete circuits on each side of the disc, coinciding in the middle, and taking the direction CC. It is the conjoined current which affects the needle: it runs in a direction a little in advance of the needle, as the inductive power of the magnet takes some time to act. As the induced current lies below the needle, the

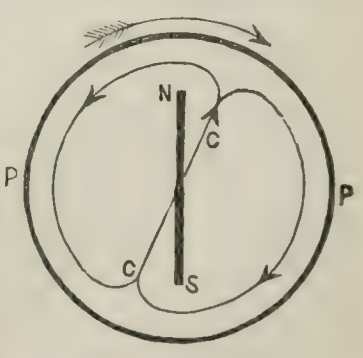


Fig. 1.

deflection (according to Ampère's rule, see GALVANISM) takes place in the direction of the motion of the disc. When cuts are made in the disc in the line of the radii, it loses almost entirely its disturbing power; the currents formed in the whole disc can no longer take place, and those formed in the various sectors are weak in comparison; by filling up the vacant spaces with solder, the power is nearly restored to it. As is to be expected, the effect of the revolving plate depends on the conducting power of the material of which it is made. It is owing to its high conducting power that copper is so much used in these experiments; hence, also, it is that copper should be so much used in the construction of magnetic apparatus. A copper compass-box, for instance, is not only desirable, from its being free from iron, but it acts as a damper to bring the needle quickly to rest when disturbed.

Fig. 2.

The magnetism of rotation is only one of a large class of phenomena, in which the motion, either of a magnet or of a conductor near it, induces an electric current in the conductor. We may here quote two experiments, which may be looked upon as the converse of the magnetism of rotation. In the first experiment, a small cube of copper (fig. 2) is hung by a thread to a frame, and placed between the poles of a powerful electro-magnet; the cube is sent into rapid rotation by the twist on the thread, previously given it; it is instantly brought to a halt, when the current is allowed to circulate in the coils of the magnet, and it begins its motion again when the current is turned off. In the second experiment, a disc of copper, *c*, is made to rotate rapidly between the poles, *n*, *s*, of an electro-magnet, by means of a handle and intervening wheel-works, turned by the experimenter. When the current invests the soft iron poles with magnetism, the disc, moving freely before, appears suddenly to meet with an unseen resistance, and the rotation continues slowly or not at all. If persisted in, the rotation causes the disc to rise in temperature, the rise being proportionate, according to Foucault, to the square of the velocity of rotation. These, and all similar phenomena, illustrate a law that holds universally in magnetic induction, and was first enunciated by Lenz. *When a current is induced by the motion of a magnet or conductor, the inductive action tends to develop in the conductor a current, in such a direction that its action will be to oppose the motion producing it.* Thus, in the last experiment, the part of the disc approaching the poles, has a current developed in it which repels them, and the part leaving the poles, has a current induced in it which attracts them. The approach of the one part, and the departure of the other, are equally opposed by the currents induced in them. The same mode of explanation applies to the other experiments referred to.

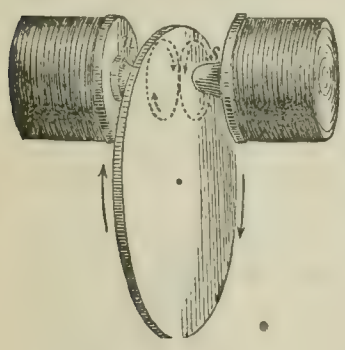

Fig. 3.

ROTATION OF CROPS. See SUCCESSION OF CROPS.

ROTATO'RIA, or ROTI'FERA, popularly known as WHEEL-ANIMALCULES, derive their name from the Latin word *rota*, a wheel. They have received these names on account of the apparent rotation of certain disc-like ciliated organs which surround the mouth. Although some of the larger forms may be detected with the naked eye, they are as a class microscopical. They are widely diffused over the surface of the earth, inhabiting both salt and fresh water, and occurring in all climates. There has been much discussion as to their true place in nature. Ehrenberg regarded them as Infusoria, and Dujardin adopted a similar view. There is, however, no doubt that their organisation is far more complex than that of the Infusoria, and the main question of dispute at the present day is whether they are most closely allied to the worms or to the crustaceans. Huxley maintains that they form a link connecting the Echinoderms with the Nematoid (or thread) worms, and that they constitute the lowest step of the Echinoderm division of the Annelida; while Leydig endeavours to shew that on various anatomical, physiological, and embryological grounds, they more nearly resemble crustaceans than worms, and proposes to call them *Ciliated Crustaceans*. Science is indebted to Leeuwenhoek for the discovery of this remarkable class of animals. In the *Philosophical Transactions* for 1702, he described one of the commonest of these animals, now known as *Rotifer vulgaris*, his attention having been especially directed towards its power of retaining its vitality after more or less complete desiccation—a fact which has been since confirmed by many other observers, and which is noticed in the article on DORMANT VITALITY. The R. have usually an elongated form, and are, in most cases, covered with a smooth hard skin, which is thrown into folds by the contractions of the subcutaneous tissue. The animal consists of a head and body. The body usually terminates in a prolongation, which, till recently, was termed the tail, but which is now known as the foot, and into which the intestines are never prolonged. The foot is composed of muscular and glandular structures, and often terminates in a pair of forceps, by which the animal can attach itself to leaves, &c. The body generally presents six segments, which are more or less distinctly marked in different genera The head presents the characteristic rotatory organs and the mouth, which always lies in the midst of them, so as to receive particles drawn in by their whirlpool action. It is by means of these organs that they swim freely about, revolving on their axis, or when at rest, producing vortex-like disturbances of the water. The form, number, and arrangement of these organs vary extremely in different genera, and have been made a basis of classification by Ehrenberg and others. The rotatory organ may be single, double, or multiple. It often consists of a disc supported by a pedicle, on whose borders are successive rows of regularly arranged cilia, the motion of which gives the appearance of rotation to the disc itself. In the genera *Floscularia* and *Stephanoceros*, these organs undergo peculiar modifications. In the former, there are five or six button-like processes about the mouth, covered with very long bristles, which move feebly and scarcely give rise to vortices; while in the latter, the rotatory apparatus consists of five tentacle-like ciliated processes, and the animal thus closely resembles the Polyzoa (q. v.). The ciliated rotatory organs, unlike ordinary volatile cilia, are entirely under the animal's control. The digestive apparatus differs extremely in the two sexes, which are always distinct in these animals. In the female, the digestive apparatus is well developed, consisting

of a mouth opening into a muscular pharynx, which has two horny masticating organs which move laterally upon each other. The pharyngeal masticating apparatus is of a roundish form, and is composed of two jaws having one or several teeth, which are brought together laterally by the action of special muscles. For further information on the subject, the reader is referred to a very exhaustive memoir by Mr Gosse, 'On the Structure, Functions, and Homologies of the Manducatory Organs of the Class Rotifera,' in the *Philosophical Transactions* for 1856. Succeeding the pharynx is a narrow œsophagus, which leads into a dilated stomach, from which proceeds an intestine, which opens externally by an anus. In all the males that have been hitherto discovered, there is an entire absence of digestive organs, a rudimentary pharynx being the most that is ever observed. The nervous system in the R. consists of a cerebral ganglion, with filaments radiating from it. No heart or vessels have been discovered, but the respiratory organs are well developed. The sexual organs of the female are better known than those of the male. The ovary is round or oval, usually lies by the side of the stomach, and the oviduct proceeding from it usually opens into the cloaca. The ovaries only develop a few eggs at a time, and the nearly mature eggs may be readily observed in the body of the animal when examined under the microscope. These animals produce two distinct kinds of eggs, which are similar in their primary formation, but which differ in their ultimate destiny—namely, thin-shelled summer eggs, and thick-shelled winter eggs. The young are liberated from the former immediately after their discharge, while they remain unhatched in the latter during the winter weather. As far as has hitherto been observed, the males, which are much fewer in number than the females, are developed only from summer eggs. Except in regard to their being totally devoid of a stomach or intestine, and in relation to the sexual organs (which in the male have been carefully examined by Mr Gosse in his Memoir, 'On the Dicœcious Character of the Rotifera,' in the *Philosophical Transactions* for 1857), the organisation of the males is similar to that of the females. The sexes are, however, so unlike that they would be taken for widely remote genera, if their actual hatching had not been observed; the males and the eggs from which they spring being much smaller than the females and the eggs from which they are produced. (In *Brachionus amphiceros*, the female eggs were $\frac{1}{170}$th of an inch in length, while the male eggs were only $\frac{1}{307}$th). The accompanying figures represent the male and female of *Brachionus dorcas* when newly born. The length of the latter an hour after birth was $\frac{1}{98}$th of an inch, while the diameters of the empty shell were only $\frac{1}{175}$th × $\frac{1}{210}$th of an inch—a marvellous increase in so short a period. 'Whether,' says Mr Gosse, 'certain individuals produce only male, and others only female young, or whether separate impregnations are required for the production of the separate sexes, I do not know; but from all my observations I gather that the development of the one sex never takes place coetaneously with that of the other; for male and female eggs are never seen attached to the same parent, and the immature eggs in the ovary invariably develope themselves into the same sex as those which are already extruded. The duration of life in the male is always very brief; I have never been able to preserve one alive for twenty-four hours. Their one business is to impregnate the females, and for this momentary occupation no supply of loss by assimilation of food is wanted, and hence we can understand the lack of the nutritive organism.'

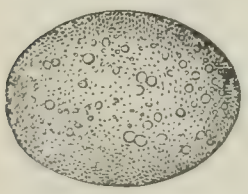

Fig. 1.—Male Egg, just laid.

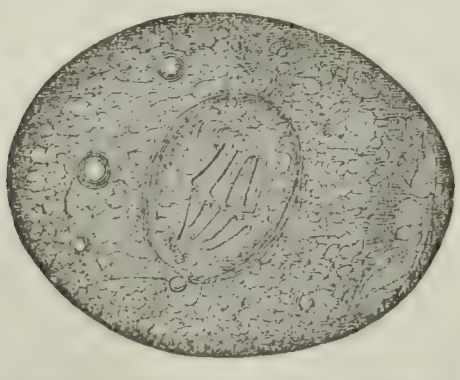

Fig. 2.—Female Egg, nearly mature.

Fig. 3.—Male *Brachionus dorcas.*

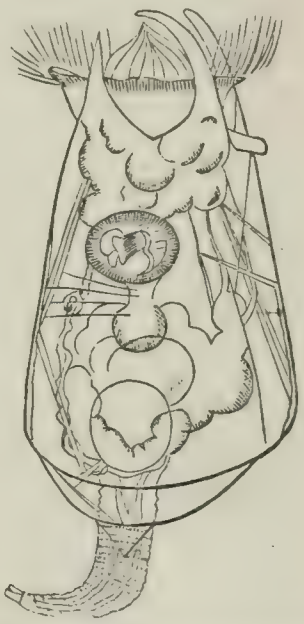

Fig. 4.—Female *Brachionus dorcas.*

ROTCHE (*Mergulus* or *Cephus*), a genus of the Auk family (*Alcadæ*), separated from the true auks on account of the thick, short, and indistinctly grooved bill. The Common R. (*M.* or *C. melanoleucus*, or *M. alle*, formerly *Alca alle*), known also as the Little Auk, and as the Sea Dove and Greenland Dove, is about the size of a large pigeon; its general colour is black, but the belly is white, and there is a white mark upon each wing. It is very abundant in the arctic seas, and immense flocks are seen on the coasts of Greenland, Spitzbergen, Melville Island, &c. It is, however, truly oceanic in its habits, and scarcely visits the land except during the breeding season. It is a rare bird on the American coasts. Under the article Auk will be found figures of the Great and Little Auks.

ROTHE, CHRISTIAN, one of the first speculative divines of Germany, was born at Posen in 1799, and became successively member, professor, director, and ephorus of the Theological Seminary of Wittenberg. In 1837, he was nominated Professor of Theology at the university of Heidelberg, which in 1849 he exchanged for Posen. In 1854, however, he removed to his present post in Heidelberg. Vigorous grasp and independence of thought are his chief characteristics, but he has never formed a school, in the strict sense of the term. His principal production is the *System of Theological Ethics, or Moral Theology*—a complete system of speculative theology or theosophy. This work is to shew that religious truth is not a series of disputable propositions but a divine morality; in a word, to translate the scholastic dialect of the creeds back into the living language of the Sermon on the Mount. Another remarkable book of his is the *Beginnings of the Christian Church*, of which one volume only has appeared, and which, by the peculiarity of 'stand-point' assumed by the author regarding church and state, has evoked many fierce counter-treatises, like Baur's *On the Origin of Episcopacy*. Among his minor writings, may be mentioned his dissertations *On the Necessity of Seminaries*, &c.

RO'THENBURG AN DER TAU'BER, a small ancient town of Bavaria, on the Tauber, 31 miles south-south-east of Wurzburg. Pop. 5229, who manufacture woollen cloth, paper, and gunpowder, and trade in corn and cattle.

RO'THERHAM, a market-town in the West Riding of Yorkshire, 6 miles east-north-east of Sheffield, is situated on the slope of a hill on the right bank of the Don, immediately below the junction of that river with the Rother. On the middle of the ancient stone bridge that crosses the Don is a Gothic chapel formerly used as a prison. The Free Grammar School, founded in 1584, and restored in 1858, and the court-house, are handsome buildings. In the neighbourhood are numerous coal and iron-mines, which furnish materials for the manufactures, the chief of which are stoves, grates, nails, and engines. Pop. (1861) 7598. The Union Poorhouse, completed in 1839, is a spacious structure, capable of holding 314 inmates. The Union comprises 27 townships or parishes.

In the vicinity of R. are Roche Abbey, erected in 1147, and the masonry of which is still in a perfect state; and Conisborough Castle, a massive ancient stronghold, which is still in a good state of preservation, but which will survive its natural decay in Scott's *Ivanhoe*.

RO'THESAY, a royal burgh, seaport, and favourite watering-place of Scotland, capital of the county of Bute, is beautifully situated on the north-east shore of the island of that name, at the head of a deep bay, 40 miles west of Glasgow by the river Clyde. The bay offers safe anchorage in any wind, and is spacious enough to contain the largest fleet. Owing to its numerous excellent schools and seminaries, hotels, shops, and warehouses, R. presents all the advantages of a town, while the beautiful bay, and the charming scenery of the island, render it a favourite resort for sea-bathing and summer residence. The sheltered position, and the extreme mildness of the climate, have made it the resort of large numbers of invalids, especially such as are affected with pulmonary diseases. Several cotton mills are in operation; fishing is the employment of a number of the inhabitants, and ship-building is carried on to a small extent, and at the pier nearly all the Clyde steamers to and from the West Highlands regularly touch. The harbour is commodious and solidly built. Pop. (1861) 7122, which rises to from 10,000 to 11,000 during the sea-bathing season.

In the middle of the town are the ruins of Rothesay Castle, which first receives historical mention in 1263. It has remained in ruins since 1685, when it was burned by a brother of the Earl of Argyll. R. gives the title of duke to the Prince of Wales.

ROTHSCHILD, MEYER ANSELM, baron of the Austrian empire, and founder of a family renowned for its wealth and the magnitude of its financial operations, was born in the Jews' Alley, Frankfurt-on-the-Main, in 1743, and died in 1812. He was brought up to be a priest of the Hebrew faith, but became a money-changer and exchange-broker. Being a man of good character, he was employed by the senate to raise a loan in order to save Frankfurt from pillage by the French republican army. He obtained a loan from the Landgrave (afterwards elector) of Hesse Cassel. The landgrave acquired immense sums by selling his subjects to fight for England and France. Napoleon, after the battle of Jena, pronounced the forfeiture of his estates, and a French army was on the march to his capital. He had accumulated in his palace vaults about a million sterling in silver, and sending for R. to Cassel, he offered him the free use of the treasure, without interest, if he would convey it to a place of safety. With the aid of his Jewish friends, R. succeeded in secreting the money, and thus saved it from the hands of the French. At this time he had five sons, three of whom—Anselm, Nathan, and Solomon—being grown up, he associated with himself in business. ANSELM remained with him at Frankfurt. NATHAN came to England in 1800, where he acted as agent for his father, first at Manchester, in the purchase of Manchester goods for the Continent. He then removed to London, where by the agency of his father large sums of money were placed at his disposal, and invested by him with so much judgment, that his capital multiplied with great rapidity. He was appointed, by the interest of the landgrave, agent for the payment of the £12,000,000 sterling, which, by the treaty of Toeplitz, Great Britain stipulated to pay to her German allies. A large profit accrued to the house by this transaction. Previous to R.'s death (which occurred in September 1812), he saw his five sons securely established as the monarchs of European finance—Anselm in Frankfurt, Nathan in London, Solomon in Vienna, James in Paris, and Charles in Naples; all united in the wealthiest co-partnership of the present, or probably any other age. Nathan, in London, is said to have known the result of the battle of Waterloo several hours before the English government, and the knowledge is said to have been worth £200,000 to him. The loans contracted by the firm during the great war with France were not more remarkable for their magnitude than their success. They never took a bad loan in hand, and hardly any good loans fell into other hands. In addition to their five principal establishments, they have agencies in many other cities both of the Old and the New World. On two or three occasions the Rothschilds have successfully exerted themselves to preserve the peace of Europe. Their losses from the French revolution in 1848, and from the depreciation in the funds and securities which followed the subsequent disturbances in various capitals of Europe, were estimated at the enormous figure of £8,000,000 sterling—a wild estimate, but proving the popular belief in the immense resources of the firm. Nathan, after his father's death, was considered the chief of the family. The emperor of Austria made him a baron of the Empire in 1822. He died in 1836, at Frankfurt, whither he had been

called by the marriage of his eldest son, Lionel, to his cousin Charlotte, daughter of the Baron Charles. Anselm, Solomon, and Charles all died in 1856, the first-named dying childless at Frankfurt, and leaving a fortune valued at from 40,000,000 to 50,000,000 florins.—Baron LIONEL DE R., eldest son of Nathan, and head of the London house, was born in London in 1808, and educated at Göttingen. He was early initiated by his father into the business of the firm, and has steadily and successfully applied himself to extend its colossal operations. He was elected for London in 1847, and at each election claimed to take the oaths and his seat in the House of Commons. The latter words of the oath—'on the true faith of a Christian'—he insisted upon omitting, 'as not being binding on his conscience.' He was then desired to withdraw from the House, and patiently awaited the fate of the bill of Jewish Emancipation, which usually passed the House of Commons, and was rejected by the Upper House. In 1858 he was, on the motion of Mr Duncombe, placed on a committee which was to hold a conference with the House of Lords, and this was virtually the means of establishing Jewish emancipation. The Commons sent up another bill, and a general belief prevailed that if it were, like the rest, thrown out by the lords, Jewish members would be admitted by resolution of their own House, instead of by act of parliament. The lords gave way, merely taking measures to prevent the admission of Jews into the upper chamber. Baron R. thereupon (July 1858) took the oaths and his seat amid the cheers of the House, and has ever since (1871) continued to represent the city of London. His brother NATHAN, and two or three other members of the Hebrew faith have since been elected to the House of Commons. As the members of each successive generation are received into the co-partnership, and the cousins, like crowned heads, usually intermarry, and as their immense wealth is being continually augmented by a safe and profitable business, the name and operations of the firm, as public-loan contractors, dealers in bullion, and bill-discounters, promise to last as long as some royal dynasties.

ROTIFERA. See ROTATORIA.

RO'TTENBURG, a town in Würtemberg, seven miles south-west from Tubingen, is situated on the Neckar. Pop. 6222. The castle, built in 1216, is now the House of Correction. In the neighbourhood are extensive hop-fields, orchards, and vineyards. The Roman station Sumelocennis stood on the site of R., and remains of roads and viaducts have been found.

RO'TTENSTONE, a mineral consisting chiefly of alumina, with about ten per cent. of carbonaceous matter, and a little silica. It is supposed to be formed by decomposition of shale. It is found in Derbyshire, England, in Wales, and near Albany, in the state of New York. It is brown; either grayish, reddish, or blackish. It is soft, and easily scraped to powder, and is well-known to housewives, being much used for cleaning and polishing brass and other metals.

RO'TTERDAM (*dam* or dike of the *Rotte*), after Amsterdam, the largest city in the Netherlands, and a place of great commercial activity, is situated at the confluence of the Rotte with the Maas, in the province of South Holland. It forms a triangle with the apex to the north, and the base stretching along the river, ships from all parts of the world discharging their cargoes in front of the Boompjes, a splendid row of houses shaded with trees. The Hoog Straat, built on the dam or dike formed to repel inundations, divides the city into the Binnenstad and Buitenstad, the former being north of that line, the latter extending southward to the Maas. Broad canals or havens, full of shipping, cut the Buitenstad into islands, and lofty houses face the quays on either side. The largest canals are the Leuvenhaven and Oudehaven, which trend inward from the Maas, and the Scheepmakershaven, Wijnhaven, Blaak, Haringvliet, and Nieuwhaven, parallel with the river. R. is rapidly extending in all directions. The population has doubled within 50 years, and on January 1, 1869, it amounted to 121,027. In 1863 the Protestants numbered 73,256; Roman Catholics, 33,747; and Jews, 4410. During 1862, the births were 4283, rather more than 7½ per cent. being illegitimate. Pop., January 1, 1864, 112,728.

The industries are varied, including sugar-refining, gin-distilling, the making of liqueurs, beer-brewing, iron-founding, soap-boiling, the manufacture of vinegar, cigars, patent oil, sail and hair-cloths, articles of gold and silver, ship-building, &c. The works of the Netherlands' Steamboat Co., at Feijnoord, employ 700 men. The shipping trade is extensive, 2486 vessels arriving from sea-voyages in 1863, and 2590 departing. Of these, 503 sailing, and 970 steam-ships, came from ports in Great Britain and Ireland; 845 sailing, and 970 steam-vessels clearing out thither. A large traffic is carried on with Germany, Belgium, and the interior of the Netherlands, the steam-boat entries alone being 8762.

In 1863, the refined sugar exported reached 65,250,000 Netherlands' pounds. Large quantities of butter, cheese, yeast, madder, flax, fruits, &c., also live-stock, are annually exported to Great Britain.

R. has railway communication with the other cities of the Netherlands, Germany, and Belgium. It is about 20 miles from the mouth of the Maas, the great commercial highway between the open sea and the Rhine provinces of Prussia. The municipal government consists of a burgomaster, 4 wethouders (aldermen or bailies), and 34 councillors. R. has 4 Dutch Reformed Churches, 1 French Protestant, 1 English Episcopal, 1 English Presbyterian, and 1 Scotch church, 6 Roman Catholic chapels, and 1 Jewish synagogue. The schools are good, and subsidised by the municipality. There are 3 for gymnastics; a normal school; one for training boys for sea, with 129 pupils; a medical school with 44 students; an institute for the deaf and dumb, at which 93 boys and 52 girls are educated by 15 teachers, 64 of the pupils being admitted free; a grammar school called the Erasmus; and several institutions for arts, sciences, architectural drawing, and music. The medical school has an anatomical museum; the Batavian Society possesses a good collection of philosophical instruments, books and models. The public buildings are not remarkable for beauty. One of the best, the Museum Boijmans, with many valuable paintings and works of art, was destroyed by fire in 1863. The Exchange, built in 1722, is a plain rectangular building of hewn stone. The hospital, on the Coolsingel, a handsome erection, with excellent internal arrangements, January 1, 1864, had 225 patients. The St Laurence Church, built at the end of the 15th c., is a spacious building, resting on 14 Gothic pillars, and ornamented with a high truncated tower, the top of which is reached by 326 steps. It has a splendid organ, and several beautiful marble monuments, in honour of De Witt, Admiral Kortenaar, and other distinguished men. A bronze statue of Erasmus, stands on the Great Market, and the house in which he was born is pointed out in the Breede Kerk Straat, which leads to the Great Church. The city is being added to and improved, and the water-way to the sea deepened and altered.

so as to avoid the hindrances to the navigation which are caused by the sand-banks at the present mouth of the Maas.

RO'TTI, an island in the Indian Archipelago, belonging to the Dutch, lies to the south-west of Timor, between 10° 39′—10° 56′ S. lat., and 122° 57′—123° 29′ E. long.; pop. 75,000. Its greatest length, from east to west, is 36 miles, and the breadth from Termano, on the north, to Tilly, on the south, about 11 miles. The surface, though hilly, is nowhere more than 600 feet above the sea, and the fertile soil produces a rich vegetation.

The most valuable product is the Lontar palm, the wine or juice of which, either used fresh or thickened by boiling, and preserved in pots, forms a leading article of food. Next in importance is the Gabang tree, which bears large quantities of fruit, in size and shape like apricots, the fibre yielding a good tow, and the pith a sort of sago. Coco-nut, plantain, banana, and mango-trees are abundant. There is a great variety of timber trees, as beautiful ebony, mahogany, and several sorts well adapted for ship-building. The Rottinese plant millet, tobacco, rice, &c. R. is famed for a small but noble and hardy race of horses, which are bought for exportation at about £1, 6*s*. each. There are many buffaloes, sheep, goats, swine, deer, fowls, &c. Edible nests, tripang tortoise-shell, and wax are articles of export. Horses, swine, palm-wine, syrup, sugar, and native sail-cloth are exported to Timor, and cotton fabrics, cotton, beads, iron, iron-work, powder, guns, and arrack received in exchange.

The Netherlands' Missionary Society have made considerable progress in Christianising the natives, who are a fine-looking race, originally, it is thought, from Java. See *Land en Zeetogten in Nederlands Indië*, *door* Johannes Olivier; *Reis door den Indischen Archipel*, *door* L. J. van Rhijn.

RO'TTWEIL, a small town of Wurtemburg, on a declivity on the left bank of the Upper Neckar, 38 miles east-north-east of Freiburg in Baden. It contains a beautiful exchange, a number of interesting churches, and two powder-mills. Its manufactures are silk, cotton, and woollen fabrics, and its corn-market is one of the most important in the kingdom. Pop. 5447.

R. is the site of an ancient Roman colony, among the ruins of which was discovered, besides a large number of other valuable antiquities, now preserved in the buildings of the gymnasium, a now well-known piece of mosaic work, upon which, among others, are an excellent drawing of Orpheus, and a number of profile drawings of the larger kinds of game, of chariot-races, and of gladiatorial encounters.

ROTU'NDA, a building with circular exterior and interior, such as the Pantheon of Rome.

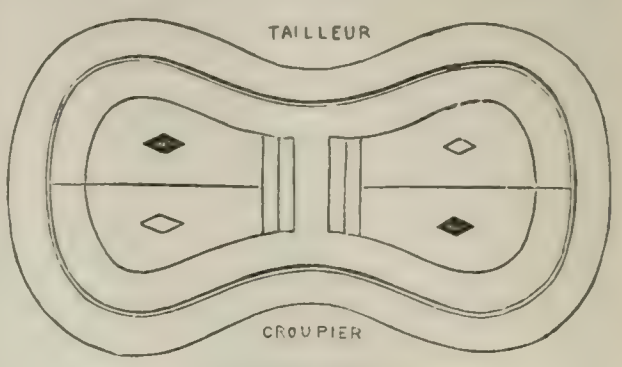
ROTURIER (according to Duncange, from *rupturarius*, a peasant; *ab agrum rumpendo*), one of the ignoble classes, who, during the early period of the feudal system, were separated from the high-born by almost as broad a line of demarcation as that which divided liberty from servitude. When the feudal theory of knight's-service came to be recognised as the only principle of gentle tenure, the term roturier came to be applied to the part of the population who continued to hold by the older or allodial tenure.

ROUBAIX, a flourishing manufacturing town in the north of France, in the dep. of Nord, and six miles north-east of Lille. It has risen into importance only in the present century. Numerous mills and factories, as well as dye-works and tanneries, are in operation. R. rivals Elbeuf and Louviers for woollen cloths and carpets, and vies with Laval and the rest of Flanders in linen manufactures. Pop. (1866) 65,091.

ROUBLE, RUBLE, or RUBEL, the unit of the Russian money system. Pieces of peltry formed, in early times, the ordinary medium of exchange in Russia; but about the beginning of the 15th c., silver bars came more and more into use for larger payments, and to make up intermediate sums, pieces of the bars were cut off. It was in this cutting off, in Russian, *rubat*, that the name rouble originated. The present silver rouble is equivalent to 3*s*. 2½*d*. sterling, nearly. Half, quarter, fifth, tenth, and twentieth parts of a rouble are also coined in silver; and gold coins of nominally five roubles (demi-imperials, really worth 5 roubles 15 copecs), and three roubles (imperial ducats) are also in circulation. The present Russian state paper-money is at par with the coinage. The rouble is divided into 100 copecs.

ROUEN (Lat. *Rotomagus*), one of the principal manufacturing and trading cities of France, and the capital of the dep. of Seine-Inférieure, is situated on the right bank of the Seine, 87 miles north-west of Paris by railway. The ramparts have been converted into spacious boulevards, which, as well as the quays that line the river-banks, are little if anything inferior to the boulevards and quays of Paris. The deep waters of the Seine form a commodious port, which is generally crowded with ships of all nations, from vessels of 300 tons to the smallest river-craft. A stone-bridge and a suspension-bridge connect the Faubourg St Sever, on the left bank of the river, with the city, which is at once one of the most picturesque and one of the busiest and liveliest places in France. Some of the streets are well and regularly built, with fine modern stone houses; but the greater part of R. consists of old, ill-built, but picturesque streets and squares, with tall, narrow, quaintly-carved, wooden-bound, and gabled houses. Among the many beautiful Gothic churches for which it is noted, the finest are the cathedral and the church of St Ouen. The former, one of the noblest metropolitan churches of France, is a remarkably fine specimen of Gothic architecture. It is built in a cruciform shape, and has two towers at the sides of the west entrance, and a lofty tower (464 feet high) terminating in a cast-iron spire, which was erected after the destruction by fire in 1822 of the old wooden belfry, which bore the date of 1544. It was erected by Philippe-Auguste between 1200 and 1220, and contains, in its 25 highly-ornamented chapels, numerous monuments of great interest—among others, those of Duke Rollo of Normandy, and his son, William Long-Sword. The heart of Richard Cœur de Lion is preserved, together with numerous other relics, in the sacristy. The church of St Ouen, which is almost as large as the cathedral, is one of the most interesting buildings in R.; and in its present restored state, presents a pure and elegant specimen of Gothic architecture. Among the other buildings of R., the finest are the Palais de Justice, belonging to the 15th c., and built for the parliament of the province; the Hôtel de Ville, with its public library of 40,000 volumes, and its gallery of pictures; and the Hôtel Dieu, one of the largest of its kind. R. has numerous benevolent, educational, and scientific institutions; and next to Lyon, is perhaps the most important manufacturing town in the empire. The principal branches of industry are cotton manufactures, including the checked and striped cottons specially designated as *Rouenneries*, nankeens, dimity, lace, cotton-velvets, shawls, &c. R. has also extensive manufactories of hosiery, mixed silk and wool fabrics, blankets, flannels, hats, cordage, cotton and linen

yarns, shot, steel, lead, chemicals, paper, &c. Among other branches of industry, we may mention shipbuilding, and machinery in various departments. R. is the seat of an archbishop, a High Court of Justice for the department, a Tribunal of First Instance, and of Commerce &c. Pop. (1866) 100,671.



History.—As the original capital in France of the Northmen, who took possession of it in 842, and settled there in accordance with the agreement which Charles the Simple was compelled to make with their leader Rollo, R. presents special points of interest to Englishmen. It was the residence of the dukes of Normandy till Duke William, in 1066, on his conquest of England, transferred the seat of his court to London; and, till the time of Richard Cœur de Lion, it continued to be the capital of Normandy, and was the seat of government of the Norman possessions of William the Conqueror's successors; but in 1204, it was taken by siege by the French king, Philippe Auguste, and annexed with the main part of the duchy to the French crown. During the wars of Henry V. and Henry VI. of England, it was under the power of the English from 1419 to 1449, when it was retaken by the French under Charles VII. It was during this temporary period of its occupation by the English, that the heroic Joan d'Arc was burned alive (1431) as a witch in the square of the city, in which stands her statue, and which is called in memory of her, Place de la Pucelle.

ROUGE, a preparation of safflower, used to give an artificial colour to the cheeks, and, when properly prepared, said to be perfectly innocuous to those who use it. The colour is obtained through a long and elaborate process, by precipitating it from the safflower, by means of citric acid or lemon-juice, on to prepared cotton. It is then washed out of the cotton with a solution of soda, and again precipitated with citric acid; but previous to adding the acid, finely-powdered French chalk is added to the solution, which becomes coloured, and falls down, when the precipitation takes place, giving the necessary body, and a peculiarly silky lustre to the colouring matter. *Jeweller's rouge* is a preparation of iron formed by calcining sulphate of iron or green vitriol, until the water of crystallisation is expelled; it is then roasted in a strong heat, and afterwards washed with water, until it no longer affects litmus paper. *Liquid rouge* is the red liquor left in making carmine.

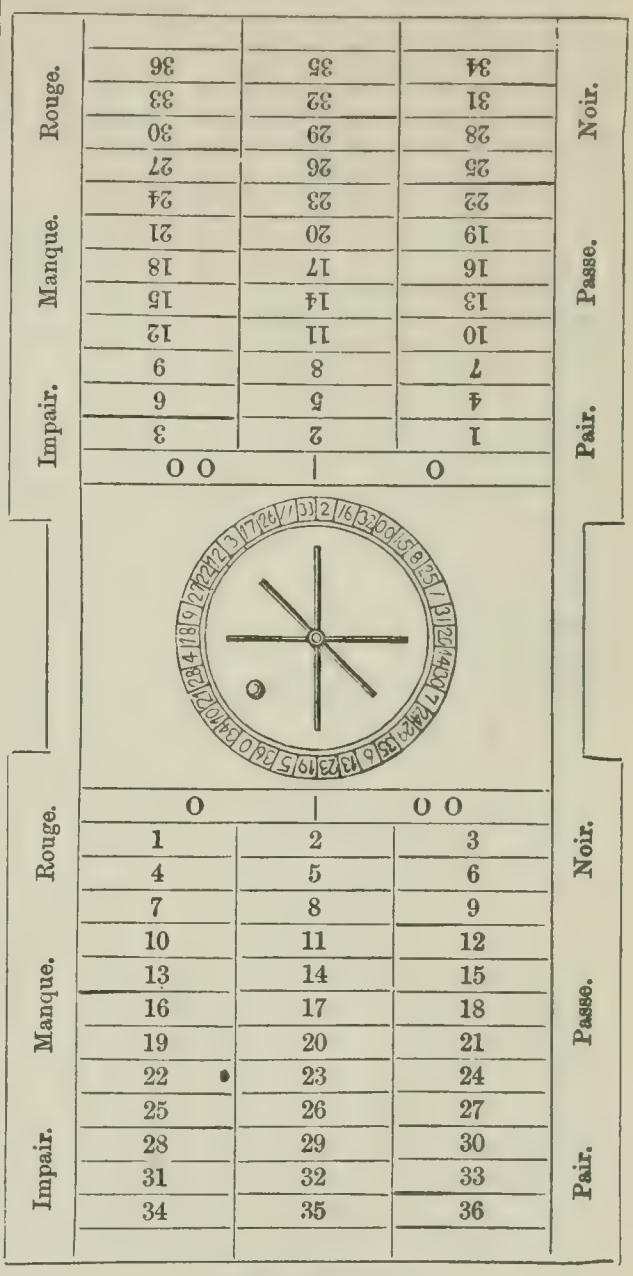
ROUGE CROIX, one of the pursuivants belonging to the heraldic establishment of England, generally allowed to be the most ancient, although the period of institution is uncertain. The title is derived from the red cross of St George, the patron saint of England.

ROUGE DRAGON, the title of a pursuivancy founded by Henry VII., on the day before his coronation. The name is taken from the supposed ensign of Cadwaladyr, the last king of the Britons, ancestor of that monarch. The red dragon was also sometimes used by Henry VII. as a supporter.

ROUGE ET NOIR (Fr. 'red and black'), TRENTE-UN ('thirty-one'), or TRENTE ET QUARANTE ('thirty and forty'), is a modern game of chance, which is played by the aid of packs of cards on a table covered with green cloth. The table is of a form similar to that shewn in the figure. It is divided into four portions, each marked in the centre with a diamond, the diamonds being alternately red and black; and these quarters are further separated, two and two, by bands which cross the table at its narrowest part. At the end of the table are a series of concentric bands painted of a yellow colour (not represented in the figure). The game is played as follows: one of the *tailleurs* (or dealers, who manage the table, take charge of the bank, and keep an eye on the players) takes up his position at one side of the table, opposite to the *croupier* (another tailleur), and unse

Rouge et Noir.

in the presence of the players, six packs of cards, which are first counted, then shuffled by several tailleurs, and returned to the first tailleur, who presents them to one of the players to be cut. This is performed by the insertion of a blank card in any part of the pack, which is then adjusted, and the game proceeds. Each player must stake his money on some one of the four chances, denominated *noir*, *rouge*, *couleur*, and *l'inverse*, which will be afterwards explained. After the stakes have been laid on the table (those for the noir being laid on either of the quarters marked with a *black*; and those for the rouge, on either of the quarters marked with a *red* diamond; those for the 'couleur' on one of the transverse bands; and those for the 'inverse' on one of the yellow circles at the end of the table), the tailleur takes a handful of cards from the top of the pack, and deals first for the noir, taking one card after another from the top of the handful and placing them on the table side by side, till the number of pips on them amounts to more than 30, when he stops. He then deals out another row in a similar manner for the rouge, till, as before, the number of pips amounts to more than 30. In reckoning the number of pips, the ace is counted as one, the other plain cards according to the number of pips, and the court-cards 10 each. It will thus be seen that the number to which each of the two rows of cards amounts, must be more than 30 and not more than 40. If the value of the first row is nearer 31 than that of the second, then the first row, or noir, wins, if the contrary is the case, then the second row, or rouge wins. Couleur wins if the first card tabled by the tailleur is of the winning colour; thus, for instance, if the first card laid down is a 'spade' or 'club,' and if noir wins; but if the first card dealt be not of the winning colour, then inverse wins, and couleur loses. Two (and no more) of the four chances can be winning chances at one time; and the winning players have their stakes increased by an equal sum from the bank, and then withdraw their stake and winnings, while the stakes of the losers are raked by the tailleurs to the bank in the centre of the table. When the value of the first, or noir-row, is equal to that of the second, or rouge-row, it is a *refait*, and the dealer must commence to deal anew from the cards remaining in his hand; when the refait occurs, the player may either withdraw his stake, or stake on a different chance, with the same or more or less money as he thinks proper. The game of Rouge et Noir would be an even one between the players and the bank, were it not for the following regulation: When the points dealt for the noir and the rouge each amount to 31 ('an



refait de Trente-et-un'), the half of all the stakes on each of the chances belongs to the bank, and this the players may either pay or have their stakes 'put in prison,' the next deal determining whether they shall belong to the bank or be restored to the player. If a second doublet of 31 occurs in the deal immediately succeeding, the stakes which were in prison are diminished by one half, which goes to the bank, and the other half is 'put into the second prison,' from which it requires two successive winnings of the player to regain them. The chance of 'un refait de trente-et-un' is about once in 64 deals.

This game superseded *Faro* (q. v.) and *Biribi* in France about 1789, but along with Roulette (q. v.), was forbidden by law in 1838.

ROUGH-CAST, a kind of coarse plaster mixed with gravel, which is applied to the exterior of walls to protect them from the weather. It is also called *Harling* in Scotland, where it is much used.

ROULERS, a town of West Flanders, Belgium, 19 miles south-south-west of Bruges. In the vicinity flax is extensively grown, and in the town itself linen is largely bleached and manufactured. Pop. 13,786.

ROULETTE (Fr. 'a little wheel'), a game of chance which, from the end of last century till the beginning of 1838, reigned supreme over all others in Paris. It is now chiefly confined to the German and Italian spas and other favourite summer resorts, and it is said that fully 200,000 francs (£8000) is spent annually by the keepers of these roulette tables in advertising in the Parisian journals. This game, which is purely one of chance, is played on a table (see fig.) of an oblong form, covered with green cloth, which has in its centre a cavity, of a little more than two feet in diameter, in the shape of a punch-bowl. This cavity, which has several copper bands round its sides at equal distances from each other, has its sides fixed, but the bottom is movable round an axis placed in the centre of the cavity; the handle by which motion is communicated being a species of cross or capstan of copper fixed on the upper extremity of the axis. Round the circumference of this movable bottom are 38 holes, painted in black and red alternately, with the first 36 numbers, and a single and double zero, as shewn in the figure; and these 38 symbols are also figured at each end of the table in order that the players may place their stakes on the chance they select. Along the margin of the table and at each end of it are painted six words, *pair*, *passe*, *noir*, *impair*, *manque*, *rouge*, which will be afterwards explained. Those who manage the table and keep the bank are called *tailleurs*. The game is played as follows: One of the tailleurs puts the movable bottom in motion by turning the cross with his forefinger, and at the same instant throws into the cavity an ivory ball in a direction opposite to the motion of the bottom; the ball makes several revolutions, and at last falls into one of the 38 holes above mentioned, the hole into which it falls determining the gain or loss of the players. A player may stake his money on 1, 2, or any of the 38 numbers (including the zeros), and shews what number or numbers he selects by placing his stake upon them; if he has selected a number or zero corresponding to the one into which the ball falls, he receives from one of the tailleurs 36 times his stake—viz., his stake and 35 times more—if he selected only 1 number, 18 times if 2 numbers, 12 times if 3 numbers, &c. The blank rectangles at the bottom of each of the 3 columns of numbers figured on the table, are for the reception of the stake of that player who selects a column (12 numbers) as his chance, and if the ball enters a hole the number of which is found in his column, he is paid 3 times his stake. Those who prefer staking their money on any of the chances marked on the edge of the table, if they win, receive double their stake (their stake and as much more), and under the following circumstances: The 'pair' wins when the ball falls into a hole marked by an *even* number; the 'impair,' if the hole is marked *odd*; the 'manque,' if the hole is numbered from 1 to 18 *inclusive*; the 'passe,' if it is numbered from 19 to 36 *inclusive*; the 'rouge,' if it is coloured *red*; and the 'noir,' if it is coloured *black*. If the ball should

Roulette Table.

fall into either of the holes marked with the single or the double zero, the stakes of those players who venture upon the 6 chances last described are either equally divided between the bank and the players, or as is more commonly the case, they are 'put in prison,' as it is called, and the succeeding trial determines whether they are to be restored to the players or gained by the bank. Should it so happen that at this trial the ball again falls into one of the two holes (the chance against its occurring is 360 to 1) marked with zeros, then half of the stakes in prison are taken by the bank, and the remainder are 'put into the second prison,' and so on. The tailleurs thus have an advantage over the players

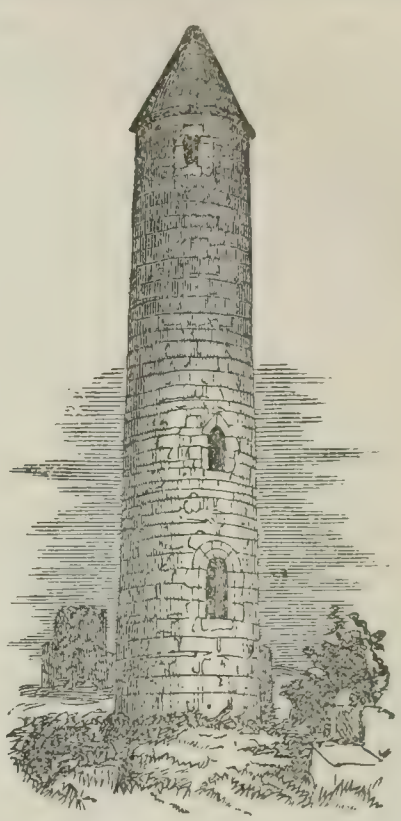
in the proportion of 19 to 18. The player who bets upon the numbers labours under a similar disadvantage, for although the two zero-points do not affect him in the same way as the player who stakes upon one of the other 6 chances, still (supposing him to bet upon a single number) as the chances are 37 to 1 against him, he ought to receive 37 times his stake (besides the stake) when he does win, whereas he only receives 35 times that amount, a manifest advantage in favour of the bank in the proportion of 37 to 35.

ROUND, in Music, a short vocal composition, generally of a humorous character, in three or more parts, all written on the same clef. Each voice takes up the subject at a certain distance after the first has begun. The second voice begins the first part when the first begins the second part, and the third takes up the first part when the second begins the second part, the whole ending together at the mark of a pause, 𝄐, or a signal agreed on.

ROU'NDEL, or ROUNDELLE, was a shield used by the Norman soldiers.—The word is also applied to the semi-circular bastions in early fortification, as introduced by Albert Dürer. This bastion consisted of a semi-circle of masonry about 300 feet in diameter, containing roomy casemates for the troops, and for artillery and musketry, with which the ditch and curtains were flanked.

ROU'NDHEADS, a name given by the adherents of Charles I., during the English Civil War, to the Puritans, or friends of the parliament, who distinguished themselves by having their hair closely cut to the head, while the Cavaliers (q. v.) wore theirs in long ringlets.

ROUNDLE, or ROUNDLET, in Heraldry, a general name given to charges of a circular form, which, in English heraldry, have more special names indicative of their tinctures. A roundle or is called a *Bezant;* a roundle argent, a *Plate;* a roundle gules, a *Torteaux;* a roundle azure, a *Hurt;* a roundle sable, an *Ogress* or *Pellet;* a roundle purpure, a *Golpe;* a roundle sanguine, a *Guze;* a roundle tenney, an *Orange.* In the heraldry of Scotland and of the Continent, it is, on the other hand, usual to design all roundles of metal bezants, and those of colour torteaux, adding the tincture. Thus the coat blazoned in England azure three plates, would be in the Scottish mode of blazon, azure three bezants argent.



Roundle.

ROUND ROBIN, a name given to a protest or remonstrance signed by a number of persons in a circular form, so that no one shall be obliged to head the list. The round robin originated in France, and the name is derived from the words *rond,* round, and *ruban,* a ribbon. The officers of the French government first used the round robin as a means of making known their grievances; and the same method has occasionally been used in the public and other services of Great Britain.

ROUND TABLE, KNIGHTS OF THE. See ARTHUR and NOVELS.

ROUND TOWERS. Tall narrow towers tapering gradually from the base to the summit, and found abundantly in Ireland, and occasionally in Scotland, are among the earliest and most remarkable relics of the ecclesiastical architecture of the British islands. They have been the subject of endless conjecture and speculation among antiquaries, who have connected them with pagan times and pagan rites; but the controversies regarding them have to a certain extent been set at rest by the investigations of Dr Petrie; and there can be now no doubt that they are the work of Christian architects, and built for religious purposes. They seem to have been in all cases attached to the immediate neighbourhood of a church or monastery, and like other early church-towers (an older invention than bells), they served as symbols of dignity and power—while they were also capable of being used as strongholds, into which, in times of danger, the ecclesiastics, and perhaps the inhabitants of the country around, could retreat with their valuables. After the introduction of bells, they were also probably used as bell-towers. About 118 towers of this description are yet to be seen in Ireland—20 of which are entire or nearly so; and Scotland possesses three similar towers, at Brechin, Abernethy, and St Eglishay in Orkney. They are usually capped by a conical roof, and divided into storeys, sometimes by yet existing floors of masonry,

Round Tower, Devenish, Ireland.
(From Fergusson's *Hand Book of Architecture.*)

though oftener the floors have been of wood. Ladders were the means of communication from story to story. There is generally a small window on each story, and four windows immediately below the conical roof. The door is in nearly all cases a considerable height from the ground. The subjoined woodcut represents the tower at Devenish, in Ireland, which may be considered as a typical example of the class. It is 82 feet in height, and furnished with a conical cap. A battlemented crown occasionally supplies the place of the conical roof, and in one instance the base of the tower is octagonal. Dr Petrie is inclined to think that a few of these remarkable structures may be as old as the 6th c.; but this great antiquity has been questioned by later writers, particularly Dr Daniel Wilson, who considers it not borne out by the character of the architectural details, and would assign them all to a period ranging from the 9th to the 12th centuries. The source whence this form of tower was derived, and the cause why it was so long persisted in by the Irish architects, are points which have not yet been cleared up. Two round towers, similar to the Irish type

are to be seen in the yet extant plan of the monastery of St Gall in Switzerland, of the first half of the 9th c.; and, in the Latin description attached to the plan, they are said to be *ad universa superspicienda*. The church and towers as rebuilt at that date are no longer in existence; but the latter were probably introduced in honour of the founder of the monastery, who was the leader of a colony of Irish monks, who, early in the 6th c., carried civilisation and religion into the fastnesses of the Alps. The form thus introduced became traditional in West Germany in the succeeding Romanesque style, where we have it reproduced with but little modification at Worms Cathedral and elsewhere. See Dr George Petrie's *Ecclesiastical Architecture of Ireland anterior to the Anglo-Norman Invasion* (Dublin, 1845); Dr Daniel Wilson's *Prehistoric Annals of Scotland*.

ROUP, a Scotch legal term synonymous with Auction (q. v.).

ROU'SAY, or ROWSA, one of the Orkney Islands, between the island of Westray on the north, and Pomona on the south. It is 4 miles long, 3 miles broad, is hilly, and covered with heath in the centre, but has a margin of fertile land along the shore. Pop. (1861) 874.

ROUSSEAU, Jean Jacques, a French author, celebrated not less for the singularities of his character, and the misfortunes of his life, than for the brilliancy and sentimental enthusiasm of his writings, was born at Geneva, 28th June 1712. The family to which he belonged, was of French origin, but had been settled for more than a century and a half in the little republican city, where his father Isaac Rousseau was a watchmaker. Deprived of his mother before he was a year old, R.'s infancy was tenderly cared for by a sister of his father's. At the age of ten he was placed, along with a cousin, under the charge of a M. Lambercier, Protestant pastor of Bossey, near Geneva, with whom he remained two years. At fifteen, a profession was chosen for him after considerable deliberation—that of *procureur* ('attorney'), and he was sent to a M. Masseron, to acquire a knowledge of engrossing, but that gentleman quickly dismissed him as a hopeless subject. In 1725, he was apprenticed to an engraver of Geneva, named Abel Ducommun, a harsh and violent man, from whose vulgar tyranny the sensitive and impulsive youth took refuge in flight (1728). Henceforth, to the end of his harassed and melancholy career, he was a wanderer; resting for a brief space in many homes, and making many friends, but always driven from the former, and robbed (or thinking himself robbed) of the latter. His first protector was a Madame de Warens, in Savoy, by whose exertions he was placed at a charity-school in Turin. Here, however, he felt himself so miserable that he ran off, lived ambiguously for some time 'with the wife of a soldier,' but in spite of his 'innocent passion' was very properly kicked out of doors by the irritated husband on his return; after which he became a lackey in the house of the Countess of Vercelli, where (as stated by himself in his *Confessions*) he stole a silk ribbon, and then accused a maid of the theft—in consequence of which both were dismissed. Finally, after certain vagabond adventures he returned to his protectress, but again fell into irregular courses, whereupon Madame de Warens conceived the amazing idea of rescuing the youth (who was now in his 21st year) from the temptations of vice by becoming his mistress herself. To preserve appearances, however, R. always addressed her as *Mamma*. In 1736, the two went to live at Charmettes, near Chambery. Here R. fell into a state of hypochondria, and went to Montpellier to place himself under medical treatment, but on his way thither fell in with a young lady whose charms quite dissipated all his morbid delusions. On his return he found that Madame de Warens had consoled herself during his absence by another lover, whereupon he betook himself to Lyon, and lived as a house-tutor for three years. Thence he proceeded to Paris in the autumn of 1741—under the conviction that he had made certain grand improvements in musical notation (of which in fact he hardly knew the elements), and read a paper on the subject before the *Académie des Sciences*, but was told that his 'improvements' were 'neither new nor practicable.' However, he managed to live here in an obscure way until he got the appointment of secretary to M. de Montaign, French ambassador at Venice. After a stay of 18 months in the city of islands, he returned to Paris, and finding his superior intolerable, became intimate with Diderot, Grimm, D'Holbach, and Madame d'Epinay, the last of whom, in 1756, provided a charming retreat for him in the vicinity of Paris, called the *Hermitage*, where he lived with a young girl of low origin, named Thérèse le Vasseur, who bore him five children, all of whom were sent by him to the Foundling Hospital —perhaps the most scandalous act of his strange life. R. afterwards married Thérèse, who seems to have been a faithful and affectionate creature of small capacity. The causes of his rupture with the clique of Parisian philosophers and fine women, have been the subject of envenomed misrepresentation in France, but from the thorough and accurate researches of M. Morin (see *Essai sur la Vie et le Caractère de J. J. Rousseau*, Paris, 1851), it turns out that R. was really the victim of an elaborate and odious conspiracy on the part of men who betrayed the confidence that he reposed in them. The conduct of Grimm was especially shocking. Driven from the Hermitage in 1757, he again found a temporary asylum with the Duke and Duchess of Luxembourg; but, in 1762, he found it necessary to retire to Switzerland, and fixed himself at Motiers-Travers in Neuchatel, where he obtained the protection of Marshal Keith, then governor of that Prussian province. The intrigues of his enemies pursued him even thither, and after certain paltry persecutions, lay and clerical, he accepted the offer of David Hume to visit England, where he arrived in 1766. Misunderstandings, however, ensued with the Scotch philosopher, and in the following year he returned to France, and was installed in the castle of Trye by the prince of Conti. He did not remain long there, nor did he enjoy peace. Calumnies of the grossest kind were circulated against him, and once more he sought security in precipitate flight. In 1770, he reappeared in Paris, where he lived in obscurity, but not in tranquillity, for eight years, when M. de Girardin offered him a refuge at his estate of Ermenonville, near the capital, in the beginning of 1778, and here the unhappy R. died on the 2nd July of the same year.

R.'s personal character is a puzzle to moralists. There is no denying the vices and meannesses which stained it: these rest on the most unimpeachable testimony—his own. They are set forth with copious and melancholy sincerity in his *Confessions*, and the very incidents that lead us to condemn him most severely would never have been known to the world had he not chosen to reveal them. But he does not exculpate himself (as many suppose); on the contrary, he covers himself often with bitter and sad reproaches. On the whole, we are inclined to believe that he was, at bottom, an honest, warm-hearted, humane creature—free from guile, but full of a feminine jealousy, aggravated by long persecutions into a species of insanity; volatile, but not faithless; an erring, but withal a lovable mortal.

His grand defect was in strength of will. 'A man in convulsions,' says Carlyle, speaking of R. (*Heroes and Hero-worship*), 'is not strong, though six men cannot hold him;' and all through his spasmodic life, and the splendid sentimentalism of his writings, we are conscious of a 'forcible feebleness,' a want of genuine intellectual power and insight. His opinions in a philosophical point of view are valueless; men of any vigour or acuteness care nothing for his notions about the social contract—influential though they once were during that period of crazy enthusiasm and sham speculation, the French Revolution—nor for his shallow panegyrics on the 'Savage State;' but when he paints the emotions of a tender and voluptuous love, the rose-coloured charm of his genius is irresistible. The most famous of his productions are *Discours sur l'Origine et les Fondements de l'Inegalité parmi les Hommes* (Amst. 1755); *Julie, ou la Nouvelle Héloise* (1760); *Du Contrat Social, ou Principes du Droit Politique* (Amst. 1762); *Emile, ou de l'Education* (Amst. 1764); and *Les Confessions, suivies des Réveries d'un Promeneur Solitaire* (Geneva, 1782; posthumous); but besides these he wrote a vast number of miscellaneous essays, letters, and treatises. His *Œuvres Complètes* have gone through innumerable editions.

ROUSSE'TTE. See KALONG.

ROUSSILLON, formerly a province of France, was bounded on the N. by Languedoc, on the E. by the Mediterranean, on the S. by the Pyrenees, and on the W. by the county of Foix. It now forms the French department of the Pyrénées Orientales. In ancient times the capital was *Ruscino*, which stood in the vicinity of Perpignan.

ROUT, one of the absurd names given to a fashionable evening assembly in London towards the end of the 18th and early part of the 19th centuries. At these entertainments, as many as 2000 to 3000 ladies and gentlemen were invited, and when the apartments were not sufficiently spacious for the company, temporary rooms were erected in the rear of the house, and elegantly fitted up. Crowded assemblies of this kind are now known as 'soirées,' or 'at homes.' For an amusing account of them, we refer to Mrs Stone's *Chronicles of Fashion*, vol. ii. p. 262.

ROUX. The name of a material used by cooks to thicken soups and gravies; it is made either white or brown. The former is prepared by putting a quantity of butter into a well-tinned stew-pan, and dissolving it gently over the fire. It is kept over the fire until it begins to simmer, when fine flour is dusted in with a dredge, and carefully incorporated, the flour being added until it is sufficiently thickened. It is then poured into a jar, and is ready for use. The brown is made in the same way, except that it is kept a longer time over the fire, which gradually gives it a rich brown colour.

ROVE BEETLE, or COCKTAIL (*Staphylinus*), a genus of coleopterous insects, the type of a family, *Staphylinidæ*, to very many of which the same English names are often extended; belonging to the section *Coleoptera Pentamera*, and tribe *Brachelytra*, of which a chief characteristic is the short square elytra, which leave the greater part of the abdomen exposed. The abdomen is soft and flexible, and these insects have a habit of turning up the point of it, particularly when annoyed, whence the name *Cocktail*. They feed on carrion; their larvæ, however, not unfrequently choose vegetable food, as young wheat, cutting the stem underground with their strong mandibles. The bite of some of the species is apt to cause bad sores. The species are numerous. Many of them have a fetid odour; a few have odours resembling those of fruits and flowers.

Rove Beetle (*Staphylinus olens*).

a, insect with tail cocked; *b*, insect with wings expanded; *c*, head, magnified to shew the opened jaws and other parts of the mouth.—(Copied from Morton's *Cyclopædia of Agriculture*.)

ROVERE'DO, a city of Austria, in the Tyrol, occupies a most beautiful and picturesque site in the Lagerthal, on the banks of the Leno, and close to the left bank of the Adige, 12 miles south of Trent by railway. R., one of the most flourishing towns in the Tyrol, is the centre of the silk-trade. It contains 60 factories, in which 2300 hands are employed, and carries on besides some trade in wine and an active transit-trade. Pop. 12,000. R. was the scene of a battle between the French and Austrians on the 3d and 4th of September 1796, in which the latter were defeated.

ROVI'GNO, a trading-town and seaport of Istria, stands on a rocky promontory which forms a double harbour 45 miles south of Trieste. The best Istrian wine is grown in the vicinity, which is also abundantly productive in oil. 30,000 casks of olive oil are exported annually; and ship-building, the usual manufactures to which a seaport gives rise, and the tunny and sardine fisheries, are the chief branches of industry. Pop. 13,000.

ROVI'GO, a city of Austrian Italy, stands on the Adigetto, 38 miles south-west of Venice. It is a handsome fortified city; has a cathedral, which contains some fine paintings, and a picture-gallery. The staple produce of the neighbourhood is grain and wine. Pop. 9910.

ROVING. See SPINNING.

ROW'AN TREE, MOUNTAIN ASH, or QUICKEN TREE (*Pyrus aucuparia*; *Sorbus*

Rowan, or Mountain Ash (*Pyrus aucuparia*).

aucuparia of many botanists), a tree abundant in Britain, especially in the Highlands of Scotland, and in many parts of continental Europe. It does not attain a great size, has in general a very straight erect stem, and is distinguished from the other species of Pyrus (q. v.) by pinnated glabrous leaves, terminated by a single leaflet, serrated leaflets, corymbs of small flowers, and small globose fruit. The wood is valued for its compactness. The inner bark and sapwood have a very peculiar smell. In the superstitions of the Scottish Highlands, and also of the Lowlands, a peculiar importance was assigned to the rowan tree, a mere twig of which was supposed to have great efficacy in scaring away evil spirits. It is very ornamental, especially when in fruit. The fruit (*Rowan berries*) is sometimes used for preserves. It has much acidity, and a peculiar bitterness. It is generally red; but there is a variety with yellow fruit; and a very nearly allied species, *P. Americana*, a native of North America, has clusters of scarlet fruit.

ROWE, NICHOLAS, a dramatic poet and translator, the contemporary and friend of Congreve, Addison, Steele, and the other wits of the Queen Anne period, was the son of a serjeant-at-law, and was born at Little Barford, in Derbyshire, in 1673. He was educated at Westminster, and studied law in the Middle Temple; but inheriting a small competency by the death of his father, he devoted himself to literature. Between 1700 and 1714, he produced eight plays, of which three were long popular, viz.—*Tamerlane*, 1702; *The Fair Penitent*, 1703; and *Jane Shore*, 1714. The character of Lothario in the *Fair Penitent* was the prototype of Lovelace in Richardson's *Clarissa Harlowe*, and the name is still the synonym for an accomplished rake. R. translated Lucan's *Pharsalia*, and his translation was so highly valued, that after his death his widow received a pension expressly on account of this service to literature rendered by her husband. He was also the first editor of Shakspeare, 1709. The popular talents and engaging manners of R. procured him many friends, and he was appointed to several lucrative offices. The Duke of Queensberry made him his Under-secretary of State. In 1715, he succeeded Tate as poet-laureate; and the same year he was appointed one of the land-surveyors of the customs of the port of London; the Prince of Wales conferred on him the office of Clerk of his Council; and the Lord Chancellor Parker made him Clerk of the Presentations. He died December 6, 1718, and was buried in Westminster Abbey.

As a dramatist, R. is characterised by an easy and elegant style of diction and versification, but is destitute of originality, subtlety, or force in the delineation of character or passion. In the construction of his dramas, 'there is not,' as Johnson remarks, 'much art;' but there is no extravagance or gross violation of taste or decorum, and he excels in scenes of domestic pathos and tenderness.

RO'XBURGH, a county in Scotland, comprising the districts of Teviotdale and Liddesdale, with part of Tweeddale, extending in length about 40 miles, and in breadth 28 to 30 miles, is bounded on the E. and S. by Northumberland and Cumberland; on the S.-W. by Dumfriesshire; on the W. by Selkirk; and on the N. by Berwickshire. The physical aspect of the county is varied and picturesque, having the Cheviot and Lauriston hills bounding a considerable portion of its borders. The Cheviots do not rise to any great height, the highest not exceeding 2000 feet. The herbage is green to the summit, and affords valuable pasture to sheep. The interior of the county is generally composed of good soil; and the farms being mostly large, and held by men of capital and skill, it is farmed to the greatest advantage. The chief river is the Tweed, which flows through the northern districts of the county. The Teviot runs through the county a distance of 40 miles, and falls into the Tweed at Kelso. There are several other streams of note, the Allan, the Slitrig, the Jed, the Gala, &c.

R. possesses an interesting history in connection with border feuds of former days; and it has many magnificent remains of monastic life and institutions, which, with its many legends and traditional stories, render it of much interest.

The proprietors are not numerous—the Dukes of Roxburghe and Buccleuch, the Marquis of Lothian, the Earl of Minto, and a few others holding a great proportion of it. The number of occupants in 1857 was 983. The area is 670 sq. m., or 428,494 acres, of which, in 1857, there were under grass and hay, 46,669; and under rotation of crops, 124,479: of which there were in wheat, 8558 acres, yielding 25 bushels 3½ pecks per acre on the average; in barley 12,107 acres, 35 bushels 0½ pecks on the average; in oats 28,428 acres, 38 bushels 3½ pecks on the average; in beans and peas 1657 acres, 23 bushels 1¾ pecks on the average; in turnips 23,993 acres, 14 tons 19¾ cwt. on the average; in potatoes 1590 acres, 3 tons 7¾ cwt. on the average. Of live stock there were, horses 5470, cattle 16,192, sheep 437,058; total stock, 463,096. The pop. in 1861 was 54,119; the inhabited houses, 7757. The parliamentary constituency in 1863 was 1580. The county town is Jedburgh (q. v.).

ROXBURGHE CLUB, a society called after John, Duke of Roxburghe, the celebrated collector of ancient literature. On the death of the duke in 1812, his valuable library, rich in the old romances of chivalry and early English poetry, was brought to the hammer, and the large prices realised for some of the books were unprecedented. As a specimen, it may be stated that a copy of the first work printed by Caxton in 1471, the *Recuyell of the Historyes of Troye*, sold for £1050. The largest sum, however (and perhaps the greatest ever paid for a single printed volume), was there given by the Marquis of Blandford (afterwards Duke of Marlborough) for the first edition of Boccaccio's *Decameron*, which fetched £2260. In commemoration of the interest which the sale of this collection occasioned among literary antiquaries, the R. C. was instituted, for the purpose of printing a limited number of impressions of MSS. and rare works for the use of its members, to whom they are strictly limited. The R. C. has in this way issued a series of 76 very curious and interesting works, which are only, however, to be found in the collections of the members, or in a few of the larger public libraries. On the anniversary (June 12) of the sale of the copy of Boccaccio's *Decameron* above referred to, the Club holds a symposium in London.

The R. C. may be regarded as the parent of many literary societies subsequently founded for similar purposes, among which may be mentioned the Camden, Percy, Shakspeare, Cheetham, Wharton, and Surtees Societies, in England; the Bannatyne, Maitland, Abbotsford, and Spalding Clubs, in Scotland; and the Celtic Society in Ireland. The labours of these bodies in printing MSS. and fugitive black-letter tracts have added many important contributions to British literature.

ROXBURGHIA'CEÆ, a natural order of plants, belonging to the Dictyogens (q. v.) of Lindley, twining shrubs with reticulated leathery leaves; and large, shewy, solitary, fœtid flowers; the perianth of four divisions, the stamens four, hypogynous, the ovary one-celled, the ovules numerous;

the pericarp one-celled, 2-valved, with two clusters of seeds at the base; the seeds attached to long cords. The species are very few, natives of the hotter parts of the East Indies. The stems of *Roxburghia viridiflora*, a native of Chittagong, the Malayan Islands, &c., are sometimes 100 fathoms long. The roots are boiled and soaked in lime-water, to remove their acridity, and are then preserved in syrup, and eaten.

RO'XBURY, a city adjoining and incorporated with Boston, Massachusetts, in 1868, and now known as Boston Highlands, is built upon hills, and in hollows, which give it fine building sites and attractive scenery. Besides numerous elegant residences, churches, schools, banks, and newspapers, it contains many forges, steam-engine and boiler factories, cordage-mills, and manufactories of cotton, wool, carpets, flax-cotton, organs, starch, glue, &c.

ROY, WILLIAM, major-general in the British army, was born May 4, 1706, at Milton Head, in the parish of Carluke, Lanarkshire. His early history is quite unknown, and the incidents of his professional career comparatively unimportant, but his name will always be remembered by succeeding generations as that of the first of British geodesists. After the great rebellion in 1745, he was employed in preparing for government a map of the Highlands, and finally of the whole mainland, which, however, owing to imperfect instruments, and the hurried nature of the survey, was only, to use R.'s own words, 'a magnificent military sketch.' R.'s next important operation was the measuring a base line (see ORDNANCE SURVEY) on Hounslow Heath, of 27,404¾ feet, or about 5⅕ miles, which, though the first measurement of the kind in Britain which pretended to accuracy, was executed with such care, that, on being remeasured after R.'s death, the difference between the two results was found to be only 2¾ inches. For this splendid labour, R. received the Royal Society's Copley medal. R.'s labours connected with the survey extended from July 1787 till September 1788, when he returned to London in ill health, which necessitated his removal to the warmer latitude of Lisbon in the winter of 1789; but he returned to London in the following April, and died there 1st July 1790. In 1767, R. was elected a Fellow of the Royal Society, to whose *Transactions* he contributed, in 1777, a paper entitled 'Experiments and Observations made in Britain, in order to obtain a Rule for Measuring Heights with the Barometer.' He had also, during his survey of Scotland, paid particular attention to the camps and other Roman remains in that country, and had completed an elaborate work on this subject, illustrated by drawings and plans, and by a copy of his map of the country. This work was published (1793) by the Society of Antiquaries (of which R. had been a member), to whom it had been presented by R.'s executors. R. was also surveyor-general of the coasts of Great Britain.

ROYAL ACADEMY OF MUSIC, an institution founded in 1823, by a number of musical amateurs, headed by the Earl of Westmoreland, for the purpose of affording to a certain number of pupils the opportunity of obtaining a first-rate musical education, and of enabling those who make music a pursuit to provide themselves with the means of honourable livelihood. The Academy is supported by contributions and annual subscriptions, the subscribers and contributors being divided into four classes, of whom the first three recommend and elect the students. The government is in the hands of a committee and sub-committee of directors. Of the scholars, some are boarders and some out-door pupils. The pupils are placed under the tuition of chosen instructors in every branch of musical education. The Academy was incorporated by royal charter in 1830. Since its foundation, a number of its pupils have gone forth to the world as musicians of eminence, including among others Dr Sterndale Bennett, Messrs G. A. Macfarren, Blagrove, Brinley Richards, Madame Sainton-Dolby, Miss Loder, &c. Concerts are given by the pupils of the Royal Academy, to which the public are admitted.—See Cazalet's *History of the Royal Academy of Music* (Lond. 1854).

ROYAL ASSENT. See PARLIAMENT.

ROYAL FAMILY. In its more restricted signification, the royal family of Great Britain only includes the Queen-consort and Queen-dowager, and the children or other descendants of the sovereign. In a larger sense, it comprehends all the British descendants of the royal house, or perhaps, more properly, as indicated by Blackstone, all who may by possibility succeed to the throne. With regard to the position and rights of a Queen-consort and Queen-dowager, see QUEEN. The husband of the Queen-regnant is not as such a member of the royal family; but the style of Royal Highness, and a precedence next to Her Majesty, were conferred on the late Prince-consort by statute. The Prince of Wales (q. v.), or heir-apparent to the throne, and the Princess of Wales, are distinguished by law from the rest of the royal family. By the statute 25 Edw. III., to compass the death of the Prince of Wales, or violate the chastity of the Princess of Wales, is high treason. The eldest daughter of the sovereign is styled the Princess Royal, and the violation of her chastity is, by the same statute, high treason. The heir-presumptive to the throne has no special rank or precedence as such, as his position may be altered by the birth of an heir-apparent.

The younger sons and daughters of the sovereign are entitled to a peculiar place in the House of Lords; statute 31 Henry VIII. c. 10 enacts that no person except the king's children shall presume to sit or have place at the side of the cloth of estate in the parliament chamber. A question which arose under the statute as to the position and precedence of Edward Duke of York, second son of Frederick Prince of Wales, and grandson of George II., was referred by the king to the House of Lords, who decided that, under the description of the king's children, his grandsons are included, and that the Duke of York ought to have place next to the Duke of Cumberland, the king's youngest son, and might have a seat on the left hand of the cloth of estate. But when the son and grandson of George II. became, by the death of that monarch, brother and uncle of the reigning king, they were considered bound to vacate their seats at the side of the cloth of estate.

On a reference made to all the judges by George I., it was resolved that the education and care of the king's grandchildren, when minors, and also the approval of their marriages, belongs to the king, even during their father's lifetime. This care and approval has more recently been held to extend to the heir-presumptive, and it is difficult to say how far it comprises also the remoter branches of the royal house. Questions regarding the marriages of the royal family are now further regulated by the Royal Marriage Act (q. v.).

On the consolidated fund are charged £8000 a year to Princess Frederick-William of Prussia, £15,000 to the Duke of Edinburgh, £6000 to Princess Ludwig of Hesse, £6000 to Princess Christian of Schleswig-Holstein, £6000 to the Duchess of Cambridge, £3000 to her daughter the Grand Duchess of Mecklenburg-Strelitz, £12,000 to the Duke of Cam

bridge, £5000 to Princess Teck, formerly Princess Mary of Cambridge, £6000 to Princess Louisa, and £15,000 to Prince Arthur.

ROYAL GEORGE, a British man-of-war, of 108 guns, the sudden sinking of which in Portsmouth harbour with all on board, 29th August, 1782, created a widespread feeling of sorrow. The R. G. was the principal vessel of Lord Howe's fleet, and while undergoing repairs was too much heeled over, so that the water rushing through the port-holes of the depressed side, speedily filled her, and she sank with all on board, including the admiral, Kempenfeldt, the captain, officers, crew, and about 300 women and children, who happened to be on board at the time —1100 in all. Of these, however, 200 were saved; but a small vessel, which happened to be anchored near, was drawn into the vortex occasioned by the R. G.'s descent, and swallowed up; and other vessels were also placed in imminent danger. Captain Waghorn, who escaped, was subsequently tried by court-martial for negligence and carelessness in the careening operation, but was acquitted. This calamitous event has been celebrated in an elegy by Cowper. Many of the guns were fished up soon afterwards, and several schemes were projected for the raising of the ship bodily, but without success, until, in 1839, the mass was blown to pieces by the explosion of large metal cases filled with gunpowder. Most of the valuables which had been in the ship were brought up, and the brass guns which were recovered sufficed to defray the cost of the operation.

ROYAL MARRIAGE ACT. Act 12 Geo. III. c. 2 enacts that no descendant of the body of Geo. II., other than the issue of princesses married into foreign families, shall be capable of contracting marriage without the previous consent of the sovereign, signified under the Great Seal; and any marriage contracted without such consent is declared void. But such descendants, if above the age of 25, may, after twelve months' notice given to the Privy Council, contract and solemnise marriage without consent of the crown, unless both Houses of Parliament shall, before the expiration of the year, expressly declare their disapproval of such intended marriage. The penalties of Præmunire (q. v.) are attached to all persons who shall solemnise, assist, or be present at any such marriage. This act was passed in consequence of the marriage of the Duke of Gloucester, brother of George III., with the Countess Dowager of Waldegrave, and of the Duke of Cumberland with the widow of Colonel Horton and daughter of Lord Irnham. The marriage of the late Duke of Sussex in 1793 to Lady Augusta Murray, daughter of the Earl of Dunmore, was declared by the Prerogative Court to be a violation of the Royal Marriage Act, and therefore null and void, in August 1794; and the claims of their son, Sir Augustus d'Este, were declared invalid by the House of Lords in 1844. The Royal Marriage Act is heartily disapproved by many as impolitic and despotic, and as tending to immorality and scandalous conduct, and was not passed without great resistance in parliament. But the influence of the government was then too strong for public opinion.

ROYAL-MAST, the fourth mast from the deck, and usually the highest carried. It is most commonly made in one piece with the top-gallant-mast. It carries the royal-yard, which bears a sail called the 'royal.' The royal-mast is surmounted by the truck, at which the pendant or other flag is displayed when necessary.

ROYAL SOCIETY (OF LONDON) consists of a number of persons associated together for the promotion of mathematical and physical science. Although the year 1660 may be regarded as the date of its final establishment, various societies and clubs having the same objects in view previously existed, and paved the way for its appearance at that special time. The meetings of one of these Clubs were held commonly at Gresham College; and the company being much increased, 'we were,' to quote from Wallis, 'about the beginning of the year 1662, by his majesty's grace and favour, incorporated by the name of the Royal Society.' Rules for the establishment of the new Society were agreed to; a regular code of laws drawn up (12th December 1662), and the Society fairly started. The meetings were held in Gresham College till the year 1710, when the Society removed to a house in Crane Court, Fleet Street. It startles the scientific inquirer of the present day to find that amongst the early subjects of discussion were the production of 'perfect sea-fowl' from barnacle shells; inquiries regarding 'the fish that turns to the wind when suspended by a thread,' &c. In 1664, the Charter-book was opened, the leaves of which are of the finest vellum, with the arms of England emblazoned on the first page, and those of the Society on the next. After copies of the charters and statutes, comes the autograph portion of the volume, containing on its first page the signatures of CHARLES R., Founder (dated January 9, 1664—1665), JAMES, Fellow, and GEORGE RUPERT, Fellow. The next page is occupied with the signatures of the foreign ambassadors; while the third and succeeding pages contain those of the ordinary Fellows. On the 1st March 1664—1665, it was ordered at a meeting of the council 'that the *Philosophical Transactions*, to be composed by Mr Oldenburg, be printed the first Monday of every month, if he have sufficient matter for it;' and in conformity with this order, the first number of the *Transactions* appeared on Monday the 6th March. The *Transactions* contain multitudes of valuable memoirs by the most eminent men who have appeared since the foundation of the Society, and form of themselves a complete record of the progress of science, and of its condition at any given epoch. In 1752, an important change was made in the mode of bringing out the *Transactions*. The selection of the papers deemed fit for publication had till that period been left in the hands of the secretaries. The 47th volume, which appeared in 1753, was published under the superintendence of a committee of the council—a course which has been continued to the present time. In 1780 they removed from their secluded residence in Crane Court to Somerset House, a portion of which was set apart for their use by government; and there they remained till 1857, when more commodious rooms were provided for them at Burlington House.

About twenty years ago, there was a general feeling among men of science that admission into the R. S. was too much a matter of personal favour, and it was resolved in 1848 that every candidate shall be proposed and recommended by a certificate in writing, signed by six or more Fellows, of whom three at least shall certify their recommendation from personal knowledge. At the first meeting in March, the names of all candidates proposed during the preceding year are announced by the secretary in alphabetical order, and the certificates are suspended in the meeting-room until the day of election. From this list the council select by ballot fifteen names to be recommended to the Society for election. Each Fellow may alter this list as he pleases, but as a matter of fact the selected list is agreed to by the Society, and the election takes place on the first Thursday in June. This change has proved eminently successful, and to be elected a Fellow of the R. S. is now regarded as the

highest scientific honour that any Englishman can receive. The average number of candidates has of late years been more than three times as great as the number to be selected; and in the year 1865 the council had the difficult task of selecting the best 15 out of no less than 53 candidates.

Each Fellow receives a copy of all the parts of the *Transactions* and *Proceedings* published since his election, and has the free use of the library, containing nearly 50,000 volumes, and very rich in scientific books and journals. The fee paid by each Fellow is £10 for admission-money, and an annual subscription of £4; or the annual payments may be compounded for by a single payment of £60. The Society receives an annual grant of £1000.

Three medals are annually offered by the Society for scientific discoveries; viz., one Copley medal, which was first awarded in 1731; and two Royal medals, which have been regularly awarded since 1826; and in addition to these, the Rumford medal, for discoveries in light and heat, is given whenever investigations of sufficiently high merit in these departments come before the notice of the Society. See Weld's *History of the Royal Society*, 2 vols. 1848.

ROYAL SOCIETY (OF EDINBURGH) was incorporated by royal charter in 1783. It owed its origin to Principal Robertson the historian, who successfully laboured to found in Edinburgh a Society on the model of the Berlin Academy, for the investigation and discussion of subjects in every branch of science, erudition, and taste. The Society was formally constituted at a meeting held in the College Library on the 23d June 1783, where the subsequent meetings were held till 1810, when the Society purchased a house in George Street. In 1826, the Society removed to its present apartments, leased from government, in the Royal Institution building in Princes Street. The original list of members included the names of most of the literati of Scotland. The first president was Henry Duke of Buccleuch. He was succeeded in 1812 by Sir James Hall, who, resigning in 1820, was succeeded by Sir Walter Scott. On the death of Sir Walter in 1832, Sir Thomas M'Dougall Brisbane was appointed president; and was succeeded in 1860 by the Duke of Argyle. In 1864, Sir David Brewster, K. H., was elected successor to the duke, and held the office until his death in 1868.

The meetings of the Society are held on the 1st and 3d Mondays of every month from November to June. The admission fee of resident Fellows is £2, 2*s*., and the annual contribution is £3, 3*s*., which, after ten years, is reduced to £2, 2*s*., and ceases after 25 years' membership. The society is also assisted by an annual grant of £300 voted by parliament. The papers read before this learned body are published in its *Transactions*, of which 23 volumes have been published in quarto. Abstracts of the papers also appear in its *Proceedings*, of which five volumes have appeared in octavo.

The number of *ordinary* Fellows in 1865 was 277, and of *honorary* 43.

The Society has the disposal of some valuable prizes, which are bestowed on the authors of the best communications on scientific and other subjects. These are the Keith Prize, founded by Alexander Keith of Dunnottar; the M'Dougall Brisbane Prize, founded by Sir Thomas M. Brisbane; and the Neill Prize, founded by Patrick Neill, Esq., LL.D.

RUATA'N, or RATTAN, an island situated in the Bay of Honduras, in the Caribbean Sea, in lat. 16° 30′ N., long. 86° 30′ W. It is 30 miles long by 9 broad in its widest part; and its dependencies are Bonacca, Utilla, Helena, Barbarette, and Morat. The whole comprise the colony of the Bay Islands, and were formerly part of the British dominions, but they were surrendered in 1860 to the republican government of Honduras.

The islands were discovered by Columbus in his fourth voyage in 1502, and remained some time in possession of Spain; but were taken possession of by English settlers from Jamaica, and were eventually annexed to the British dominions, and placed under the government of the superintendent of Honduras.

The surface of the island is moderately elevated, the mountains rising to 900 feet, and is well wooded, but to the westward it consists of grassy plains. Near the southern extremity are good harbours, called Port Royal, Coxen's Hole, and others, surrounded with dangerous coral reefs.

The island has a fine climate, with a prolific soil, that produces all the fruits and vegetables indigenous to the tropics. The products find their chief markets at New Orleans, Belize, and Truxillo; and the value of their exports is about £5000 annually, and imports about £4000.

The population, estimated at about 2000 souls, of whom about 200 are whites, including nearly 100 Spaniards, are principally the emigrants from the Caymans, and are an athletic race, descended from English bucaneers by African mothers. They have erected comfortable habitations, and their principal employment is fishing, and the cultivation of the soil. Fine turtle abound around the coast.

R. was the rendezvous of General Walker and the American Fillibusters (q. v.) in their repeated attacks and depredations on the states of Central America.

RUBA'SSE, a mineral much prized for ornamental uses, is rock crystal, limpid or slightly amethystine, filled internally with minute brown spangles of specular iron, which reflect a bright red, equal to that of the most brilliant ruby. The finest R. is found in Brazil. A very inferior kind occurs in the iron mines of Nassau-Ussing. The name R. is that used by lapidaries.—There is an artificial R., made by heating very pure rock crystal red hot, and repeatedly plunging it into a coloured liquid. It thus becomes full of cracks, which imbibe the colouring matter. For red, cochineal is used; for very dark red, sandal-wood; for blue, tincture of indigo or litmus; for yellow, saffron; for violet-blue, juice of buckthorn; for green, a mixture of tinctures of litmus and saffron.

RUBA'TO, TEMPO (Ital. stolen time), in Music, a capricious style of performance in which some notes are prolonged beyond their legitimate time, while others are curtailed, the aggregate value of the bar remaining unaltered. It is a style of performance which is very apt to be abused by inferior players and singers.

RU'BBLE, a common kind of masonry, in which the stones are irregular in size and shape. Walls faced with ashlar are generally packed with rubble at the back. Rubble is of various kinds, according to the amount of dressing given to the stones. Common rubble is built with stones left almost as they come from the quarry. Hammer-dressed rubble is so called when the stones are squared with the mason's hammer; coursed rubble, when the stones are squared and equal in height, &c.

RUBEFA'CIENTS are external agents employed in medicine for the purpose of stimulating, and consequently reddening, the part to which they are applied. All agents which, after a certain period, act as blisters, may be made to act as rubefacients, if their time of action is shortened. The mildest rubefacients are hot poultices, cloths soaked in very hot water, moderately stimulating liniments—as, for example, soap-liniment, with various proportions of

liniment of ammonia, or chloroform, &c. Spanish fly, in the form of *Emplastrum Calfaciens*, or warm plaster, in which the active ingredient is blunted by the free admixture of soap-plaster, resin-plaster, &c., is a good form of this class of agents. Capsicum or Cayenne pepper, in the form of a poultice, is an excellent rubefacient; it is much used in the West Indies, but is seldom employed in this country. Mustard, in the form *Cataplasma Sinapis*, or mustard poultice, and oil of turpentine, are perhaps the best of the ordinary rubefacients. The former is applied to the soles of the feet and the calves of the legs in the low stage of typhus fever, in apoplexy and coma, in narcotic poisoning, &c. It is also applied to the chest, with much advantage, in many cases of pulmonary and cardiac disease, and to the surface of the abdomen in various affections of the abdominal viscera. The best method of employing turpentine is to sprinkle it freely on three or four folds of clean flannel, wrung out of boiling water. The sprinkled surface of this pad is placed upon the skin, and a warm dry towel is laid over the flannel. Two or three such applications will produce a powerful rubefacient effect. Turpentine thus applied is serviceable in all the cases mentioned in the remarks on Mustard, as well as in sore throat, chronic rheumatism, neuralgia, &c.

RUBENS, Peter Paul, one of the greatest of the Flemish painters, was born probably at Siegen, in Westphalia, in 1577. His parents settled in Cologne in 1578, where they remained till 1587, when R.'s father died, and his mother removed with her family to Antwerp. He was first placed under Verhaagt, a landscape painter; however, inclining more to historical painting, he became a pupil of Van Noort, but soon quitted his school for that of Otho Van Veen, or Venius, who then enjoyed a high reputation; and after studying four years with that painter, went to Italy in 1600. Recommended to Vincenzo Gonzago, Duke of Mantua, he was sent on a mission by the duke to Philip III. of Spain and on that occasion painted several portraits of Spanish noblemen. He also spent a considerable time at Venice and Rome making copies for the duke, and executing independent works, which added largely to his reputation. In 1608, after an absence of eight years, R. returned to Antwerp on account of the illness of his mother, but she died before he had accomplished the journey. He intended to return to Mantua, but was induced to remain by the Archduke Albert, governor of the Netherlands. In 1621, he visited Paris by invitation of Maria de' Medici; and in 1625, completed the series of sketches for the pictures destined to adorn the palace of the Luxembourg. R. was sent by the Infanta Isabella, widow of the Archduke Albert, on a diplomatic mission to Philip IV. of Spain, in 1628; and in the following year, on a similar mission to Charles I. of England, by whom he was knighted in 1630. R.'s success as a political diplomatist is worth noting, and seems to indicate a large, solid, and practical nature, such as painters in general do not possess. He died, very rich, in 1640. R. is the acknowledged head of the Flemish school. By the expression of powerful and energetic action, and strongly marked character—by great breadth and brilliant colouring, he successfully embodied the tendencies of the age in which he lived, to pleasures of sense, strong passion, and stirring action; and while admitting the coarseness, and almost grossness of his subjects, especially where the nude figure is introduced, we are in a manner carried away by the spirit of joyousness and an animal vigour conspicuous in his works, and the truthful manner in which he viewed nature. His portraits rank with the highest efforts in that walk of art. He painted animals admirably; and his landscapes possess great brilliancy and natural effect. Sir Joshua Reynolds (*Journey to Flanders*) says, 'Rubens was perhaps the greatest master, in the mechanical part of the art, that ever exercised a pencil.' His style has had great influence on the English school.

RUBE'OLA. See Measles.

RUBIA'CEÆ, a natural order of exogenous plants, in which, according to many botanists, the *Cinchonaceæ* are included as a suborder; but which, as restricted by others (*Stellatæ* of Ray, *Galiaceæ* of Lindley), consists entirely of herbaceous plants, with whorled leaves, angular stems, and numerous very small flowers; the calyx superior, with 4, 5, or 6 lobes, or almost wanting; the corolla wheel-shaped, or tubular, regular, inserted into the calyx, and with the same number of divisions as the calyx; the stamens equal in number with the lobes of the corolla; two styles; the fruit a dry pericarp with two cells, and one seed in each cell. There are between 300 and 400 known species, chiefly abounding in the northern parts of the northern hemisphere, and on the mountains of tropical regions. The most important plant of the order is Madder (q. v.). To this order belong also Bedstraw (q. v.) and Woodruff (q. v.).

RU'BICON, a stream of Central Italy, falling into the Adriatic, has obtained a proverbial celebrity from the well-known story of its passage by Cæsar, who, by crossing this river—which, at the outbreak of the civil war between him and Pompey, formed the southern boundary of his province—virtually declared war against the Republic. Hence the phrase, 'to cross the Rubicon,' has come to mean, to take an irrevocable step. The modern Luso, called by the peasants on its banks *Il Rubicone*, has claims to being the ancient R.; but arguments preponderate in favour of the *Fiumicino*.

RUBI'DIUM (sym. Rb, eq. 85·4) and CÆSIUM (sym. Cs, eq. 123·4) are two alkaline metals, discovered in 1860—1861, by Bunsen and Kirchhoff, by means of spectrum analysis. They resemble potassium more nearly than any other substance, and their names are derived from *rubidus*, dark red, and *cæsius*, sky-coloured, in consequence of two red lines of remarkably low refrangibility being present in the spectrum of the former, and two characteristic blue lines in that of the latter. They are widely diffused in nature, but always occur in very small quantities. They have been detected in many mineral waters, and in certain minerals; as, for example, lithia-mica, lepidolite, petolite, and felspar; also in the ashes of the beet-root, and in tobacco-leaves, in coffee, tea, cocoa, and crude tartar. The best material for the preparation of R. is lepidolite, which will sometimes yield as much as 0·2 per cent. of the metal, while the principal source of cæsium is the brine of Dürkheim, in which both these metals were originally found; every ton of the water containing about three grains of chloride of cæsium, and rather less than four grains of chloride of rubidium. It has, however, been recently asserted that the mineral *Pollux* contains no less than 34·07 per cent. of oxide of cæsium. Both metals are so analogous to potassium, that they cannot be distinguished either from it or from one another by reagents or before the blow-pipe. Like potassium, they form double salts with bi-chloride of platinum, which are much more insoluble than the corresponding potassium salt; and it is on this property that the separation of these metals from potassium is based. It is unnecessary to enter into any details regarding the compounds of these metals. It is worthy of remark that R. is electro-positive towards potassium, and that cæsium is electro-positive towards R. and potassium,

and is thus the most electro-positive of the known elements.

We have included the notice of Cæsium with that of R. in this article, because its recent discovery prevented it from being considered in its proper alphabetical place. For the same reason, we may here briefly notice another metal, INDIUM, similarly discovered quite recently, by Reich and Richter, in the Freiburg arsenical ores. Its most striking property, and that which led to its discovery, is the indigo-blue line which all its compounds (in so far as they have been investigated) shew in the spectroscope. Its eq. is 37, its sp. gr. varies from 7·1 to 7·3; its colour is between that of tin and silver; it is exceedingly soft and very ductile; and its fusing-point is about that of lead.

RU'BRICS (Lat. *rubrica*, from *ruber*, red), in classic use, meant the titles or headings of chapters in certain law-books, and is derived from the red colour of the ink in which these titles were written, in order to distinguish them from the text. In medieval and modern use, the name is restricted to the directions which are found in the service-books of the church, as to the ordering of the several prayers, and the performance of the sometimes complicated ceremonial by which they were accompanied. The same name, together with the usage itself, is retained in the Church of England Prayer-book; and in all these, even where the direction has ceased to be printed in red ink, the name rubric is still retained. Where red ink is not employed, the rubric is distinguished from the text by italics, or some other variety of print. In the Catholic Church, a considerable controversy exists as to whether the rubrics of the missal, the ritual, and the breviary, are to be considered preceptive, or only directive—a question into which it would be out of place to enter. A similar controversy has existed at various times in the English Church. The science of rubrics is with Catholics a special branch of study, the chief authorities on which are Gavanti, Merati, Cavalieri, and other more compendious writers.

RUBRUQUIS, WILLIAM DE, one of the most distinguished of medieval travellers, was born early in the 13th c.—probably about 1228. He entered, while very young, into the Franciscan order, and being hindered in his favourite scheme of missionary labour in the Holy Land, he was sent by Louis IX. of France into Central Asia, for the purpose of forming an alliance with Sartsch, the son of Batû Khan of Kiptchak, a supposed Christian sovereign, against the infidels who held the Holy Land. Taking Constantinople as the starting-point, R., with two companions, also Franciscans, sailed for Soldaia—now Soujac—near Cherson, made his way across the steppes between the Dnieper and the Don, and crossing the latter river, reached, August 2, 1253, the camp of Sartach, who was now discovered not to be a Christian, and by whom they were sent forward to his father, Batû. When they reached the encampment of Batû, on the Volga, near its mouth, that prince refused to treat with them, and sent them forward to the Tartar emperor, Mangû Khan, whom they reached on the 27th December. At this rude court they remained for several months, and accompanied it about Easter to Kara-korum, where they found a few Europeans. Some time afterwards, R., being charged with having spoken of the emperor as an infidel, although he defended himself courageously, was compelled to return, but was treated with a certain degree of rude consideration. Proceeding along the banks of the Volga, he penetrated the difficult defiles of the Caucasus, proceeded through Armenia, Persia, and Asia Minor, to Syria, arriving at Tripoli in August 1255, having spent two years and a half in his eastern travel. As King Louis, by whom the mission had been accredited, had meanwhile returned to France, R. requested permission to follow him, in order to report the result; but fortunately for science, the Franciscan provincial refused to permit him to leave the East, and directed him to report in writing. To this fortunate severity we owe the interesting and curious account which he drew up, and of which a lucid summary will be found in Lardner's Cyclopædia, *Inland and Maritime Discovery*, vol. i. p. 261, and following. Of the later history of R., the only fact known is, that he was living in 1293, when Marco Polo was returning from the East. His narrative is among the most plain and sober in its tone of all that have come down to us from the adventurous voyagers of the 13th century.

RU'BUS, a genus of plants of the natural order *Rosaceæ*, suborder *Rosaceæ* proper, distinguished by a 5-lobed calyx without bracts, and the fruit formed by an aggregation of small drupes adhering to each other upon a long *torus*. The fruit is eatable in all, or almost all, the species, which are very numerous, and natives chiefly of the colder parts of the northern hemisphere, although some are natives of warm climates, and are occasionally to be seen in our hothouses. Some of them are herbs with perennial roots, some are shrubs with subligneous—often only biennial—stems, and they have digitate, pinnate, or lobed leaves. They cause great difficulty to botanists, the varieties being extremely numerous, and the specific distinctions very uncertain. The RASPBERRY (q. v.) and BRAMBLE (q. v.) are well-known fruits. The CLOUDBERRY (q. v.) also belongs to this genus. Besides these, and the species most nearly resembling them, and which have been described along with them, notice may be taken of *R. spectabilis*, a shrubby species, with leaves of three leaflets, and fine large dark purple fragrant flowers, produced singly on long terminal flower-stalks, a native of the banks of the Columbia River. The fruit is about the size of a raspberry, dark yellow, acid, and somewhat astringent, making excellent tarts.—*R. saxatilis*, sometimes called the *Stone Bramble*, is a perennial herbaceous plant, with slender stem, leaves of three leaflets, small greenish-yellow flowers, and pleasant fruit of very few rather large drupes. It is a native of stony places, in mountainous parts of Britain.—*R. arcticus* is a small herbaceous plant with creeping roots, slender stems 2—6 inches high, each with three or four leaves, which have three leaflets; the flowers large and of deep rose colour, and a purplish red fruit of exquisite flavour. In Siberia, it is known by a name signifying *Prince-berry*. A syrup, a jelly, and a wine are made of it. The fruit is highly esteemed; the plant grows very well in English gardens, but it seldom bears fruit. The more interesting species of Rubus known in the United States are *R. odoratus*, or large purple-flowering, with inedible fruit; *R. strigosus*, or wild red raspberry; *R. occidentalis*, or black raspberry; *R. villosus*, or common high blackberry, and *R. hispidus*, or dewberry.

RUBY, a gem much prized, and only inferior in value to the diamond, or perhaps also to the sapphire. It is regarded by mineralogists as a red-coloured Sapphire (q. v.) or Spinel. The *Balas R.* is rose-red. The Almandine R. is tinged with violet or brown. The finest red rubies are generally known as *oriental rubies*, and are brought chiefly from Ceylon and the Burman empire. The best generally come from Syriam, in Pegu. In Ceylon, rubies are found in remarkable abundance in alluvial deposits, which have been searched for them for ages, whilst the natives seem never to have thought of digging

in the rock of the mountains; but Dr Gygax found innumerable small rubies, in a state of decomposition, falling to powder, in a stratum of gray granite with iron pyrites and molybdena; and Sir James E. Tennent thinks that mines might be opened with confidence of success. Sir Alexander Burnes describes a ruby-mine at Badakshan, in Bactria. Tavernier states that the throne of the Great Mogul was adorned with 108 rubies, of from 100 to 200 carats each. The king of Arracan is said to have possessed a R., in the form of a six-sided prism, about an inch in diameter, terminated by a six-sided pyramid. But the greatest R. ever heard of was that possessed by the king of Ceylon, which, according to Marco Polo, was a span in length, as thick as a man's arm, and without a flaw. Kublaï Khan sent an ambassador to demand this R., offering the value of a city as its price; but the Ceylonese monarch refused to sell it. What has become of it is not known.

RÜCKERT, FRIEDRICH, one of the most pleasing lyric poets of Germany, was born May 16, 1789, at Schweinfurt, received his education at the gymnasium of his native town, and studied at Jena University. In 1826, he was nominated Professor of Oriental Languages at Erlangen; went in 1840 to Berlin, as professor and privy councillor, but resigned that position in 1849, and until his death, in 1860, lived on his estate of Neuses in Coburg. R. began his literary career under the pseudonym of Freimund Raimar with his *Deutsche Gedichte* (German Poems, Heidelb. 1814); and *Napoleon, eine politische Komödie in drei Stücken* (Napoleon, a Political Comedy in three Parts, Stuttg. 1816). Under his own name he published: *Kranz der Zeit* (A Wreath of the Time, Stuttg. 1817); *Oestliche Rosen* (Eastern Roses, Leip. 1822); *Gesammelte Gedichte* (Collected Poems, 6 vols., Erl. 1834—1838). As fruits of his oriental studies are to be considered his translations of Hariri's *Makamen*, under the title *Die Verwandelungen des Abu-Seid* (The Transformations of Abu-Seid, 2 vols. Stuttg. 1826); of the Indian tale, *Nal und Demajanti* (Frank. 1828); *Hamasa, oder die Aelteste Arabische Volkslieder* (Hamasa, or the oldest Arabic Ballads, 2 vols. Stuttg. 1846), and *Amrilkais der Dichter und König* (Amrilkais, the Poet and the King, Stuttg. 1847). Original poems of R., also relating to the East, are: *Morgenländ. Sagen und Geschichten* (Eastern Tales and Stories, 2 vols. Stuttg. 1837); *Erbauliches und Beschauliches aus dem Morgenländ* (2 vols. Berl. 1837); *Rostem und Suhrab* (Erl. 1838); *Brahmansche Erzählungen* (Brahmanic Tales, Leip. 1839); *Die Weisheit des Brahmanen, ein Lehrgedicht in Bruchstücken* (The Wisdom of the Brahman, a Didactic Poem in Fragments, 6 vols. Leip. 1836—1839); *Leben Jesu* (The Life of Jesus, Stuttg. and Tüb. 1839). The titles of his dramas are: *Saul und David* (Erl. 1843); *Herodes der Grosse* (2 vols. Stuttg. 1844); *Kaiser Heinrich IV.* (2 vols. Frank. 1845); *Cristofero Colombo* (2 vols. Frank. 1845). R. is one of the most learned, versatile, and sprightly lyrists of modern times. He has tried all sorts of metres, the Greek hendecasyllabic, the old Norse alliterative verse, the old German couplet, the *Nibelungen* strophe, the popular ballad, the delicate yet stately measure of the eastern gazelle (sonnets), and every kind of European quatrains, distiches, &c.; and he has succeeded in all. Perhaps his fancy and wit are more remarkable than his depth of lyric feeling, yet the simple pathos of such pieces as the *Aus der Jugendzeit* could hardly be surpassed.

RUDD. See RED-EYE.

RUDDER, in a ship or boat, is that part of the steering apparatus which is in immediate contact with the water. It is shaped as at A (fig. 1), hung

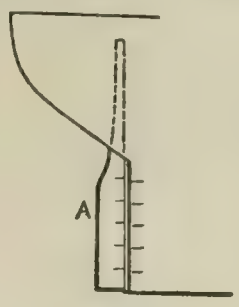


Fig. 1.

Fig 2.
A, brace; B, pintle.

to the stern-post by pintle and brace hinges (fig. 2), and the upper end passing into the vessel, is acted on by the tiller. So long as the rudder, AB (fig. 3), is in a straight line with the keel, the water which glides past the vessel acts equally on both sides, producing equilibrium; but if the rudder be turned, as AB, it will be relieved from the pressure on the side DC, while that on the side DE will act with greater force and cause the ship to revolve around the centre of gravity, G. When the head has turned sufficiently, as to D, the rudder is again put in line with the keel. See HELM.

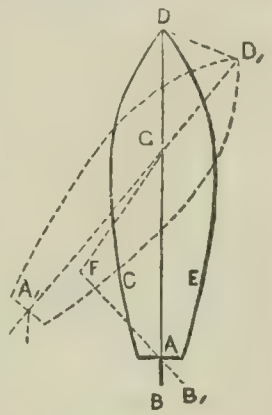

Fig. 3.

RUDDIMAN, THOMAS, the greatest of Scottish grammarians, was born in Banffshire, at a place called Raggel, in the parish of Boyndie, October 1674. He received the rudiments of his classical education at the parish school, where he already gave promise of his future proficiency. At 16 years of age, he went to King's College, Aberdeen, where he took his degree of M.A. four years later. On leaving the university, he was engaged as tutor in a private family, in which capacity he remained a year, and thereafter became parish schoolmaster of Laurencekirk. Here he accidentally made the acquaintance of the celebrated physician and Latinist, Dr Archibald Pitcairne, who was so impressed with R.'s learning and sagacity, that he exerted his influence, and succeeded in getting him appointed assistant-keeper of the Advocates' Library, Edinburgh. His new office gave him ample opportunity for prosecuting his favourite studies, but the remuneration was so small, that, in 1707, he was compelled to commence business as an auctioneer. It was at this time that he began his career as an editor by publishing an edition of Volusenus's (Florence Wilson's) *Dialogue on the Tranquillity of the Mind*, to which he prefixed a life of the author. In 1709, he published Arthur Johnston's *Poetical Paraphrase of the Song of Solomon*, and the same author's *Cantica*—both in Latin. In 1714 appeared his well-known work—by which his name will always be honourably perpetuated among Scotchmen—*Rudiments of the Latin Tongue*, a text-book from which, under a great variety of forms, his countrymen still continue to be initiated into classical literature. In 1715, he published his great edition of Buchanan's works (2 vols. folio); and in that year, exchanged the calling of an auctioneer for the more congenial one of printer. In this capacity he was assisted by his brother, who became his partner, and had been originally bred

to the business. Some years afterwards, he was appointed printer to the university of Edinburgh. In 1725, he published the first part of his great grammatical work, his *Grammaticæ Latinæ Institutiones*, which is devoted to the Etymology of the language; and in 1732, the second part, which treats of the Syntax. His philological reputation rests mainly on this work, which has been re-edited in Germany by Stallbaum, and is repeatedly referred to in the Latin Lexicon of Freund. He also prepared an elaborate treatise on Prosody, of which, however, he published only an abridgment. His next appointment was that of principal keeper of the Advocates' Library. In this capacity he published a magnificent edition of Anderson's *Diplomata et Numismata Scotiæ* (1 vol. folio), and prefixed a learned introduction in Latin. Controversy with men such as Benson, who contrasted the Latin verse of Johnston unfavourably with that of Buchanan, and with Logan on the hereditary right of the kings of Scotland to the crown, consumed a great part of his time, but did not so pre-occupy his thoughts as to prevent him from publishing, in 1751, an edition of Livy in 4 vols. 12mo, a gem of typography, and still known as the 'immaculate' edition, from its entire exemption from errors of the press. R. died in Edinburgh, January 19, 1757, in his 83d year. In politics, he was, like his friend Pitcairne, an ardent Tory and Jacobite; and in private life, a most upright and estimable man. Besides the publications already noted, he edited the translation of Virgil's *Æneid* by Bishop Gawain Douglas, and appended a very valuable glossary (folio, 1710). He also founded the *Caledonian Mercury* newspaper, and published or edited a multitude of minor tracts and books. His life has been written by George Chalmers, the antiquary (1 vol. 8vo, 1794).

RU'DENTURE, the moulding, in form like a rope or staff, filling the flutings of columns, usually one-third of the height. It is sometimes plain, and sometimes ornamental.

RÜ'DESHEIM, a small town of Germany, in Nassau, on the right bank of the Rhine, opposite Bingen, and 16 miles west-south-west of Mainz. In the vicinity is grown one of the most aromatic and fiery of the Rhine-wines (q.v.) called the *Rüdesheimer;* about 650 casks are produced yearly. Pop. 3087.

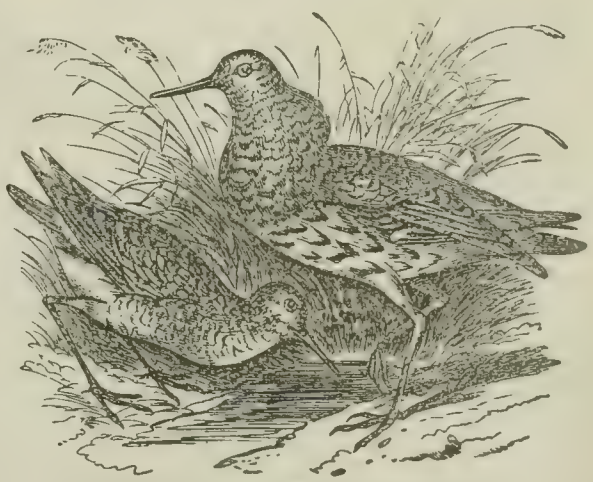
RUDOLF, or RODOLF, of Hapsburg, the founder of the imperial dynasty of Austria, which for a time was that of Germany, was born in 1218, and was the son of Albert Count of Hapsburg and Hedwig of Kyburg-Zäringen. R. early exhibited great personal daring and military skill, and acquired celebrity in his native canton of Aargau for the prowess and ability with which he repulsed the many bands of banditti who infested the district. The death, in 1264, of his uncle, Hartmann of Kyburg, to whose rich heritage he succeeded, raised him from the condition of a poor noble to the rank of an influential lord of extended territories, which included the greater part of Aargau, and various domains in the cantons of Bern, Lucerne, Zug, and Zürich. The able manner in which he governed these dominions, and exercised the functions of Protector of the Waldstätter or Forest Cantons, attracted the notice of some of the great electoral princes of Germany; and on the death of the Emperor Albert in 1273, R. was elected his successor, chiefly through the instrumentality of his powerful friend, the Archbishop of Mainz. The ratification by Pope Gregory XI. of R.'s title was obtained at the cost of various concessions, as, for instance, the renunciation of all jurisdiction in Rome, and of all feudal superiority over Spoleto and the Marches of Ancona; together with the cession of all right on the part of the emperor and his successors to interfere in ecclesiastical elections, or in the internal administration and management of the German Church. By this agreement, the feuds were appeased which had existed for nearly 200 years between the empire and the see of Rome, and R. was able to turn his attention to the settlement of the internal disturbances of Germany. His chief enemy was Ottocar, king of Bohemia, under whom he had once served against the Prussians and Hungarians, and who now refused to do homage to him. Fortune, however, favoured R. in the war with the Bohemian king, who, after a first defeat, again rose in arms against the empire, but was ultimately defeated and killed in battle (1278), when the emperor seized all the Austrian territories which Ottocar had possessed. Wenceslaus, the son of the slain king, having lost no time in tendering homage for the kingdoms of Bohemia and Moravia, the cause of the war was at an end, and peace being restored, R. thenceforth devoted himself to the organisation of the state. His great merit was in breaking the arbitrary power of the nobles, by compelling them to demolish the fortresses and strongholds, by means of which they carried on plundering expeditions against one another, and defended themselves from the power of the law; and we are told that in one year he condemned to death 30 refractory nobles, who had long disturbed the public peace, and razed to the ground double that number of strongholds. He also granted charters to many trading towns and municipalities, and thus gave considerable impetus to trade. The policy of his rule generally was indeed so greatly to favour the burgher and working classes, and to repress the tyranny of the powerful nobles, that his reign presented in this respect a favourable contrast to those of his predecessors, and the respect in which he was held by all ranks, bears the strongest testimony to his admirable qualities as a ruler. R. died in 1291, and was succeeded in Austria by his son, Albert I., Duke of Austria. See Schönhuth's *Geschichte Rudolf's von Habsburg* (2 vols. Leips. 1843—1844).

RUDOLF or RODOLF II., eldest son of the Emperor Maximilian II. of Germany, was born in 1552, and educated at the Spanish court by the Jesuits. On the death of his father in 1576, he succeeded to the imperial crown, after having, during the lifetime of his father, been proclaimed king of the Romans. This first reigning namesake of the great progenitor of the Austrian dynasty did not add to the dignity or greatness of the Hapsburg family; and the whole of his reign of 36 years was marked by persecutions and intolerance on his side, and by discontent and even insurrection on that of his subjects. His bigotry and intolerance in forbidding Protestants the free exercise of their religion, led them to ally themselves with their co-religionists in the Low Lands and in France (1608), and by implicating the empire in foreign wars, augmented taxation, and increased the monetary difficulties of the state. R., who was gloomy, taciturn, and bigoted, had not the qualities necessary to secure the good-will of those around him, and he died, unregretted by his subjects, 20th January 1612, leaving no issue, and bequeathing to his brother Matthias, who succeeded him, an impoverished and distracted state. R.'s taste for astrology and the occult sciences, and his anxious desire to discover the philosopher's stone, led him to extend his patronage to Kepler and Tycho Brahé, whose study of astronomy was thought specially to qualify them for that much-coveted discovery; and the patronage which R. extended to the Danish discoverer, when the latter was obliged to leave his own country, through the jealousy of his brother-

nobles, has proved one of the few claims possessed by R. to the grateful remembrance of late times. The important astronomical calculations begun by Tycho, and continued by Kepler, which are known as *The Rudolphine Tables*, derive their name from this emperor, who originally undertook, but subsequently failed, for want of means, to defray the expenses incidental to the undertaking. See Kurz's *Geschichte Oestreichs unter Kaiser R.* (Linz, 1821).

RU'DOLSTADT, the chief town of the principality of Schwarzburg-Rudolstadt, is charmingly situated in a hill-girt valley, on the left bank of the Saale, 18 miles south of Weimar. Pop. 6922.

RUDRA is, in Vedic Mythology, a collective name of the gods of the tempest, or Maruts, Rudra (in the singular) being the name of their father. (See John Muir's *Contribution to a Knowledge of the Vedic Theogony and Mythology*, in the *Journal of the Royal Asiatic Society*, new series, vol. i. part 4, London, 1864.) In later and Puranic mythology (see HINDU RELIGION and PURÂNA), Rudra (the terrible) is a name of S'iva, and the Rudras are his offspring. 'From Brahmâ's forehead,' the *Vishn'u-Purân'a* relates, 'darkened with angry frowns, sprang Rudra, radiant as the noontide sun, fierce and of vast bulk, and of a figure which was half male, half female. "Separate yourself," Brahmâ said to him, and having so spoken, disappeared: obedient to which command, Rudra became twofold, disjoining his male and female natures. This male being he again divided into eleven persons, of whom some were agreeable, some hideous, some fierce, some mild; and he multiplied his female nature manifold, of complexions black or white.' See Wilson's *Vishn'u-Purân'a*.—The word *rudra* apparently comes from the Sanscrit *rud*, weep; but as the sense of this radical does not yield any satisfactory clue to the meaning of the deity called Rudra, the *Purân'as* invented a legend, according to which Rudra received this name from Brahmâ, because, when a youth, he *ran about crying aloud;* and when asked by Brahmâ why he wept, replied that he wanted a name. 'Rudra be thy name,' rejoined Brahmâ: 'be composed; desist from tears.' In this legendary etymology there is, moreover, a punning on the similarity between *rud*, cry, and *dru*, run—an illustration of one of the sources whence the later mythology of India derived some of its boundless stock of absurd myths.



RUE (*Ruta*), a genus of plants, of the natural order *Rutaceæ*, having a short 4—5-parted calyx, 4 or 5 concave petals, affixed by a claw, 8 or 10 stamens, and a 4—5-lobed germen, with 8 or 10 nectariferous pores at the base. The species are natives of the south of Europe, the north of Africa, the Canary Isles, and the temperate parts of Asia. They are half shrubby; and have alternate, stalked, repeatedly pinnate leaves with translucent dots, the flowers small, and in terminal corymbs. COMMON R., or GARDEN R. (*R. graveolens*), grows in sunny stony places in the countries near the Mediterranean. It has greenish-yellow flowers, and glaucous evergreen leaves with small oblong leaflets, the terminal leaflets obovate. It is not a native of Britain, but is frequently cultivated in gardens. It was formerly called *Herb of Grace* (see *Hamlet*, act iv. scene 5), because it was used for sprinkling the people with holy water. It was in great repute among the ancients, having been hung about the neck as an amulet against witchcraft in the time of Aristotle. It is the *Pēganon* of Hippocrates. R. is still employed in medicine as a powerful stimulant, but the leaves must be used fresh, as they lose their virtues by drying. The smell of R., when fresh, is very strong, and to many very disagreeable; yet the Romans used it much for flavouring food, and it is still so used in some parts of Europe. The leaves chopped small are also eaten with bread and butter as a stomachic, but they must be used

Common Rue (*Ruta graveolens*).

sparingly, as they are acrid enough to blister the skin if much handled, and in large doses act as a narcotic poison. All their properties depend on an acrid volatile oil, which is itself used for making *Syrup of Rue*, eight or ten drops of oil to a pint of syrup; and this, in doses of a teaspoonful or two, is found a useful medicine in flatulent colic of children. The expressed juice of R., mixed with water, and employed as a wash, promotes the growth of the hair.—Some of the species found in the north of India resemble Common R. in their properties, and are used for the same purposes.

RUFF (*Machētes pugnax*), the only known species of its genus, is a bird of the family *Scolopacidæ*, and like snipes and many others of the family, an inhabitant of marshy places. It is found in most of the northern parts of the world, migrating southwards in autumn, and northwards in spring. It is

Ruff and Reeve (*Machētes pugnax*).

found in England and in Ireland, but not in Scotland, probably because there are few localities in that country suitable to it. In size, the R. is considerably larger than a snipe, and is about a foot in entire length, from the point of the bill to the tip of the tail. The tail is short and pointed. The wings are long and pointed. The legs are long and slender, the *tibia* naked for some distance above the tarsal joint. The bill is straight, rather

slender, as long as the head. The neck of the male is surrounded, in the breeding season, with a *ruff* of numerous long feathers, whence probably the English name. The males are remarkable for diversity of colours, no two specimens being ever similar; but ash-brown prevails, spotted or mottled with black: the head, ruff, and shoulders are black, glossed with purple, and variously barred with chestnut. The female (the *Reeve*) is mostly ash-brown, with spots of dark-brown, much more uniform in colour than the male. Their nest is usually situated on a tussock in a moist, swampy place, and is formed of the coarse grass which surrounds it. The eggs are four in number. The R. is taken for the table in spring, but the young birds taken in autumn are very preferable. They are often fattened after being taken, and are fed on bread and milk with bruised hemp-seed. After being fattened, they are sent to market. They feed readily when quite newly caught, and fight desperately for their food, unless supplied in separate dishes, which is therefore the regular practice of the feeders, who find it also advantageous to keep them in darkened apartments. The R. is gradually becoming scarcer in England, owing to the destruction of its favourite haunts, the fens, by drainage.

RUFFE, or POPE (*Acerina cernua*), a very pretty little fish of the Perch family (*Percidæ*), abundant in the lakes, slow rivers, and ditches of many parts of the middle of Europe and of

Ruffe or Pope (*Acerina cernua*).

England. It is not found in Scotland. It is never more than five or six inches long. In shape, it resembles the common perch, but has only a single dorsal fin. The R. is highly esteemed for the table. It is very easily caught, a small red worm being used as bait.

RUFFLE is a low vibrating sound, less loud than a roll, produced by drummers. It is used as a compliment to general officers and at military funerals.

RU'GBY, a market-town of England, in the county of Warwick, and 15 miles north-east of the town of that name, is pleasantly situated on a rising ground on the left bank of the Avon, and is reached by five different railways. It derives its importance and celebrity wholly from its grammar-school, founded by Lawrence Sheriff, a London shopkeeper, in 1567. The buildings of the school, consisting of a fine Elizabethan quadrangle, with cloisters, and an elegant detached chapel, are of brick, with stone-work round the windows and at the angles and cornices. The chapel contains among other monuments of head-masters, that of the late Dr Arnold. In 1865, the school was attended by 500 pupils. The endowment of the school produces about £5000 a year, and it offers 20 exhibitions of values varying from £40 to £80 a year, and tenable for four years. A park of eleven acres is set aside for foot-ball, cricket, and other games. The railways and the school give rise to almost all the trade of the town. Pop. (1861) 7818.

RU'GELEY, a market-town in the county of Stafford, on the right bank of the Trent. There are iron-works in the town, and collieries in the vicinity. Pop. (1861) 4362.

RÜ'GEN, the largest of the islands of Germany, belongs to Prussia, and lies in the Baltic, off the coast of Pomerania. Greatest length, 33 miles; greatest breadth, 28 miles; area, 423 sq. miles. Pop. 46,746. It is separated from the mainland, with which at one time it was probably connected, by a strait, about a mile in width. The island is so deeply indented on all sides by the sea, that it seems to be formed of several narrow tongues of land attached to each other, and to which the name of peninsulas has been given. On the peninsula of Jasmund is the precipitous cliff called the Stubbenkammer, the highest point of which (420 feet) is called the King's Seat, because Charles XII. witnessed from this spot a sea-fight between the Swedes and Danes, August 8, 1715. From this peak, a flight of 600 steps, cut in the rock, leads to the beach below. In the vicinity is Hertha Lake, believed to be the place where, according to Tacitus, the goddess Hertha (Earth) was worshipped. The soil of the island is productive, cattle are reared, and the fisheries around the island are carried on with profit. The scenery of R., which is everywhere pleasing, and is frequently grotesque and romantic, together with the facilities for sea-bathing, attract numerous visitors. Chief town, Bergen, in the middle of the island, with 3536 inhabitants.

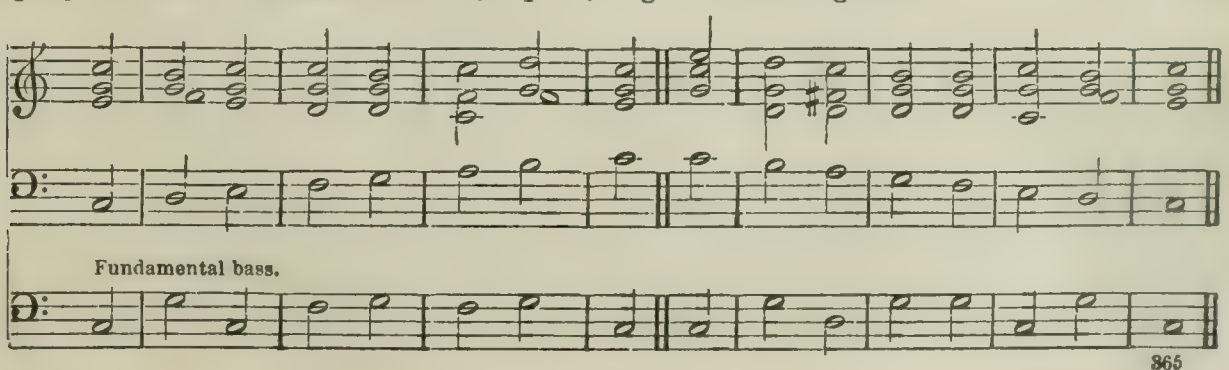
RUHNKEN, DAVID, born 2d January 1723 at Stolpe, in Pomerania, received his academical education first at the Königsberg gymnasium, where he distinguished himself not only in classical learning, but even in music and drawing, and afterwards at Wittenberg University, where he spent two years in the assiduous study of ancient literature, history, and jurisprudence. He graduated 1743; after which he went to Leyden, where for six years he prosecuted his classical studies under the guidance of Hemsterhuis, and bestowed particular attention on the Greek writers, nearly all of whom he read. He devised a new edition of Plato, collected the scholia of that author, and published an excellent edition of Timæus's *Lexicon Vocum Platonicarum* (Leyd. 1754; re-edited in a much improved form, 1789). He went in 1755 to Paris, where, for a whole year, he examined the MSS. of the Royal Library and of the Library of St Germain. Hemsterhuis then got him appointed as lector (reader) in the university of Leyden, in which capacity he was the assistant and colleague of his great master. In October 1757, he introduced his series of lectures by a discourse, *De Græcia Artium et Doctrinarum Inventrice* (Leyd. 1757). For four years he discharged the duties of his office with a skill and success that raised him in public esteem, as one of the most learned men in Holland. In 1761, he succeeded Oudendorp in the chair of Eloquence and History. In 1767, he lost his friend and master Hemsterhuis; and in his capacity as rector of the university, delivered a splendid tribute to the deceased in his *Elogium Tiberii Hemsterhusii* (Leyd. 1768). In 1774, he succeeded Gronovius as librarian to the university, which he enriched with a multitude of valuable books and MSS. He died 14th May 1798, and in gratitude to his memory, the city of Leyden purchased his great library, and gave his widow an annuity of 500 florins.

R. will long be remembered as one of the best scholars and critics of the 18th century. His fine taste and sagacity, aided by an astonishing memory

and vast learning, enabled him to illustrate the authors of antiquity with wonderful success. He was also a brilliant prælector, for which he was no doubt indebted to the extreme lucidity and grace of his Latin style. A list of his works would occupy much space. In addition to those already noted, we may mention his edition of vol. ii. of Alberti's Hesychius; his edition of Rutilius Lupus; of Velleius Paterculus; of Muretus, &c. He contributed to the editions of the classics by other scholars, such as Ernesti and Schweighäuser, and thereby accumulated a vast amount of valuable material in the shape of correspondence and miscellanea. His life has been written by his famous pupil Wyttenbach (Leyd. 1799; new and improved edition, Leips. 1822, and Freiberg, 1846).

RUHR, a river of Prussia, an affluent of the Rhine, rises about a mile from Winterberg, in the east of Westphalia, and flowing in a west-north-west direction, enters the plain of the Rhine at Mühlheim, and joins the great river at Ruhrort, two miles north-west of Duisburg. Entire length 143 miles.

RU'HRORT, a small town of Rhenish Prussia, on the right bank of the Rhine, 63 miles north-east of Aix-la-Chapelle by railway. It has the best harbour on the Lower Rhine, possesses many large ship-building docks, is the seat of an immense coal-trade with Holland—the coal being derived from large beds of the mineral on the banks of the Ruhr—and carries on a large carrying-trade in corn, timber, and wool, and in miscellaneous articles. A large fleet of steamers, with passengers and traffic, ply from R. up to Strasburg, and down to Holland. A railway crosses the Rhine here, and passengers and goods are carried across the river in the carriages, and without being put to the trouble of shifting their seats, by means of a large steamer, the deck of which is fitted with rails. On each side of the river is a tower, 120 feet high, connected with the railway, and furnished with a powerful engine, by means of which the railway carriages are lowered to the water on one side, and lifted to the railway on the other. Pop. 7773.



'RULE BRITANNIA,' one of the national anthems of Great Britain, which has been described by Southey as 'the political hymn of this country as long as she maintains her political power.' Its original appearance was in a masque entitled *Alfred*, the words by James Thomson the poet, and David Mallet, and the music by Dr Arne, which was performed for the first time on August 1, 1740, before Frederick, Prince of Wales, at his residence at Cliefden. The words of the ode are believed to be the composition of Mallet. *Alfred* was altered by Mallet in 1751, when three stanzas of *Rule Britannia* were omitted, and three others, by Lord Bolingbroke, substituted for them; but it is the ode in its original form that has taken root.

RULE NISI, in the English and Irish courts of law, is a technical term denoting the first step in an interlocutory application to the court, such as an application for a new trial. The usual course is for the party who takes the initiative to move, *ex parte*, for a rule nisi, i. e., an order of the court that something shall be done, *unless* the opposite party, within a certain time, usually three or six days, shew cause, i. e., some good reason why the thing proposed should not be done. When the party obtains a rule nisi, he sends a copy of it to the other party, who must then, at the time appointed, shew cause, and if the cause is deemed sufficient, the rule is discharged, i. e., the application is refused; if the cause is insufficient, the rule is made absolute, i. e., the opposite party is bound to do the thing asked, otherwise he will be liable to some disadvantage or sometimes to imprisonment, according to the nature of the subject matter.

RULE OF FAITH, the name given in polemical theology to what is regarded as the code from which the faith of Christians is to be drawn. One of the most vital of modern religious controversies is that which turns upon the question: What is the Christian rule of faith? We can but undertake to state the conflicting views. The Reformers, as a body, laid it down as a first principle, that the Word of God alone, by which they meant the written word, or the Scriptures, could safely be accepted as a rule of faith. If the Fathers could be received at all, it is only in the light of witnesses, and fallible witnesses, to the ancient interpretation of the Scriptures. This doctrine appears to be much modified in the English Church of the Laudian period, and by the successors of that school, the modern Tractarians, who admit the 'consent' of the Fathers as an authoritative interpretation of the Scriptures. Roman Catholics, on the contrary, while they admit that God's word alone is the rule of faith, yet contend that the Scriptures are not to be considered as the only depository of God's word. Much of our Lord's teaching to his apostles was not committed to writing in these authentic Scriptures; and as the teaching of Christ, wherever found, is God's word, even as much as what is written in the Scriptures, they hold that if it be possible to find such teaching elsewhere than in the Bible, the teaching so found is to be held as part of the rule of faith. Now they hold that the traditions of the church, contained in the writings of the Fathers, the decrees of councils, the decretals of popes, are a depository of Christ's teaching, less accessible, it is true, but when unanimous, not less certain than the Scripture itself; and of this certainty of such unanimous interpretation, they regard the church as at all times the authoritative expositor.

Protestants acknowledge the authority of the oral teaching of Christ himself, and of his apostles, or others speaking by inspiration; but in respect of the want of any authoritative or trustworthy record, they deny that any such teaching, not recorded in the Scriptures, is of any value to us. As to the right of the church to expound authoritatively, they deny it altogether.

RULE OF THE OCTAVE, a well-known formula of musical progression, which shews the method of accompanying or harmonising the ascending and descending scale.

RULE OF THREE is the technical term for that rule in arithmetic, otherwise called Proportion (q. v.), which teaches the finding of a fourth number proportional to *three given numbers*. The term 'rule of three' has been in use from the commencement of the 16th c.; and from the great utility of the operation in commercial transactions, it received, almost from the commencement, the name of the GOLDEN RULE (q. v.). To the ordinary 'rule of three' was added the *backer rule*, or 'rule of three inverse' (corresponding to inverse or Reciprocal [q. v.] proportion), and the 'double rule of three,' in which two or more ratios are given as determining the number to be found.

RUM, a mountainous island of Argyleshire, belongs to the group of the Inner Hebrides, 15 miles north-north-west of Ardnamurchan Point. It is 8 miles long, about 7½ miles broad; area upwards of 30,000 acres, only about 6 per cent. of which is under cultivation. Pop. (1851) 162; (1861) 73. The island is a mass of high sharp-peaked mountains, rising in Ben More to the height of 2320 feet.

RUM, a kind of spirit made by fermenting and distilling the 'sweets' that accrue in making sugar from cane-juice. The scummings from the sugar-pans give the best rum that any particular plantation can produce; scummings and molasses, the next quality; and molasses the lowest. Before fermentation water is added, till the 'sett' or wort is of the strength of about 12 per cent. of sugar; and every ten gallons yields one gallon of rum, or rather more. The flavour of rum depends mainly on soil and climate, and is not good where canes grow rankly. Pine apples and guavas are at times thrown into the still, but on the great scale, no attempt is made to influence flavour artificially. The finest-flavoured rums are produced by the old-fashioned small stills. The modern stills, which produce a strong spirit at one operation, are unfavourable to flavour. The colour of rum is imparted after distillation by adding a certain proportion (varying with the varying taste of the market) of caramel, or sugar melted without water, and thus slightly charred. Rum is greatly improved by age, and old rum is often very highly prized; at a sale in Carlisle in 1865, rum known to be 140 years old sold for three guineas per bottle. It forms a very important part of British colonial produce: the quantity imported in 1867 was no less than 6,845,502 gallons, of which 4,316,058 gallons were retained for consumption. It is distilled both in the East and West Indies.

RU'MA, a small town of Austria, in the crownland of the Temeser Banat and Servian Wojwodschaft, on an affluent of the Save, 35 miles north-west of Belgrade. The chief industry is wine-culture, and the rearing of horses. Pop. 7800.

RUMFORD, BENJAMIN THOMPSON, COUNT, an American inventor, was born at Woburn, Massachusetts, March 26, 1753. Having received the rudiments of education at a common school, he entered a merchant's office at Salem, at the age of 13, and got his living as a clerk and school teacher, while he studied medicine and physics. In 1770, he was engaged as teacher of an academy at Rumford, now Concord, the capital of New Hampshire; and in 1772, married a rich widow of that place, and was made major of militia by the English governor. The jealousy of officers over whom he had been promoted, and charges of disaffection to the royal cause, at this period of the outbreak of the American revolution, drove him from Rumford to Boston, where he became acquainted with General Howe; and when General Washington compelled the surrender of Boston, Thompson was sent to England as bearer of dispatches. In London, he so won the favour of the government by his intelligence, as to be appointed Under-secretary of State in the Colonial Office. On a change of ministry, however, he returned to America, and fought in the royal cause. When it failed, he entered the service of the king of Bavaria, by whom he was knighted; and in 1784, he was settled at Munich as aide-de-camp and chamberlain to the reigning sovereign. In this post he exhibited the energy of his mind and the fertility of his invention. He reorganised the army and improved its tactics. In 1790, he suppressed beggary throughout the kingdom, took measures for improving the breeds of horses and cattle, and laid out a park for Munich. He rapidly rose to the offices of major-general, councillor of state, lieutenant-general, minister of war, and was created Count of the Holy Roman Empire, when he chose Rumford, where his fortunes had begun, as his titular designation. In 1795, he visited London, where he was treated with much attention, and finding that his opinion was sought after on technological subjects, he published the results of his experience and the records of his labours in Bavaria. Having long and carefully studied the phenomena of heat, he was the first to demonstrate the now accepted proposition that it is but a mode of motion. (See E. L. Youmans, in *The Correlation and Conservation of Forces.*) He also discovered the principles upon which fireplaces and chimneys have since been constructed. The improvement of cooking-ranges, stoves, &c. also engaged much of his attention. On his return to Bavaria, he was appointed President of the Council of Regency, and soon after, Minister Plenipotentiary to the Court of St James; but the British government, holding to the doctrine of inalienable allegiance, refused to recognise him in that capacity. Declining an invitation to America, he finally settled in Paris; devoted himself to improvements in artillery and illumination; founded a professorship, in Harvard College, of the Application of Science to the Arts of Living; married the widow of Lavoisier; and died at Auteuil, near Paris, August 21, 1814, after making many important bequests to the Royal Society of London, the American Academy of Sciences, and Harvard University. See *Memoirs of Sir Benjamin Thompson, Count Rumford, &c.*, by George E. Ellis, Philadelphia, 1871; *The Works of Count Rumford*, Philadelphia, 1871.

RU'MILI. See TURKEY.

RUMINA'NTIA, in the zoological system of Cuvier, and of almost all recent naturalists, the name given to an order of Mammalia called *Pecora* by Linnæus, an extremely well defined natural order, among the individuals of which the habit of *rumination* or chewing the cud is universal and almost peculiar. The R. are all strictly and exclusively herbivorous, and exhibit a great similarity of structure. They have no incisors in the upper jaw, the front of which is occupied by a callous pad. 'The grass is collected and rolled together by means of the long and movable tongue; it is firmly held between the lower cutting teeth and the pad, the cartilaginous upper lip assisting in this; and then, by a sudden nodding motion of the head, the little roll of herbage is either torn or cut off, or partly both torn and cut.'—Youatt. In the lower jaw, there generally appear to be eight incisors; but the two outer are more properly to be regarded as canines, and in the *Camelidæ*, they assume the ordinary canine form. Some of the R. have canine teeth in the upper jaw, and some are destitute of them. In front of the molar teeth, there is a long vacant space in both jaws. The molars are six on each side in each jaw; their surface exhibits

crescent-shaped ridges of enamel. The head is elongated, the neck is always of considerable length, the eyes are placed at the side of the head, and the senses of smell and hearing, as well as of sight, are extremely acute. The head is in many R. armed with horns, which in some are found in both sexes, in some only in the male, whilst in others they are wholly wanting; and the absence of them characterises varieties of some species, as the sheep and ox, in which they are ordinarily present. The horns differ very much in different families, even in their structure, some being hollow (true *horns*), some solid (*antlers*). All the four limbs are terminated by two large toes, which are hoofed. Behind the hoof are always two small spurs, rudimentary toes. The metacarpal and the metatarsal bones are united into one, called the *cannon* bone. The legs are rather long, and the spinal column is very flexible. The brain of the R. is small, and they do not exhibit much intelligence; nor are they distinguished by any remarkable instincts; and though easily tamed, they are scarcely susceptible of any kind of training or education. Very few, however, of the numerous species of R. have been truly domesticated, and probably much is yet to be done in this way.

The R. are generally gregarious; they are distributed over almost the whole world; but none are natives of Australia. They are found both in the warmest and the coldest regions. The flesh of all the R. is fit to be used for human food; the fat (tallow) hardens more on cooling than the fat of other animals, and even becomes brittle. The fat, hide, horns, hoofs, hair, bones, entrails, blood, and almost all parts are useful to man.

The intestines are long in all the Ruminantia. The cæcum is also long. The complex stomach, adapted to rumination, requires a more particular description. The stomach consists of four distinct bags or cavities. The first of these, into which the gullet or œsophagus enters, is, in the mature animal, by far the largest, and is called the *Paunch* (Lat. *rumen*). Into this the chief part of the food passes. It is lined with a thick membrane, presenting numerous prominent hard papillæ, secreting a fluid in which the food is soaked. The second cavity is the *Honeycomb Bag* (Lat. *reticulum*), so called from its being internally covered with a net-work of cells, like those of a honeycomb. In Scotland, it is known as the *King's Hood*. This second cavity, or stomach, has also a direct communication with the œsophagus, and fluids seem in general to pass immediately into it, but sometimes or partly also into the other cavities; and it is here that the cells for retaining water are chiefly found in the camel. The third cavity, or stomach, is the *Manyplies* (Lat. *psalterium*), so called because its lining membrane forms many deep folds, like the leaves of a book, beset with small hard tubercles. This also communicates directly with the œsophagus, by a sort of prolongation of it. The leaves of the membrane seem to serve for the absorption of superfluous fluid from the food. Finally, the food passes into the fourth cavity, which is of a more elongated form than any of the others, and is next in size to the first. This is called the *Reed* or *Rennet* (Lat. *abomasus*). It may be considered as the true stomach, homologous —if any one of the four parts can be so regarded— to the simple stomach of mammals in general. It is lined with a velvety mucous membrane in longitudinal folds. It is here that the gastric juice is secreted. In young animals, it is the largest of the four cavities, and it is only when they pass from milk to crude vegetable food that the paunch becomes enlarged, and all the parts of the complex stomach come fully into use. It seems to be by a power of what may be called instinctive volition that the animal directs what passes through the gullet into the first cavity, the second, or even the third. It has been found by M. Flourens, who made many experiments on this subject, that the food consumed by ruminants passed chiefly into the first cavity, but part of it also at once into the second, and even, when it was given in a *mashed* or in a much comminuted state, into the third.

The particular means by which hastily swallowed food is brought from the paunch, formed into pellets at the base of the œsophagus, and brought up into the mouth for rumination, or second and more thorough mastication, are not yet very thoroughly understood, notwithstanding the patient investigations of M. Flourens. He ascribes the formation of the pellets, however, to the action of the muscular duct which connects the œsophagus with the second and third stomachs, and the power which the animal has of closing or opening at will the orifices of these cavities.

Chewing of the cud is very generally performed in an attitude of repose, and evidently affords great pleasure to the animal.

The R. are arranged by naturalists in seven families, all very natural—*Camelidæ* (see CAMEL), *Moschidæ* (see MUSK), *Cervidæ* (see DEER), *Camelopardidæ* (see GIRAFFE), *Antelopidæ* (see ANTELOPE), *Bovidæ* (q. v.), and *Capridæ* (q. v.). The most important genera and species are separately noticed.

RUMP PARLIAMENT. In order to bring about the condemnation of Charles I., Oliver Cromwell, on 6th December 1648, sent two regiments, under the command of Colonel Pride, to coerce the House of Commons. Forty-one members of the Long Parliament who were favourable to accommodation were imprisoned in a lower room of the house, 160 were ordered to go home, and only 60 of the most violent of the Independents were admitted. The clearance was called *Pride's Purge*, and the privileged members ever afterwards passed by the name of the *Rump*, forming, as it were, the fag-end of the Long Parliament. This assembly, in conjunction with the army, brought about the arraignment, trial, and condemnation of Charles I. Five years later, the Rump Parliament, forgetting that it was but the creature of the army, attempted to make a stand against certain demands on the part of the soldiers. The result was that Cromwell filled the House with armed men; the Speaker was pulled out of the chair, the mace taken from the table, the room cleared, the door locked, and the parliament declared to be dissolved. Supreme in the three kingdoms, Cromwell convoked an assembly which assumed the title of Parliament, and acquired from the name of one of its most prominent members, a leather-seller, called Praisegod Barebones, the name of the *Barebones Parliament*. The Barebones Parliament, after subsisting five months, was dissolved, and Cromwell, raised to the dignity of Protector, convoked two parliaments, and dissolved them for refusing to sanction his measures. On Oliver Cromwell's death, and Richard's succession to the Protectorate, the military malcontents coalescing with the Independents in Richard's parliament, declared the expulsion of the Rump illegal, and restored that assembly to its functions. With the revival of the Rump, its quarrel with the army revived; and the troops, again surrounding Westminster Hall, expelled it on 13th October 1659, a provisional government of officers assuming the direction of affairs. But the general dissatisfaction having led to a coalition between the Presbyterians and Royalists, the army, unable to carry on the government, was reduced to the necessity of once more restoring the Rump, which had been twice ignominiously

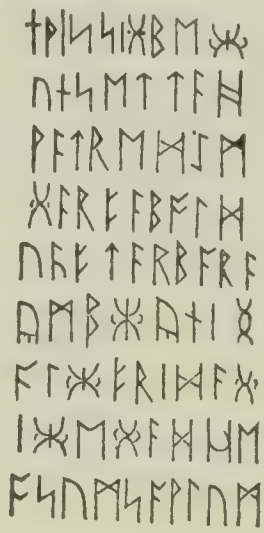
expelled. The advance of Monk, however, with the army of Scotland led to a general cry throughout the country for a free parliament. A number of the members who had been excluded by Pride's Purge reappearing in the House, placed the Independents in the minority; and on 16th March 1660, the despised and derided Rump at last solemnly decreed its own dissolution. The most prominent members of the Rump Parliament were Vane and Hazlerig.

RUM SHRUB, a liqueur in which the alcoholic base is rum, and the other materials are sugar, lime or lemon juice, and the rind of these fruits added to give flavour. Almost every maker has his own receipt, and much credit is assumed by each for his own especial mixture.

RU'NCORN, a thriving market and manufacturing town and river-port of Cheshire, on the left bank of the Mersey, 12 miles south-east of Liverpool. There is a station of the North-western Railway on the Lancashire side of the river, and the town is the terminus for the Bridgewater and the Mersey and Irwell Canals. It is a free port, has a custom-house, and contains iron-foundries, soap and chemical works, ship-building yards, &c.; and in the vicinity are collieries, and slate and freestone quarries. Large quantities of freestone are shipped for distant ports. In 1864, 4566 vessels, of 278,000 tons, entered and cleared the port. Pop. (1851) 8049; (1861) 10,434.

RUNES, the earliest alphabet in use among the Teutonic and Gothic nations of Northern Europe. The exact period of their origin is not known. The name is derived from the Teutonic *rûn*, a mystery, whence *runa*, a whisper, and *helrûn*, divination; and the original use of these characters seems to have been for purposes of secrecy and divination. The resemblance which some of the runic characters bear to the Phœnician alphabet and others derived from it, has led to the supposition that they were first introduced by Phœnician merchants who traded with the coasts of the Baltic; and while the mass of the people were allowed to possess but a very partial acquaintance with them, the priests systematised them, and retained a full knowledge of them in their own hands, no doubt finding them useful in establishing a reputation for superior power and intelligence. Scandinavian and Anglo-Saxon tradition agree in ascribing the invention of runic writing to Odin or Wodin. The countries in which traces of the use of runes exist include Denmark, Norway, Sweden, Iceland, Germany, Britain, France, and Spain; and they are found engraved on rocks, crosses, monumental stones, coins, medals, rings, brooches, and the hilts and blades of swords. Runic letters were also often cut on smooth sticks called *rûn-stafas*, or mysterious staves, and used for purposes of divination. But there is nô reason to believe that they were at any time in the familiar use in which we find the characters of a written language in modern times, nor have we any traces of their being used in books or on parchment. We have an explanation of the runic alphabet in various MSS. of the early middle ages, prior to the time when runes had altogether ceased to be understood.

The systems of runes in use among the different branches of the Teutonic stock were not identical, though they have a strong general family likeness, shewing their community of origin. The letters are arranged in an order altogether distinct from that of any other alphabetical system, and have a purely Teutonic nomenclature. Each letter is, as in the Hebrew-Phœnician, derived from the name of some well-known familiar object, with whose initial letter it corresponds. Runes being associated in the popular belief with augury and divination, were, to a considerable extent, discouraged by the early Christian priests and missionaries, whose efforts were directed to the supplanting of them by Greek and Roman characters. But it was not easy suddenly to put a stop to their use, and we find runes continuing to be employed in early Christian inscriptions. This was to a remarkable extent the case in the Anglo-Saxon kingdoms of Northumbria, Mercia, and East Anglia, where we have traces of runic writing of dates varying from the middle of the 7th to the middle of the 10th century. Its continued prevalence in this particular district has been accounted for by the fact that, after the death of Edwin and the flight of St Paulinus, the restoration of Christianity in Northumbria was effected by missionaries of the Irish school, whose predecessors had adopted the policy, not, like Augustine and his brethren, of destroying the monuments of pagan antiquity, but of allowing them to remain, and consecrating them by marking them with the symbols of Christianity. Runes are said to have been laid aside in Sweden by the year 1001, and in Spain they were officially condemned by the Council of Toledo in 1115.



The different systems of runes, all accordant up to a certain point, have been classed as the Anglo-Saxon, the German, and the Norse, each containing different subordinate varieties. The Norse alphabet is generally considered the oldest, and the parent of the rest. It has 16 letters corresponding to our *f*, *u*, *th*, *o*, *r*, *k*, *h*, *n*, *i*, *a*, *s*, *t*, *b*, *l*, *m*, *y*, but has no equivalent for various sounds which existed in the language, in consequence of which the sound of *k* was used for *g*, *d* for *t*, *b* for *p*, and *u* and *y* for *v*: *o* was expressed by *au*, and *e* by *ai*, *i*, or *ia*; and the same letter otherwise was made to serve for more than one sound. Other expedients came, in the course of time, to be employed to obviate the deficiency of the system, as the addition of dots, and the adoption of new characters. But the runic system received a fuller development among the Germans and Anglo-Saxons, particularly the latter, whose alphabet was extended to no fewer than forty characters, in which seem to have been embraced, more nearly than in any modern alphabets, the actual sounds of a language. Till recently, the Norse runes had been most studied; but of late the Anglo-Saxon have become the subject of considerable attention. The following table exhibits the best known forms of the Anglo-Saxon, German, and Norse runic alphabets, with the names and the power of the several letters:

Anglo-Saxon.			German.		Norse.	
ᚠ	feoh	f	ᚠ	feh	ᚠ	fé
ᚢ ᚣ	ur	u (short)	ᚢ	uur	ᚢ	ur
ᚦ	thorn	th	ᚦ	dorn	ᚦ	thurs
ᚩ ᚬ	os	o (short)	ᚬ	oos	ᚬ	oss
ᚱ	rad	r	ᚱ	rat	ᚱ	ridr
ᚳ	cæn	k	ᚲ	cen	ᚴ	kaun
ᚷ	gyfu	g	ᚷ	gebo

ᛤ						
ᛥ						

The Anglo-Saxon runes, as here given, are derived from a variety of MS. authorities, the most complete containing forty characters, while some only extend as far as the twenty-fifth or twenty-eighth letter. Neither the name nor the power of some of the later letters is thoroughly known, and they are without any equivalents in the Norse runic system. The German runes are given from a MS. in the conventual library of St Gall in Switzerland. Though the various runic alphabets are not alike copious, the same order of succession among the letters is preserved, excepting that, in the Norse alphabet, *laugr* precedes *madr*, although we have placed them otherwise, with the view of exhibiting the correspondence of the three systems. The number of characters in the Anglo-Saxon alphabet is a multiple of the sacred number eight; and we have the evidence both of a Swedish bracteate containing twenty-four characters, and of the above-mentioned St Gall MS., that there was a recognised division of the alphabet into classes of eight letters—a classification which forms the basis of a system of secret runes noticed in that MS. Of these secret runes, there are several varieties specified; in particular 1. *Iis-runa* and *Lago-runa* (of which specimens exist in Scandinavia), consisting of groups of repetitions of the character *iis* or *lago*, some shorter and some longer, the number of shorter characters in each group denoting the class to which the letter intended to be indicated belonged; the number of longer ones, its position in the class. 2. *Hahal-runa*, where the letters are indicated by characters with branching stems, the branches to the left denoting the class, and those to the right the position in that class. There is an inscription in secret runes of this description at Hackness in Yorkshire. 3. *Stof-runa*, in which the class is indicated by points placed above, and the position in the class by points below, or the reverse.

The best known inscriptions in the Anglo-Saxon character are those on two gravestones at Hartlepool in Northumberland, on a cross at Bewcastle in Cumberland, and on another cross at Ruthwell in Dumfriesshire. The inscription on the west side of Bewcastle cross, which we give as a specimen of Anglo-Saxon runes, is a memorial of Alcfrid, son of Oswiu, who was associated with his father in the government of the kingdom of Northumbria, in the 7th century.

Runes.

It has been thus deciphered into the Anglo-Saxon dialect of the period:

+ THIS SIGBECUN
SETTÆ HWÆTRED
EM GÆRFÆ BOLDU
ÆFTÆR BARÆ
YMB CYNING ALCFRIDÆ
GICEGÆD HEOSUM SAWLUM.

Or in modern English:

This memorial
Hwætred set
and carved this monument
after the prince
after the king Alcfrid,
pray for their souls.

The inscription on the Ruthwell cross, after being long a puzzle to antiquaries, was first deciphered in 1838 by Mr John M. Kemble, an eminent Anglo-Saxon scholar. It is written alternately down one side of the stone and up another, and contains a portion of a poem on the subject of the Crucifixion. Mr Kemble's interpretation received a very satisfactory confirmation by the discovery of a more complete copy of the same poem in a MS. volume of Anglo-Saxon homilies at Vercelli.

Mr D. H. Haigh, whose researches have added much to our knowledge of Anglo-Saxon runes, has endeavoured to set up for them a claim of priority

over the Norse characters. Instead of considering the additional Anglo-Saxon letters as a development of the Norse system, he looks on the Norse alphabet of sixteen letters as an abridgment of an earlier system, and finds occasional traces of the existence of the discarded characters in the earliest Norse inscriptions, and in the Scandinavian *Iis-runa* and *Hahalruna*, where the letters are classified in accordance with the Anglo-Saxon groups of eight.

The Scandinavian kingdoms contain numerous runic monuments, some of them written *boustrophedon*, or with the lines beginning alternately from the right and left; and there are many interesting inscriptions on Swedish gold bracteates, generally having reference to some design which they accompany. The Celtic races, from their connection with the Scandinavians, became acquainted with their alphabet, and made use of it in writing their own language; and hence we have in the Western Islands of Scotland, and in the Isle of Man, runic inscriptions, not in the Anglo-Saxon, but in the Norse character, with, however, a few peculiarities of their own. Some of the most perfect runic inscriptions are in Man; others of a similar description exist at Holy Island, in Lamlash Bay, Arran, and there is an inscription in the same character on a remarkable brooch dug up at Hunterston in Ayrshire. Dr D. Wilson considers that the Celtic population of Scotland were as familiar with Norse, as the Northumbrians with Saxon runes.

We sometimes find the Norse runes used to denote numerals, in which case the sixteen characters stand for the numbers from 1 to 16; *ar* combined with *laugr* stands for 17, double *madr* for 18, and double *tyr* for 19. Two or more letters are used to express higher numbers, as *ur ur*, 20; *thurs thurs os*, 34.

See Planta's essay, *On the Runic or Scandinavian Language;* W. C. Grimm, *Ueber Deutsche Runen; Archæologia*, vol. 28; Haigh's *Anglo-Saxon Conquest of Britain;* Dr D. Wilson's *Prehistoric Annals of Scotland.*

The term RUNIC KNOTWORK is often applied loosely and inaccurately to a kind of interlaced ornamentation to be seen in MSS. and on monuments of Anglo-Saxon, Norman, Scandinavian, Scoto-Irish, and Pictish origin, from the 6th to the 12th century.

RUNGPU'R, a British district of India, in the presidency of Bengal, bounded on the E. by the Brahmaputra, and on the N. by the protected state of Cush Behar. Area, 4130 sq. m.; pop. 1,200,000. The surface is so low, that a large proportion of it is inundated during the rains. Indigo, for the manufacture of which there are numerous large factories in the district, is the great article of export.

RUNJEET-SINGH, maharajah of the Punjab (generally described by English writers as the *king of Lahore*), was born at Gugaranwalla, 2d November 1780. His father, Maha-Singh, was sirdar of Sukur-Chukeah, one of the twelve missouls or military organisations of the Sikhs, and died when R. was about 12 years old, leaving a full treasury and a well-regulated government. His widow took charge of the administration, and attempted by every means in her power to render her son effeminate, but R.'s character was not capable of being weakened by such treatment. When about 17 years old, his mother died suddenly (poisoned, as it is reported, by her son), and he immediately assumed the government. R. now shewed himself to be a prince of overwhelming ambition, and capable of attaining his object either by policy and address, or by force. In 1799, having rendered important service as an ally to Zemân Shah of Afghanistan, who had invaded the Punjab, he received from that monarch liberty to take possession of Lahore, which he accordingly did, and held it, despite the utmost efforts of his brother sirdars. To these quarrelsome neighbours he next turned his attention, and succeeded in subduing some and rendering others tributary, so that by 1809 he had greatly reduced their number. His successes having alarmed the Sikh chiefs, situated between the Sutlej and the Jumna, they besought the governor-general's interference, and this was the only occasion on which he ever came into collision with the British. Arrangements were amicably made, and Britain gave up all pretension to interference north of the Sutlej, on condition that that boundary should be carefully respected. R., thus freed from the only danger he feared, pursued his schemes of aggrandisement; and in 1812, having compelled all but three of the Punjab sirdars to resign their authority, he organised the whole under one sovereignty, and proclaimed himself *rajah*. His army had for several years previously been organised and disciplined according to the European fashion by English officers who had entered his service, so that the wild and undisciplined troops of the neighbouring states had not a chance of successfully opposing him. About this time his capital was resorted to by two of the dispossessed rulers of Afghanistan, one of whom, Shah-Sujah, was the possessor of the celebrated *Koh-i-nûr* (q. v.), which prize R. eagerly coveted, and at last obtained as the price of his assistance in recovering the throne of Cabul. In 1813, R. obtained possession of Attock, took Mûltan by storm in 1817, and in 1819 annexed Cashmere, assuming after these exploits the title of *maharajah*. In 1822, he took into his service Allard and Ventura, two French officers who formerly served under Napoleon, and by their aid he finished the reconstruction of his army, with the view of extending his dominion to the west of the Indus. In pursuance of this scheme, he wrested (1829) from the Afghans the province of Peshawur. He had now an extensive territory, peopled by more than 20,000,000, and a well-trained army of 70,000 men, of whom 36,000 were infantry, thoroughly disciplined, and this numerous host was employed for several years in desultory wars with the Afghans. Between him and the British there was always a mutual distrust, dissembled by the show of extreme cordiality; but as both parties scrupulously abstained from any cause of offence, pacific relations were never interrupted. In 1836, his army was totally defeated by the Afghans, but this reverse seems not in the slightest degree to have affected the stability of his rule, even in the most recently-acquired districts; and, strange to say, his long reign was not disturbed by a single revolt. He died 27th June 1839. R. is one of the most remarkable men in eastern history; in person he was short and slight; his countenance, deeply marked with small-pox (which had deprived him of the sight of one eye), was, however, expressive of strong determination, to which the calm of his brilliant dark eye lent additional effect. He was totally uneducated; could neither read nor write; yet the indefatigable energy of his administration, and his clemency and moderation (rare qualities in an Asiatic despot), are without a parallel in the East. See H. T. Prinsep, *Origin of the Sikh Power in the Punjaub, and Political Life of Runjeet-Singh*, 1839; W. L. Macgregor, *Runjeet-Singh; History of the Sikhs.*

RUNNER (*flagellum*, a whip), in Botany, is a long slender branch proceeding from a lateral bud

of a herbaceous plant with very short axis, or in popular language, without stem. It extends along the ground, and produces buds as it proceeds, which often take root and form new plants. Strawberries afford a familiar example. Another is found in *Potentilla anserina*. Runners are common in the genus *Ranunculus*.

RUNNERS. See KIDNEY BEAN.

RU'NNIMEDE, a long stretch of green meadow, lying along the right bank of the Thames, from which it is partly concealed by plantations of willows, 20 miles west-south-west of London. It is proposed to derive the name from the Sax. *rhynes*, water-brooks, which abound in these meadows; others suppose the word to be *Runningmead*, referring to the horse-races which appear to have been held here from time immemorial, and which still take place in the month of August. R. is of great historical interest, from the fact that Magna Charta was signed by King John, June 19, 1215, either on this meadow, or on Charter Island, lying a short distance off the shore. The Great Charter itself professes to have been signed *per manum nostram in prato quod vocatur Runnimede*. See MAGNA CHARTA.

RU'NRIG LANDS, a peculiar species of property known in Scotland, by which alternate ridges of land belong to two individuals respectively. The origin of holding lands in this way is said to have arisen out of the practice of common defence and watching, and the common ploughing and labouring necessary or natural in the occupation of burgh acres and lands near towns. Each party is absolute proprietor of his own ridge; but owing to the obstruction often caused to agricultural improvement, a mode of compulsory division or allotment of the lands was introduced by statute in 1695. This remedy, however, does not apply to burgh acres, or to patches of land less than four acres in extent.

RUPEE' is the name of a silver coin current in India, of the value of 2*s*. English. The word is a corruption of the Sanscrit *rûpya*, from *rûpa*, shape, form, meaning, according to Pân'ini, a coin—not necessarily of silver—on which the shape *of a man*, according to the Kâs'ikâ commentary on this grammarian, is struck; and if this ellipsis of the word *man* is correct, as it very probably is, the word rupee would be of great numismatic interest, inasmuch as it would prove that even as early as at the time of the grammarian Pân'ini (q. v.) coins existed with a *human* figure impressed on them. The coin bearing the name of rupee was first struck by Shir Shah, and was adopted by Akbar and his successors; it was of the weight of 175 grains troy, and was considered to be pure; but in the decline of the Mohammedan empire every petty chief coined his own rupee, varying in weight and value, though usually bearing the name and titles of the reigning emperor. In the reign of Shah Aalam, a great variety of coins bore his name and the years of his succession, until 1773, when they were suppressed in the territories subject to the East India Company, and a rupee was struck, called the Sicca rupee, with an inscription on it, which, translated, runs: 'The king, Shah Aalam, the defender of the faith of Mohammed, the shadow of the grace of God, has struck this coin, to be current through the seven climes;' and on the reverse: 'Struck at Murshidabad, in the 19th year of the auspicious accession.' Though rupees were coined also at Dacca, and finally only at Calcutta, and also at various dates, the place of coinage (the mint of Murshidabad) and the date just named (the 19th of Shah Aalam's reign) remained unaltered, in order to put a stop to the practice which money-changers had introduced, of levying an arbitrary rate of discount on rupees of different places of coinage and of previous dates, without reference to any actual diminution of weight by wear. Although the Dacca rupee was thus the actual medium of exchange, the Company's accounts were for a long time kept in a different valuation, or that of the *Chalani*, or current rupee, 100 Sicca rupees being reckoned as equivalent to 116 Chalani rupees. The Sicca rupee served also as a unit of weight—80 Sicca weight being equal to one *ser*, and 40 sers to one *man* or *maund* = 82 lbs. Beside the Sicca rupee, two other rupees were current in the Bengal presidency—the Benares rupee, which ceased to be struck in 1819, and the Farakhabad rupee. At Madras, the rupee of the Nawabs of the Carnatic, originally struck at Arcot, and at Bombay that of the Nawabs of Surat, became the currency of the Company. In 1818, the standard of the Sicca and Farakhabad rupees was altered, but their intrinsic value was unaffected, as they continued to have the same amount of fine silver. Other changes of these coins took place—of the latter in 1824, of the former in 1833; but in 1835, the coinage of the Company was entirely remodelled, and a coin, thenceforth termed the Company's rupee, with its proportionate subdivisions, was struck to replace all the former currencies, being of the same weight and fineness throughout, and bearing inscriptions in English, or on one face the head and name of the reigning sovereign of Great Britain and Ireland, and on the reverse the designation of the coin in English and Persian, with the words 'The East India Company' in English. The latter, of course, have disappeared since India has been placed under the direct government of the English crown. The weight, intrinsic purity, and value of the British currency of these several coins are as follows:

		Weight.	Pure Contents.		
		Troy Grains.		*s*	*d.*
Sicca Rupee,	1773	179·666	175 923	2	2
Do.,	1818	191·916	175·923	2	2
Do.,	1823	192·000	176·000	2	2
Benares,	1806	174·760	167·000	2	0⅝
Farakhabad,	1803	173·000	165·215	2	0⅓
Do.,	1819	180·234	165·215	2	0⅓
Do.,	1824	180·000	165·000	2	0⅓
Madras,		176·400	166·480	2	0⅝
Do.,	1818	180·000	165·000	2	0⅓
Bombay,	1800	179·000	164·680	2	0⅓
Do.,	1829	180·000	165 000	2	0⅓
East India Company's,	1835	180 000	165·000	2	0⅓

But as silver is subject, in the London mint, to a seigniorage of nearly 6 per cent., the London mint produce of the rupee, if of full weight and standard value (11 dwts. fine) should be 1*s*. 11*d*. For further detail, see H. H. Wilson, *Glossary of Judicial and Revenue Terms* (Lond. 1855), under RUPEE.

RUPERT, PRINCE, the son of the Elector-Palatine Frederick V., and Elizabeth, daughter of James I. of England, was born in 1619. In 1642, he received from his uncle, Charles I. of England, a commission to command a regiment of horse at Worcester against the Parliamentarians. The impetuosity with which he charged the enemy there, and in the battle of Edgehill, would have proved of greater use to the Royalists had not his rashness in pursuing the wavering foe nearly counteracted the advantages which he had already gained. Subsequently, at Chalgrove, Newark, and Newbury, he was more successful; but his petulant disregard of orders, and his hasty retreat from the field of battle at Marston Moor, resulted in a signal

defeat, the consequences of which had a most disastrous effect upon the fortunes of the Royalist party. His conduct at Naseby, and his hasty surrender of the city of Bristol, irritated the king, who forthwith deprived him of his command, and requested him to leave England without delay. In 1648, however, he was recalled and appointed to the command of the royal fleet. In this new vocation he acquitted himself with much daring and somewhat more caution, and for three years he kept his ships afloat, after escaping the blockade in which he had been held for a twelvemonth off the Irish coast by the great parliamentarian Admiral Blake; but in 1651, the latter attacked the prince's squadron, and burned or sunk most of his ships. With the few vessels still remaining to him, R. escaped to the West Indies, where, in concert with his brother Maurice, he led a bucaneering life, maintaining himself and his men by seizing upon English and other merchantmen. After a few years spent in this manner, R. managed to elude the vigilance of Cromwell's captains, and made good his way to France, where he remained till the restoration of his cousin, Charles II. R. served with distinction under the Duke of York, and in concert with the Earl of Albemarle, against the Dutch, and died in 1682 in the enjoyment of various offices and dignities, being a privy councillor, a member of the Admiralty, governor of Windsor Castle, &c. The last ten years of his life were spent in retirement in the pursuit of chemical, mechanical, and physical researches, for which he evinced considerable aptitude. Although it is certain that he did not discover the art of engraving in mezzotinto—the real inventor of which appears to have been a German, Von Tregen, whose early works bear the date of 1642—R. no doubt improved the mechanical mode of the art, which he described and illustrated for the Royal Society of London in 1662, after he had completed several interesting engravings on the new principle. The glass bead known as Prince Rupert's Drop (q. v.) derives its name from the prince.

RU'PERT'S LAND, so called from Prince Rupert (q. v.), who was one of the founders of the Hudson's Bay Company, the official designation of that extensive tract in North America which forms the basin of Hudson's Bay and Strait, and is bounded on the west, south, and north by the water-sheds of the Arctic, St Lawrence, and Atlantic rivers. The western boundary is a little indefinite, but it may without much risk of error be assumed to run from Deer Lake in a south by east direction, enclosing a portion of the territory west of Lake Winipeg (q. v.) and the Red River Settlement (q. v.). The whole of this vast territory slopes inwards towards Hudson's Bay, and is well supplied with rivers of sufficient magnitude to serve for commercial highways. The mountains of this region, which are chiefly on the boundaries, are of primitive rock, and a great portion of the country is densely wooded. The soil is rich, but on account of the severity of the climate—which is not only of a generally low temperature, but exceedingly variable in summer and autumn—the cereals and other alimentary plants are not cultivated to any extent; in fact, they are only planted in the neighbourhood of the trading posts of the Hudson's Bay Company (q. v.) and in the agricultural settlement on Red River, in the south-west. In the north, the vegetation and climate are those of the polar regions. The chief dependence of the inhabitants of R. L. for food and clothing is on the animal kingdom, which is here most abundantly represented. Beavers are still found, and bears, otters, martens, and musk-rats are abundant, their skins forming the chief commercial product of the country. There are also abundance of foxes of various colours, bears, wolves, Canadian lynxes, &c. Among the animals used for food are the wapiti, reindeer, moose, and other species of deer; the musk-ox, hares, and an immense variety of wood-fowl and other birds. Rupert's Land was surrendered by the Hudson's Bay Company in 1870, and a portion of it admitted into the Dominion of Canada, under the name of Manitoba.

RU'PIA is a somewhat severe form of skin-disease. It is characterised by flattish, distinct *bullæ* or blebs, containing a serous, purulent, or sanious fluid, which become changed into thick scabs. Several varieties of this disease have been established by dermatologists. In its simplest form, the blebs are not preceded by any inflammatory symptoms, are about an inch in diameter, and contain a fluid which is originally thin and transparent, but soon thickens, becomes purulent, and dries into brown ragged scabs, which are elevated in the centre. The scabs are easily separated, and leave ulcerated surfaces, on which several successive scabs usually form before healing ensues. In a more severe form, known as *Rupia prominens*, the scab projects so much in the centre as to resemble a limpet-shell in form.

Rupia is a chronic disease, and is usually limited to the limbs, the loins, and the nates. It is not contagious, and generally attacks persons debilitated by old age, intemperance, bad living, or previous diseases, especially small-pox, scarlatina, and syphilis. The general treatment consists mainly in the administration of tonics, such as quinia, the mineral acids, ale, wine, animal food, &c. Some writers strongly recommend the tincture of serpentaria; and there is no doubt that certain cases which will not yield to tonics, rapidly improve when treated with iodide of potassium. The local treatment consists in puncturing the blebs as soon as they arise, in removing the scabs by poulticing, and in applying a slightly stimulating application—such as a solution of nitrate of silver—to the subjacent ulcers. The disease is frequently tedious and obstinate, but the patient almost always ultimately recovers.

RUPPI'N, NEU, a town of Prussia, in the province of Brandenburg, on a small lake of the same name, which communicates by water with the Elbe, 38 miles north of Potsdam. It contains a castle, a lunatic asylum, and 12,000 inhabitants, who are engaged in brewing, spinning, and the manufacture of linen and woollen cloths.

RU'PTURE. See HERNIA.

RURAL DEAN, an official, ordinarily a beneficed clergyman, appointed in a diocese to maintain in a certain district, called a deanery, a supervision over the condition of churches, church furniture, glebe houses, schools, the appliances of public worship, and all other things appertaining to the service, and to report on all to the bishop as occasion may arise.

RURIK, who is considered to have been the founder of the Russian monarchy, was, according to most authors, a 'Varangian' of Scandinavian origin, who was invited by the Slaves of Novgorod to come and rule over them; according to others, he was the chief of a tribe of Norse colonists which was located near the Gulf of Finland, and after a long contest, succeeded in subduing the northern Slaves and some neighbouring tribes of Finns; while Kostomarof attempts to prove that he was a Lithuanian. That he was either a Scandinavian or of Scandinavian origin, there seems to be very little doubt, and it is as generally maintained that, accompanied by his brothers, Sindf (Sineous) and

Truvor, he, at the head of a small army, took possession of the country to the south of the Gulf of Finland, Lakes Ladoga, Onega, and Beloe in 861 or 862, and laid the foundation of a monarchy. His brothers afterwards settled, the one at Bielo-ozero, and the other at Izborsk; but dying without issue, their principalities were united to Novgorod by Rurik. Novgorod was made the seat of government in 864 or 865, and the various insurrections of his Slavic subjects were quenched in blood, Vadim, their leader, whose valour is celebrated by the ancient chroniclers, perishing by R.'s own hand. To secure himself and his descendants in their newly-acquired territory, R. invited various colonies of Varangians to settle in the country, and after reigning peaceably from this time, he died in 879. During his reign, some of the Varangians attempted a land expedition against Constantinople, but renouncing the scheme, settled on the banks of the Dnieper, and founded the little state of Kiev. The family of R. reigned in Russia till the death, in 1598, of Feodor, son of Ivan the Terrible, when, after a brief intestine contest, it was succeeded by the nearly allied House of Romanoff (q. v.). Many noble families of Russia, such as Odojefski, Obolenski, Dolgorouki, Lfot, Belosselski-Beloserski, and Gagarin, are legitimately descended in the male line from R.; and the princes of Romodanofski-Ladyshenski are legitimate descendants in the female line.

RU'SA, a genus of *Cervidæ*, or subgenus of *Cervus* (see DEER), containing a number of species of deer, natives of the forests of the East Indies, which may be described as stags with round antlers, a snag projecting in front just above the base of each, and the top forked, but the antlers not otherwise branched. They are generally of large size, and among them are some of the finest kinds of Asiatic deer. The GREAT R. (*R. Hippelaphus*) is supposed by some to be the *Hippelaphus* of Aristotle; but his description is not complete enough to identify the species. It is a native of Java, Sumatra, &c., and is about the size of a large stag, with brown rough hair, the neck with a long mane.—The SAMBUR or SAMBOO (*R. Aristotelis*) of India, is a

Sambur (*Rusa Aristotelis*).

similarly large and powerful animal, and no Indian deer is more sought after by European sportsmen. It also is supposed by some to be the *Hippelaphus* of Aristotle. The colour is sooty brown, and the male has a mane. It is solitary in its habits, and delights in low forests where water abounds.—The Axis (q. v.) is very nearly allied to this genus.

RU'SCUS. See BUTCHER'S BROOM.

RUSH (*Juncus*), a genus of plants of the natural order *Junceæ*, having a glume-like (not coloured) perianth, smooth filaments, and a many-seeded generally 3-celled capsule. The species are numerous, mostly natives of wet or marshy places in the colder parts of the world; some are found in tropical regions. Some are absolutely destitute of leaves, but have barren scapes (flower-stems) resembling leaves; some have leafy stems, the leaves rounded or somewhat compressed, and usually jointed internally; some have plane or grooved leaves on the stems; some have very narrow leaves, all from the root. The name R. perhaps properly belongs to those species which have no proper leaves; the round stems of which, bearing or not bearing small lateral heads of flowers, and popularly known as *Rushes*, are used for plaiting into mats, chair-bottoms, toy-baskets, &c.—The SOFT R. (*J. effusus*) is a native of Japan as well as of Britain, and is cultivated in Japan for making mats. In ruder times, when carpets were little known, rushes were much used for covering the floors of rooms; to which many allusions will be found in early English writers. The stems of the true rushes contain a large *pith* or soft central substance, which is sometimes used for wicks of candles. There are 20 or 22 British species of R., some of which are very rare, some found only on the highest mountains, but some are among the most common of plants. They are often very troublesome weeds to the farmer. Thorough drainage is the best means of getting quit of them. Lime, dry ashes, road scrapings, &c., are also useful. Tufts of rushes in pasture are a sure sign of insufficient drainage. Many marshy and boggy places abound with rushes, of which there are 18 or 20 natives of the U. States; but the one most troublesome is *J. effusus*, which forms numerous unsightly tussocks in wet grounds. It also occupies rice-fields as soon as they are thrown out of cultivation. The *black* grass common in salt marshes along the coast is the *J. bulbosus*, and the common little species abounding in dry paths is the *J. bufonius*.

RUSH, BENJAMIN, M.D., an American physician, was born near Philadelphia, December 24, 1745, was educated at Princeton College, studied medicine in Philadelphia, London, Edinburgh, and Paris, and in 1769 was made Professor of Chemistry in the Philadelphia Medical College, and became a contributor to medical literature. Elected a member of the Continental Congress, he advocated and signed the Declaration of Independence. In 1777, he was appointed Surgeon-general and Physician-general of the continental army. His duties did not prevent him from writing a series of letters on the constitution of Pennsylvania, which was changed by his influence. He resigned his post in the army, because he could not prevent frauds upon soldiers in the hospital stores. In 1785, he planned the Philadelphia Dispensary, the first in the United States; and was a member of the convention which ratified the Federal constitution. Retiring from politics, he became Professor of the Theory and Practice of Medicine in the Philadelphia Medical College; and was so successful in the treatment of yellow fever in 1793, that he was believed to have saved the lives of 6000 persons. His practice, in consequence, became so large that he prescribed for 100 patients a day, whom he saw even at his meals. Virulently attacked by Cobbett, who published a newspaper in Philadelphia, he prosecuted him for a libel, and recovered 5000 dollars damages. His medical works produced honours from several European sovereigns. The chief of them were *Medical Inquiries and Observations*, *Diseases of the Mind*, *Medical Tracts*, *Health*, *Temperance*, *and Exercise*. In 1779, he was appointed Treasurer of the United States Mint, which post he held until his death in Philadelphia, April 19, 1813.

RUSH-NUT. See CYPERUS.

RUSHWORTH, JOHN, an English author, whose work entitled *Historical Collections of Private Passages of State, Weighty Matters in Law, and Remarkable Proceedings in Parliament*, is a most important contribution to our knowledge of the civil war, and the events that led to it, belonged to an ancient family in Northumberland, and was born there about 1607. He studied at Oxford, but left the university without taking a degree, and settled in London as a barrister. His interest in political affairs was, however, so strong, that he appears to have spent a great deal of his time, for many years, in attending the Star Chamber, the Court of Honour, the Exchequer Chamber, Parliament, &c., and in taking down short-hand notes of the proceedings. When the Long Parliament met in 1640, R. was appointed assistant to Mr Henry Elsyngne, clerk of the House of Commons, an office which afforded him ample opportunities for adding to his *Collections*. He rendered a variety of important services to his party during the civil war. The restoration of Charles II., in 1660, was fatal to his fortunes. Though not molested, he was one of those to whom the 'cold shoulder' was shewn by the triumphant royalists. In 1677, Sir Orlando Bridgman, Lord Keeper of the Great Seal, appointed the old man, now (it is conjectured) in straitened circumstances, his secretary; and curious to say, we find him, two years after, a member of parliament. In 1684, when he had reached the age of 77, he was arrested for debt, and imprisoned in the King's Bench, where he died in 1690. His last years were rendered doubly miserable, partly by the loss of his understanding, and partly by his addicting himself to intemperance.

R.'s *Historical Collections* were published in four parts at different times. The first, embracing the period from 1618 to 1629, was published in 1659; the second, embracing the period from 1629 to 1640, in 1680; the third, embracing the next five years, in 1692; and the fourth, extending to 1648, in 1701. The whole was republished in 1721. The work has been violently attacked by royalist and High Church writers, as unfair, and even false, but their charges have not been substantiated.

RUSKIN, JOHN, the most eloquent and original of all writers upon art, is the son of a wealthy wine-merchant, and was born in London in 1819. He studied at Christ Church, Oxford, where he gained the Newdegate prize for English poetry in 1839, and took his degree in 1842. The year following appeared the first volume of his *Modern Painters*, the primary design of which was to prove the infinite superiority of modern landscape-painters, especially Turner, to the old masters; but in the later volumes (the 5th and last was published in 1860), the work expanded into a vast discursive treatise on the principles of art, interspersed with artistic and symbolical descriptions of nature, more elaborate and imaginative than any writer, prose or poetic, had ever before attempted. *Modern Painters* was essentially revolutionary in its spirit and aim, and naturally excited the aversion and hostility of the conservatives in art. But the unequalled splendour of its style gave it a place in literature; crowds of admirers and disciples sprang up; the views of art enunciated by R. gradually made way; and without alluding further to the fierce and scornful controversies which they excited, it may be said that, with whatever abatements necessitated by the conflict of criticism, they have substantially rooted themselves in the English mind, and have largely determined the course and character of later art. In 1849 appeared *The Seven Lamps of Architecture*; and in 1851—1853, *The Stones of Venice*, both being efforts to introduce a new and loftier conception of the significance of domestic architecture. They were illustrated by the author himself, who proved himself in these volumes to be one of the best and most accurate draughtsmen in England. About this time, *Pre-Raphaelitism* began to develop itself as a distinctive phase of modern art, and R. warmly espoused its cause. His letters to the *Times*, his Pamphlet on the subject (1851), and his 'Notes' on the Royal Academy Exhibitions (1855—1860), besides numerous casual expressions of opinion, bear testimony to the ardour and sincerity of his admiration. In 1854, he published four singularly pithy and ingenious *Lectures on Architecture and Painting*; in 1857, two *Lectures on the Political Economy of Art*; *Notes* on Turner's Pictures and Drawings exhibited in Marlborough House; *Elements of Drawing, in Three Letters, for Beginners*; *Elements of Perspective*; *The Two Paths*; in 1864, *Sesame and Lilies*; *The Ethics of Dust*; in 1865, *Ten Lectures to Little Housewives on the Elements of Crystallisation*; in 1866, *The Crown of Wild Olive: Three Lectures on Work, Traffic, and War*; and in 1869, *The Queen of the Air: a Study of Greek Myths of Cloud and Storm*. He is also the author of a great variety of review articles. He built a number of model houses for the poor of London. He was elected Slade professor of art at Oxford in 1869.

RUSSELL, HOUSE OF. The first dukedom of Bedford (q. v.) expired in the person of the great Regent of France (in the time of Henry VI.), with whom the present dukes are unconnected by affinity. The early descent of the Russells, and their derivation from the Du Rozels of Normandy, have been traced by Mr Wiffen in his *Memoirs of the House of Russell*. This great historical family is said to derive its descent from Olaf, the sharp-eyed king of Rerik, in the 6th c., one of whose descendants, Turstain, a Scandinavian jarl, settled in Normandy, on its conquest by the Northmen, and became possessed of the barony of Briquebéc, and the castle of Rozel, near Caen. In a charter of Matilda, wife of the Conqueror, dated 1066, Hugh de Rozel appears as a witness, and is no doubt the same knight who accompanied William in his invasion of England, and assisted at the battle of Hastings. His name, together with that of his brother, is found on the roll of Battle Abbey. They both accompanied Duke Robert of Normandy in the first Crusade, where the elder died. The younger, Hugh de Rozel, upon his return from the Holy Land, established himself in England, and was the progenitor of Sir James Rozel, or Russell (as it had then begun to be called), governor of Corfe Castle in 1221, and of Sir W. Russell, who represented Southampton in the first parliament of Edward II. From the later Russell directly descended Sir John Russell, one of the most valiant soldiers of the age of chivalry. His son, Sir John Russell, was Speaker of the House of Commons in the time of Henry VI. The high fortune and eminence of the House of R. date from his grandson, JOHN RUSSELL, one of the most accomplished gentlemen of his time, who, in 1538, was elevated to the peerage, under the title of 'Lord Russell, Baron Russell of Cheyneys, county Buckingham.' His son, the second earl, was a person of eminence in Queen Elizabeth's reign, and was, like his father, a Knight of the Garter. The next notable member of the family was EDWARD RUSSELL, who was bred to the sea, and was groom of the bedchamber to the Duke of York, afterwards James II., but upon William Lord Russell's judicial murder, retired from court. Strenuously supporting the Revolution, he obtained high naval commands from William III., and distinguished

himself as one of the most eminent naval heroes of the period, particularly by his victory over the French fleet at La Hogue, in 1692. His cousin was—

Lord William Russell, son of William, 5th earl, who has left an imperishable name, as one of the most glorious martyrs of English liberty. He was born September 1639; was educated at Cambridge; passed some years at Augsburg and other places on the continent, and returned to England at the Restoration. In 1678—1679, he was returned to parliament for the county Bedford. His first public act was worthy of his subsequent career. He inveighed against the corruption of the Cabal, the influence of France, the dishonourable commencement of the war with Holland, and the fraud practised upon the bankers. He was ever afterwards found conspicuous wherever the designs of the court could be traversed, or the cause of constitutional liberty befriended. He appeared publicly in the King's Bench at Westminster Hall, June 16, 1680, and presented the Duke of York as a recusant. He also carried up to the House of Lords the bill of exclusion against the duke, at the head of more than 200 members of the Commons. This bill, setting forth that the Duke of York was a papist, declared him incapable of succeeding to the crown. The king and duke determined to be revenged upon Russell and the other leaders of the Whig party. Charged as participators in the Rye House Plot (q. v.), Lord Russell, the Earl of Essex, and Algernon Sidney were arrested. Russell was, July 13, 1683, arraigned at the Old Bailey for high treason. Infamous witnesses easily satisfied a packed jury. As they were about to withdraw, the prisoner said: 'I call Heaven and earth to witness that I never had a design against the king's life.' But the jury pronounced the fiat that condemned Russell to the block, and the horrible sentence of death for high treason was forthwith pronounced. The king and the duke were determined to have his blood, and to crush the leaders of the Whig party. Some of the Tory ministry ventured to plead in his favour, but in vain. The Earl of Bedford had gained the king's favourite, the Duchess of Portsmouth, to his interest, and offered, through her, £100,000 for the life of his son. To satisfy his aged father, and at the earnest request of his afflicted wife, Russell himself petitioned the king. He solemnly disclaimed the least intention against the king's life, or the least design to change the constitution. There is reason to believe that Charles was disposed to relent, but that the Duke of York insisted upon the prisoner's death, which took place July 21, 1683. The simple relation of his last hours by Bishop Burnet, his intimate friend and companion, is justly considered one of the most pathetic passages in history. The murder of Russell, perpetrated for the most unconstitutional end by the most unconstitutional means, followed by that of Sidney, rendered the despotism of the Stuarts odious, and led, in the next reign, to the overthrow of the family. R. died in the 42d year of his age, leaving a name to be remembered and revered wherever truth has a sanctuary or liberty a shrine. His attainder was annulled after the Revolution. His widow, Lady Rachel Wriothesley, second daughter and heiress of Thomas Earl of Southampton, survived her lord more than forty years. She cherished the memory of her lord with the most tender recollections. She died September 29, 1723, at the advanced age of 86. Her eldest son by Lord Russell was Wriothesley, second Duke of Bedford.

John, fourth duke, was First Lord of the Admiralty in the Pelham administration of 1744. He became, in 1756, Lord-lieutenant of Ireland. In 1762, he was accredited Minister Plenipotentiary to the court of France, and signed at Fontainebleau the preliminaries of peace with France and Spain. He was President of the Council in the administration formed by Mr Grenville in the autumn of 1763. His concern with public affairs extended over the important term comprised between the fall of the administrations of Walpole and Chatham. When First Lord of the Admiralty (from 1744 to 1748), he shared with Mr Pelham, the premier, and the Duke of Newcastle, the substantial power of the government. His correspondence, preserved at Woburn Abbey, and given to the world by Earl Russell, contains authentic materials for the illustration of the political history of England from 1744 to 1770. The introduction to the first volume contains a brief but able historical sketch by the noble editor of the period from the administration of Walpole to 1748, and some interesting particulars of the private life and personal character of the duke. He died in 1771, and was succeeded by his grandson—

Francis, fifth duke, born in 1765. He was a steady friend to the cause of popular freedom, and was regarded by his friends, among the most devoted of whom was Charles James Fox, with feelings of attachment amounting to enthusiasm. He died unmarried in 1802, and was succeeded by his brother—

John, sixth duke, born 1766, father of Lord John (now Earl) Russell (q. v.). He died October 20, 1839, and was succeeded by his eldest son—

Francis, seventh duke, who, after a short career in the Lower House, was summoned to the House of Lords in his father's barony of Howland. He declined office, but invariably supported the views and measures of the Whig governments, and in the dissensions among the Whig party, the political congresses at Woburn exercised great influence. He was much consulted by his distinguished brother, when First Lord of the Treasury, and on more than one occasion, his advice on political affairs was sought by his sovereign. He was an enthusiastic patron of the turf from early life, and his stud at Newmarket was of princely dimensions. Of late years, he devoted himself to the happiness of his tenantry and the comfort of the labourers on his extensive estates. He died May 14, 1861, and was succeeded by his only son—

Francis, eighth duke, born in 1809. He was M.P. for Tavistock from 1832 to 1841, but is most retired in his habits, and takes no active part in political affairs. The heir-presumptive to the honours and representation of the House of R. is the Hon. Colonel Francis C. H. Russell, M.P., born 1819, eldest son of the late Major-general Lord George W. Russell, second son of John, sixth duke.

The Dukes of Bedford have a magnificent mansion and park at Woburn, a few miles from Bedford.

RUSSELL, John Russell, Earl, K. G., English minister and statesman, third son of the sixth Duke of Bedford, was born in Hertford Street, Mayfair, London, August 18, 1792, educated at Westminster School, whence he was sent to Edinburgh, at that time preferred to the English universities by the great Whig families. Here he pursued his studies with industry and success, under the care of Professor Dugald Stewart; and here, at the meetings of the Speculative Society, he first exercised his powers of debate. In 1809, he proceeded on a continental tour, and France being closed against English travellers, he directed his steps to Portugal and Spain. In 1821 appeared his *History of the British Constitution*, and in 1824 *Memoirs of the Affairs of Europe from the Peace of*

Utrecht. In more recent years he has given to the world, from the family archives, the *Correspondence of John, fourth Duke of Bedford*, which throws much light on the secret history of the early part of George III.'s reign; the *Life, Diary, and Letters of Thomas Moore*, in pursuance of a promise made to the poet several years before; the *Correspondence of Charles James Fox*, and the first volume of the *Life and Times* of that great Whig statesman. Having now noticed his career as an author, we may briefly pass in review his long, honourable, and consistent career as a politician. In 1813, he was elected for the family borough of Tavistock, and vigorously but vainly opposed the repeal of the Habeas Corpus Act in 1817. He made his first motion in favour of parliamentary reform in 1819, and continued to bring the subject almost annually before the Lower House, until he stood forward as a minister of the crown to propose the great measure of 1831. He was also the strenuous advocate of the repeal of the Test and Corporation Acts, Roman Catholic Emancipation, and other measures of civil and religious liberty. In 1828, he carried by a large majority his motion for the repeal of the Test and Corporation Acts, although it was opposed by the Duke of Wellington's government. In 1829, he supported the Catholic Emancipation Bill. At the general election of 1830, caused by the death of George IV., the rallying cry of Parliamentary Reform sent many additional Liberals into the House of Commons. The 'Great Duke' was driven from office; and Earl Grey being appointed prime minister, proceeded to form a cabinet pledged to peace, retrenchment, and reform. R. did not receive a seat in the cabinet, but he was appointed to the lucrative office of Paymaster of the Forces, and was one of the four members of the government to whom Earl Grey intrusted the task of framing the draft of the first Reform Bill. The great and imperishable honour next devolved upon R. of proposing the bill (March 1, 1831). The fortunes of the measure belong to the history of the time; suffice it to say, that on the 4th of June 1832, the bill obtained the royal assent, and that the country was saved from the throes of revolution and civil war, which at one period appeared imminent. R. left office with the Melbourne government (which had succeeded to that of Earl Grey) in November 1834. In March 1835, he brought forward a motion in favour of taking into consideration the temporalities of the Irish Church. It was opposed by the government, but after three nights' debate, was carried by 322 votes against 289. On the 4th April, he carried a resolution in committee in favour of appropriating any surplus which might remain, after fully providing for the spiritual wants of the members of the Irish Church, to the general education of all classes of Christians. The report of the committee having been affirmed by the whole House, the government of Sir Robert Peel was dissolved, and that of Lord Melbourne restored. R. now became Home Secretary, with a seat in the cabinet. On the 5th of June 1835, he brought in an important bill for the reform of the municipalities of England and Wales, which was carried after some mutilation, and secured an effective reform of municipal institutions. Next session, he proposed and carried the government plan for the commutation of tithes in England. Also a bill for a general registration of marriages, births, and deaths, the value of which, in social and statistical inquiries, can scarcely be overrated; and a bill for the amendment of the marriage laws, which enabled dissenters to be married in their own chapel. He likewise passed an English Church Reform Bill, making a new distribution of episcopal dioceses and incomes. In 1837, he carried a series of bills for further amending the criminal law, by which capital punishment was finally removed from forgery and all offences except seven. An Irish Tithe Bill was also passed, but the 'appropriation clause' being always rejected by the Lords, R. was obliged to accept the bill divested of the clause. He exchanged the seals of the Home for those of the Colonial Office, when the Canadians broke into rebellion in 1839, and sent over Lord Durham, who recognised the right of the Canadians to self-government; and who, with his successor, Lord Sydenham, brought the Canadas into loyal and harmonious relations with the mother-country, which have never since been disturbed.

In 1841, R. proposed a fixed duty of 8*s*. per quarter on foreign corn, and a reduction of the duties on sugar and timber. Being defeated by the opposition, the Melbourne government appealed to the country without success; and R. and his colleagues made way for the administration of Peel. In this general election, he challenged the verdict of the city of London upon the free-trade measures of the government, by boldly leaving Stroud, and standing for the city. He was elected by the narrow majority of nine votes, and continued to represent the city until his elevation to the peerage. In November 1845, R. wrote a letter from Edinburgh to the electors of the city of London, announcing his conversion to the total and immediate repeal of the corn laws. This letter led to the resignation of the Peel cabinet; and R. was commissioned by the Queen (December 11, 1845) to form an administration, which at first he failed to do through the antipathy of Earl Grey to Lord Palmerston, and Sir Robert Peel being recalled to power, had the honour of carrying the repeal of the corn-laws. His Irish Coercion Bill, however, being defeated by the combined Whigs and Protectionists, he resigned; and R. became nominally what he had been really during the greater part of the Melbourne administration—prime minister. In 1846, a series of assassinations in Ireland compelled him to propose a more stringent coercion act than that of the previous session. In 1847, he had to deal with the Irish famine; and in 1848, with a miniature Irish rebellion. The papal bull, parcelling England into dioceses, extorted from R. an indignant protest, first in the form of a letter to the Bishop of Durham, and next in the Ecclesiastical Titles Bill of 1851, prohibiting the assumption of territorial titles by Roman Catholic prelates. R.'s advice to the Queen to dismiss her Foreign Secretary and his ancient colleague, Lord Palmerston, for communicating, without consultation with his colleagues, his approval of the French *coup d'état*, precipitated the downfall of the R. administration, and in February 1852 he ceased to be First Lord of the Treasury. Lord Derby made an unsuccessful attempt to carry on the government; and in the succeeding cabinet of the Earl of Aberdeen, R. consented, December 1852, to fill the post of Foreign Secretary with the leadership of the House of Commons. In the session of 1854, he brought forward a new Reform Bill, but was most reluctantly compelled to resign it in consequence of the Crimean War. He was next appointed Commissioner to the Congress of Vienna, and incurred so much unpopularity by recommending terms of peace, and a plan of counterpoise suggested by Austria, that he was forced by the pressure of unfavourable opinion to leave the ministry (July 1855). He voted against the government on Mr Cobden's motion against Lord Palmerston's Chinese policy, which led to a dissolution. When the second administration of Lord Palmerston

was formed (June 1859), R. became for the second time Foreign Secretary, which office he held till October, 1865. He threw the moral influence of his name and the nation he represented into the scale of Italian unity and independence. He uttered warnings and remonstrances against the annexation of Savoy and Nice by France, which gave great offence to the government of the Emperor Napoleon by their frankness and candour. He preserved British neutrality in the American civil war, except in allowing the Alabama to leave Liverpool to prey on American commerce. He wrote spirited dispatches expressive of the indignation with which the British government regarded the despotic acts of Russia in Poland; but he incurred many reproaches from the Poles and their sympathisers in France and England, for withdrawing from the Austrian and French alliance when war with Russia appeared imminent. He took an active but not a successful part in the Slesvig-Holstein dispute, which the peculiar policy of the French emperor brought to nothing. R. has always taken a prominent part in promoting the education of the people, and, with the assistance of Lord Lansdowne, laid the foundation of the present British system of national education, supported by parliamentary grants, and administered by the Committee of Privy Council for Education. He brought forward for many years a measure admitting the Jews to parliament, which passed in 1858 upon a compromise suggested by the Earl of Lucan. But the question with which he has ever been identified in the public mind is parliamentary reform. He brought in a Reform Bill in 1852, and a second in 1854; moved the resolution which procured the condemnation of the Derby Reform Bill in 1859; and in 1860, brought in another government bill, which failed to pass. In 1861, he was called to the Upper House, and exchanged the courtesy title of 'Lord John,' by which he had been so long known, for that of Earl Russell. In October, 1865, he was made prime-minister, on the death of Lord Palmerston, W. E. Gladstone being made chancellor of the exchequer. In 1866, this ministry prepared a Reform Bill which produced a long and exciting debate. The bill was defeated, although the professed liberals were in the majority, and the ministry resigned. His language is simple, clear, plain, and terse, yet pregnant with meaning. Upon great constitutional questions and historical precedents, he is perhaps the best living authority, and upon such themes his speeches rise to a high order of eloquence. His indomitable self-reliance and tenacity of self-assertion were sarcastically painted by the Rev. Sydney Smith, who called him the 'Lycurgus of the Lower House,' and said that he was 'utterly ignorant of moral fear.' He is an admirable and fearless debater; but his voice is often weak, his delivery somewhat hesitating, mincing, and affected, and his action has little variety. He married, in 1835, the daughter of Thomas Lister, and relict of Lord Ribblesdale; and secondly, in 1841, the daughter of the Earl of Minto. For a list of his speeches, essays, tales, &c., see *Allibone's Dict. of Authors.*

RU'SSIA, Empire of, extending over a large proportion of the northern regions of the globe, includes the eastern part of Europe, the whole of Northern Asia, and a part of Central Asia. Lat. 38° 30′—78° N., long. 17° 19′ E.—169° W. It is bounded on the N. by the Arctic Ocean; on the E. by the Pacific Ocean; on the S. by the Chinese empire, Turkestan, the Caspian Sea, Persia, Asiatic and European Turkey, and the Black Sea, and on the W. by Austria, Prussia, the Baltic Sea, and Sweden. Its length from west to east, from the Prosna, on the Prussian frontier, to Behring's Straits, is about 6500 miles; its breadth from north to south is about 2667 miles. Its circumference is estimated at 20,000 miles, of which 11,000 miles are in coast-line. The area is stated at 8,018,475 sq. m.; pop. more than 78,000,000 in 1864. The following table gives the names, the areas, and the populations of the six governments of European Russia, and of the grand duchy of Finland, the kingdom of Poland, Trans-Caucasia, and Siberia and Central Asia:

Names of Governments in 1864.	Area in Eng. square miles.	Population in 1864.
1. Archangel,	279,460	284,244
2. Astrachan and Kirghises,	84,740	511,250
3. Bessarabia,	13,445	1,000,316

* Incorporated with Russia in 1868.

The Russian Sea-board.—The northern shores of the Russian territories, which are washed by the Arctic Ocean, are deeply indented. The White Sea (q. v.), an immense arm of the Arctic Ocean, penetrates 350 miles into the mainland, and is subdivided into the gulfs of Onega and Archangel or Dwina. The other chief inlets on the north of R. are the Kara Sea and the gulfs of Obi and Yenisei. Westward from Nova Zemla (usually, but less correctly, spelled Zembla), the Arctic Ocean is navigable for three months of the year; east from that island, the sea, even at the mildest season, is encumbered with floating icebergs. The chief islands in this ocean are Nova Zemla, Spitzbergen, and the Liakov Islands, or New Siberia. The eastern shores of R. are washed by the Pacific, subdivided into the Behring, Okhotsk, and Japan Seas; and the islands belonging to this country in these seas are Sakhalin and the northern part of the Kuriles. On the south are the Black Sea (q. v.) and the Sea of Azov

(q. v.), the latter communicating with the former by the Strait of Kertch, and so shallow that it is navigable for small craft only. Of the Caspian Sea, R. commands almost all the shore bordered by Persia and Khiva, and has (1871) a naval station at Astrabad, at the S. E. corner of the Caspian. The north and north-eastern banks of the Caspian are the seats of the chief fisheries of the empire. On the north-west of R. are the Baltic Sea, with the gulfs of Riga, Finland, and Bothnia; and in these waters, the islands of Aland, Oesel, and Dago belong to the empire. The freezing of the water near the shores of the Baltic renders the navigation of this sea impracticable during five months of the year, although a few ports are accessible throughout the whole year. Possessing means of easy communication with the most fertile governments of the interior, and sustaining chiefly the commerce of the Russian empire with the other parts of Europe and with America, the Baltic is of the highest commercial importance.

Surface, Hydrography, and Soil.—European Russia consists of a vast plain bordered with mountains. On the east are the Ural Mountains (q. v.), forming a broad range of no great elevation, ending on the north on the shores of the Arctic Ocean, and on the south in a range of elevated plains on the left bank of the Volga. On the south-east of the great plain is the lofty range of the Caucasus (q. v.), crossed by the Pass of Derbend and the so-called Military Georgian Road. The Crimean Mountains, a continuation of the Caucasian chain, rise to 5000 feet in their highest summit. The districts in the south-west of R., between the Vistula and the Pruth, are covered by hilly ranges from the Carpathian Mountains (q. v.), which in Poland are known as the Sandomir Mountains. The Finland Mountains, on the north-west, are ranges of granite rocks, embracing numerous lakes, and not rising higher than 600 feet. The Alaunsky table-land, which connects itself with the Ural Mountains by a chain of hills in latitude about 62° N., is the key to the configuration of European Russia. From this table-land, with an elevation of about 1200 feet, the country, with gradually declining slopes, falls away in four directions—north to the Arctic Ocean, north-west to the Baltic, south to the Black, and south-east to the Caspian Seas. The sloping country on the north of the Alaunsky heights is called, from its eastern and western limits, the Ural-Baltic table-land; that on the south of the same dividing heights is called, for the same reason, the Ural-Carpathian table-land. The Alaunsky heights form the great water-shed, and regulate the course of all the great rivers in Russian Europe. To the north, they throw off the Petchora, the Northern Dwina, and the Onega; to the south, the Dniester, Bug, Dnieper, Don, and Kouban; to the south-east, the Volga, with its great affluents the Oka and Kama. The Western Dwina, the Niemen, and the Vistula fall into the Baltic Sea. The important rivers of R. receive separate notice under their own names. At the foot of the north-west slope from the central terrace is the lake-country of European Russia, and the great lakes (which are noticed separately) are Ladoga, Onega, Ilmen, Peipus, and Pskov. The plain of European Russia naturally divides itself into three tracts or zones, each of which differs from the others in the nature and quality of its soil. The northern zone extends between the Arctic Ocean and the Ural-Baltic table-land, the middle zone between the Ural-Baltic and the Ural-Carpathian table-land, and the southern zone between the Ural-Carpathian table-land and the Black and Caspian Seas. The soil of the northern zone is marshy, and the climate inclement. In its middle part, between the rivers Onega and Mezen, and especially along the banks of the Northern Dwina, forests of fir-wood and large tracts of fodder-grass occur. Toward the east of this tract the woods disappear, and vast marshes, frozen the greater part of the year, cover the country. The middle zone reaches south-west to the government of Volhynia and the south of Poland, and north-east to the Ural Mountains. In the west, it consists of an extensive hollow, covered with woods and with marshes, the chief of which are those of Pinsk (q. v.). In the middle part of this zone, the soil is partly heavy and covered with mould; and towards the north, sandy. Beyond the Oka, luxuriant meadows abound; and on the east, beyond the Volga, this tract forms an extensive valley, covered with a thick layer of mould, abounding in woods, and rising into hills in the vicinity of the Ural range. The southern zone consists of steppes extending along the shores of the Black and Caspian Seas. The steppes of the Black Sea have mostly a mouldy soil, covered with grass; but in the south-east, shifting sands and salt marshes predominate. The steppes of the Caspian consist of sand, salt marshes, and salt lakes—the Elton lake, yielding nearly 4,000,000 poods (about 1,290,000 hundredweight) of salt annually, being the most remarkable.

Constitution and Administration.—The government is an unlimited monarchy, the head of which is the emperor, who unites in himself every authority and power—that is to say, is the head of the military, the legislative, and the judicial system, and is also the ecclesiastical chief of the orthodox Greek Church. The order of succession is by primogeniture, hereditary in heirs male, and in females in default of males. Every military or civil officer of the crown is required to take an oath of allegiance. The expenses of the imperial palace amount to about $5,325,000 annually; the crown appanages, constituting the private property of the imperial family, yield an annual revenue of $2,766,000. The administration of the empire is entrusted to four great boards or councils. The first is the *Council of the Empire*, consisting of a president and an unlimited number of members appointed by the emperor. In July, 1869, this council consisted of 42 members, exclusive of the ministers, who have a seat *ex officio*, and of the princes of the imperial house. The council is divided into three departments—namely, Legislative, Civil Administration, and Finance. The council stands in direct communication with the 'Private Cabinet of the Emperor.' The second college, or board of government, is the Directing Senate, which is the High Court of Justice of the empire. The third college is the *Holy Synod*, to which is committed the superintendence of the religious affairs of the empire. The fourth board is the *Council of Ministers*, and is divided into eleven departments, viz.: 1. Imperial House; 2. Foreign Affairs; 3. War; 4. Navy; 5. Interior; 6. Public Instruction; 7. Finance; 8. Justice; 9. Imperial Domains; 10. Public Works; 11. General Control. The ministers communicate directly with the *'Private Cabinet of the Emperor,'* in which body centres the whole executive authority of the empire. The empire is divided into general governments or vice-royalties, governments, and districts. In 1870 there were 14 of the first, 51 of the second, and above 320 of the last, and several extensive districts not organised into governments, but called provinces or *oblasts*. At the head of each general government is a viceroy or general-governor, the representative of the emperor, who has supreme control of all affairs, civil and military. The government of the parish and part of the local administration are entrusted to the people.

The grand duchy of Finland preserves its ancient constitution (1772—89), which provides for a national parliament of four estates, nobles, clergy, burghers, and peasants. The right of legislation and general taxation is nominally in the hands of the assembly, but really in the senate appointed by the Emperor Grand Duke.

Poland, which had a separate government from

1830 to 1864, was deprived of the total remnant of its independence, and was in 1868 incorporated with Russia. In 1865 reforms were instituted which are in progress throughout all the various branches of the government. Reforms in the municipal and rural administration of the provinces, which give increase of self-government, are also in operation. Several important legal reforms — indeed, an entirely new legal system, incorporating oral testimony and trial by jury with the present system of Russian jurisprudence, and opening the business of the courts to the public eye—were laid before the public in a published form in 1864, and have since been carried out. By the Russian law, capital punishments are only inflicted for high-treason or *lèse-majesté*. Corporal punishment by the Knout (q. v.) was abolished in 1863. The severest punishments inflicted for violations of the law are labour in the galleys, in the public works, deportation to the mines of Siberia, &c. There are prisons in every town throughout the empire, but the prison-system is still primitive, rude, and ill-administered. In 1862, 82,449 persons were condemned by the several courts of justice to different degrees of punishment for various crimes, and about 9000 persons were convicted by the military and naval courts for offences against the laws and discipline of these services.

Distinctive Rank of Classes.—The nobility occupy the highest place in the social scale, enjoy many special privileges, such as freedom from conscription and poll-tax, and form in every province a separate body, headed by a marshal, chosen by and from themselves. Functionaries, officials, artists, and clergy possess almost as many privileges as the nobility. The next class is that of the merchants. The burghers and peasants constitute the lowest class, and are subject to claims of service and to personal taxation. Each class enjoys, to a certain extent, the right of self-administration in its own affairs. Each apportions its taxes, and chooses some of its own functionaries. The emancipation in 1863—5 gave freedom to 22,000,000 peasants or serfs, who, prior to the year 1861, being governed exclusively by their owners, enjoyed very limited rights. Communal government is the fundamental principle of all the rights of the peasant class. In general, the lands allotted to the peasants are not their individual property, but belong to the commune, and are shared among all its members.

Revenue and Expenditure.—The following table shows the amount and the details of the revenue and expenditure for the year 1870:

NET REVENUE.

1. Direct Taxes (Poll-tax $69,675,346)	$77,443,794
2. Indirect Taxes (Spirits, $94,395,447; Salt, $7,726,608; Tobacco, $5,391,468; Beet Sugar, $1,925,298; Customs, $25,783,245; Stamps, $5,084,517; Passports, $1,565,250; various others, $4,858,884)	146,730,720
3. Royalties, Mines, Posts, Telegraphs, &c.,	3,119,391
4. Crown Lands, Railroads,	19,581,914
5. Various, arrears, &c.,	38,343,996
6. Revenue from Poland,	124,764
7. Revenue from the Transcaucasus,	4,246,149
8. Extraordinary Revenues, Former Loans,	6,816,434
Special Receipts to order,	12,117,753
Railway Loans,	8,332,683
Total (roubles, 422,479,348),	$316,857,292

EXPENDITURES.

1 Public Debt, Interest and Management,	$58,781,622
2 Superior Institutions of State,	1,352,280
3. Holy Synod,	6,497,487
4 Imperial Court,	6,716,018
5. Foreign Affairs,	1,705,398
6. War Department,	105,591,183
7. Navy Department,	13,065,222
8. Treasury Department,	58,853,370
9. Imperial Domains,	6,629,418
10. Department of the Interior,	27,733,065
11. Public Instruction,	7,593,255
12. Public Works,	$23,938,206
13. Justice,	6,827,283
14. Board of Control,	1,418,607
15. General Direction of Studs,	496,867
16. Expenses of Poland and Transcaucasus,	7,646,565
17. Extraordinary Expenses, Railways, Posts, Deficits, &c.,	22,700,436
Total (roubles 476,728,317),	$357,546,237

The budget of 1870 differed but slightly from that of 1869, the expenditure having been almost the same, while the estimates of revenue showed an increase of 4,210,000 roubles, or about $3,157,500. Although the estimates of revenue and expenditure are always nearly balanced, there has been no financial period during the last 40 years without a large deficit. These deficits are covered either by sums withdrawn from banks and other institutions under government, or by the issue of paper money, or by loans contracted abroad.

National Debt.—Since 1840, the Russian government has been a regular borrower of foreign capital, continuing to this day to make large loans annually in London or Amsterdam. The total amount of loans to cover deficits of 30 years, 1832—61, was, in round numbers, 1,375,385,000 roubles, or $1,031,538,750. On April 13, 1869, the consolidated debt amounted to 940,183,517 roubles, or $705,137,637, the floating debt, 221,405,126 *paper* roubles, and debt to the Bank of the Empire, 631,421,532 *paper* roubles, the discount on which varied from 29 to 17 per cent., making the Russian debt *proper* 2,003,484,160 roubles, to which must be added, debt of Poland, railway advances, emancipation of serfs, $289,923,019.

Army.—The institution of a standing army took place in R. towards the close of the 17th c. under Peter the Great. Before that time, military levies were raised for longer or shorter periods, to suit the exigencies of the moment; although a small permanent force was in existence from very early times. The army of R. has undergone a thorough transformation during the last ten years. The entire male population is liable to military service, the privileged classes excepted. Each military district is obliged to place at the disposal of the government a yearly quota of young men (4 in every 1000 belonging to the class liable to service), so that a district containing 25,000 inhabitants of these classes must furnish 100 recruits yearly and 50 men for the reserve. The community may pay at its option for the whole or part of the contingent, while every one of those designated for, or already enlisted in, the army, can obtain his release by paying a stipulated sum, or furnishing a substitute. According to Russian law, the age of the recruits is from 18 to 40, the standard height is 5 feet 1 inch, and the term of service is 15 years, though few actually serve more than 7 years. On Jan. 1st, 1870, the effective force of the army consisted of 726,000 men; the reserve of 553,000, of whom 430,000 would be required to place the army on a war-footing. There is also a large body of irregular troops comprised in 132 regiments, and 25 batteries, with 200 pieces of artillery. The number of Cossacks mounted in time of peace is from 70,000 to 80,000 men, and in case of necessity every Cossack from 15 to 60 years is bound to render military service. The military establishment of the empire was maintained, in 1866, at the expense of $87,444,273 By imperial ukase, issued in 1864, the military regulations were changed, the old system was abolished, and that now existing in the French military service adopted, and the whole empire divided into ten military districts.

Navy.—The Russian boundaries were first advanced to the sea under Peter the Great, and from the genius of that monarch the Russian navy sprang. Besides the naval depôts on the Baltic, the Black, and the Caspian Seas, there are also naval establishments on the shores of the North Pacific and on the Amur. Accord-

ing to an official report, the Russian fleet consisted, in 1869, of 290 steam vessels, of 38,000 horse-power, carrying 2295 guns; and 29 sailing vessels, with 65 guns. The largest of the iron-clads, which numbered 24 in 1868, is the 'Sevastopol,' which nearly equals the British iron-clads 'Black Prince' and 'Warrior' in dimensions, and exceeds those of the French 'Gloire' and 'Normandie.' Her plates are 4½ inches thick, fastened to a double coating of teak from 6 to 9 inches thick. Not only are the hulls of the several new iron-clads built in Russia, but the iron used is entirely home-made. The steam-engines and boilers, the armour-plating, and the armament are also wholly of Russian manufacture. The Sevastopol cost nearly two millions of roubles ($1,555,800). The greater and more formidable part of the naval force is stationed in the Baltic. The Black Sea fleet numbers 43; the Caspian, 39; the Siberian, or Pacific, 30; and the Lake Aral, or Toorkistan, squadron, 11 vessels. The rest are either stationed at Kronstadt or engaged in cruising in European waters. All the above vessels are of iron. The imperial navy was manned, at the beginning of 1868, by 60,230 sailors and marines, under the command of 3791 officers, among whom there were 119 admirals and generals. The navy is organised after the mode of that of France, but the government of naval affairs is divided between the High Admiral of the Fleet and the Minister of the Navy; the latter having sole charge of the administrative departments.

Religion and Churches.—Toleration of all religions which do not violate public morality or good order, exists in R., and not to profess the orthodox Greek faith, the national religion, does not disqualify for the enjoyment of any civil rights. The law does not allow those who already belong to the established faith to secede from it; and if, in a household, either of the parents be a member of the Greek Church, all the children must be brought up within that communion. The emperor is head of the church, the affairs of which he directs by means of a synod composed of the chief prelates, who are summoned from their dioceses to attend its meetings (see RUSSIAN CHURCH). The direction and regulation of all other religious communities emanate from a department in the offices of the Minister of the Interior. By the latest enumeration there were in R., exclusive of Finland and Poland, of Orthodox Greeks, 51,117,971; Schismatics, 801,745; Roman Catholics and Armenian Catholics, 2,875,386; Protestants, 2,083,152; Jews, 1,631,706; Mohammedans, 2,091,861; and idolaters, 200,284. There were also about 550 convents, of which 480 are for men, and 70 for women. In 1858 there were 5648 monks, and 4879 lay-brothers; 2931 nuns, and 7669 lay-sisters; 50,394 priests and deacons, and 63,421 other persons, who were employed in religious services in the 50,165 orthodox churches. For the education of the clergy, there are 4 academies, 50 seminaries, and 201 schools, in which 54,000 persons are trained. The churches, convents, and the ecclesiastical departments in general, are maintained by government.

Public Instruction.—The department of public instruction in R. is presided over by a ministry, although many of the schools are directed by other departments. The greater number of these establishments are supported out of the imperial treasury. There are 9 universities in the empire—namely, in St Petersburg, Moscow, Dorpat, Kiev, Kharkov, Kazan, Odessa, Wilna, and Warsaw. Of the students—who do not reside within the universities—the poorest are allowed stipends for their maintenance, and the candidates for admission as students must have passed satisfactory examinations in the courses of instruction gone through at the gymnasia. Degrees are conferred in law, medicine, philology, mathematics, natural history, and the oriental languages. Degrees in theology are granted at Dorpat to students of the Lutheran faith. The professors are appointed and paid by the government. Four institutions, the law school and the lyceums of St Petersburg, Nijni, and Jaroslav, are specially devoted to legal science. The gymnasia, schools of the second class, about 100 in number, are found in the provincial towns. Besides the universities and gymnasia, there are numerous district schools; but the means of instruction, though rapidly increasing, are very insufficient. In 1853, there were only 3000 village schools; in 1867, the number had increased to 35,300. There are also numerous special schools for instruction in mining, in wood-craft, civil engineering, navigation, &c. The military schools form a separate system. The cadets are transferred from the military gymnasia to the 'military schools,' in which they qualify to fill the posts of commissioned officers. Three academies, for the staff, the engineers, and the artillery, are devoted to the higher branches of military science. Theological education for the orthodox church is superintended by the clergy. Official tables for 1867 state that the number of schools in R., public and private (1083), was 36,343, attended by 1,155,773 pupils, male and female.

Literary and Scientific Institutions, Museum, Press, &c.—Many of the most important institutions in R., as the Academy of Sciences and the Pulkova Observatory, flourish in or near St Petersburg (q. v.). There are, however, throughout the empire numerous institutions and societies for the promotion of the arts and sciences. The Imperial Library at St Petersburg, with upwards of a million volumes, is one of the finest in the world. Numerous clandestine papers are published in Moscow and St Petersburg, and large numbers of the two democratic journals published in the Russian language in London and Geneva are smuggled every week into the country. In consequence of the censorship of the press, many of the most talented journalists abandoned the journalistic career in 1867—1868. In 1858, 1577 original works, and 284 translations, were printed in R.; and in 1857, 1,613,862 volumes were imported.

Charitable Institutions are for the most part supported by government; and although their number is increasing annually, the scarcity of large national institutions—especially public hospitals—is painfully felt. Medical assistance is obtained in the provinces with the greatest difficulty, owing to the distances of the towns and the sparseness of the population. The foundling hospitals of St Petersburg and Moscow receive annually about 15,000 abandoned infants and orphans.

Public Roads and Canals.—The want of good roads and ready means of communication is particularly felt in R., where the distances are so great, and the population so scanty. To keep the roads in repair, is a work of the greatest difficulty here, for two reasons—the first, a difficulty in concentrating a sufficient amount of labour where the labourers are so few, and so widely dispersed; and the other, the melting of the snows and overflowing of the rivers in spring. During four or five months of the year, the soil is thickly covered with snow, which, when it becomes hardened by the frost, offers an excellent, an easy, and a universal means of transit. On the return of mild weather, however, the snow, melting, sinks into and softens the earth, which is also overflowed by the rivers. The roads, being thus flooded, are rendered almost wholly impassable for traffic till the soil dries. In autumn, the usual rains fall, and the earth is again soaked, so that the time for easy communications during summer is very short. On the 1st of January, 1870, 27 lines, comprising 4700 English miles of railway, were open for traffic, of which 762 miles belonged to the state. On the 1st of March, 1870, there were in operation 8008 versts of railway, or 5258 English

miles. On the 1st of January, 1874, 9500 miles are to be opened. St Petersburg and Moscow are connected with several of the large provincial towns—the most remote of which are Kharkov, Kiev, Warsaw, Riga, and Nijni-Novgorod—by macadamised causeways, which are now generally kept in good repair. The other towns are connected by ordinary track-roads, which are generally impracticable in spring and autumn. Owing to the generally bad character of the surface, and to the abundance of the rivers which traverse it, the water-communications of this empire are very important as commercial highways, though the vast transit-trade of the country is not confined to them alone. The transport of merchandise across the broad expanse of the empire is much facilitated by canals, which have here become an important and a peculiar institution. The four seas surrounding European Russia are connected by canals: 1. The Caspian is connected with the White Sea by the canal of the Prince of Wirtemberg, between the river Scheksna, an affluent of the Volga, and the upper waters of the Northern Dwina. 2. The Caspian and Baltic are connected by three systems of canals. See VOLGA. 3. The Black Sea is connected with the Baltic by three lines of canals—those of Beresina, Oginsky and Dnieper, and Bug, between the affluents of the Dnieper and those of the Western Dwina, Niemen and Vistula.

Postal Service.—This service was inaugurated in 1664. In 1843, the government instituted a uniform tax of about 3*d.* for the transmission of a letter under half an ounce in weight to any part of the empire. In 1868, the number of letters conveyed by the Russian post was 21,837,793.

Electric Telegraph.—Notwithstanding the immense extent of the surface of R., and the distance from each other of its principal towns, these are now nearly all united by lines of electric telegraph. On the 1st of January, 1869, 48,666 miles of telegraphic wires had been laid by government. A very interesting project was attempted by which it was intended to unite the town of Irkutsk in East Siberia, already in communication by telegraph with St Petersburg, to America by the projected telegraphic line on the other shore of the Pacific, and by a submarine wire, crossing at Behring Strait, but was subsequently abandoned.

Population.—The population of the empire is spread with great irregularity over the surface. In European Russia, its average is less than 31 per Eng. sq. m.; in the Caucasus, more than 31; in Siberia, $\frac{3}{4}$; in Poland, 101; and in Finland, 11 per Eng. sq. mile. These figures, however, cannot be taken as a correct illustration of the actual distribution of the masses over the enormous surface of the country; for, upon comparison, the degree of the density of the population of European Russia is found to vary greatly in the different governments. The government of Moscow contains 166 inhabitants per Eng. sq. m.; while that of Archangel contains only $\frac{3}{4}$. The central and south-west governments of this part of the empire are the most densely peopled. The town residents are $9\frac{1}{2}$ per cent. of the whole population of European Russia; $7\frac{1}{2}$ per cent. of that of the Caucasus; and 5 per cent. of that of Siberia. Russian society is divided into five classes, and of these the nobility forms 1·49 per cent.; the clergy (including their families) 1·01 per cent.; the burgesses (tiers état), 8·60; the peasants, 82·55; and the military, 6·35 per cent. Irrespective of Asiatic Russia, we find that in Europe this empire comprises a greater variety of races than any other European state. It is not, however, like Austria, a composite community, speaking various idioms, and having different physical characteristics and political interests. In European Russia, the predominant race is the Slavonian, and the Russian 'element' and language prevail almost universally. The 61,222,308 Russians who inhabit Europe are divisible into—1. Great Russians (22,854,660), inhabiting the central and northern provinces. 2. Little Russians (7,001,835), located in the south; including the Cossacks of the Don (5,117,700), in Southern or New Russia. 3. Western R., including the White Russians (9,020,077). 4. Baltic provinces (2,986,423); and 5. Eastern R. (14,242,613), including Astrakhan, Cossacks of Orenbourg, Perm, &c. The other Slavonic races are Poles (4,860,000), in Russian Poland, and partly in the west provinces (where they form only $10\frac{2}{5}$ths per cent. of the population); Servians and Bulgarians in Bessarabia and New Russia. The Finnish race (4,630,000), which occupies, under different names, the north and north-east of European Russia, and the north-west of Siberia, has in great part adopted Russian language and manners. The Lithuanians and Letts (2,420,000) dwell mostly between the Niemen and Dwina. The Turkish Tartarian race (4,780,000), in the south-east, and partly in Siberia, comprises Tchuvashes, Tartars of Kazan, Kirghiz, &c. The Mongols (500,000), comprising Kalmucks and other races, in the south-east of European Russia, and in the east of Siberia. Besides these races, there are Roumains and Wallachs (780,000), in Bessarabia and New Russia; Persians, Kurds, Armenians, &c. (540,000), near the Caspian Sea; Germans (830,000), distributed over the whole empire, but found in the greatest numbers in the Baltic provinces; Swedes (150,000), in Finland; Greeks (50,000), in the south; Bohemians—i. e., Gipsies (50,000)—chiefly in Bessarabia; Jews (2,290,000), mostly in Poland and the west provinces; Caucasians (800,000); Samoieds in the north of R., and many other tribes in East Siberia and Central Asia.

Climate.—Owing to its vast extent, the Russian empire presents great varieties of climate. At Archangel, the mean temperature of the year is 32° F.; at Yalta, in the Crimea, 52°; and at Kutais, in the Caucasus, 58°. Consisting of an immense area of dry land, the climate of the empire is essentially continental; and the climate of localities in its interior is much more rigorous than that of places on the western shores of Europe in the same latitudes. The mean temperature of Edinburgh and Christiania is higher than that of Moscow and Kazan. The rigour of the climate of the empire increases not only with the latitude, but as you advance eastward; thus, the mean winter temperature of the town of Abo, on the Gulf of Bothnia, is the same as that of Astrakhan—viz., 23° F.; although the former is in lat. 61°, and the other in lat. 47°, or 14° nearer the equator. The difference of the mean summer temperature under the same latitudes is, on the contrary, not very considerable. The isothermal line of Moscow ($64\frac{1}{2}$° F.) passes through Warsaw, in Poland, and Berlin. In the east, the maximum heat is even greater than in the west; and such heat-loving plants as the water-melon are grown more successfully in the south-east of R. than in the west of Europe, under the same latitude. The dryness of the atmosphere increases in the direction from north-west to south-east. On the banks of the Baltic, the average number of rainy and snowy days is 150, and the annual rainfall is 20 inches, while near the Caspian the number of such days is 70, and the rainfall only 14 inches. The climate of R. is in general healthy; but there are several places where diseases seem to be localised, as the shores of the Frozen Ocean, where scurvy is common, the marshes along the Niemen and Vistula, where the Plica Polonica (q. v.) is the chief disease, and the marshy lands on the Black, Azof, and Caspian seas, where ague always prevails.

Manufactures.—Manufacturing industry in R. may be said to date from the reign of Peter the

Great. With a view to its promotion, foreign manufactured goods are heavily taxed on importation. In 1863, the number of factories (exclusive of iron-works and all establishments engaged in the preparation of metals) was 15,453, which employed 465,000 hands, and produced articles amounting to 326,000,000 roubles. Of these factories, a half were in the governments of St Petersburg, Moscow, and Vladimir. The metallurgical works are mostly in the government of Perm, and in other eastern governments bordering on the Ural Mountains. Small handicraft manufacturing establishments abound in all the central governments, especially in the neighbourhood of Moscow, where whole villages during the winter season are employed in some special industry, as weaving, tanning, fur-dressing, joiners' work, shoemaking, &c. The chief manufacture is spinning and weaving flax and hemp. Linen is manufactured to the value of 100,000,000 roubles, chiefly in hand-looms; although the finer qualities are manufactured by power-looms, mostly in the governments of Jaroslav and Kostroma, and the capitals. Hemp is manufactured into sailcloth and ropes, which articles are largely exported. Woollen and worsted stuffs are made to the value of 50,000,000 roubles, and the quantity is on the increase. Fine cloths and mixed fabrics are made in the capitals, and in the governments of Livonia and Tchernigov. Silk-spinning and weaving are carried on in the factories of Moscow, which is renowned for its brocades, and gold and silver embroideries. Owing to the excessive taxation on imported cotton goods, cotton manufactories, employing a capital of 60,000,000 roubles, which might here be more profitably utilised, have been commenced within the last 30 years. After weaving, the next most important branch of industry is tanning, the products of which amount to 20,000,000 roubles. The other important branches of industry are cutlery, made in the town of Tula, the Russian Sheffield, and in the governments of Nijni-Novgorod, Vladimir, and Kostroma; and pottery and glass-works, the former carried on in the government of Moscow, the latter in that of Vladimir. Machine and chemical works are still in a backward state; the products of the former, in 1863, did not exceed 12,000,000 roubles; of the latter, 5,000,000 roubles.

Commerce.—The Russian empire, including provinces varying widely in their natural and industrial resources, presents an extensive field for internal commerce, while the abundance of its products maintains a vast foreign trade. Of the former, which is by far the more important, the extent and value cannot be given, owing to the want of statistical data. Moscow, in the centre of the industrial provinces of the empire, and the great dépôt for the wares that supply the trades of the interior, is the chief seat of the home-trade. The other large trading towns are chiefly those on the banks of the great rivers. The goods yearly conveyed by the Volga alone amount to 200,000,000 roubles. Owing to the distances between the great trading towns, fairs are still of great importance in Russia. The transactions of all the fairs in the empire amount to more than 300,000,000 roubles, and the chief are those of Nijni-Novgorod (q. v.), Irbit (q. v.), Kharkov (q. v.), Poltava (q. v.), and Kursk (q. v.).—The foreign trade consists mainly of the export of raw products, and the imports of colonial and manufactured goods. The foreign trade by sea is five times greater than the trade by land; and of the latter, the commercial transactions with Europe amount in value to ten times the Asiatic trade. One-third of the whole foreign commerce is transacted at St Petersburg, one-ninth at Odessa, and one-fifteenth at Riga. In 1867, 11,047 vessels, measuring 1,385,738 tons, entered the ports, and of these, 1241 belonged to the Russian commercial marine, 2381 were English, 1052 Italian, 1134 Swedish and Norwegian, and 11,090 vessels, of 1,400,252 tons, cleared outward. The following table gives a view of the chief articles of export and import for the years 1868 and 1869.

EXPORTS.

	1868. Roubles.	1869. Roubles.
Cereals,	73,632,000	86,876,000
Flax,	29,030,000	32,857,000
Linseed,	26,728,000	31,002,000
Wool (raw),	11,425,000	7,667,000
Tallow,	9,760,000	8,356,000
Wood,	12,521,000	11,638,000
Hemp,	8,090,000	10,483,000
Bristles,	3,131,000	8,949,000
Cattle,	6,182,000	7,608,000
Tow or Flax,	2,294,000	2,668,000
Hides and Skins,	3,001,000	4,213,000
Metals (crude),	1,414,000	1,914,000
Potash,	1,414,000	1,693,000
Furs,	1,026,000	1,652,000

IMPORTS.

	1868. Roubles.	1869. Roubles.
Cotton (raw),	35,975,000	35,684,000
Metals, Manufacture of	17,865,000	29,107,000
Machinery,	16,321,000	28,386,000
Tea,	15,895,000	17,424,000
Metals (unwrought),	17,374,000	25,081,000
Dyestuffs,	11,844,000	12,982,000
Silk and Silk Manufacture,	9,708,000	9,444,000
Oils,	8,168,000	9,659,000
Spirituous Liquors,	8,332,000	11,097,000
Fruit,	6,561,000	7,239,000
Woollen Manufactures,	6,133,000	9,020,000
Coffee,	3,497,000	5,133,000
Cotton Yarn,	4,343,000	5,193,000
Tobacco,	3,497,000	4,845,000
Cottons,	3,235,000	4,065,000
Coal,	1,761,000	7,349,000
Salt,	2,253,000	4,514,000

The total exports to Europe (excluding Finland), exclusive of coin and bullion, in 1868, amounted to 209,530,000 roubles; in 1869, 247,095,000 roubles. The total imports in 1868, 239,892,000 roubles, and in 1869, 319,375,000 roubles. One rouble = 78 cts. gold.

Geology and Mineral Products.—A more intimate knowledge of the geological structure of R. may be said to date from 1841, when the eminent geologist, Sir R. I. Murchison, undertook a scientific journey to R. and the Ural Mountains. His geological investigations, together with the palæontological researches of his colleagues, E. de Verneuil and Count Kayserling, have served as a basis for further surveys. The oldest stratified rocks are the Silurian, on the southern shores of the Gulf of Finland, sinking down below the Devonian strata, which run in two large branches—on the south-east to Voronesh, and on the north-west to Archangel, both overlaid to the east by a still more extensive deposit of carboniferous rocks. The immense triangle between those layers and the Ural is occupied by the Permian system (except the north-east extremity, which is covered by Jurassic beds), named by Sir R. I. Murchison from its development in the government of Perm. To the south of the south-east Devonian branch extend deposits of the cretaceous period, and detached patches of the carboniferous formation. The latter contains, in R., only the older members of the group up to the mountain limestone, which contains numerous but thin seams of coal, generally poor in quality. The field along the Donetz forms an exception, and yields annually about 96,400 tons ($\frac{9}{7}$ths of the total quantity raised in R.) of good coal and anthracite. The remaining south-west and south-east parts of the empire are covered by tertiary beds, more or less recent. The Ural Mountains present an outcrop of all the secondary and palæozoic formations down to the stratified gneiss and granite, which latter composes

nearly the whole province of Finland, and skirts the middle course of the Dnieper. The mining and metallurgic industry of the empire has made great progress in recent years. Vast establishments for producing machinery, tools, and other articles of steel, iron, and copper have been founded in the Ural provinces, especially in Orenbourg and Perm, which, served by skilful workmen from Germany, tend to exclude the highly taxed foreign goods of the same kind. The Ural Mts. produce gold, platinum, copper, and iron of excellent quality, especially the last, which is manufactured from magnetic ore. Gold, silver, copper, plumbago, &c. are also obtained from the Altai and Nerchinsk mines in Siberia (q. v.). In 1863 the product of gold amounted to 52,624 lbs., valued at $15,445,689; platinum, 1030 lbs., valued at $69,750; silver, 38,808 lbs., valued at $681,928; total, $16,197,367; of lead, 2,591,472 lbs., valued at $116,000; that of iron in 1866 was 408,000 tons of pig iron, and 350,000 tons of wrought iron. In 1859 upwards of 54,000,000 poods of salt were extracted chiefly from salt lakes of Bessarabia and the Crimea, from Lake Elton in Astrakhan, and from the inexhaustible layers of rock-salt near Iletzk (q. v.). Excellent china clay or kaolin is found near Gluchov in the government of Tchernigov.

Agriculture and Products.—R. is an eminently agricultural country, although only a comparatively small portion (271,000,000 acres) is under cultivation. In the *central zone* (see above, under *Surface*), the soil is almost entirely black mould, extremely fertile, and hardly ever requiring manure. The system of husbandry most extensively practised is what is called the 'three-field system,' in the working of which, one-third of the land is always in fallow. In the south and south-east, a system of agriculture peculiar to R. is in operation: it is called the 'fallow system,' and consists in raising three or four consecutive crops from the same land, and afterwards allowing it to lie fallow for five or six years, after which time it begins to grow feather-grass (*Stipa pennata*), which is considered a token of returning fertility. Husbandry, in general, has undergone great changes since the emancipation of the serfs, to whom a considerable portion of the land has been transferred in freehold. The landowners, deprived of their former right to the labour of their serfs, now find it more profitable to reduce the amount of their land in cultivation, or grant portions of it in lease to the peasants, often in return for the half of the produce of the crop. A great drawback to the development of agriculture is the want of proper means of communication, and consequently the low price of corn in the locality in which it is grown. Fodder-grass is rarely cultivated, as a sufficient supply of fodder is afforded by the extensive natural meadows. The chief cereals are wheat, which is grown as far north as lat. 62°; rye, barley, and oats. Buckwheat and millet are grown in the south, and from these, but specially from rye, the staple food of the inhabitants is made. Hemp and flax are extensively cultivated; and the oil extracted from the seeds of the former is an indispensable article of the peasant's household, as it is used for food during the fasts, which, taken together, extend over about half the year. Of flax, 12,000,000 puds are annually produced; of hemp, 7,000,000 puds, and 3,000,000 puds of oil-seeds. After the famine of 1839, government introduced, and afterwards did much to promote the cultivation of potatoes. The yearly produce of this crop amounts to 35,000,000 *tchetverts* (1 tchetvert = 5·77 imp. bushels). Tobacco crops cover 16,000 acres, and the amount produced is 2,500,000 puds. Beet-root and maize are also cultivated; and there are numerous vineyards in the Crimea, in Bessarabia, and along the Don. Gardening is an important branch of industry, the products being cucumbers, onions, cabbages, and other vegetables and fruits. An area of 486,000,000 acres is covered with woods, but the quantity of timber, from which material the peasant supplies almost all his wants, is at present suffering diminution. The Russian builds his cottage with timber, heats his room with it, lights his house with firewood, makes his household utensils from the same material, as well as his cart, &c., he also wears shoes, and uses mats for coverings, which are made from the inner bark of the lime-tree. In the north, the forests occupy from 90 to 95 per cent. of the whole surface; in the south, they are 2 per cent. less than in England. Coniferous trees are the chief in the northern districts; but in the central tracts, oaks, limes, maples, and ashes are the chief. Timber is the chief article of internal commerce, and is floated down the rivers from the well-wooded districts to those which are destitute of wood.

Animals and Animal Products.—In the northern and central provinces, cattle are kept chiefly for the purpose of obtaining manure; but in other parts cattle-breeding is an important branch of industry. On an average, there are 30,000,000 head of cattle in Russia. Of horses, the best, chiefly trotters, are reared in breeding-stables in the southern central governments; but the great bulk of the horses are obtained from the half-wild studs of the Cossacks, Kalmucks, and Kirghiz. The horses of Viatka, Kazan, and Finland are strong and hardy. The total number of the horses in R. is about 18,000,000. Sheep-breeding is carried on extensively on the southern steppes. The sheep number 10,000,000, of which upwards of 1,000,000 are of the fine merino breed. Besides these animals, there are camels in the south of R., reindeer in the north, and hogs and poultry in great abundance everywhere. A breed of the *Urus* (q. v.), a huge and rare animal, which does not occur in any other country, is preserved in a forest of the government of Grodno. Among the wild animals are (chiefly in the north), the bear, wolf, elk, fox, and marten; on the northern coasts, are found the seal and walrus, and the eider-duck and other wild-fowl. The more expensive kinds of furs are procured from Siberia, and from the Russian colonies in America, where the Russian-American Company has the exclusive privilege of the fur-trade. The most important Russian fisheries are those of the Caspian and Black Seas, and the Sea of Azof, and their tributaries. The Baltic Sea is not remarkably rich in fish; but the produce of the adjoining lakes is much more considerable. The herrings, cod-fish, and salmon, caught in abundance in the White Sea, constitute the chief resources of the inhabitants of the adjoining districts. The value of all the fisheries amounts to about £2,000,000. Bee-culture is very general in R., and of the wax obtained, 150,000 puds are used in making church candles. Silk-worms are reared chiefly in the Caucasus, where 66,155 lbs. were produced in 1865, and 194,054 lbs. in the whole of R. in Europe.

History.—The population of the Russian empire is composed of various nationalities, but the predominant one is the Slavonic (q. v.). The Eastern Slavs, the ancestors of the Russians, were settled near the sources of the rivers Volkhof, Bug, Dniester, Dnieper, and Don, and consisted of several tribes whose chief towns were Novgorod and Kief. Being much harassed by their warlike neighbours, and distracted by intestine dissensions, the Slavs of Novgorod and the neighbouring Finnish tribes, in 862, sent ambassadors to 'the Variags (Varangians, Normans) beyond the sea,' inviting their chiefs to come and reign over them. Three brothers of the tribe, called by the old chroniclers *Rurik* (q. v.),

Sineous (Sindf), and Truvor, accepted the invitation, and at the head of a band of armed followers (*droujina*) took possession of the territory of Novgorod. Oleg (879—912), who exercised authority as regent to Igor, Rurik's son, took Kief, and made it the capital of the embryo empire, subduing the neighbouring tribes, and even successfully attacking the Byzantines. *Igor* (912—945) did nothing of note, but his widow and successor, *Olga* (945—957), was a wise and able ruler. She was baptised in 955 by the patriarch of Constantinople, and abdicated soon after in favour of her son *Sviatoslaf* (957—972), a warlike monarch and a pagan, who was treacherously murdered by a neighbouring tribe with whom he was at war. On his death, the principality was divided among his three sons, and the quarrels usual in such cases followed, and continued till *Vladimir* (980—1015), the youngest son, became sole ruler. The Normans now definitively became amalgamated with the Slavonic race. Vladimir's reign is the 'heroic' epoch of Russian history; and the glories of the court, and the valiant feats of the warriors of the 'sunny Prince Vladimir,' have been handed down through ages in legend and song. His successful wars extended the boundaries of R. to Lake Ilmen on the north, to the mouths of the Oka and of the Khoper (an affluent of the Don) on the east, to the falls of the Dnieper on the south, and to the sources of the Vistula on the west. He became a convert to the Greek faith, and in 988 was baptised with his followers; his example being shortly followed by the whole nation, for whose spiritual guidance and supervision a metropolitan was established at Kief. He followed the evil example of his father in dividing his dominions, and after his death a civil war broke out among his four sons, in which *Jaroslaf*, prince of Novgorod, was ultimately (1036) successful. This prince did much to civilise his subjects by building towns, founding schools, and especially by ordering the compilation of the first Russian code of laws (the 'Rousskaia Pravda'), the most prominent item of which was the limitation of the right of family feud, a limitation which was changed into total abolition after his death in 1054, by his sons, who shared the principality among them. Each of these petty princes in turn divided his portion of territory among his sons, till the once great and united realm became an agglomeration of petty states quarrelling with each other, undergoing absorption by a more powerful neighbour, or being redivided. This state of anarchy, confusion, and petty warfare dates from the death of Jaroslaf in 1054, and continued, more or less, till 1478. The principal among the subdivisions of R. during this period were, according to Russian authorities, *Sousdal*, which occupied the upper and central parts of the basin of the Volga, and from which, in the beginning of the 13th century, sprang the principalities of *Tver*, *Rostof*, and *Vladimir*; *Tchernigof* and *Seversk*, which occupied the drainage-area of the Dessna (an affluent of the Dnieper), stretching to near the sources of the Oka; *Riazan* and *Murom*, along the Oka basin and the sources of the Don; *Polotsk*, including the basins of the Western Dwina and Beresina; *Smolensk*, occupying the upper parts of the basins of the Western Dwina and Dnieper; *Volhynia* and *Galicia*, the first drained by the Pripet, the second lying on the north-east slope of the Carpathian Mountains, which were united in 1198; *Novgorod*, by far the largest of all, which occupied the immense tract bounded by the Gulf of Finland, the Lake Peipus, the upper parts of the Volga, the White Sea, and the Northern Dwina; and the grand-duchy of *Kief*, which, from its being formerly the seat of the central power, exercised a sort of supremacy over the others. Novgorod, however, from its size and remoteness, as well as from certain privileges which had been granted to it by Jaroslaf, was almost independent of the grand-duchy. The citizens of Novgorod chose their own dukes, archbishops, and in general all their dignitaries, and proved the superiority of their system of self-administration by increasing in power and wealth year by year. One of the chief factories of the great Hanseatic League was established in Novgorod in the 13th century. In fact, so great was its fame throughout R., as to give rise to the proverb, 'Who can resist God and the mighty Novgorod.' The princes of these states had each his standing army, and were continually quarrelling; but the people were less oppressed than would naturally be expected under such circumstances, on account of the establishment in each state of a 'common council' or *veche*, which exercised an important influence in state affairs, and without which the prince was almost powerless. This period was also marked by the gradual amalgamation of the different Slavic races into one, the present Russian race, a process doubtless aided by the universal dissemination of Christianity, which assimilated their various languages, manners, and customs. The chief of the grand dukes of Kief was *Vladimir*, surnamed 'Monomachus' (1113—1125), whom chroniclers are never tired of lauding as a model prince, and one whose authority was acknowledged almost as paternal by the princes of the other provinces. In 1163, the ruler of Vladimir took possession of Kief, and proclaimed himself grand duke. In 1222, the Mongol tide of invasion had swept westwards to the Polotzes, a nomadic tribe who ranged over the steppes between the Black Sea and the Don, and whose urgent prayers for aid were promptly complied with by the Russian princes; but in a great battle, fought (1223) on the banks of the Kalka (a tributary of the Sea of Azof), the Russians were totally routed. The Mongols, as usual, did not follow up their victory; but twelve years afterwards, Batû Khan, at the head of half a million of Kiptchak Mongols, conquered the east of Russia, destroying Riazan, Moscow, Vladimir, and other towns. The heroic resistance of Prince George of Vladimir cost the lives of himself and his whole army on the banks of the Siti. The Mongol conqueror's victorious career was, however, arrested by the impenetrable forests and treacherous marshes to the south of Novgorod, and he was forced to return to the Volga. In 1240, he ravaged the south-west, destroying Tchernigof, Galich, and Kief; ravaged Poland and Hungary, defeating the Poles at Wahlstatt, and the Hungarians at Saïo; but being checked in Moravia, and receiving at the same time the news of the khagan's death, he retired to Saraï on the Akhtuba (a tributary of the Volga), which became the capital of the great khanate of Kiptchak. Thither the Russian princes repaired to swear allegiance to the khan, and take part in the humiliating ceremonies which the barbarous conqueror exacted from his tributaries. The taxes of R. were farmed out by the khan to contractors, who were generally oriental merchants, and they were collected by the aid, when necessary, of the khan's soldiers. But in later times (during the most of the 14th and 15th centuries), when the fiery energy of the Mongols was on the decline, the taxes were collected by the Russian princes and sent to Saraï. The Mongol invasion had an evil influence on the political, social, and moral life of R.; it totally destroyed the elements of self-government, which had already attained a considerable degree of development, arrested the progress of industry, literature, and the other elements of civilisation, and threw the country

more than 200 years behind the other states of Europe. The principalities of Kief and Tchernigof never recovered this crushing blow, and the seat of the metropolitan was removed to Vladimir. Their decline, however, made room for the rise of Galich to pre-eminence in Western R., and under the rule of a series of wise princes it preserved greater independence than any of the Russian principalities, till, in the latter half of the 13th c., it was taken possession of by Kasimir III. of Poland; and about the same time Volhynia was joined to the grand-duchy of Lithuania. The rise of this latter state was much favoured by the prostration to which the Russian princes were reduced by the Mongol invasion, and after a flourishing existence of several centuries, during which it extended in power, so as to include Livonia proper, and the Russian provinces of White R., Volhynia, Podolia, and the Ukraine, it was joined in 1569 to Poland. On the north of Lithuania arose in the beginning of the 13th c. another power, the Livonian Knights Sword-bearers, who took possession of Livonia, Courland, and Esthonia, as well as some portions of the territory of Novgorod and Pskov. The grand-ducal title passed after the Mongol invasion from Kief to Novgorod, and afterwards to Vladimir, where the celebrated Alexander Nevsky (q. v.) (1252—1263) swayed the sceptre. In the beginning of the 14th c., Eastern R. consisted of the principalities of Sousdal, Nijni-Novgorod, Tver, Riazan, and Moscow, and long and bloody contests took place between the two most powerful of these, Tver and Moscow, for the supremacy. At last, under the guidance of *Ivan Kalita* (1328—1340), the founder of the system of administrative centralisation which prevailed down to the time of Peter the Great, Moscow became the chief grand-duchy. This result was due to various causes, of which the central position of Moscow, the prevalence there of the law of primogeniture, the favour of the Mongol khan, the sympathy of the church, whose head the metropolitan had removed thither from Vladimir in 1325, and the weakness of most of the other princes, were the chief. Ivan's son and successor, *Simeon the Proud* (1340—1353), followed in his father's footsteps, as did also the regency which administered the government during the reign of the weak-minded *Ivan II.* (1353—1359), and the minority of his son, *Dmitri* (1359—1389). Dmitri conquered Nijni-Novgorod, carried on war with success against Tver and Riazan, and profited by the weakness of the Mongol khanate, which was now divided into the four hordes of Nagaisk, Crimea, Kazan, and Astrakhan, to make the first attempt to shake off the shameful yoke under which the Russians had groaned so long. His brilliant victory over the Khan Mamaï on the banks of the Don (1380), which conferred on him the epithet of Donskoï, was the first step to liberation; but the succeeding khan, in revenge, burned Moscow, exacted a heavy tribute from the people, and rivetted their bonds more firmly than ever. *Vassili I.* (1389—1425) obtained possession of the principality of Nijni-Novgorod with the full consent of the khan, and conquered Rostof and Murom. During his reign, R. was twice invaded by the Tartars, first under Timur, and again under Edijeï, and was at the same time attacked by the Livonians. *Vassili II. the Blind* (1425—1462) reigned during a period marked with continual civil wars among the various princes for the grand-ducal throne; but from this period the division of power in Eastern R. rapidly disappeared, internal troubles ceased, and the re-united realm acquired from union the power of casting off the Tartar yoke. These results were achieved by *Ivan III.* (1462—1505), surnamed 'the Great,' who availed himself of every opportunity for abolishing the petty principalities which owed him allegiance as grand-duke, and manœuvred so skilfully, that some of the princes voluntarily surrendered their rights, others bequeathed their lands to him; while others, as the prince of Tver, were reduced by force of arms. The heaviest task of all, however, was the reduction of Novgorod, but so vigorously did Ivan carry out his schemes, that in 1478 this last of the great principalities was added to his empire. He then took advantage of the dissensions between Achmet, khan of the Golden Horde, and Mengli-Gheraï, khan of the Crimean Horde, to deliver R. from its state of servitude by uniting with the latter; their combined arms destroying the power of the former in 1480; and the kingdom of Astrakhan, which rose on its ruins, was wholly unable to cope with the now powerful monarchy. He next turned his attention to the western provinces, which had formerly belonged to the descendants of St Vladimir, but were now in the hands of the Lithuanians, under whom the adherents of the Greek Church were bitterly oppressed by the Catholics, and accordingly hailed the advance of Ivan's army as a deliverance from persecution. The battle which followed was in favour of the Russians, but was productive of no results of any importance. Ivan married (1472) Sophia, a niece of Constantine Palæologus, the last Byzantine emperor, and introduced the arts of civilisation through the medium of architects, founders, coiners, miners, &c., whom he brought from Italy, and the result of whose labours is seen in the Kremlin and the Cathedral of the Assumption (Ouspenski Sobor). He also fortified many towns, introduced to his court the splendour of Byzantium, assumed the title of Czar of all the Russias, adopted the arms of the Greek empire, and united the existing edicts into a body of laws, the *Soudebnik*. *Vassili III.* (1505—1533) followed closely his father's policy, made war upon the Lithuanians, from whom he took Smolensk, and incorporated with his dominions the remainder of the small tributary principalities. His son, *Ivan IV.* (1533—1584), known afterwards as 'The Terrible,' became monarch at the age of three years, and the country during his long minority was distracted by the contentions of factious bojars who strove for power. Fortunately, however, on his attaining his majority in 1547, he found two wise and prudent counsellors, Sylvestre and Adascheff, who, along with his queen, Anastasia Romanoff (see ROMANOFF), exercised over him a most beneficent influence. The interior administration was remodelled, the 'soudebnik' of his grandfather was reformed and amended, the *streltzi*, the first standing army in R., were established, and printing introduced. His arms were everywhere victorious; the strongly fortified city of Kazan was captured in 1552, and the kingdom of which it was the capital was annexed to his empire, and the kingdom of Astrakhan shared the same fate soon after. The marauding Tartars of the Crimea were held in check, and the Knights Sword-bearers attacked and driven from Livonia and Esthonia. About this time a remarkable change came over Ivan's character, which seems to have been in some way connected with the death of his wife, Anastasia. He became suspicious of every one, believed himself surrounded with traitors, banished his two counsellors, Sylvestre and Adascheff, and persecuted the bojars, many of whom perished on the scaffold, while others fled to foreign countries. His insane rage fell upon whole towns; thousands of people were destroyed in Tver, Novgorod, and Moscow; and, finally, he murdered his eldest son. Stephen

Bathory, king of Poland, meantime wrested Livonia from him, and the Crim-Tartars made an irruption northwards, and burned Moscow. It was during the reign of this monarch that Western Siberia was conquered for R. by the Cossack Ermak. See SIBERIA. His son, *Feodor* (1584–1598), was a feeble prince, who intrusted his brother-in-law, Boris Godounof, with the management of affairs. Godounof was a man of rare ability and intellect, and proved himself an able administrator. The Russian dominion in Siberia was consolidated, numerous towns and fortresses were erected in the south as barriers against the Crim-Tartars, the Greek Church in R. was declared independent of the patriarch of Constantinople. Feodor was the last reigning monarch of the house of Rurik, for he died childless, and his only brother, Dmitri, was murdered in 1591 by order of Godounof, according to popular rumour. After the death of Feodor, representatives of all classes were convoked at Moscow to elect a new sovereign, and their choice fell on *Godounof* (1598—1604). The mysterious death of Prince Dmitri favoured the appearance of pretenders to his name and rank, the first of whom, a supposed monk of the name of Gregory Otrepieff (see DEMETRIUS), was defeated by Godounof, but on the sudden death of the latter he was crowned in 1605. A revolt, headed by Prince *Vassili Shouisky* (1606—1610) soon broke out, the czar was murdered, and Shouisky elevated to the vacant throne. But a second false Dmitri now appeared, and Sigismund of Poland, taking advantage of the confusion thus produced, invaded R., proclaimed his son Vladislaf czar, and took possession of Moscow (1610), carrying away the czar to die in a Polish prison. At the same time hordes of Tartars, predatory bands of Poles, and gangs of robbers devastated the provinces, and the wretched country was reduced almost to the verge of complete disorganisation. But the clergy nobly stood forth to save the state from ruin, and Minin, a common citizen of Nijni-Novgorod, so worked up the feelings of his fellow-citizens that they volunteered for military service, and chose as their leader the Prince Pojarsky, a man of distinguished valour. Pojarsky retook the capital, drove the Poles out of R., and convoked an assembly of representatives, who unanimously chose for their czar *Michael Feodorovitch Romanoff* (1613—1645). See ROMANOFF. The first care of the new monarch was to put an end to the revolt of the Don Cossacks, who had set up the son of the first false Dmitri as czar, and to the depredations of the robber-gangs in the south-west of Russia. In 1617, he concluded a treaty with Sweden, by virtue of which that power received the coasts of the Gulf of Finland and a considerable pecuniary indemnity, in consideration of Philip, the brother of the Swedish monarch, renouncing his claims to the Muscovite throne. In 1618 and 1634, he purchased peace from the Poles at the cost of Smolensk and a portion of Seversk. Having thus freed himself from all danger of foreign interference, he directed his attention to the internal administration, which, especially the courts of justice, was reduced to a deplorable condition, and to aid him in this necessary task, he summoned a general council of representatives at Moscow. *Alexei* (1645—1676), his son and successor, being a minor, the nobles seized the opportunity of increasing their power and exercising oppression and extortion over their inferiors, till rebellions broke out in various districts. Other causes of discontent were the heaviness of the taxes, the oppression of the serfs, the depreciation of the currency, which was changed from silver to copper, and the secession from the Russian Greek Church of those who disapproved of the changes and corrections in the books and liturgy of the church introduced by the patriarch Nikon. These malcontents were accordingly persecuted, and fled, some to the north of R., and others to the Ukraine, where they founded many colonies, and still exist apart under the name of 'Old Ritualists' (*Staro-obriadzy*). A general council, which was now convoked to deliberate on the best means of restoring peace to the country, revised the existing laws, and composed (1649) a new code—the 'Sobornoe Ulajenie,' which granted to every subject the right of direct appeal to the czar. Tolls on the highways were abolished, the English and other foreign merchants were deprived of their privilege of free-trade with R., and the silver currency reintroduced. The chief events in foreign policy were the acquisition of Little Russia, by the voluntary submission of the Cossacks (see POLAND); a consequent war with Poland, in which R. acquired Smolensk and the greater part of White Russia; and a war with Turkey, which continued till after the accession of *Feodor* (1676—1682), when it was terminated (1681) by the treaty of Bakhtchisarai, by which Turkey gave up all claims to Little Russia. After Feodor's death, the general council of the land, in accordance with his last wishes and their own predilections, chose his half-brother Peter as czar, but his half-sister Sophia, an able and ambitious princess (see PETER THE GREAT) succeeded in obtaining the reins of power as princess-regent. She concluded peace with Poland in 1686, made two unsuccessful campaigns against the Tartars of the Crimea; and after an attempt to deprive Peter of his right to the throne, and failing this, to assassinate himself and his mother, she was forced to resign all power and retire to a convent. All her accomplices were executed; and PETER (1689—1725) ascended the throne as sole ruler, his half-brother Ivan being allowed to retain the title of czar conjointly, and to appear as such at public ceremonies, but without any real authority. In order more fully to discover the importance of the changes wrought by Peter in R., a brief retrospect of its social and political condition at the date of his accession is necessary. At the head of government stood the czar with absolute power in administrative, judicial, and military affairs. In the exercise of authority he was aided by his council, the 'Bojarskaia Douma,' and in cases of extreme need by a general council of representatives of the people, which latter, however, possessed only a right of deliberation. The criminal code was cruel in the extreme. Of the standing army the streltzi only deserved the name. The population were divided into two great classes, the *bojars* or nobles, who were bound to render service for their estates, and the *burghus* or industrial and trading classes, and *serfs*, who were bound to the soil. The clergy exercised great influence over all classes, possessed offices in the 'douma,' and exercised political functions. Agriculture was at a low ebb, and the few manufactories and industrial establishments were in the hands of foreigners. Civilisation and learning, which had been introduced during the confederative period, had never recovered the shock they had received from the Mongol invasion, but in later times they entered R. through the connection of Novgorod with the Hanse League, and from intercourse with Poland, though they never reached the rural population or the lower classes. The education even of the higher classes was limited to reading and writing, and the first school for classics and theology only made its appearance during Feodor's reign. Fine arts were limited to architecture and painting (of sacred subjects) after the Byzantine school. The first newspaper appeared (in Moscow), and the first theatre was established,

during the reign of Alexis. The degraded condition of civilisation and the Oriental influence of the Mongols left powerful traces on the domestic manners and habits of the Russians, among which were the despotic authority of the father over his household, and the low position of women in domestic life; those of the lower ranks being made mere slaves, while those of higher rank were completely excluded from social intercourse with the other sex, and were condemned to pass a dull and dreary existence in their 'terems.' Marriages were concluded by the parents without the consent of the bride and bridegroom.

The history of R. during Peter I.'s reign is merely a biography of that monarch, and under his name is given a brief sketch of the numerous and important improvements effected by him in the government and civilisation of his subjects. It must, however, be noted, that in the carrying out of his well-meant schemes, he seldom consulted the national character of his people, or the natural conditions of the country; and consequently, when the irresistible pressure of his high intellect and indomitable will was withdrawn, it was found that, in great part, the civilisation which he had forced upon his subjects was but skin-deep. In accordance with the terms of his will, his second wife, *Catharine I.* (q. v.) (1725—1727), succeeded him, though the old or anti-improvement part of the nobility supported the claims of the only son of the unfortunate Alexis (q. v.), *Peter II.* (q. v.) (1727—1730), who soon after obtained the imperial throne. The reigns of both of these sovereigns were occupied with court quarrels and intrigues, Menchikow (q. v.) during the former, and Dolgorouki during the latter, being the real rulers. On the death of Peter II., the privy council, setting aside the other descendants of Peter I., conferred the crown on Anna (q. v.), Duchess of Courland, the daughter of Ivan. Her reign (1730—1740) was marked by the predominance of the German party at court, who, unchecked by the weak sovereign, treated R. as a great emporium of plunder, and the Russians as barbarians (see BIRON). Under their influence, R. restored to Persia (q. v.) her lost Caspian provinces, and was led into a war with Turkey, which was productive of nothing but an immense loss of men and money. Her successor was *Ivan* (1740—1741), the son of her niece, Antonia, the Princess of Brunswick; but he was speedily dethroned by *Elizabeth* (q. v.) (1741—1762), the daughter of Peter I., who deprived the German party of the influence it had so shamefully abused, restored the senate to the power with which it had been intrusted by Peter the Great, established a regular system of recruiting, abolished tolls, and increased the duties on imports. During her reign, French influence was paramount, and the language of that nation supplanted German at court. R. gained by the treaty of Abo (1743) a portion of Finland, and took part in the *Seven Years' War* (q. v.). Elizabeth's nephew and successor, *Peter III.* (q. v.) (1762—1762), put a stop to all interference with the quarrels of Western Europe, and introduced some commendable ameliorations of the oppressive enactments of his predecessors; but he was speedily dethroned by his able and unscrupulous consort, who, as *Catharine II.* (q. v.) (1762—1796), ascended the throne, and proved herself the greatest sovereign of R. after Peter I. Her successful wars with Turkey, Persia, Sweden, and Poland, largely extended the limits of the empire; and while by her foreign policy protecting her subjects from external invasion, she as little forgot the necessity for external reforms. The laws and administrative arrangements were revised, and the empire was divided into governments (an arrangement which, with very slight modification, still subsists), each government being under a separate administration, both as to matters of polity and justice. Her son and successor, *Paul I.* (q. v.) (1796—1801), at first, through apprehension of the revolution in France, joined the Austrians and British against France, but soon after capriciously withdrew, and was about to commence war with Britain, when his assassination took place. He gave freedom of worship to the 'Old Ritualists,' which till this time had been withheld; but he also established a severe censorship of the press, prohibited the introduction of foreign publications, and organised a secret police. His eldest son, *Alexander I.* (q. v.) (1801—1825), was at the outset desirous of peace, but was soon drawn into the vortex of the great struggle with France, in which he played a prominent, although at one period an inconsistent, part, and raised R. to the first rank among European States. The character of his rule and the internal improvements he effected are sketched under his name; and an outline of the warlike operations is given in the article NAPOLEON. The Holy Alliance (q. v.) and the example of conservative policy set by Austria, exercised a pernicious influence on the latter part of his reign; and the higher classes, who had looked for the introduction of at least a portion of the liberal institutions they had seen and admired in Western Europe, became so dissatisfied, that when his youngest brother, *Nicholas I.* (q. v.) (1825—1855), from whom they had nothing to hope, succeeded, they broke out into open rebellion, which was speedily crushed. A full stop was now put to the rapid advance of R.'s prosperity; wars were declared with Persia and Turkey; and a long and deadly struggle commenced with the Caucasian mountaineers—all for the ill-concealed object of extending Russian domination; and the cession of Erivan and Nahituvan by Persia, of the plain of the Kuban, of the protectorate of the Danubian principalities, and of the free right of navigation of the Black Sea, the Dardanelles, and the Danube by Turkey, only whetted his appetite for more spoil. In 1830, he converted Poland (q. v.) into a Russian province; in 1849, he officiously aided Austria in quelling the insurrection of the Magyars; and in 1853, his almost irresistible craving for more territory led him (being, in all probability, under the impression that Turkey would stand alone, as she had always done hitherto) into the Crimean war, in which, though the allies, Britain, France, and Sardinia, did not obtain any decided success, R. suffered immense loss of military prestige on the Danube, at Silistria, the Alma, and before Sebastopol, and was almost drained of her vast resources of men and money. On the accession of *Alexander II.* (1855), one of his first acts was the conclusion of the peace of Paris (1856), by which R. lost the right of navigation on the Danube, a strip of territory to the north of that river, and the unrestricted navigation of the Black Sea. Alexander's first great reform was the abolition of serfdom. The farming-system of the indirect taxes was also abolished, the judicial power separated from the administrative, and founded on trial by jury, the term of military service lessened, and land-banks established. The insurrection in Poland (q. v.), in 1863—1864, was suppressed with extreme severity. During the struggle 30,000 insurgents were killed or severely wounded, 361 condemned to death, &c., 85,000 transported to Siberia and the Ural Mts., while 10,000 Poles sought an asylum abroad. In 1864 the Polish peasants were emancipated, and all connection severed between them and the nobility by the establishment of communal self-government. In 1864 the war with the Circassians, which had lasted about 30 years, was brought to a close. In the same

year the Russians subjugated two of the states of Turkestan, and in 1865 Russian Turkestan was constituted, and reorganised in 1867. In 1866 a proposed Polish insurrection in Siberia was promptly suppressed. In 1868 Poland was incorporated with Russia, and rigorous measures instituted to suppress the Polish language. A new war with Bokhara broke out, and Samarcand was ceded to the Russians. The criminal code was revised in 1868, retaining many of the Draconic sections of the old code. In 1870 a diplomatic note was addressed to the European powers, protesting against those articles of the treaty of Paris which neutralised the Black Sea. A conference of the powers, held in London in 1871, acceded partially to Russia's claim.

RUSSIAN CHURCH, the community of Christians subject to the emperor of Russia, using the Slavonic liturgy, and following the Russian rite. The early history of the R. C., as a distinct national community, is involved in much obscurity. That Christianity had been introduced into Russia before the middle of the 9th c., must be inferred from one of the letters of Photius, written in 866; but its diffusion was very limited. Even the prospect which, in the middle of the 10th c., was opened by the conversion and baptism of the Princess Olga (q. v.), was but slowly realised. Her son, Swätoslav, sturdily resisted the representations of his Christian mother and the missionaries; nor was it till the alliance of Wladimir with the court of Byzantium, by his marriage with Anne, sister of the Emperor Basil II., and his baptism in 988, that the foundation of Christianity can be said to have been regularly laid in Russia. Nicholas Chrysobergos, patriarch of Constantinople, taking advantage of the occasion, sent a bishop and a number of priests, by whom a number of the people were baptised in an incredibly short space of time, 20,000, it is said, having received baptism in a single day. At this time, Constantinople being in communion with Rome, the R. C. was also subject to the same jurisdiction; and although, in the schism under Michael Cerulanus, the R. C. naturally followed silently in the train of Constantinople, yet, it would appear that at the time of the Council of Florence (1439), the adherents of the Roman Church throughout Russia were as numerous as those of the Greek party. The complete separation of the R. C. from Rome was effected by an archbishop of Kiew, named Photius, in the latter part of the same century.

For more than a century from this date, the R. C. continued directly subject to the patriarch of Constantinople; but in the year 1588, the patriarch Jeremias being in Russia, held a synod of the Russian bishops, and erected the see of Moscow into a patriarchate, with jurisdiction over the entire territory; this decree being afterwards confirmed by a synod held at Constantinople. This dignity, however, was subordinate to the patriarch of Constantinople, and the subordination was acquiesced in down to the reign of Alexis Michaelowitz, father of Peter the Great, when the patriarch of Moscow, Nikon, refused to acknowledge it further. The pretensions of this prelate, and of his successors, however, gave offence to the czar, and one of the first among the great schemes for the reorganisation of his empire, conceived by Peter the Great, was the suppression of the patriarchate, and the direct subordination of the church to the headship of the emperor. He took his measures, nevertheless, with great deliberation, and on the death of the patriarch Adrian, in 1700, he contented himself with not filling up the vacant dignity, appointing in the meantime as acting director of ecclesiastical affairs, a bishop, with the title of Exarch, by whom all matters of importance were to be referred, either directly to the czar, or to a council of bishops, who held their sittings at Moscow. After an interval of 20 years, the public mind having been taught to forget the patriarchate, that office was formally abolished in 1721; and the permanent administration of church affairs was placed under the direction of a council, called the 'Holy Synod,' or 'Permanent Synod,' consisting of archbishops, bishops, and archimandrites, all named by the emperor. Under the direction of this council, a series of official acts and formularies, and catechetical, doctrinal, and disciplinary treatises was drawn up, by which the whole scheme of the doctrine, discipline, and church government of the R. C. was settled in detail, and to which all members of the clergy, and all officials and dignitaries, are required to subscribe. The leading principle of the new constitution thus imposed in the R. C., is the absolute supremacy of the czar; and in order to mark still more signally the principle that the crown is the source of all church dignity and of all ecclesiastical jurisdiction, the arrangement of provinces, archbishoprics, and bishoprics underwent a complete revision; the old metropolitan sees, as they became vacant, were filled up with simple bishops, and not with archbishops as before; and a new arrangement of archbishoprics was established, partly by the act of the czar himself, partly by the interposition of the permanent synod.

The constitution of the R. C. established by Peter, has been maintained in substance to the present time. The Holy Synod is regarded as one of the great departments of the government, the Minister of Public Worship being *ex officio* a member. One of the most cherished objects of the traditional imperial policy of Russia, has been to effect a uniformity of religious profession throughout the empire. Dissent, in all its forms, has not only been discouraged, but in many cases rigorously and even cruelly repressed; and as the Roman Catholic dissentients from the R. C. form the most numerous, and the most formidable class, they have generally, but more particularly under the late Czar Nicholas, been the object of especial severity.

As regards doctrine, the R. C. may be regarded as identical with the common body of the GREEK CHURCH (q. v.). With that church the R. C. rejects the supremacy of the pope, and the double procession of the Holy Ghost. All the great leading characteristics of its discipline, too, are the same; the differences of ceremonial which exist being, although in many cases considered by the Russians themselves of vital importance, too minute to permit our entering into the detail. There is one point on which some explanation may be required. The liturgy of the R. C. is the same as that of the church of Constantinople; but it is celebrated not in the Greek, but in the Slavonic language. The service books, however, are not in the modern Russian, but in the ancient language, such as when they were originally translated, with the exception of the modification which they underwent at the time of the patriarch Nikon (see RASKOLNIK, PHILIPPINES), and the further revision under Czar Peter. The discipline, as to the marriage of the clergy, is the same as that described for the Greek Church; and in carrying out the law which enforces celibacy upon bishops, the Russians adopt the same expedient with the Greeks, viz., of selecting the bishops from among the monks, who are celibates in virtue of their vow.

Besides the established R. C., there exists also in Russia a not inconsiderable body of dissenters of various kinds. One class of these has been already described under the head Raskolniks. But by far the most numerous dissenters are the Roman Catholics, who are found chiefly in Poland and White Russia. At the partition of Poland, a special provision was made

for the Roman Catholic people of Poland, under the new government, by the erection of an archbishopric in communion with Rome, at Mohilew, in 1783; and the organisation was still more formally completed by the czar, Paul, who established, in 1798, five bishoprics under that metropolitan see; and the arrangements of the Congress of Vienna having somewhat deranged these ecclesiastical dispositions, a new arrangement was entered into by Pius VII. in 1818. But it cannot be doubted that the whole policy of the Russian government, in reference to the church, makes it almost impossible that they should permit free exercise of worship and of thought to the Catholics in communion with Rome. During the year 1869 the government commenced a radical reform of the clergy by the promulgation of a decree for the abolition of the hereditary character of the Russo-Greek clergy. It has been proposed to permit civil marriages of Russian dissenters who do not acknowledge the orthodox sacraments. With the exception of the restraints laid on the Jews, all religions may be freely professed in the empire.

The statistics of the Russo-Greek Church, compiled by the Countess Olga Pontiatine in 1865, exhibited 55,000,000 orthodox; 37,702 parochial clergy, and 76,587 clerks and deacons.

The United Russians, according to Wetser's *Kirchen-Lexicon*, are about 6,000,000, of whom 4,000,000 are Poles and 2,000,000 resident in White Russia. They are subject to two archbishops, of Mogilev and of Warsaw, and 13 bishops.

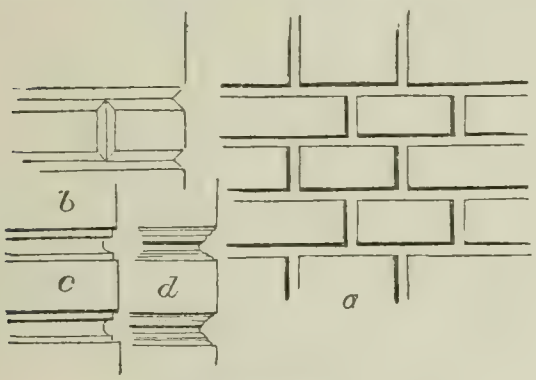
RUSSIAN LANGUAGE AND LITERATURE. Russian, a principal member of the Slavic family of languages, first became a written language in the time of Peter the Great, till which period the Old Slavic—the language of the Church—had been the only medium of literary expression, and had, in consequence, exercised an important influence on the Russian popular speech, as on that of other Slavic dialects. The Mongol conquest, and the preponderance of Polish elements in the western parts of the empire, have also introduced into the Russian language a great number of Mongolian and Polish expressions; in addition to which, the efforts of Peter the Great to give his subjects the benefits of western culture, have enlarged the Russian vocabulary, especially in arts and industry, with numerous German, French, and Dutch words. The chief characteristics of Russian, as a language, are simplicity and naturalness. The grammatical connection of sentences is slight, and the number of conjunctions scanty. Perspicuity and expressiveness are obtained by the freedom allowed in the placing of words. Auxiliary verbs and articles there are none; while personal pronouns may or may not be used along with verbs. The vocabulary of Russian is very rich—foreign words being, so to speak, Russianised. The capability of the language for forming compounds and derivatives is so great, that from a single root not less than 2000 words are sometimes derived. The purest and most grammatical Russian is spoken in the centre, about Moscow. The oldest Russian Grammar is that of Ludolf (Oxf. 1696); others are the Grammars of the St Petersburg Academy (1802), of Gretsch (Petersb. 1823; new ed. 1834), and of Vostokov (7th ed. Petersb. 1848). A *Russian Grammar for Englishmen* was published at St Petersburg in 1822, and another (by Heard) in 1827. The best Dictionaries are those of the Russian Academy (4 vols. Petersb. 1847), of Heynn (3d ed. Leips. 1803—1805), of Schmidt (Lps. 1815), Oldekop (4 vols. Petersb. 1825), and Sokolov (Petersb. 1834). There is an English-Russian grammar and dictionary by Constantinoff (3 vols. London).

The beginnings of Russian literature are contemporaneous with the introduction of Christianity by the missionaries Cyril (q. v.) and Method, who employed the Old Slavic church-tongue for literary purposes. To this earliest period belongs—besides the *Prawda Ruskaja*, a book on law—the noted history or chronicle of Nestorius. After the subjugation of Russia by the Tartars, knowledge withdrew into the shelter of the monasteries, whence proceeded several important historical works. During this period of foreign domination, the Russian people seem to have sought consolation and hope in writing patriotic ballads and songs about their great hero-king, Vladimir (q. v.)—the Russian Charlemagne — the most celebrated of which is *Igor's Expedition against the Polowzi* (Berl. 1855). When at length the country was freed from the oppression of the Mongols by Ivan I., in 1478, Russian literature received a fresh impulse, but so tardy, nevertheless, were its motions, so circumscribed its achievements, that, up to the commencement of the 18th c., the only notable names that can be mentioned are the metropolitan Makarius (died 1564), who wrote *Lives of the Saints*, &c.; Zizania, the author of a Slavic Grammar (Wilna, 1596); and Matviejev (17th c.), who composed several historical and heraldic works. The czar, Alexei Michailovitch (whose prime-minister Matviejev was), caused a valuable collection of Russian laws to be printed in 1644, and shortly after founded an academy at Moscow, in which grammar, rhetoric, poetry, dialectics, philosophy, and theology were taught. But from political causes, the Polish element now began to predominate in Russian literature, and continued to do so, more or less, until the time of Peter the Great, who made his native language the universal vehicle of communication in business and writing. He established schools and founded the famous St Petersburg Academy. During his reign, the metropolitans Demetrius (b. 1651—d. 1709) and Javorskij (b. 1658—d. 1722); the archbishop Prokopovitch (1681—1736); Sellij (d. 1746); the national historian Tatishshev (1686—1750); the poets Kantemir; and the Cossacks, Klimovskij and Danilov; were the most distinguished supports of literature. The first to place on a firm basis the Russian metrical system, was Trediakovskij (1703—1769). In the period that followed the death of Peter, the writer that exercised the strongest influence on Russian literature was Lomonossov, who first drew the lines of distinction sharply between old Slavic and Russian, and established the literary supremacy of the dialect of Great Russia. Among his successors, the poet Sumarokov (1718—1777) did great service in the development of the Russian drama; so did Kniashnin (1742—1791), whose pieces still keep their place on the Russian stage; while Wizin (1745—1792) ranks as one of the first prose writers of his age.—Some of his prose comedies are full of the most genuine humour. Other notable names in poetry, belonging in whole or part to this period, are Cheraskov, Oserov, Prince Michailovitch, Dolgoruki, Chvostov, Petrov, Bogdanovicz, and Derzavin (q. v.), the first universally popular Russian poet. Prose literature, however, developed itself more slowly. Lomonossov was for a long time the model that was followed. Among the first to make a fresh reputation, were Platon, the metropolitan of Moscow, and Lewanda (1736—1814), archpriest of Kiev; who distinguished themselves from the mass of their bombastic brethren by the strength and vigour of their thinking; the historians Schtsherbatov (1733—1790), Boltin (1735—1792), and Muraviev (1757—1807). Still more important, in the same department, were the labours of the German, Gerh. Friedr. Müller, a native of Westphalia, who, in 1755, established at St

Petersburg the first literary journal. Novikov (1744—1818) gave a powerful stimulus to the book trade and to literary productivity, partly by his professional zeal, and partly by the publication of a satirical journal, entitled *The Painter*, which was widely read.

A new epoch in Russian literature commenced with Alexander I., who was enthusiastic in the cause of education and progress. The number of universities was raised to seven; learned societies were also increased. The great ornament of literature at this period was Karamsin (q. v.), who freed it from the trammels of the pseudo-classicism, within which it had been confined by Lomonossov. His labours were continued by Dmitriev and Batjushkov, while Shishkov combated with success the tendency to deprive the language of its Slavic character; and in the poetry of Shakovski, the national elements again re-asserted themselves. Along with these may be mentioned the historian Bolchovitihov (1767—1837) and the theologian Drosdov, archbishop of Moscow; the poets Koslov, Prince Alexander, Shachovski (d. 1846), one of the best comic authors of Russia, and possessed of amazing fertility; Gribojedov, Glinka, Prince Vjasemski (b. 1792), a celebrated song-writer, elegist, and critic; Davidov, and Gnieditsh. Mersljakov, who died a professor in Moscow, was a very able critic; while Chemnicer (1744—1784) and Krylov (1768—1844) rank first among the original fabulists of Russia. Bulgarin and Gretsh belong rather to the most recent period of Russian literature—a period characterised by the predominance of Russian influences, and the complete absorption into the one national spirit of all minor and foreign elements. The late czar Nicholas laboured with his wonted passionate energy in this direction. Among the poets of this thoroughly Russian period, the most conspicuous and brilliant is Pushkin (q. v.), whose verses are a mirror of Russian life, in which we see shadowed forth the joys and griefs, the humour and the patriotism of the true Russian peasant. The most remarkable of Pushkin's contemporaries and successors are the poets Baratynski (d. 1844), Baron Delvig, Benediktov, Podolinski, and Lermontov; the dramatists Nikolaus Polevoi and Nestor Kukolnik, who drew the matter of their dramas from the national history; and Gogol (q. v.), one of the most illustrious names in Russian literature. Russian novels exhibit a condition of society in which barbarism struggles for supremacy with a superficial civilisation. The best writers in this department are Bestushev, Bulgarin, Sagoskin, whose most popular work, *Jury Miloslavski, or the Russians in* 1612, is modelled after the historical manner of Sir Walter Scott; Vasili Ushakov, author of *Kirgis-Kaisak*, &c.; Count Solohub, whose novels give a graphic picture of St Petersburg society; Prince Odojevski, Baron Theodor. Korff, Konst. Masalski, and Senkovski, reckoned one of the first journalists in Russia; nor must the name of Alexander Herzen (q. v.), the 'liberal Russian' exile, be omitted. The delineations of Cossack life are too numerous for special notice, but they constitute quite a distinct section of the literature of Russian fiction, and are composed for the most part in the dialect of Little Russia. Great attention has also been paid in Russia, as in all Slavic countries, to popular songs and proverbs. The principal collections of these are by Novikov, Kashin, Maximovitch, Makarov, and Sacharov. The latest developments of Russian literature have been chiefly in the department of history, and among the most distinguished names are those of Professor Ustrialov of St Petersburg, Professor Pogodin of Moscow, Polevoi, Vasili Berg (d. 1834), Lieutenant-general Michailovski Danilevski, Professor Snjegirev, Sreznevski, Slowzov, Samailov, Solovjev, Strovjev, Neverov, and Arszenjev. Such philosophy as exists in Russia is mainly an echo of the modern German schools, and therefore possesses no particular originality. Advances in theology are hardly to be looked for as yet from a church so deeply sunk in ignorance and intellectual stupor as the Russian, yet nowhere is reform more urgently required. Nevolin and Moroshkin have acquired a reputation as writers on jurisprudence; so has Nikita Krylov, professor at Moscow. The ablest physicists are Pavlov Maximovitch and Spaski; Perevoshtchikov is an eminent mathematician; and Vostokov is celebrated as a Slavic linguist. See Borg, *Poetic Works of the Russians* (Ger., 2 vols.; Riga, 1823); Gretsch, *Extracts from the Poets and Prose-writers of Russia* (St Petersb. 1821); Gretsch's *History of Russian Literature* (Petersb. 1822); Jevgenij, *History of Russian Literature* (Petersb. 1818–1827—1838); Köning, *Literary Pictures from Russia* (Stuttg. 1837); Otto, *Text-book of Russian Literature* (Lps. 1837; translated into English by Cox, Oxford 1839); Jordan, *History of Russian Literature* (Lps. 1846); and Talvi (Mrs Robinson), *Historical View of the Languages and Literature of the Slavic Nations* (N. Y., 1850); Texier, *European Journalism*, 1868.

RU'SSNIAKS, also **Russine** and **Ruthéni**, the name of a variety of peoples who form a branch of the great Slavic race, and are sharply distinguished from the Muscovites, or Russians proper, by their language and the entire character of their life. They are divided into the R. of Galicia, North Hungary, Podolia, Volhynia, and Lithuania, and are estimated by Schafarik at 13,000,000. They are almost all agriculturists, and, on the whole, rather uncultivated. Before the 17th c., they were a free race, but were then subjugated, partly by the Lithuanians, partly by the Poles, and for a long time belonged to the Polish kingdom. Their language has consequently become closely assimilated to the Polish. In earlier times it was a written speech, with quite distinctive characteristics, as may be seen from the translation of the Bible, published at Ostrog, in 1581, and from various statutes and other literary monuments still extant. Recently, printing in the Russniak tongue has been recommenced. The R. belong, for the most part, to the United Greek Church, but in part also to the Non-united. They preserve many old customs peculiar to themselves, and much folk-lore, prose and poetic, very like that current in Poland and Servia. This has been collected by Vaclav in his *Piesni Polskie i Ruskie* (Lemberg, 1833). Levicki has published a *Grammatik der Russinischen Sprache für Deutsche* (Przemzsl, 1833).



RU'SSO-GE'RMAN WAR, the name given by German historians to the last stage of the great European war against Napoleon, beginning with the Russian campaign of 1812 and terminating on the field of Waterloo. See Napoleon.

RUST, the name given to a disease of plants, which shews itself on the stems and leaves of many plants, and on the ears of grasses, both of the cereal grasses, and of many pasture or forage grasses; in brown, yellow, or orange-coloured spots; and after destroying the epidermis of the plant, assumes the form of a powder, which soils the fingers when touched. R. seems to consist at first of small fungi of one cell, sometimes divided by a transverse wall, belonging to the genera *Uredo* and *Puccinia*; which, finally, breaking through the diseased epidermis, form a coloured dust consisting of mere spores. The name R. is sometimes restricted to

the *Uredo rubigo vera*, but it is doubted by some if this is not really a young state of a *Puccinia*. Not a few authors regard R. as an eruptive disease (*exanthema*), which makes its appearance chiefly in damp weather, and sometimes extends so far as seriously to injure the plants affected by it, the mycelium and spores which appear in it being regarded as present accidentally, or in consequence of the disease. This, however, is the least probable opinion concerning it.—R. is sometimes very injurious to crops. No remedy is known for it; but it is certain that rank manures tend to produce or aggravate it. See UREDO.

RUSTCHUK, a town of European Turkey in Bulgaria, eyalet of Silistria, and 70 miles west-south-west of the town of that name, on the south bank of the Danube, opposite Giurgevo. Its position on a range of hills, with its white chimneys, its mosques and minarets rising from amid forests of fruit-trees, give it a striking and picturesque appearance. It is surrounded by an extended line of fortifications, contains nine mosques, several Greek and Armenian churches, synagogues, and baths. The Danube is here about two miles wide, but its banks are low, and its channel is marked with islets and shallows. It is the most important manufacturing Turkish town on the Danube. The principal articles of manufacture are cloth, linen, leather, muslin, silk and tobacco. Pop. 23,000.

RU'STIC OR RU'STICATED WORK and RUSTICA'TION. The name of that kind of masonry in which the various stones or courses are marked at the joints by splays or recesses. The surface of the stone is sometimes left rough, and sometimes polished or otherwise dressed. Rustication is chiefly used in classical or Italian architecture, although Rustic Quoins (q. v.) are often used in rough Gothic work. In the figure, *a* and *b* shew

Rustication.

forms of rustication usually applied to surfaces; *c* and *d* shew rustic quoins with mouldings on the angles.

RUSTRE, in Heraldry, one of the subordinaries, consisting of a Lozenge (q. v.) with a circular opening pierced in its centre. Ancient armour was sometimes composed of rustres sewed on cloth.

Rustre.

RUTA BAGA. See TURNIP.

RUTA'CEÆ, a natural order of exogenous plants, consisting mostly of trees and shrubs, but containing a few herbaceous plants. The leaves have no stipules, are simple and entire, lobed, pinnate, or decompound, and are covered with pellucid resinous dots. The flowers are hermaphrodite, sometimes irregular. The calyx has four or five segments; the petals are equal in number to its segments, or wanting, or are united into a monopetalous corolla; the stamens are equal in number to them, or fewer by abortion, or twice or thrice as many. There is a cup-shaped disk. The ovary is sometimes stalked; it has as many carpels as there are petals, or fewer; there are generally two ovules in each carpel. The fruit consists of several capsules cohering firmly or imperfectly.—There are about 400 known species, natives of the warmer temperate and of tropical regions. The *Diosmaceæ* are sometimes separated as a distinct order. A bitter taste and powerful odour are general characteristics. Rue, Bucku, and Dittany are examples of the order. See also ANGOSTURA BARK and BRUCEA. The barks of a number of tropical species, of different genera, possess febrifugal properties.

RUTH, BOOK OF, one of the Hagiographa, placed in the Authorised Version, as in the LXX., between Judges and Samuel; and in the Jewish canon, as the second of the five Megilloth, coming after the Song of Songs. It consists of four chapters, and describes how Ruth, the Moabite widow of a Hebrew, Machlon by name, in the time of the Judges, became—by faithful, loving adherence to her mother-in-law, Naomi, for whose sake she had left her home and kindred—the wife of Boaz, and through him the ancestress of David himself. A fragmentary genealogy of David's house—of which the principal links only are given—forms the conclusion of the book, which is characterised throughout by the most naïve simplicity, and minute truthfulness of detail. If there be a tendency in the book—which is doubtful—it would naturally be to shew how utterly even that strictest of prejudices, in the mind of ancient peoples, especially the Hebrews, against intermarriage with the 'stranger,' is vanquished by genuine human love and piety; nay, that the heroine of the tale, even a Moabite, was deemed worthy for her virtue to become the foundress of the royal house of Israel. Considering that the Book of Kings contains no details about David's genealogy, this book, apart from its indescribable natural charm, becomes a most useful historical record, and further supplies many items on the forms and domestic customs of a time about which we have such very scant information elsewhere.

The time of the events related mounts back to about a century before David, yet both the contents and tendency of the book shew clearly enough that it was hardly written before the last years of David's reign, if it was at all written in his lifetime. For a change had already taken place in the interval in the manners and customs of the people (cf. the 'in former time,' iv. 7), and the genealogy carried down to David, shews the theocratic significance he had acquired by the time it was written down. Its canonicity has never been questioned in or out of the church.

RUTHE'NIUM (symb. Ru, equiv. 104, spec. grav. 11·3) is a metal which was discovered in 1843 by Claus in the ore of platinum. In most respects, excepting in its specific gravity, it closely resembles iridium, the coloured reaction of the salts being, almost without exception, the same in both. For details regarding this metal, which is of no practical importance, the reader may consult *Annales de Chimie et de Physique*, for 1859; and art. RUTHENIUM, in Watts's *Dict. of Chemistry*, London, 1869.

RU'THERGLEN, or, by popular abbreviation, RUGLEN, a royal, parliamentary, and municipal burgh, in Lanarkshire, on the Clyde, three miles south-east of Glasgow. It consists of one long wide street and of several narrow streets or lanes branching from it at right angles. In ancient times it was a place of considerable importance, carried on a large traffic on the river, and embraced

Glasgow within its municipal boundaries. Its trade is now mainly dependent upon that of Glasgow, and its inhabitants are employed in weaving muslins for Glasgow manufacturers, and in the mills, print, chemical, and dye-works, and collieries of the burgh and vicinity. Pop. (1861) 8062. In parliamentary representation, it is one of the Kilmarnock district of boroughs.

RU'THIN, a municipal and parliamentary borough of North Wales, in the county of Denbigh, eight miles south-east of the town of that name, stands on the summit and slope of a hill on the right bank of the Clwyd. The site of the ancient castle, said to have been built in the reign of Edward I., is occupied by a fine modern castellated edifice in Gothic. Pop. (1861) 3372.

RU'THVEN, Raid of, a conspiracy of note in Scottish history, contrived and executed in 1582 by William, first Earl of Gowrie, father of the principal actor in the Gowrie Conspiracy (q. v.), in conjunction with Lord Lindsay of the Byres, the Earl of Mar, and the Master of Glammis. The object of the conspirators was to obtain the control of the state by seizing the person of James VI., then a boy of 16, and under the guardianship of the Duke of Lennox and Earl of Arran. The king being by invitation at Gowrie's seat of Ruthven Castle, the conspirators assembled 1000 of their vassals, surrounded the castle, and obtained complete possession of James. Arran was thrown into prison, and Lennox retired to France, where he died broken-hearted. The Presbyterian clergy warmly espoused the cause of the Ruthven lords, who received the thanks of the General Assembly, and full indemnity from a Convention of Estates. Nearly a year elapsed before the king regained his freedom. His feigned acquiescence in his position led the confederates so to relax their vigilance that he was enabled to throw himself into the castle of St Andrews, whose keeper was in his confidence, and thus to become his own master. Gowrie and the other lords made their submission, and were pardoned; but soon afterwards a royal proclamation characterised their enterprise as treason. Gowrie was commanded to leave Scotland; but while waiting for a vessel at Dundee, he was drawn into a conspiracy to surprise the castle of Stirling, for which he was tried and executed.

RU'TILE, a mineral, which is essentially *Oxide of Titanium* or *Titanic Acid*, although generally containing a little peroxide of iron. It is of a brown, red, or yellow colour; and is found massive, disseminated, in thin laminæ, and in four-sided or six-sided prisms, which are sometimes needle-like, and permeate rock-crystal. It is found also in granite, syenite, gneiss, mica-slate, limestone, chlorite-slate, &c., and its geographic distribution is very wide. It is used to give a yellow colour to porcelain.

RU'TLANDSHIRE, an inland county of England, much the smallest in England and Wales, is bounded on the N.E. by Lincoln, on the S.E. by Northampton, and on the W. by Leicester. Area, 95,805 acres; pop. (1861) 21,861. The river Wash, flowing east through the middle of the county, divides it into two portions, of which the northern is a somewhat elevated table-land, while the southern consists of a number of valleys running east and west, and separated by low hills. The principal streams are the Welland, forming the boundary on the south-east, and its affluents the Wash and Chater. The climate is mild and healthy, the soil is loamy and rich, and there is hardly an acre of waste land in the whole county. R., however, is not a crop producing but a grazing county. Oxen and sheep are reared in great numbers. R., which abounds in pleasing scenery, contains many stately mansions, as well as a number of ecclesiastical remains dating from the Norman period. The county returns two members to the House of Commons.

RU'VO IN APU'LIA, a city of Southern Italy, province of Bari, and 22 miles west of the city of that name. Pop. 15,133. It is built upon a rising ground, contains many churches, and two museums of Italo-Grecian vases, and is famous for its potteries. The staple produce is grain, pulse, and dried fruits. R. is the Rubi of Horace.

RUYSDAEL, or RUÏSDAEL, Jakob, was born at Haarlem. The date of his birth is uncertain; some make it 1625, others 1630 or 1635. It is said that there is a picture by him signed and dated 1645, which makes the last date improbable. He died in 1681. It has been stated, that for some years he directed his attention to the study and practice of surgery, but was advised by his friend Nicholas Berghem to devote his time to painting. In his pictures the trees are excellent in form, the foliage touched with sharpness and precision, and the skies are light and floating. His style of composition is entirely original, and characterised by a certain compactness in the arrangement; the Italian painters have generally groups of trees at the sides, and running out of the picture; in R.'s compositions, they are almost always massed within the picture. R. and Hobbima hold about an equal position—namely, that of the best landscape-painters of the Dutch school; but R. was also equally eminent for his sea-pieces. His etchings, seven in number, are much prized by collectors. Jan van Kessel and Jan Renier de Vries were imitators of Ruysdael. His elder brother, *Salomo* (born *circa* 1613, died 1676), was also a painter of some note.

RUYTER, Michael Adriaanszoon Van, Dutch admiral, was born at Vliessingen in 1607, of poor parents, who sent him to sea as a cabin boy when only eleven years old. He became a warrant officer, and in 1635 rose to be a captain in the Dutch navy. After serving several years in the Indian seas, he was, in 1645, made rear-admiral. He engaged and sunk a piratic Algerine squadron off Sallee in 1647. In 1652, when war broke out between the States and England, then under the Protectorate, he was placed in command of a squadron, and ordered to convoy a large number of merchant-ships. He was met by the English fleet under Sir G. Ayscough off Plymouth, and an engagement took place. Neither of the fleets gained any decisive advantage; but R. succeeded in saving his convoy. In 1653, when a fight of three days took place between the English and Dutch fleets off Portland, R. commanded a division under Van Tromp. The English, under Blake, finally obtained a great victory, taking and destroying 11 Dutch men-of-war and 30 merchantmen. The states-general, in 1659, sent him to assist Denmark against Sweden. He defeated the Swedish fleet, and obtained a title of nobility and a pension from the king of Denmark. In 1664, he fell upon the English factories at Cape Verde, and attempted to seize the island of Barbadoes. As other depredations of the Dutch upon English merchants, as well in the East Indies as on the high seas, were complained of, war was declared against the Dutch. In June 1666, R. and Van Tromp, with 90 sail, engaged the English fleet under Prince Rupert and the Duke of Albemarle. Both sides fought with such obstinacy that the battle lasted four days, and ended without any decisive result. In July, the conflict was renewed, when the English gained a complete victory, destroying above 20 of R.'s

men-of-war. In 1667, he destroyed the shipping at Sheerness, sailed up the Medway as far as Chatham, burned several English men-of-war, and effected more towards the conclusion of peace at Breda (1667) than any diplomatist. In 1671, he commanded the Dutch fleet, and fought several battles with the combined English and French fleets, but without decisive results. In 1675, he was sent to the Mediterranean. He fought, off the coast of Sicily, a desperate battle with the French fleet, under the celebrated Admiral Duquesne. Victory declared itself on the side of the French; but R. made good his retreat into the harbour of Syracuse. He had his legs shattered in the engagement, and died of his wounds, April 1676. Europe did justice to his bravery; and Louis XIV. said he could not help regretting the loss of a great man, although an enemy. His death was deeply mourned by his countrymen, and a splendid monument was erected to his memory at Amsterdam.

RY'AN, Loch. See Wigtonshire.

RYBI'NSK, a district town of Great Russia, in the government of Jaroslav, stands on the right bank of the Volga, 418 miles east-south-east of St Petersburg. It is the great centre of the corn trade on the Volga, and, after Nijni Novgorod, is the chief commercial centre on that river. The trade of R. consists principally in transhipping and forwarding to the capital the goods brought hither by large vessels up the Volga. For this purpose, upwards of 6000 barges are built here every year. The landing-place extends along the river for several miles, and is divided into nine sections, each of which is appropriated to special varieties of goods. The chief articles of trade are corn, flour, tallow, spirits, metals, and timber, and these are forwarded to St Petersburg by three systems of communications, of which the Mariinsky Canal conveys goods to the value of £5,000,000; the Tichvin Canal, goods to the value of £4,000,000; and the Vyshnivolotsk Canal, goods to the value of £2,000,000. Pop. 14,192.

RYDE, a flourishing and fashionable watering-place and market-town, on the north coast of the Isle of Wight, Hampshire, occupies the east and north slopes of a hill, six miles south-south-west of Portsmouth, from which it is separated by the roadstead of Spit Head. It consists of Upper and Lower R.; the former anciently called *Rye*, or *La Riche*, and the latter of quite modern construction. The shores are wooded to the verge of the water, and the appearance of the town, with its streets and houses interspersed with trees, is pleasing and picturesque. The pier, nearly a mile in length, forms an excellent promenade. Yacht and boat-building are carried on to some extent. Steamers cross every hour to Portsmouth in summer, and several times a day in winter. R., the largest town in the island, had, in 1851, 7147, and in 1861, 9269 inhabitants.

RYE, a seaport, market-town, and parliamentary and municipal borough in the south-east of the county of Sussex, ten miles north-east of Hastings. It is charmingly situated on an eminence bounded east by the Rother, and south and west by the Tillingham, which streams unite here, and, entering the sea two miles below the town, form the old harbour. The appearance of the town is remarkably quaint and old-fashioned. Overlooking the junction of the streams is a small castle built by William de Ypres, in the reign of Stephen, and now used as a jail. The church is a beautiful and interesting structure—the central tower, transepts, a number of circular arches, &c., all being early Norman. In former times the sea flowed close up to R., washing the rock on which the Ypres tower stands, but it has retired to a distance of two miles. The harbour admits vessels of 200 tons, and has been recently improved. This ancient town receives historical mention as early as 893. It was walled on two sides by Edward III., and contributed nine ships to the fleet with which that monarch invaded France. Brewing, ship-building, and a growing trade in corn, coal, timber, hops, &c., are carried on. R. is one of the Cinque Ports, and sends a member to parliament. Pop. (1861) 8,502.

RYE (*Secăle*), a genus of grasses, allied to Wheat and Barley, and having spikes which generally consist of two-flowered, rarely of three-flowered, spikelets; the florets furnished with terminal awns, only the upper floret stalked. One species (*S. cereale*) is a well-known grain. It has, when in fruit, a roundish-quadrangular spike, with a tough rachis. Its native country, as in the case of the other most important cereals, is somewhat doubtful; but it is said to be found wild in the desert regions near the Caspian Sea, and on the highest mountains of the Crimea. It has long been cultivated as a cereal plant; although the supposed mention of it in Exodus ix. 32 is doubtful, spelt being perhaps intended. It is much cultivated in the north of Europe and in some parts of Asia. Its cultivation does not extend so far north as that of barley; but it grows in regions too cold for wheat, and on soils too poor and sandy for any other grain. Its ripening can also be more confidently reckoned upon in cold regions than that of any other grain. But R. succeeds best, and is most productive, in a climate where wheat still ripens. It delights in sandy soils. The varieties of R. are numerous, although much less so than those of other important cereals. Some are best fitted for sowing in autumn, others for sowing in spring. The former kinds (*Winter R.*) are most extensively cultivated, being generally the most productive. In some places on the continent of Europe, R. is sown at midsummer, mowed for green fodder in autumn, and left to shoot in spring, which it does at the same time with autumn-sown R., producing a good crop of small but very mealy grain. In America, R. is not a common grain crop, but is cultivated in the Middle States to a considerable extent in lighter soils. The total product in 1869 was estimated at 22,527,000 bushels. In Britain it is sometimes sown to be used as a green crop, for feeding sheep and oxen in winter, and is found particularly good for milch cows. It is sometimes also mown for horses and other animals. — Bread made of R. is much used in the north of Europe. It is of a dark colour, more laxative than that made of wheat-flour, and, perhaps, rather less nutritious. R. is much used for fermentation and distillation, particularly for the making of whisky. R. affected with Ergot (q. v.) is a very dangerous article of food. The straw of R. is tougher than that of any other corn-plant, and is much valued for straw-plait. — Perennial R. (*S. perenne*) differs from Common R. in having a very hard, red-like culm; ears, 3—5 inches long, flatly compressed, with a brittle rachis, and 50—60 closely imbricated spikelets. It endures for many years, but is not much cultivated, as its grain is slender, and does not yield as easily separable flour.

RYE-GRASS (*Lolium*), a genus of grasses, having a two-rowed, flatly-compressed spike, the spikelets appressed edgewise to the rachis. Common R., or Perennial R. (*L. perenne*), the *Ray-grass* of the older English authors, is frequent on waysides, and in meadows and pastures, in Britain, and on the continent of Europe. The spikelets are much longer than their solitary external glume, 6—8 flowered;

the florets awnless or nearly so; the culm flattened, from one foot to three feet high; the root producing leafy barren shoots, which add much to the agricultural value of the grass. This grass is highly valued for forage and hay, and is more extensively sown for these uses than any other grass, not only in Britain, but on the continent of Europe and in North America. It grows well even on very poor soils. The *Common Perennial R.* is the kind most generally cultivated. A kind called *Annual R.*—not really an annual plant, although useful only for one year—is sometimes cultivated, but is, in almost every respect, inferior.—ITALIAN R. (*L. Italicum*, or *L. multiflorum*, or *L. Bouchianum*), a native of the

1, Common Rye-grass; 2, Italian Rye-grass.

south of Europe, is much esteemed as a forage and hay grass. In many soils and situations in Britain it succeeds extremely well, and is remarkable for its verdure and luxuriance in early spring. It is preferred by cattle to the Common Rye-grass. The young leaves are folded up, whilst those of the Common R. are rolled together.—There are many varieties of Rye-grass. It is nowhere so much valued or cultivated as in Britain. It was cultivated in England before the end of the 17th century. Italian R. was introduced into Britain in 1831 by Mr Thomson of Banchory and Messrs Lawson and Son of Edinburgh. R. is generally sown along with some kind of corn, and vegetating for the first year amongst the corn, appears in the second year as the proper crop of the field.

RYE'HOUSE PLOT. In 1683, at the same time that a scheme was formed in England among the leading Whigs to raise the nation in arms against Charles II., a subordinate scheme was planned by a few fiercer spirits of the party, including Colonel Rumsey and Lieutenant-colonel Walcot, two military adventurers; Goodenough, under-sheriff of London; Ferguson, an Independent minister; and several attorneys, merchants, and tradesmen of London—the object of which was to waylay and assassinate the king on his return from Newmarket. The deed was to be perpetrated at a farm belonging to Rumboldt, one of the conspirators, called the Ryehouse Farm, whence the plot got its name. The R. P. is supposed to have been kept concealed from Monmouth, Russell, Shaftesbury, and the rest of those who took the lead in the greater conspiracy. It owed its defeat to the circumstance, that the house which the king occupied at Newmarket took fire accidentally, and Charles was thus obliged to leave that place eight days sooner than was expected. Both the greater and lesser conspiracy were discovered before long, and from the connection subsisting between the two, it was difficult altogether to dissever them. The indignation excited by the R. P. was extended to the whole Whig party; Lord Russell, Algernon Sidney, and Lieutenant-colonel Walcot were brought to the block for treason; John Hampden, grandson of his more noted namesake, was fined £40,000; and scarcely one escaped who had been concerned in either plot.

RY'OT (from the Arabic *raaya*, to pasture, to protect, to govern; hence, literally, the governed, a subject) is the vernacular term for a Hindu cultivator or peasant.

RYOTWAR (literally, according to or with ryots) is the term applied to the revenue settlement which is made by the government officers in India with each actual cultivator of the soil for a given term—usually a twelvemonth—at a stipulated money-rent, without the intervention of a third party. This mode of assessment prevails chiefly, though not exclusively, in the Madras presidency. See H. H. Wilson, *Glossary of Judicial and Revenue Terms* (Lond. 1855), under RÂIYATWÂR.

RYSBRACH, MICHAEL, a sculptor of considerable talent, born at Antwerp in 1693. He settled in London in 1720, and executed numerous works there, in particular the monuments to Sir Isaac Newton in Westminster Abbey, and to the Duke of Marlborough at Blenheim, a bronze equestrian statue of William III. for the city of Bristol, a colossal statue of George II. for the parade at Greenwich Hospital; a Hercules, and busts of many of the eminent poets, wits, and politicians of his time. Scheemakers, also a native of Antwerp, and Roubilliac, a Frenchman, were contemporaries and rivals of his, and shared with him most of the commissions for works of sculpture in England at the period. With Scheemakers was placed as a pupil Nollekens, who became so distinguished for his busts, and as one of the founders of the English school of sculpture. R. died 8th January 1770.

RY'SWICK, PEACE OF, a treaty concluded in 1697 at Ryswick, a Dutch village between Delft and the Hague, which was signed by France, England, and Spain on September 20, and by Germany on October 30. It put an end to the sanguinary contest in which England had been engaged with France. It has been often said that the only equivalent then received by England for all the treasure she had transmitted to the continent, and all the blood which had been shed there, was an acknowledgment of William's title by the king of France; but it must not be forgotten how much the allies were benefited by the check given to the gigantic power and overweening ambition of France.

S

THE 19th letter in the English and other western alphabets (the 18th in the Latin), belongs to the dental series, and marks the fundamental sound of the hissing or sibilant group, *s*, *z*, *sh*, *zh*. The Sanscrit has characters for three hissing or *s*-sounds; the Semitic languages had four (see ALPHABET). The Hebrew or Phœnician character, from which the modern *s* is derived, was called *shin*—i. e., tooth, and in its original form probably represented two or three teeth. The same character, with the presence or absence of a diacritic point, marked either *s* or *sh*. In Eng., *s* is used both for the sharp and flat sounds, as *this*, *those* = *thoze*. The nearness of the *s*-sound to *th* is seen in the Eng. *loves* = *loveth*, and in the phenomenon of lisping—*yeth* = *yes*. This seems to furnish the transition to the so frequent interchange of the High-Ger. *s* for the Low-Ger. *t*, as in Ger. *wasser* = *water*; Ger. *fuss* = *foot*. Comp. Gr. *thalassa* = *thalatta*. The substitution of *r* for *s* is noticed under R. In such cases as *melt*, compared with *smelt*; *pike*, with *spike*; *lick*, with *sleek*; Ger. *niesen*, with Eng. *sneeze*; Eng. *snow*, Goth. *snaivs*, with Lat. *nix* (gen. *niv*-is); Gr. *mikros*, with *smikros*; *short*, A.-S. *sceort*, with *curt*—it is difficult to say whether the form with, or that without the *s* is the older. Grimm considers *s* as the remnant of an old prefixed particle (*as*, *is*, *us*), having, perhaps, the force of *ex* in Lat. *exopto*, I wish greatly; or *ur* in Ger. *urklein*, very small. An initial *s* before a vowel in Lat. corresponds to Gr. *h*; comp. Lat. *sub*, *sex*, *sal* (salt), with Gr. *hypo*, *hex*, *hals*. In Greek and Latin, *s* was pronounced feebly at the end of words, and still more so between two vowels. It thus frequently disappeared in these positions, and this was one of the chief sources of the irregularities in the declensions and conjugations, which had originally been formed on a uniform system (see INFLECTIONS). The dropping of *s* is one of the ways in which the forms of modern French words have become so degraded; compare Lat. *magister*, old Fr. *maistre*, modern Fr. *maître*; *presbyter*, *prestre*, *prêtre*. Even where still written, final *s* in French is mostly silent—e. g., *vos*, *les*.

SAAD-ED-DIN, a Turkish historian, was born in 1536, and died at Constantinople in 1599. His history, entitled the *Taj-al-Tuarikh* (the Crown of Histories), a work held in high estimation by scholars, gives a general account of the Ottoman empire from its commencement in 1299 till 1520; it has never been printed, but MS. copies of it are found in most of the great libraries of Europe, and an inaccurate translation into Italian was published in 1646—1652. S. also wrote the *Selim-Nameh*, or History of Selim I., which is chiefly a collection of anecdotes regarding that prince.

SAA'LÉ, a river of Germany, distinguished from other and smaller rivers of the same name as the Saxon or Thuringian S., rises on the western slope of the Fichtelgebirge (Bavaria), and flowing northward through several minor states, and finally across the Prussian province of Saxony, falls into the Elbe, about 25 miles above Magdeburg, after a course of 200 miles. It is navigable only within the Prussian dominions.

SAA'RBRÜCK, a town of Rhenish Prussia, on the Saar, 40 miles south-south-east of Treves. It is the seat of an active industry, of which coal-mining, spinning, and the manufacture of woollen and linen fabrics, and of pottery and tobacco, are among the principal branches. Pop. (1868) 7193. The Franco-Prussian war of 1870—71 commenced on August 2, 1870, by an attack upon the town of Saarbrück.

SAA'RDAM. See ZAANDAM.

SAAZ, a town of Bohemia, on the Eger, 45 miles west-north-west of Prague. Hops are largely cultivated in the vicinity, and important corn-markets are held. Pop. 8870.

SABADE'LL, a rising manufacturing town of Spain, in Catalonia, 14 miles by railway north-west of Barcelona. It has risen into importance only within recent years, and it is now the Manchester of Catalonia. Woollen and cotton fabrics are the staple manufactures, and of the 100 factories in the town, by far the greater number are engaged in these manufactures. Pop. about 16,000.

SABADI'LLA, CEBADILLA, or CEVADILLA (*Asagræa officinalis*, formerly *Helonias officinalis*), a Mexican plant of the natural order *Melanthaceæ*, the seeds of which are employed in medicine, because of properties analogous to those of White Hellebore (*Veratrum album*). The plant has a bulbous root, and grows in tufts; the leaves are linear and grassy, about four feet long, and not above a quarter of an inch broad; among them rises a round *scape* (leafless flower-stem), about six feet high, bearing a very dense raceme, a foot and a half long, of small white flowers. The seed-vessels are papery *follicles*, three together; the seeds one, two, or three in each follicle, two or three lines long, winged, and wrinkled. The powdered seeds have been known in medicine since the end of the 16th century. On submitting them to chemical analysis, they are found to consist of fatty matter, two special organic acids, to which the names *Cevadic* and *Veratric* acids have been given; of varieties of resin, yellow colouring matter, gum, and a highly poisonous alkaloid named *Veratria* in combination with gallic acid; and to these constituents, a French chemist, Couerbe, has added a crystalline body named *Sabadilline*.

Notwithstanding its highly poisonous properties, S. is prescribed on many parts of the continent as a vermifuge in cases of tape-worm and ascarides, and it may be administered to an adult in 8 or 10 grain doses, mixed with a little sugar, and a few drops of oil of fennel. In the form of powder, it is sometimes applied to the head to destroy lice, but if the skin be broken, some other remedy should be selected, as absorption to a dangerous extent might

ensue. From its stimulating properties, it is usefully employed in the form of tincture (which, however, is not an officinal preparation) as an external application in chronic rheumatism and paralysis, and in cases of nervous palpitation.

The active principle of S., the *Veratria*, in doses of $\frac{1}{12}$th of a grain, gradually increased, and taken thrice a day, has been found very efficacious in acute rheumatism; and applied in the form of ointment, it has been highly recommended in scrofulous diseases of the joints. When prescribed internally, its use should be at once suspended if the patient complain of pain in the throat or stomach, vomiting or diarrhœa.—Similar qualities are said to exist in the seeds of *Veratrum Sabadilla*, a native of Mexico and the West Indies, and in some of the species of *Helonias*, natives of the southern parts of North America.

SABÆ'ANS, the supposed descendants of one, two, or three Shebas mentioned in the Bible. Historically, the S. appear chiefly as the inhabitants of Arabia Felix or Yemen (to the north of the present Yemen), the principal city of which was called Saba, and the queen of which is said to have visited Solomon, attracted by the fame of his wisdom. Josephus, however (*Ant.* viii. 6, 5), makes her the queen of Ethiopia (Meröe), and the modern Abyssinians claim her as their own. Her name, according to their tradition, was Makeda; and her visit to Jerusalem made her not only a proselyte to the religion of Solomon, but she became one of his wives, and had by him a son, Menilek, who afterwards ruled Ethiopia (q. v.). The Arabs, on the other hand, call her Balkis, the earliest name that occurs of a Himyaritic queen; but there is no more historical value to be attached to this tradition than to the innumerable legends that have clustered round her name in connection with the great king.

Numerous passages in Greek and Roman writers, as well as in the Bible, testify to the vast importance of these dwellers in Yemen as a wealthy, widely-extended, and enterprising people, of fine stature and noble bearing. Their chief greatness lay in their traffic, the principal articles of which consisted of gold and perfumes, spice, incense and precious stones, a very small portion of which, however, was of home production, Yemen being only productive in corn, wine, and the like matters of ordinary consumption. But the fact was, that the S. held the key to India, and were the intermediate factors between Egypt and Syria, which again spread the imported wares over Europe; and even when Ptolemy Philadelphus (274 B.C.) had established an Indian emporium in Egypt, the S. still remained the sole monopolists of the Indian trade, being the only navigators who braved the perilous voyage. As in many other respects, they also resembled the Phœnicians in this, that, instead of informing other people of their sources and the tracks of their ships, they told them the most preposterous tales about the countries they visited, and the fearful dangers they encountered; and in regard to most things, endeavoured to impress upon the minds of their customers that what they sold them was, if artificial, their own manufacture—if natural products, home growth. Being the principal merchants of those things which the over-refined luxury of late classical times considered as absolute necessities of life, they could not fail to gather enormous riches; e. g., in the 3d c. of the Roman empire, every pound of silk—a material enormous quantities of which were used—that came from Arabia was paid by a pound of silver, at times even of gold. As a natural consequence, the S. became luxurious, effeminate, and idle. The pictures of them drawn by the classic writers are doubtless exaggerated. The country itself, according to the reports of Greek writers, grew spice-wood to such an extent that its odour caused apoplexy among the inhabitants, and bad smells had to be used to counteract these over-potent influences. The meanest utensils in the houses of these merchant princes were—if we were to credit those writers—wrought in the most cunning fashion, and were of gold and silver; their vases were incrusted with gems, their firewood was cinnamon. Their colonies must, in the nature of things, have extended over immense tracts of Asia—the Ethiopian S. probably being one of the first foreign settlements; yet nothing beyond the vaguest conjectures can be given about them. Regarding their government, Dio Cassius informs us that they had a king, who never was allowed to leave his palace, and that the first child born, after the accession of a new king, into one of a certain number of noble families, was considered the heir-presumptive for the time being. Commerce had also done for them what it did for the Phœnicians—it civilised them, and caused them to carry civilisation further; and they stand out among the ancient semi-barbarous Arabs as a commonwealth of high culture. Respecting their religion, see ZABISM. Their language is supposed to have been a Semitic (Arabic) dialect, which, however, is almost entirely lost to us now. Some tablets with Himyaritic inscriptions have been found, but their readings are not quite satisfactorily fixed as yet. See SHEMITIC LANGUAGES, ARABIA.

SA'BBATH (Heb. *Shabbath*, *Sabbathon*, &c., from *shabath*, to rest; not from *shub*, to return, or *shebah*, seven) designates the seventh day of the week, set aside, in the Old Testament, as a period of cessation from work. Without entering into the question of its origin, i. e., whether it be an institution of pre-Mosaic times—either of 'paradise' or of 'heathenism'—or whether it be purely Mosaic, we shall merely state that, according to our only available source, the Pentateuch, the division of the Week (q.v.) into seven days appears at a very early period; but the celebration of the seventh day as a day consecrated to Jehovah, is first mentioned after the Exodus from Egypt, and seems to have preceded the Sinaitic legislation, which merely confirmed and invested it with the highest authority. On the occasion of the manna (Ex. xvi. 23), the S. and its solemnity seem presupposed, and the 'Remember the Sabbath-day' of the Decalogue, further seems to indicate its previous institution. There is no trace of its celebration in the patriarchal times, although the Semitic traditions of the creation, and of the divine completion of it on that day, had undoubtedly marked it early as a special day of sanctity among the Abrahamites. The significance that was superadded to it after the Exodus, i. e., that of being a remembrance of the freedom from bondage, makes it appear likely enough that its first legal promulgation dates, as a Talmudical tradition has it, from Marah, where Moses 'set them laws and rights' (Ex. xv. 25). While it thus on the one hand formed a sort of general human memento of the creation and the Creator of all things, as it is characterised in the first redaction of the commandments in Exodus, it became also, on the other hand, a national day of record of the bondage and the liberation from it, a notion prominently brought forward in the second rescension of the Decalogue (q. v.) (Deut. v. 15), and the 'rest' that was inculcated for everybody—kindred, strangers, slaves, even animals—received a double meaning. It is in the latter sense also denominated a sign between Jehovah and the generations of Israel (Ex. xxxi. 13): a kind of badge of nationality, a token of the covenant between Jehovah and Israel for ever (Ex. xxxi. 16,

cf. Ezek. xx. 12, Neh. ix. 13, &c.). It is constantly mentioned together with institutions of the same peculiar nature; such as reverencing the sanctuary (Lev. xix. 30), celebrating the feasts of a national character (Hos. ii. 11), keeping the ordinances (Ezek. xlv. 17), &c. And in like manner it was made one of the first obligations for proselytes, as one by which they were 'taking hold of the covenant' (Is. lvi. 6). A few special cases only are furnished by the Pentateuch in explanation of the word 'work' used in the prohibition—lighting a fire, gathering sticks, going out of the camp for the purpose of gathering manna. The violation of this law of rest was, as a crime of high treason against Jehovah, punishable with death; yet cessation from labour was only the negative part of the celebration of the day, which is called, like the other festivals, a 'holy convocation.' It is difficult to decide now what precise meaning is to be attached to these words, as referring to the early periods of Israelitish history, particularly before the institution of the prophets or sacred orators had been fully developed. It may be conjectured that the convocation was a kind of general religious assembly, in which readings and some kind of exposition of the law formed the principal features; and there is indeed a tradition to that effect recorded in the Talmud. Some, however, suppose that it was a festive meeting in honour of Jehovah, and refer to Neh. viii. 9—18 for proof that such a celebration was consistent with Jewish notions of keeping days holy to the Lord. As a further celebration of the day, a special burnt-offering, consisting of two lambs of the first year, with the corresponding meat and drink-offering, besides the ordinary daily sacrifice, was instituted, and the shew-bread was renewed in the sanctuary.

Thus far the Pentateuch on the Sabbath. Turning to the later biblical books of the times before the Exile, we find casual references to it as a day of rest and joy, exalted over the other days of the week, and on which agricultural labours and all things connected with them, such as carrying loads, selling and buying, &c., ceased. No deeper signification seems to have been attached to it yet. Although both Jeremiah and Ezekiel, single it out especially, in common with monotheism and the laws of morality, yet they both rest satisfied with the inculcation of its outward observance, which seems occasionally to have fallen into entire disuse. With the return from the Exile, however, a new phase was inaugurated. It is well known how energetically Nehemiah carried out his reformation, or rather the restoration of the primitive laws, as in other respects so with regard to the S.; how he 'testified' against those who were treading wine-presses on the S., and bringing in sheaves, and lading asses, &c., and, further, against those 'men of Tyre' who brought 'all manner of ware, and sold on the Sabbath unto the children of Judah and in Jerusalem.' It is by profaning the S., he urges, that their fathers have caused all the evil and wrath that befell the nation and the city. He had the gates shut from Friday evening to Saturday night, and drove away those merchants who still kept lodging outside, by threats of 'laying hands on them.'

What Nehemiah had reinstituted, seems to have been most rigorously upheld, and in many cases made more binding even than he ever intended it, or, at all events, than the originally promulgated form of his words would seem to imply at first sight. With respect to the S. in particular, we find it not more than 100 years afterwards kept with such severity that the people would not even stir in defence of the city of Jerusalem, stormed by the soldiers of Ptolemy I. on that day. Later still, those who had fled into caves to escape the persecution of Antiochus Epiphanes, allowed themselves to be butchered wholesale, nay, burned alive, without any attempt at flight or resistance; 'because they made a conscience to help themselves for the honour of the most sacred day' (2. Macc. vi. 11). It was only in consequence of these horrible catastrophes, and in consideration of the probability of the enemy's always choosing the hallowed day for his attacks, and thus gradually rooting out the nation, that fighting in self-defence was allowed; although it appears the enemy was not to be disturbed in his siege works. Yet this relaxation in favour of the defensive appears again to have been abrogated through the influence of the fanatical Chassidaic party. Both Pompey and Herod, it would seem, took advantage of the S. for the preparation of the storm on Jerusalem, relying—and successfully—on the strict observance of that day by their antagonists. The incessant tribulations, however, that followed almost without interruption till the final destruction of the Jewish empire, together with the influence of new schools and views, wrought an immense change. Shammai himself, the austere interpreter of the law, and the so-called antagonist of the milder Hillel, pronounced not only the defensive but the offensive legal and righteous (Sabb. xix. a): as, indeed, in his days, human life was placed, under all circumstances whatsoever, higher than any divine or human precept about the Sabbath. 'The Law,' it is said with regard to the S., was given, according to the Scriptures, like other laws, 'that man should *live by them*,' '*not that he should die through them*' (Tos. Shab. xvi. 5). That Joshua had never stopped in his sieges on the S., was not considered so weighty an argument as the dire and imminent necessity that forced itself upon the military and spiritual leaders of the people, of preserving at all hazards a remnant at least of the fast perishing nation.

It was probably after the Exile that the first attempts at legally fixing, or rather 'fencing about' the divine ordinance in a minute and rigorous manner, were made. As we have seen before, no special definition of the 'work' prohibited—save in a few instances—is to be found in the Old Testament. Whether it was the 'men of the great synagogue,' or the later schools, that promulgated the special precepts and prohibitions—part of which were traced to the legislation on Sinai itself (Oral Law)—is difficult to decide. The Mishna only enumerates thirty-nine principal ('*father-*') works, each of which, again, carries a certain number of minor ('*begotten*') works with it, which are strictly forbidden on the Sabbath. A certain portion of these inhibitions and prohibitions refers to work connected with agriculture and the chase; another to domestic labours generally performed by women (such as spinning, sewing, &c.); another again to trades (of builders, mechanics, labourers, &c.) and the like. One of the most harassing of precepts, and one which had at last to be amended by a number of new enactments, was the prohibition of moving things from one place into another (from public to private localities, and *vice versâ*). The minor prohibitions referred chiefly to things which might easily 'lead' to the violation of the S., such as riding on horseback, climbing trees, &c. The 'Sabbath-day's journey,' or prohibition, based on Ex. xvi. 29, of walking more than the supposed utmost space between the ark and the extreme end of the camp, seems to belong, in the Mishnaic form at least, to the Roman times; the *mil* to which it was limited, and which contains the requisite 2000 yards, being a Roman measure.

However it is to be reconciled with the well known narrative of Christ's healing on the S.-day, contained in the New Testament, there is absolutely no doubt about the fact that, according to the so-called Pharisaical code—i. e., the Oral Law, the highest and absolute authority of Judaism—the safety of life and limb utterly over-rules not only the S., but even the day of Atonement itself. It is only certain smaller alleviations of momentary pain, such as could not by any chance place the patient in the slightest danger, about which we find some kind of casuistical discussions. Practically—that is, according to the final enactments (see Maimonides Yad Chasaka)—it is not only the regard to life, but to the health and well-being of the patient, that sets all Sabbatical prohibitions at nought. The law of 'rest,' according to the Talmud, applies no more to the case of the sick or those anyhow endangered, than it did with regard to the temple, and all the 'work' therein, which, indeed, was much heavier on S. and feast days than at other times. Another difficulty is found in the words in which Christ refers to the beast that is to be taken out of a pit on a S.; the Jewish law ordaining, in reality, that it should be aided in its own efforts, if it endeavoured to get out by itself; if it did not succeed, it should be left there, food being let down to it, until the end of the S. (Luke xiv.; Matt. xii. 11; Sabb. 128 b). Could it be that the common people (the Hediots or Idiots—i. e., the untutored in the law) were ignorant of the real scope and purport of the 'Pharisaical' code, and that the argument was directed against their crude notions, as directly opposed to the law as established?—But on this we must not enlarge here. It is also impossible to enter into any of the various ancient and modern ways of looking at the S. in an allegorical and symbolical light, e. g., its being connected by Philo and his school with the planets, the spheres, the number seven and the like mystical notions. Nor can we follow here those speculations which make out a close parallel between the divine work and rest and human work and rest; and shew how well-rounded and entire time itself appears when shaped into a week after the model of the six days of creation, and how man's life is, through it, conformed to that of his Creator.

There can be no doubt about its meaning in the Old Testament. It is intended as a principal testimony of faith in the Creator of the universe. Hence its supreme importance. Though the threatened punishments for S.-breakers never seem to have been carried out to the full during the times of the established commonwealth, in the scheme of Judaism it was placed on a par with the entire body of the Law. He who transgresses the S. is considered legally, according to Maimonides, as one who has set the whole law at defiance, and is to be looked upon in every respect as like a 'worshipper of stars'—i. e., a heathen.

Regarding the development of the positive side of the Sabbatical observance, we have to mention first, that in conformity with the precept making it a day of 'holy assembly,' the synagogue (irrespective of the temple-service, its special sacrifices, prayers, and psalms for the day), assembled the faithful on that day within its precincts in every town and hamlet in and out of Palestine before and after the final Exile. A certain portion of the Pentateuch, to which afterwards was added a prophetical pericope, the Haftarah, was read, translated into the vernacular, and expounded homiletically. Special prayers and psalms, in addition to the ordinary slightly-modified service, with special reference to the sanctity of the S., were said and sung, and the rest of the day was devoted to pious meditation, study in the law, and to serenity and joyfulness. Respecting this last point, it must be borne in mind that the day is distinctly called a *day of joy and delight* (e. g., cf. Ps. xcii., Is. lviii. 13, Hos. ii. 11, 13, &c.—the words in Is. translated in the authorised version by 'doing thy pleasure,' in reality mean 'doing thy work;' the Hebrew word in this passage exactly corresponding to our 'affairs,' 'business'). A variety of minor regulations referring to bodily indulgences on that day, abundantly prove—if further proof were needed—its recognised character as a 'feast-day' in the natural and general sense of the term, in Judaism. It was to be honoured by the wearing of finer garments, by three special meals of the best cheer the house could afford (fish, meat, &c.); and it was considered a particularly meritorious thing on the part of the master of the house to busy himself personally as much as possible with the furnishing of the viands, nay, the fetching of the very wood for the cooking, so as to do as much honour to the 'bride Sabbath' as in him lay. Wine, if the means of the individual would anyhow allow it, was to crown the repast, special blessings being duly pronounced over it with reference to the holy day, both at its coming in and at its going out. From the circle of the family, this custom of welcoming, as it were, the S., and taking leave of it, with the cup of blessing, with lights, and with spice, found its way at an early period into the synagogue, on account of those strangers who, having to stop on their journey during the twenty-four hours, were often lodged and fed in or near the synagogue, and on whose behalf the blessing had to be pronounced generally. Fasting, mourning, mortification of all and every kind, even special supplicatory prayers, are strictly prohibited; but, on the contrary, the number of 'a hundred benedictions,' said at all varieties of enjoyments of the senses, are to be completed on the S., were it even by eating different kinds of fruit, smelling different spices, &c. Those who study hard during the week are to relax somewhat on that day, while those bent on business all week may indulge more freely in their readings; even school children are to be released from hard lessons on that day. Nay, the Friday itself participated in a manner in the solemnity of the Sabbath. Its very name was sunk in 'Eve of Sabbath.' At an early hour in the afternoon, trumpets were blown from the steps of the temple in Jerusalem; and certain shops, the stopping of whose business required some time, began to close. Again and again the trumpets resounded at certain intervals, and other trades ceased, as, indeed, nothing might even be begun on Friday which could not be finished or stopped at the end of that day: walking also was restricted to a certain extent on Friday, and judgment over life and death was entirely suspended. At last, when the sun disappeared from the horizon—irrespective of the situation of the place, whence a difference arose between the beginning of the S. among the dwellers in valleys or on elevations—the hallowed period commenced, and lasted until three stars were visible in the following evening.

The original formulas, much enlarged in later times, as far as they are to be traced now, of the introductory benediction, as well as the valedictory prayer, both of which we subjoin, shew the character and scope of the day in Judaism so fully, that they may stand instead of any further explanation of our own.

1. (Kiddush.) 'Blessed art Thou, O Lord, our God, King of the Universe, who hath sanctified us by His Laws, and hath made us participate in His Grace, and hath, in His Love and in His Mercy, given us the Sabbath, as a remembrance of the

creation, as the first day of Holy Convocations, and in memory of the redemption from Egypt; for Thou hast chosen us and sanctified us from all peoples, and hast given unto us Thy holy Sabbath in Love and in Grace. Blessed art Thou, O Lord, who sanctifieth the Sabbath.'

2. (Habdalah.) 'Blessed art Thou, O Lord, our God, King of the Universe, who divided between Holy and Unholy, between Light and Darkness, between Israel and the peoples, between the Sabbath and the six days of creation. Blessed art Thou, O Lord, who divideth between Holy and Unholy.'

The same character of cheerfulness, of happy rest from the toil and turmoil of the world's business; of quiet and peaceful 'return into one's self;' of joyous communion with friends and kindred over good cheer—in short, of mental and bodily relaxation and recreation that strengthens, braces, pacifies, and maketh the heart glad, while the sublime ideas which it symbolises are recalled to the memory at every step and turn—seems to have prevailed at all times, down to our own, among the Jews. Whatever difference there may be in the peculiar customs respecting the S. among some of the recent sects among them, e. g., the Karaites, the Chassidim, &c. (see JEWISH SECTS), they chiefly refer to the Liturgy (with the one vital exception, that the Karaites entirely abstain from the use of light and fire during the whole of the twenty-four hours), and to some minor points, upon which we cannot dwell here. It is also unnecessary here to go into the special 'superior' or 'mourning' Sabbaths during the year, i. e., those that precede or follow certain festivals or days of humiliation, or such as formerly inaugurated new academical semestres (Kallah), and the like. Suffice it to reiterate that in every class, every age, and every variety of Jews, from first to last, the S. has been absolutely a day of joy and happiness, nay, of dancing, of singing, of eating and drinking, and of luxury. The 'luxus Sabbatarius' of Sidonius Apollinarius has indeed been a reproach to them, as was their supposed over-indulgence in laziness. The thinking minds were, according to Philo and others, more than ever busy on that day with those sacred mysteries of God's revelation to man and his miraculous workings on behalf of the 'chosen' nation; others' hearts were lifted up by prayers, by readings, by earnest exhortations, and by pleasing and instructive homiletics. A dark, fanatical, self-torturing spirit is as foreign to the Jewish S. (which is prolonged as far as possible) as it is foreign to the Mosaic and post-Mosaic legislation, its written and oral laws in general.

The benefits of the institution itself for the individual are, after what we have said of its practice, too self-evident to require further comment. How it connected, on the one hand, the human being with the divine Creator, and, on the other, with his fellow-creatures, brother and stranger, children and slaves, nay, the very beast of burden, the ox and the ass—how, ever recurring, it inculcated with irresistible force pious reverence, fear, and love of God, the sole master of all things—man's time and property included—good-will to all things created; and the absolute equality of all men—need not be urged here. Proudhon has recently treated on it from the national-economy point of view, and he has come to the conclusion, that the proportion of the six days of work to the one of judicious rest, is one of manifest wisdom, and of great blessing to man.

It is necessary here to say a few words with reference to the notion that the S., i. e., the celebration of the seventh day as a day of rest, is an institution common to all or most of the civilised nations of antiquity (Assyrians, Arabs, Egyptians, Greeks, Romans), from whom Moses has also been charged with having borrowed it. There is no more truth in these statements than there is in the often repeated assertion of an ancient S. among the aboriginal savages. The dicta of Philo and Josephus, to the effect that there was no city, either Hellenic or barbarian, and not a single people, to which the custom of the S. had not penetrated, have absurdly enough been taken by some as a proof that the Jews borrowed the custom. If the number seven [six and one] is one to which a peculiar significance attached at a very early period, in connection with the calendar (compare the seven worlds, the seven continents, the seven seas, &c., of the Indian cosmogony), and if the weekly cycle of seven days which goes back to the ante-Mosaic period (see Gen. xxix. 27, *seq.;* vii. 4, 10; viii. 10, 12, &c.), is, probably, the common property of the Semitic races; yet there is a mighty difference between counting time by seven (the ancient Egyptians had, in fact, a ten days' previous to a seven days' cycle), and making the seventh day a 'day of rest and holy convocation,' with reference to the national life of Israel. There is no special sanctity found attached to the day either with the Egyptians or with the pre-Mohammedan Arabs, who sacrificed on that day in black garments, in a hexagonal black temple, an old bull to Saturn: exactly as they sacrificed a boy on another day of the week, sacred to the planet Jupiter. As for the Greeks, the only authenticated passage we find with reference to the subject, is Hesiod's (*Op. et D.* 770, &c.) reference to the seventh day of the month, sacred to Apollo as other days were sacred to other gods. Other verses quoted by Clemens Alexandrinus and Eusebius, as from Homer and Hesiod, are proved to be spurious Judæo-Hellenic fabrications. The Roman calendar knows absolutely nothing of a hallowed seventh day.

Thus much on the S. under the 'Old Dispensation.' We have still to consider it in relation to the Christian Church, and to trace the progress of opinion and practice in regard to the observance of the first day of the week, which in this country is frequently styled the Sabbath, or, more definitely, the Christian Sabbath.

It is hardly necessary to observe, that all the discourses of Jesus were addressed to Jewish hearers, subject, like himself, to the Mosaic law. That he is nowhere recorded to have enjoined the observance of the S. has by some been thought significant, but seems to have been natural enough in a case where those he addressed, so far from neglecting the duty, were superstitiously scrupulous in its performance. What his hearers needed and received was the lesson, that, the S. having been intended for human benefit, the duty of observing it ought to give way before the higher duty of effecting that purpose, when the two were in conflict; and that trivial acts demanding no exertion were not to be confounded with that real and exhausting labour which was the thing really forbidden. (Matt. xii. 1—14; Mark ii. 23—28; iii. 1—6; Luke vi. 6—11: cf. Hosea vi. 6; Psal. l. 8—14; li. 16, 17; Is. i. 10—17; Jer. vi. 19, 20; vii. 21—23; 1 Sam. xxi. 6). Some have thought that by making clay on a S. to anoint the eyes of a blind man, and by ordering an invalid, when cured, to carry home his bed on another S., he designed to intimate, if not the present abolition of the S., at least its approaching end. But others look upon the former of these acts as much too trivial to be confounded with 'servile work,' and the latter as an exceptional case within the scope of the principle above stated. On no occasion does he appear to

have sanctioned the performance of real work on the seventh day, unless it was demanded by some higher duty than that of bodily rest.

For several years after the death of Jesus, the Church included none but Jews, and by these the S. and other Mosaic rites continued to be observed as before. It was not till Peter's visit to the centurion Cornelius (41 A. D.) that the Gospel began to be preached to the Gentiles; and when the apostles and elders met at Jerusalem to consider what was to be done with the Gentile brethren, it was decided that no Mosaic burden should be laid upon them beyond abstinence from certain practices, of which working on the S. is not one (Acts xv. 23—29). Nevertheless, the Judaising party continued in various places to demand more or less conformity to the law on the part of the Gentile converts. This party was strenuously withstood by Paul (q. v.), in whose Epistles the dispute is a subject that frequently recurs. From his letters to the churches of Rome, Galatia, and Colosse, which contained both Jews and Gentiles, we learn that, while the Jews wished the Gentiles to observe the Sabbaths prescribed in the law, the Gentiles were prone to treat the observance of Jewish ceremonies with contempt. Upon both parties the apostle enjoins mutual forbearance and respect; forbidding the Jew who esteemed one day above another to disturb the Gentile who esteemed every day alike, and ordering the Gentile to refrain from contemning the observances conscientiously performed by his weaker brother the Jew (Rom. xiv.; Col. ii. 11—17). That he never taught the Jewish Christians to abandon the observance of the law, but, on the contrary, continued to the end to observe it himself—as appears from Acts xxv. 8; xxviii. 17; Philip. iii. 6—are facts of which different explanations have been given by theologians; some thinking that the law continued binding on the Jews, whether Christians or not, so long as the Temple stood; while most are of opinion that conformity to the rooted notions and habits of that people was tolerated for a time, in order that the diffusion of the Gospel might not be impeded amongst them. In the Eastern churches, where the proportion of Jews was greater than in the West, the S. continued to be observed till the 5th c., when we lose sight of the Ebionites (q. v.), a sect of Judaisers such as Paul withstood—and of the more moderate Ebionitic Nazarenes, who, though they conceived it to be their *own* duty to circumcise, keep the S., &c., had no desire to impose the peculiarities of Judaism on the Gentile Christians. Down to the present time, however, S.-keeping and various other Jewish rites continue to be practised along with Christian observances by the Christians of Abyssinia, whose ancestors, it is probable, derived them either (as a tradition among them indicates) from missionaries of the Alexandrian Church, of which many members were Jews, or from expatriated Hebrews who settled in Abyssinia at some much earlier date. In other countries also, many of the Gentile Christians seem to have anciently observed the S., if not by resting the whole day from work, at least by attending on it the religious meetings of their sabbatising Jewish brethren.

Hitherto we have spoken of the observance of *Saturday*, the day of rest prescribed to the Jews, and to which exclusively the name of the S.-day was anciently applied, and still continues to be given by every nation but the English and its offshoots. At what date the Sunday, or first day of the week, began to be generally used by Christians as a stated time for religious meetings, we have no definite information either in the New Testament or in the writings of the Fathers of the Church (q. v.). By none of the Fathers before the 4th c. is it identified with the S., nor is the duty of observing it grounded by them either on the fourth commandment, or on the precept or example of Jesus or his apostles, or on an ante-Mosaic S.-law promulgated to mankind at the creation and continuing in force after the coming of Christ. To the reality of such a law—which many modern Christians have deduced from Gen. ii. 2, 3; iv. 3; vii. 4, 10; viii. 4, 10—12; xxix. 27; l. 10; Ex. xvi. 4—30, and which some (as Bishop Horsley, Serm. 22) regard as an indispensable basis for a Christian S.—it has been objected that the attention of the Gentile converts, who must be supposed to have been ignorant of the law in question, is nowhere found in Scripture to have been directed to it by Paul; that his declarations of their freedom from the observance of days are so general as to apply to every law on that subject, whensoever enacted; that consequently he must either have been unacquainted with a primeval law, or (if not) have regarded it as obsolete under the new dispensation; and lastly, that the Fathers, had they known such a law, would have mentioned it in their writings, instead of justifying (as Justin, for instance, does in his *Dialogue with Trypho the Jew*) the neglect of S.-keeping by Gentile Christians, on the ground that the S. began with Moses and was not observed by the Patriarchs. By none of the Fathers is any S.-law whatever represented as being in force among the Gentiles.

On what grounds, then, did the Christians observe the first day of the week as a time for religious assemblies?—and how and when did the custom of so distinguishing it begin? To these questions, very different answers have been given. According to some theologians, apostolic precept or example is the only conceivable origin of a custom apparently so general as well as early; and of such *example* at least, they find evidence in John xx. 19, 26; Acts ii. 1; xx. 6, 7; 1 Cor. xvi. 1, 2; and Rev. i. 10. But others, doubting or denying the conclusiveness of this scriptural proof, conceive that an adequate explanation may be found in the circumstances of the primitive Church. That the desire which naturally actuates the members of every new and unpopular religious sect to meet frequently for worship, instruction, and mutual encouragement, might very soon lead to the fixing of stated days for that purpose, may be assumed as self-evident; that a weekly day should be chosen, would be a natural result of the Jewish habits of the earliest Christians; and that the day on which their Lord had risen victorious from the grave should be thought fittest for this weekly festival, is precisely what was to be expected in their circumstances. But the resurrection of Jesus is by no means the only reason assigned by the Fathers for the honour which they paid to the Sunday. By Justin (see JUSTINUS), in whose *Apology for the Christians to Antoninus Pius*, ss. 87—89, written between 138 and 150 A. D., the earliest undoubted mention of Sunday meetings in the works of the Fathers occurs, several reasons for holding them *then* are assigned—the first being, that on this day of the week the world and light were created; and the second being the resurrection of Christ. 'We all of us,' says he, 'assemble together on Sunday, because it is the first day in which God changed darkness and matter, and made the world. On the same day, also, Jesus Christ our Saviour rose from the dead; for he was crucified on the day before that of Saturn, and on the day after that of Saturn, which is that of the Sun, he appeared to his apostles and disciples, and taught them what we now submit to your consideration.' To these reasons, Origen (*Seventh Hom. on Exod.*) adds the fact that manna was first given to the

Israelites on a Sunday; while subsequent writers adduce various other events, either recorded, or by them imagined, to have occurred on that day. In arguing with Trypho, Justin opposes S.-keeping by Christians, on grounds which would have been retorted by the Jew as condemning equally the observance of a first-day S., had the Sunday at that time been regarded as the S.: from which fact, and the circumstance that in his *Apology* already mentioned, where he professes to give the Emperor Antoninus a full account of the observance of the day, no mention is made of rest from labour as a part of that observance, the inference has been drawn, that, except during the time of divine service, the Christians in this Father's age thought it lawful to follow, and actually did follow, their worldly pursuits on the Sunday. It is true that by Tertullian, who wrote in the latter half of the 2d c., the Christians are described as 'putting off even their business on the Lord's day, lest they might give place to the devil' (*De Orat.* c. 23); an indication, in Neander's opinion (*Church Hist.* i. 409, Bohn's ed.), that now the Jewish law of the S. had begun to be applied to the Lord's day. But the soundness of this interpretation has been questioned—Dr Hessey, for instance (*Bampton Lectures*, 1860, p. 63), stating that he can find in it 'nothing Sabbatarian—nothing, in fact, more than I should have expected, considering that the Church had now become somewhat settled—that, rather than that the duties peculiar to the Lord's day should be neglected, worldly business was put off to another day.' But whatever may have been the opinion and practice of these early Christians in regard to cessation from labour on the Sunday, unquestionably the first law, either ecclesiastical or civil, by which the sabbatical observance of that day is known to have been ordained, is the edict of Constantine, 321 A. D., of which the following is a translation: 'Let all judges, inhabitants of the cities, and artificers, rest on the venerable Sunday. But in the country, husbandmen may freely and lawfully apply to the business of agriculture; since it often happens that the sowing of corn and planting of vines cannot be so advantageously performed on any other day; lest, by neglecting the opportunity, they should lose the benefits which the divine bounty bestows on us' (*Cod.* iii. 12, 3). Before this time, such of the Christian writers as had endeavoured, by a mystical style of interpretation, to turn the Mosaic ceremonies to account as sources of moral and religious instruction, had, probably in imitation of Philo (q. v.) (*Works*, iii. 265, Bohn's ed.), spiritualised the law of the S. to the effect of representing it as a mystical prohibition to the Christian of evil works during all the days of his life, and a prefiguration of the spiritual repose and enjoyment which is his portion both in this world and in the next. But in addition to this significance, there now began to be discovered in the Old Testament, foreshadowings of the new Sunday-S.; and Eusebius (q. v.), bishop of Cæsarea, the friend and biographer of Constantine, was able to descry in Ps. xlvi. 5, and lix. 16, prophetic allusions to the *morning* assemblies of Christians on Sundays for worship, and in Psal. xxii. 29 a prefiguration of the weekly celebration of *the Lord's Supper* on that day. Applying Ps. xcii. to the first day of the week, the same writer says that 'the Word, by the New Covenant, translated and transferred the feast of the Sabbath to the morning light, and gave us the symbol of true rest—viz., the saving Lord's Day, the first of the light,' &c. From other passages in Eusebius and subsequent writers, it is plain that they meant, not that this transference had been formally ordained by Christ (of which there is no trace in Scripture), but that by rising from the tomb on the first day of the week he had made that day more illustrious than the S., and more worthy to be celebrated by the holding of Christian assemblies for worship than the S. was to be similarly honoured by the Jews. About the end of the 4th c., Chrysostom is found similarly expounding Gen. ii. 3, which, in his opinion, shews that already from the beginning God offered us instruction typically, teaching us to dedicate and separate the one day in the circle of the week wholly to employment in things spiritual—thus (as his translator observes) making the S. a *type* of the Lord's Day, and rest *from* bodily, of rest *in* spiritual work. (*Library of the Fathers*, ix. 209.)

It was a natural result of Constantine's law, backed by such interpretations of the Old Testament as these, that, in the words of Dr Hessey, 'a new era in the history of the Lord's Day now commenced; tendencies towards Sabbatarianism, or confusion of the Christian with the Jewish institution, beginning to manifest themselves. These, however, were slight, until the end of the 5th century, and are traceable chiefly to and in the civil legislation of the period. Afterwards they developed themselves more decidedly; Sabbatarianism became at length systematised, in one of its phases, in the ante-Reformation Church both in England and on the Continent by the later Schoolmen, probably in their desire to lay down exact rules for consciences, and under a fancied necessity of urging the precedent of Jewish enactments in support of Christian holy-days' (p. 20). But it was not till the year 538 that abstinence from agricultural labour on Sunday was recommended, rather than enjoined, by an ecclesiastical authority (the third council of Orleans), and this expressly 'that the people might have more leisure to go to church, and say their prayers;' nor was it till about the end of the 9th c., that the Emperor Leo, 'the Philosopher,' repealed the exemption which it enjoyed under the edict of Constantine (Leo. *Const.* 54). And now, the Lord's Day being thoroughly established by law as a S., the fourth commandment would more than ever be employed by the clergy as a means of persuading to its observance. The entire Decalogue, indeed, had long been used by them as a convenient summary of human duty; and by the later Schoolmen it came to be represented as, to a certain extent, —i. e., so far as it coincided with the law of nature—actually *obligatory* on Christians. This theory of its binding force, and the notion of the holiness of days, were vigorously opposed by Luther and the other Reformers, who denounced also the excessive multiplication of festivals, and proclaimed that the pardon of sin was not to be secured by their observance, or otherwise than by faith in Christ. (See Luther's *Larger Catechism;* the *Augsburg Confession*, 1530, c. vii.; Calvin's *Institutes*, b. ii. ch. viii. ss. 28—34; and his other writings on the subject, collected by R. Cox in *The Whole Doctrine of Calvin about the Sabbath and the Lord's Day*, Edin. 1860.) But, while condemning everything which they viewed as abuses and corruptions, the Reformers never ceased to acknowledge the manifold utility and high importance of the Sunday as a day of rest, worship, and decorous enjoyment. Like the later Fathers and the Schoolmen, also, they recognised in the fourth commandment a useful means of instruction and exhortation; but, as we have said, they utterly rejected it as a law. 'The Ten Commandments,' says Luther, 'do not apply to us Gentiles and Christians, but only to the Jews.' (*On the Ten Commandments.*) 'A law,' says Grotius, 'obliges only those to whom it is given; and to whom the Mosaic law is given, itself declares: "Hear, O

Israel.'" (*De Jure Belli et Pacis*, lib. i. c. i. s. 16.) He quotes also Deut. iv. 7, and Ps. cxlvii. 19, 20. This is not Antinomianism (q. v.): the Reformers acknowledged their subjection not only to the more perfect law of Christ, but to that universal and perpetual law which Paul (Rom. ii. 14) speaks of as the light to the Gentiles of old, who, 'not having the law, were a law unto themselves, shewing the work of the law written in their hearts.' See ETHICS.

The distinction, however, between Moses as a lawgiver and Moses as a teacher, was one very apt to be overlooked by the multitude, and disregarded in popular discourses by the clergy themselves. In England, where the writings of the Reformers were less studied than in Germany, the response after the fourth commandment in the Liturgy (where the Decalogue, adapted to general use by the omission of the words addressing it to the Jews, was inserted in 1552), 'Lord, have mercy upon us, and incline our hearts to keep *this law*,' must have greatly tended to instil the belief that this commandment imposed on them the duty of keeping, not a mystical, but a literal Sabbath. Accordingly, in the reign of Elizabeth, it occurred to many conscientious and independent thinkers (as it had previously done to some Protestants in Bohemia), that the fourth commandment required of them the observance, not of the first, but of the specified *seventh* day of the week, and a strict bodily rest as a service then due to God; while others, though convinced that the day had been altered by divine authority, took up the same opinion as to the Scriptural obligation to refrain from work. The former class became numerous enough to make a considerable figure for more than a century in England under the title of 'Sabbatarians'—a word now exchanged for the less ambiguous appellation of 'Seventh-day Baptists.' The other and much larger class were the Puritans (q. v.), who, justly offended by the vices and frivolity of the times, but also soured by persecution, applying to themselves the threats of Jehovah against the profaners of the token of the covenant between him and his chosen people—led astray by the mistranslation of Is. lviii. 13 above noticed—overlooking the incidents in Luke xiv. 1—12—and giving a narrower scope than the Reformers had done to the teaching of Paul—gave to Sunday-keeping an austerity by which neither it nor the S.-keeping of the Jews had ever before been marked. (See ASCETICISM.) This great party, when predominant for a time in the reign of Charles I., availed themselves of the opportunity to maintain and spread their Sabbatarian opinions, not only in numerous treatises, but through what has proved to be the more lasting and influential means of the *Westminster Confession* and *Catechisms*. (See ASSEMBLY OF DIVINES; CATECHISMS; CREEDS AND CONFESSIONS.) Chiefly through these formularies was effectually introduced into Scotland that scrupulous abstinence from recreation as well as business on Sunday, which still distinguishes the people. For it is a mistake to suppose that either Sabbatarianism or asceticism was recommended by Knox. Agreeing with the other Reformers, Knox, in setting forth in his *Confession of Faith* (1560) 'the works of the First Table,' says not a word about the Sabbath. This *Confession* and the *Geneva Catechism* were adhered to in Scotland till superseded in 1648 by the Westminster standards of faith. Nor is it only to the British Presbyterians that the opinions and habits of the Puritans have descended; as the colonists of New England they planted in that distant soil the rigid Sabbatarianism which still survives in Massachusetts and Connecticut, and retains the Jewish peculiarity (which found its chief advocates in Prynne and Shepard, 1655) of being observed from sunset to sunset. In America, too, exists now the principal remnant of the Seventh-day Baptists. (See Rupp's *Relig. Denom. in the United States*, pp. 70—111; Mrs Davis's *History of the Sabbatarian Churches*, Philad. 1851; and the publications of the American (Seventh-day) Sabbath Tract Society, New York, 1852, &c.) They have nearly disappeared in England though in the 17th c. so numerous and active as to have called forth replies from Bishop White, Warren, Baxter, Bunyan, Wallis and others.

In Holland, though some English Puritan settlers gave birth to a controversy which, during the greater part of the 17th c., engaged the pens of some of the most eminent divines (among whom were Gomarus, Walæus, Rivetus, Cocceius, and F. Burmann), the principles of the Reformers, favoured by Grotius among the laity, ultimately kept their ground, as they have done also in Protestant Germany. Yet in Holland were produced the two bulkiest defences of Sabbatarianism that have ever been published—one, in Latin, by John Brown, an expatriated Scotchman who had been minister of Wamphray, entitled *Causa Dei contra Anti-Sabbatarios* (2 vols., Rotter. 1674—1676); and the other, in Dutch, by his friend James Koelman, on *The Controversy, History, and Manner of Observance of the Sabbath and the Lord's Day* (Amst. 1685).

In England the earliest considerable treatise on the Puritan side was the *Sabbathum Veteris et Novi Testamenti* of Dr Nicolas Bound, a minister in Suffolk (Lond. 1595; 2d ed. 1606). It is written in English, though the title is partly Latin. Many converts were made by it and the similar works of Greenham and Widley, his contemporaries; but till the heterodoxy of the Seventh-day Baptist Brabourne aroused, in 1632, the indignation of the bishops, little noise seems to have been made throughout the nation by the controversy; nor would it, perhaps, have ever attained much prominence, had not Charles I. committed, in 1633, the blunder, and, as the Puritans believed, the gross impiety, of reviving his father's *Declaration concerning Lawful Sports to be used* [*on Sundays*]. (See SPORTS, BOOK OF.) This the clergy were required by Laud (q. v.) to publish in their churches, and many who refused were punished severely. Hence arose the greatest English controversy about the S., between the High-Church party on the one hand, and the Puritans on the other. Bishop White (*Treatise of the Sabbath-day*, 1635 (and Dr Heylin (q.v.) (*History of the Sabbath*, 1636) took the lead for the former, and were ably supported by Sanderson (*A Sovereign Antidote against Sabbatarian Errors*, 1636), Ironside (*Seven Questions of the Sabbath briefly Disputed*, 1637), Taylor (*Holy Living*, ch. iv. s. 6, and *Ductor Dubitantium*, b. ii. ch. ii. rule 6, ss. 43—62), and Bramhall (*On the Controversies about the Sabbath and the Lord's Day*, in his *Works*, fol. p. 907). On the Puritan side were Henry Burton (*The Lord's Day the Sabbath-day*, 1636), John Ley (*Sunday a Sabbath*, 1641), Hamon L'Estrange (*God's Sabbath before the Law, under the Law, and under the Gospel*, 1641), Richard Bernard (*A Threefold Treatise of the Sabbath*, 1641), William Twisse, prolocutor of the Westminster Assembly (*Of the Morality of the Fourth Commandment, as still in force to bind Christians*, 1641), and jointly Cawdrey and Palmer, two members of the same Assembly, in their *Sabbatum Redivivum, or the Christian Sabbath Vindicated* (2 vols. 1645—1652), which is the most elaborate defence of Sabbatarianism in our language. A still more eminent writer on that side, and one of greater breadth of view, was Dr John Owen, whose

Exercitations concerning a Day of Sacred Rest (1671), since prefixed to his *Exposition of Hebrews*, gave, however, some offence to his friends by suggesting that the duration of the religious exercises of the day should be measured by the strength of the worshipper. Since then, the Sabbatarian cause has been maintained by numberless writers, among whom may be mentioned Bishop Hopkins, Willison, Jonathan Edwards, Dwight, Stopford, Macfarlan, and others to be afterwards named; while the opposite side is supported by Baxter, Milton, Barrow, Barclay, Morer, Michaelis, Paley, Evanson, Higgins, &c.

In the first half of the reign of George III., the comparative neglect into which the observance of the Lord's Day had fallen in England aroused the anxiety of its friends, and many efforts were made to bring the people to a better disposition towards it. Paley did excellent service, especially by his chapter on the use of Sabbatical Institutions (*Moral Philosophy*, b. v. ch. vi.); while Bishop Porteus successfully exerted himself to check open indulgence in vicious and unseemly amusements. About the same time, the new 'Evangelical' party (q. v.) began those efforts which it continues to make for the promotion of a strict observance of Sunday according to the Puritan model. But what, perhaps, had most effect in turning the current of public opinion in that direction was the substitution of the Decade (q. v.) for the Week, and the abolition of public worship, by the National Convention of France in 1793 (see CALENDAR); proceedings which brought to the aid of the pious advocates of the Lord's Day the political conservatism and anti-Gallican feelings of the British people. In the next generation, the revival of the study of ancient Christian literature led to fresh advocacy of the Lutheran views concerning the S. and the Lord's Day, by Bishop Kaye (*On Justin Martyr*, 1829), Dr Whately (*Thoughts on the Sabbath*, 1830), Mr Bannerman (*The Modern Sabbath Examined*, 1832), and the Oxford 'Tractarians;' while Sabbatarianism had influential advocates in Bishop Mant (*The Christian Sabbath, its Institution and Obligation*, 1830), Dr Daniel Wilson, afterwards Bishop of Calcutta (*The Divine Authority and Perpetual Obligation of the Lord's Day Asserted*, 1830), and Dr Ralph Wardlaw (*Discourses on the Sabbath*, 1832)—in support of whose principles was founded in 1831 the London 'Society for Promoting the Due Observance of the Lord's Day,' which, aided by similar associations in Scotland and the United States, still keeps a jealous watch on behalf of the institution. For 17 years preceding his death in 1849, its most noted member, Sir Andrew Agnew, M.P. for Wigtownshire, fought indefatigably both in and out of the House of Commons for a stricter legal enforcement of rest on Sunday; and though he failed to get his bill passed, the agitation which he headed was not wholly fruitless. The attempts, however, which he and his friends have made to suppress all post-office action on Sunday, all stated conveyance of passengers on railways, and such recreations as walking in public gardens, listening to music in the London parks, and viewing works of nature and art in the national collections, have seemed, even to many friends of the institution, to display more zeal than wisdom or knowledge, and have led to the formation (in 1855) of 'The National Sunday League'—a society which, while deprecating the conversion of any part of the day into a season for ordinary labour, or for frivolous or vicious amusement, conceives that a more cheerful mode of spending some of its hours is expedient, and that the opening of public gardens, museums, and galleries of art, would promote alike the health and the moral and intellectual elevation of the people.

In France, where the Week was restored by Napoleon I. in 1806, the Sunday has not yet wholly recovered its former status as a day of rest; but efforts have lately been made by both clergymen and laymen to convince the people of the advantage of suspending all but necessary labour upon it. Among the advocates of this reform are Pérennès, Gaume, and Mullois, who, however, discountenance the austerity of the Puritans. In Switzerland, Mellet, the pastor of Yvorne, is the author of a clever treatise on *Sunday and the Sabbath*, of which there is an English translation (Lond. 1856). Bred a Sabbatarian, he was converted to the Dominical view by reading Dwight's Sabbatarian *Discourse on the Perpetuity of the Sabbath*, a doctrine still upheld by the 'evangelical' party in Switzerland.

Of late years the bearing of geological discovery on the interpretation of the Hebrew narrative of the creation, and consequently on the S. controversy, and, in particular, on questions arising out of the discrepance between the two copies of the fourth commandment, has been largely discussed. See GENESIS; DECALOGUE. Into the merits of this and other disputed points it is impossible to enter here; but, in concluding the present historical sketch, it may be allowable to express the satisfaction with which we observe, that notwithstanding the wide diversity of opinion as to the authority of the Lord's Day and the manner in which it may and ought to be spent, almost all agree in esteeming it highly as a civil institution at least, and in wishing to defend it from the intrusion of business as far as the public good will allow.

—For additional information and discussion, see (on the Sabbatarian side) Holden's *Christian Sabbath* (Lond. 1825); *Report from the Select Committee of the House of Commons on the Obs. of the Sabbath-day* (Sir A. Agnew's committee), 6th August 1832; Jordan's *Scriptural Views of the Sabbath of God* (Lond. 1848); M'Crie's *Memoirs of Sir A. Agnew* (Edin. 1850); Pirret's *Ethics of the Sabbath* (Edin. 1855); Fairbairn's *Typology of Scripture* (3d ed., Edin. 1857); J. Gilfillan's *Sabbath viewed in the Light of Reason, Revelation, and History, with Sketches of its Literature* (Edin. 1861): and (on the Dominical side) Arnold's *Sermons*, vol. iii. (Lond. 1844), and his *Life* by Stanley, 5th ed. vol. i. p. 364, and vol. ii. p. 206; Neale's *Feasts and Fasts* (Lond. 1845); Sir W. Domville's *Examination of the Six Texts commonly adduced from the New Testament in proof of a Christian Sabbath* (Lond. 1849); Hengstenberg on *The Lord's Day*, translated by J. Martin (Lond. 1853); F. D. Maurice's *Sermons on the Sabbath-day* (Lond. 1853); R. Cox's *Sabbath Laws and Duties* (Edin. 1853); Domville's *Inquiry into the supposed Obligation of the Sabbaths of the Old Testament* (Lond. 1855); *Sunday the Rest from Labour*, by a Christian (Lond. 1856); Dr W. F. Hook on *The Lord's Day* (Lond. 1856); *Time and Faith* (Lond. 1856); Alford's *Greek Testament with Commentary* (Lond. 1856—1861); F. W. Robertson's *Sermons*, 1st and 2d series (Lond. 1856); Baden Powell's *Christianity without Judaism* (Lond. 1857); Reichel's *Lord's Day not the Sabbath* (Dubl. 1859); W. Logan Fisher's *Hist. of the Institution of the Sabbath-day, its Uses and Abuses*, 2d. ed. (Phila. 1859); Dr J. A. Hessey's *Sunday; its Origin, History, and present Obligation*, being the Bampton Lectures for 1860; and the *Edin. Review* for October 1861, p. 535. Of the British Seventh-day Baptists the principal works are those of Brabourne (1632), F. Bampfield (1677), Cornthwaite (1740), and Burnside (1825). The Roman Catholic doctrine respecting the Lord's Day, is amply stated in *The Catechism*

of the Council of Trent (1567); that of The Friends or Quakers in *The Apology of Robert Barclay*, Prop. xi. As to all shades of opinion, see R. Coxe's *Literature of the Sabbath Question* (2 vols. Edin. 1865). Proudhon's work, above referred to, is entitled *De la Célébration du Dimanche considérée sous les Rapports de l'Hygiène Publique, de la Morale, des Relations de Famille et de Cité* (Paris, 1850).

SABBATHAIS ZWI, one of the most remarkable 'Messiahs' of modern times, the founder of a wide-spread sect of semi-Christians and semi-Jews throughout Europe, Asia, and Africa, was born at Smyrna in 1641. A boy of extraordinary gifts, he had at the age of 15 already mastered the Talmud, and at 18 was an adept in the mysteries of the Cabbala. Very soon incited by fantastic dreams and more fantastic friends, he declared himself to be the Messiah, who had been sent to shake off the thraldom both of Christianity and Mohammedanism from the Jews, and to convert all humanity. The supreme rabbinical council thereupon excommunicated him. He, however, continued to preach his 'mission' as before. He was now declared an outlaw, and his death was decreed, yet nobody dared to touch him. At last, his expulsion from Smyrna was resolved upon by the municipal authorities. Four apostles—one of them a reconverted Jew, who had previously turned Christian—followed him on his way to Saloniki, where he arrived in 1659, having gathered a vast number of disciples, mostly wealthy, on his road. His extraordinary personal beauty and his fiery eloquence soon brought the most influential Jewish inhabitants on his side, and his cabbalistic formulas and prayers were adopted into the ritual of their synagogue. Two years later, however, he had to leave Saloniki, where powerful antagonists had risen in the meantime, and went first to Palestine and soon after to Alexandria, accompanied by several thousand disciples. Here his power and influence grew so rapidly, that the revenues of the commonwealth to be founded by the new Messiah, and the ways and means of supporting the wars he was going to wage, were seriously taken into consideration. In 1664, no fewer than about 80,000 people belonged to the new empire; and in the following year, the beginning of the Messianic reign within a few months, and the rebuilding of the Temple in the next year, were proclaimed aloud in the streets of Alexandria by S. and six disciples, all clad in white raiments, with garlands on their heads. Somewhat later, he returned to Jerusalem; and the resurrection, to take place within six years, and the deposition of the sultan, whose crown would be placed upon S.'s head, were proclaimed far and near. Upon this all the Jews of Asia, Africa, and Europe, were divided into two camps. Those who believed, finding all the predicted signs fulfilled now, sold everything they had in order to get ready-money for their journey to, and final abode in, the new capital, Jerusalem; others, and among them some of the highest spiritual authorities, declared all the pretended Messiah's miracles to be cabbalistic tricks, and himself an impostor. Returned to his native place, Smyrna, he was received with full royal honours. Meanwhile, the attention of the Divan was drawn to this movement, and Mohammed IV., then in Adrianople, ordered the grand vizier to secure the person of S., and to commit him to prison, until the investigations set on foot should be concluded. Two agas, however, returned with their janizaries, without having effected the order, not having dared 'to stretch forth their hand against the sacred man.' He now offered to surrender voluntarily. He was committed as prisoner of state to Kuthajah, where he received visits and deputations from all parts. Being at last brought before the sultan, his courage failed him, and he declared himself to be nothing more than a simple rabbi: it was only his disciples, he averred, who had called him a Messiah. The sultan then proposed to test his 'mission.' Three poisoned arrows were to be shot at him. Did these prove harmless, he, the sultan, would at once range himself under his flag. In speechless terror, S., at the instigation of his Jewish interpreter, now took the turban from the head of some official, and placed it upon his own, thereby indicating, as the interpreter declared, that his sole object had been all along to embrace Islam, and to carry over all the Jews with him. The sultan declared himself satisfied, and honoured him with the title of an effendi, giving him an honorary post at the same time.

But, extraordinarily enough, the movement was far from having reached its end. The most wonderful stories were circulated among the believers. A fictitious man was supposed by some to have embraced Islam, while the real Messiah had ascended heavenwards. Others believed that Islam was to form part of the new religion; and S., countenancing this view, converted many Jews to Mohammedanism. Nathan, one of his most enthusiastic disciples, travelled about, and caused strife without end, even sanguinary revolts. Many, however, had turned from him by this time, and the voices of the rabbis and their excommunications began to tell more forcibly. Finally, the grand vizier was persuaded to imprison S. once more, and to send him to Bosnia, where he died in a prison in Belgrade—according to some, in consequence of poison, while according to others he was executed in 1677, ten years after his conversion. It is very difficult to judge correctly of a character like his. Even his worst enemies never had a word to say either against his morality or against the extraordinarily brilliant powers of his mind, and his erudition. Probably, he was a self-deceiver, whose plans were not measured by the means in his hands for their execution. His death, however, was only the signal for the reinforcement of his sect, which even many of his former antagonists now joined, and which now, for the first time, was developed into a proper religious system—that of the Sabbathaites or Sabbathians (Shebsen), the chief apostles being Nehemiah, previously a bitter enemy of S. (1677—1690), and Nehemiah Hajun (1708—1717). The latter taught the dogma of the Trinity as part of the new faith; and it became a principle of this religion to accept and to modify itself to the dominant creed of the country—Islam in the East, Christianity in the West. Remnants of it are still in existence in Poland and Turkey. See JEWISH SECTS.

SABBA'TIA, a genus of plants, of the natural order *Gentianaceæ*, natives of North America. They are small herbaceous plants, some with simple, and some with branched stems. They all contain, like many others of the same order, a pure bitter principle, on account of which they are useful in intermittent fevers and as a tonic. They are much employed in the United States.

SABBA'TICAL YEAR (Heb. *Shenath Shabbathon, Shebiith, Shemittah;* Gr. *Hebdomatikos* or *Sabbatikos eniantos*). There are four special injunctions found respecting the celebration of it in the Pentateuch. The first (Exod. xxiii. 10, *seqq.*) ordains that the land, after being sown, and its fruits reaped for six years, should be left to itself in the seventh, so that the poor, and the beasts of the field should eat its spontaneous growth. The same is to be the case with the vine and olive-yards

The second (Lev. xxv. 2—7) views the hallowed period as a 'Sabbath of rest unto the land'—as a solemnity in honour of Jehovah. It is there further enjoined, that the growth of the seventh year be 'meat' both for proprietor, servants, and strangers; that, in fact, it should be common property. A somewhat new significance, but strictly analogous to the first-named ordinance, is given to the institution in the third passage (Deut. xv. 1—11), in which the creditor is enjoined to release the debts owing to him by his poor brother and neighbour. It has been matter of much dispute whether this 'release' implies the entire giving up of the debt, or a mere respite. The Mishna decides in favour of the former; and such were the effects of the law, carried out in accordance with this view, that it was found necessary utterly to paralyse it by an act called the *Prosbul* (Gr. Prosboulé), passed by Hillel the Great. The fourth passage (Deut. xxxi. 10—13) contains the command to read, in the solemnity of the year of release in the 'Feast of Tabernacles,' the Law before all the people in holy convocation, men, women, children, and strangers. We need only remark here that the fundamental idea of the sabbatical year is identical with that of the weekly Sabbath itself; see also JUBILEE, the highest exaltation, as it were, of the idea of sabbatical rest. As to the practical working of the institution, we learn that it gave rise repeatedly to famine (1 Macc. vi. 49, 53; Jos. *Ant.* xiv. 16, 2, &c.), and that it was altogether so fraught with practical difficulties, that from the time it is supposed to have been inaugurated—viz., fourteen years after the Israelites' first entry into Palestine (seven years' conquest, and seven years' division of the land), it never seems to have been kept before the Exile. It has erroneously been supposed by some that the slaves were set free in the sabbatical year. The passage in question refers only to the seventh year of the individual slave's service. Like the jubilee, it was proclaimed on the tenth day of the seventh month, at the end of the harvest-time. Reasonable doubts have been expressed regarding the 'possibility' of the Jubilee (q. v.) ever having been kept in reality; yet there is no doubt about the rigour with which the sabbatical year was kept up, after the Exile, to a very late period. Alexander, Cæsar, and the late emperors exempted the Jews from tribute during it. The sabbatical year being one of the 'ordinances attached to the land'—i. e., Palestine only—it ceased with the final overthrow of the Jewish commonwealth.

SABBIONE'TTA or SABBIONETA, a city of Northern Italy, province of Cremona, with 6623 inhabitants (census of 1862, while previous to that it numbered 7036). It is situated in a marshy district, which affords abundant fodder and pasturage. It was at one time a place of some consequence; now it is a decayed city, the population of which is daily decreasing.

SABE'LLIUS, a celebrated African heresiarch of the 3d c., was born probably at Ptolemais in the Pentapolis, where, at all events, his opinions were first promulgated. Nothing is known regarding his life—the few statements current on the subject being of a contradictory and untrustworthy character, and it is generally thought that he did not broach his heresy till shortly before his death—the date of which is also unknown. S. is pronounced by Neander 'the most original and profound thinker among the Monarchians'—i. e., the Unitarians; but unfortunately only a few fragmentary notices of his teachings have been preserved, and these by his theological adversaries. It would appear that he did not reject the Scriptural phraseology used in speaking of the Godhead. 'Father,' 'Son,' and 'Holy Ghost' were sacred and venerable names to him as well as to orthodox Christians; but he was strongly opposed to the ecclesiastical conception of this Trinity, as a Trinity of distinct persons, or subsistencies (*hypostases*), which he (like many other persons since) held to be absurd and unthinkable, and argued that what is to be understood is a Trinity of manifestation. The single absolute Divine Essence—the *monas* or 'pure Deity'—unfolds itself in creation and the history of man as a Trinity. His words, as quoted by Athanasius, are: *He monàs platuntheisa gegone trias.* The 'energy' by which God called into being and sustains the universe is the 'Logos,' after whose image men were created; but when they had fallen from perfection, it became necessary for the 'Logos,' or Divine Energy, to hypostatise itself in a human body, in order to raise and redeem them; hence in the man Christ Jesus dwelt the fulness of the Godhead *bodily;* while the same Divine Energy, operating spiritually and impersonally in the hearts of believers, is the 'Holy Ghost.' This is not, perhaps, so very heretical after all. But, on the other hand, we must not overlook the fact, that S. held these Divine 'manifestations' to be merely temporary, and that after the 'Logos' and the 'Holy Ghost' had done their work, they would be reabsorbed in the absolute Deity—the *trias* would again resolve itself into the *monas;* or, in the language of St Paul, that 'God would be all in all.' Epiphanius alleges that S. derived his system from an apocryphal 'gospel to the Egyptians;' and there are (as Neander points out) so many points of resemblance in Sabellianism to both the Alexandrian Jewish theology in general, and the particular gospel referred to, that the statement may be regarded as at least indicating the direction from which proceeded the influences that determined the theosophy of the unknown Pentapolitan. The followers of S. were formally suppressed by the Catholic Church in the 4th c.; but his doctrine, which, divested of its Gnostic and Neo-Platonic phraseology about 'emanation' and 're-absorption,' &c., is substantially Unitarian, has seldom wanted eminent advocates in any subsequent age of Christianity.—Consult Tillemont's *Memoirs;* Lardner's *Credibility of the Gospel;* and the Church Histories of Mosheim, Neander, and Milman.

SABICU (*Acacia formosa;* see ACACIA), a tree the wood of which is remarkably hard and tough. It is a native of Cuba. The wood is of a dull red colour, and close short grain. The wood was used to construct the stairs of the Crystal Palace in Hyde Park in 1851, and 'after six months' use, the steps hardly exhibited any signs of wear.'

SABINE, MAJOR-GENERAL EDWARD, a celebrated British physicist, is of Irish extraction, and was born in 1790. After serving in the royal artillery for some time, he was promoted to the grade of lieutenant, and accompanied Captain Ross (q. v.) and Lieutenant Parry (q. v.) in their expedition (1819—1820) to the north coast of America (see NORTH-WEST PASSAGE), making during the voyage a series of magnetic observations of great value. These observations formed the substance of two papers which he communicated to the Royal Society on his return. A strong desire of continuing the investigation of this and other branches of experimental physics, prompted him to undertake a series of voyages to places between the equator and the north pole, making at each point observations on the length of the seconds pendulum, and on the dip and intensity of the magnetic needle. The fruits of these labours were of high importance, and were published, along with other information, in 1825.

From this period, his history is that of a studious investigator into the laws and phenomena of nature, broken only by a short term of military service in Ireland, during which he rose to the rank of major. In 1836 he communicated to the British Association at Bristol his observations on the declination and intensity of the magnetic force in Scotland; and to the same association, he delivered, at Liverpool, in 1837, a report on the variations of magnetic intensity at different parts of the earth's surface. The rest of his researches into the nature and action of magnetic force will be found in detail in the *Transactions* of the above-mentioned association, of the Royal Society, and in the *Philosophical Transactions*. His labours have led to the discovery of the laws of 'magnetic storms,' of the connection between certain magnetic phenomena and the changes of the solar spots, and of the magnetic action (independently of heat) of the sun and moon on the earth. He deserves almost the sole credit of extending the body of known facts in magnetic science by the establishment of magnetic observatories in all parts of the world, and by the collation of the enormous mass of facts thus acquired. In 1818, S. was elected a Fellow of the Royal Society; on the retirement of Mr George Rennie (q. v.) in 1850, he became its Vice-president and Treasurer, and President in 1861. In 1852, he presided over the meetings of the British Association at Belfast, and has for a series of years been the general secretary of this association. In 1856, he was raised to the rank of major-general of artillery and engineers.

SABI'NE, a river of the United States of America, rises in the north-eastern part of Texas, and flows south-easterly 250 miles to the eastern boundary of Texas, whence flowing southerly, it forms the eastern boundary, and empties itself through Sabine Bay, 18 miles long by 9 miles wide, into the Gulf of Mexico. The S. is 500 miles long, but shallow and unnavigable.

SABI'NI, an ancient people of Central Italy, whose territory lay to the north-east of Rome. The boundaries of the territory cannot be determined with exactness, but it appears to have extended from the sources of the Nar, on the borders of Picenum, as far south as the Anio. The nations conterminous to the S. were the Umbrians on the north, the Umbrians and Etruscans on the west, the Latins and Æqui on the south, and the Marsi and Picentini on the east. The entire length of the Sabine territory did not exceed 85 miles, reckoning from the lofty and rugged group of the Apennines, anciently known as the *Mons Fiscellus* (now *Monti della Sibilla*), to Fidenæ on the Tiber, which is not more than 5 miles from Rome. The principal towns were Reate, Interocrea, Falacrinum, Nursia, Amiternum, Casperia, and Cures, but none of these places were of any size or political importance. The inhabitants had no inducements to congregate in large towns. Their country was an interior region; much of it, especially in the north, very mountainous and bleak, though the valleys were (and are) often richly productive; and thus cut off from the seaboard, and even from that easy access to their neighbours which lowland districts admit of, they (like all the other races who peopled the sequestered regions of the Apennines) scarcely advanced beyond the rude simplicity of their primitive highland hamlets. The Sabines were a brave, stern, religious race, whose virtues were all of an austere and homely character. Cicero speaks of them as *severissimi homines*, and Livy notes the *disciplina tetrica ac tristis veterum Sabinorum* ('the stern and grave discipline of the old Sabines'), while the poets of the Empire—Horace, Virgil, Juvenal, &c., are fond of contrasting their simple uncontaminated modes of life with the vicious luxury and dissipation of the capital. What part, if any, they had in the foundation of the city of Rome, cannot now be ascertained, as the whole story of the Ramnes, Tities, and Luceres has come down to us in a purely mythical form (see ROME). Their native tutelary deity was 'Sancus,' or 'Semo-Sancus' = Lat. *Sanctus*, the 'Holy' or 'Venerable;' but like the other Latino-Sabellian races, they also worshipped Jove, Mars, Minerva, Sol, &c. That the S. were an ancient people in Italy, is certain. They were probably most nearly allied to the Umbrians, whose tutelary god was also 'Semo-Sancus;' and, in fact, they are generally considered an offshoot of that people; but they themselves, on the other hand, became so numerous that they were obliged to send forth numerous colonies, who founded new nations to the south and east, the Picentes, Peligni, Samnites (q. v.) &c.; while the Samnites (a name essentially the same as *Sabini*; the Greek form *Saunitai* = *Sav-nitæ* = Oscan name *Safini* or *Sabini*) in their turn became the progenitors of the Lucanians, Campanians, and Bruttii. Hence the epithet, *Umbro-Sabellian*, in use among classical ethnologists, to denote the whole of these kindred races, who were also allied, but less closely, to the Latins (see LATINI) and Oscans (see OSCI). Of the Sabine language, only a few words remain, which, however, seem to indicate that it differed from the Latin only dialectically: thus, Lat. *hircus*, Sab. *fircus*; Lat. *hostis*, Sab. *fostis*, &c.; analogous to the Aberdeen *filk* for 'whilk,' *fat* for 'what,' &c. For further information, see ROME, HISTORY OF.

SABLE (*Martes zibellina*), a species of Marten (q. v.), so nearly allied to the Common Marten and Pine Marten, that it is difficult to state satisfactory specific distinctions. The feet are covered with fur, even on the soles, and the tail is perhaps more

Sable (*Martes zibellina*).

bushy than in the British martens. The length, exclusive of the tail, is about 18 inches. The fur is brown, grayish-yellow on the throat, and small grayish-yellow spots are scattered on the sides of the neck. The whole fur is extremely lustrous, and hence of the very highest value, an ordinary S. skin being worth six or seven pounds, and one of the finest quality fifteen pounds. The fur attains its highest perfection in the beginning of winter, and the pursuit of the S. at that season is one of the most difficult and adventurous of enterprises. The S. is a native of Siberia, widely distributed over that country, and found in its coldest regions, at least wherever forests extend. The progress of geographical discovery in the eastern parts of Siberia has been much indebted to the expeditions of the hardy and daring S.-hunters, exploring new regions at the worst seasons of the year, and

spending dreary months at a great distance from all human abodes. The S. is taken by traps, which are a kind of pitfall, it being necessary to avoid injury to the fur, or by tracking it through the snow to its hole, and placing a net over the mouth of the hole. It is a very wary animal, and not easily captured. It makes its nest in a hollow tree, or sometimes, it is said, by burrowing in the ground, and lines it with moss, leaves, and grass. From this, it issues to prey on hares and smaller animals of almost any kind, its agility enabling it even to catch birds among the branches of trees. It is ready, when food is scarce, to eat the remains of an animal on which a larger beast of prey has feasted, and is said even to satisfy its hunger with berries in winter, when animal food is not to be had.

SABLE, one of the tinctures in Heraldry, implying black. In heraldic engravings, it is represented by perpendicular and horizontal lines crossing each other.

SABLE ISLAND. See NOVA SCOTIA.

SABLES D'OLONNE, LES, a seaport of France, in the dep. of Vendée. It owes its early importance to Louis XI., who excavated the port, and raised the fortifications. In 1688, its merchant marine was more important than that of either Nantes or Rochelle. The commerce is in grain, wines, cattle, fish (sardines), salt, &c. Pop. about 7000, who are almost all engaged in a seafaring line of life.

SABO'TS, a species of wooden shoes much used by the French and Belgian peasantry, especially by those who inhabit moist and marshy districts, as an effectual protective of the feet from external moisture. The fabrication of sabots forms an important branch of French industry, and is chiefly carried on in the deps. of Aisne, Aube, Maine-et-Loire, and Vosges. After being made, they are subjected to the smoke of burning wood, till they acquire that reddish colour so much prized in certain countries.

SABRE, a heavy sword, with which dragoons are armed. The back is thick, that a blow may carry the more force, and also to render the weapon useful in the rough thrust of a cavalry charge. A sabre is occasionally curved at the point, in the form of a scimitar.

SABRE-TA'CHE (Ger. *Säbeltasche*, sword-pocket), a useless square accoutrement which dangles against the legs of officers in some cavalry regiments. It purports to be a pocket for the conveyance of dispatches, &c., but probably is never used. The sabre-tache is hung by smaller ornamental belts from the sword-belt, and is itself covered with gold brocade, the emblems of the regiment, and other devices.

SABRI'NA LAND, discovered in the Antarctic Ocean, March 20, 1839, by Balleny, in lat. 69° 58′ S., long. 121° 8′ E. See ANTARCTIC OCEAN.

SA'CCHARIC ACID ($C_6H_{10}O_8$) is a product of the action of nitric acid, under certain conditions, on grape and cane sugar, or on starch, gum, and lignine. It occurs as a colourless, inodorous, deliquescent, gummy, uncrystallisable mass, which is freely soluble in alcohol. It is sufficiently powerful to dissolve iron and zinc, with extrication of hydrogen. It has a tendency to form double salts, so that it is probably a bibasic acid.

SACCHARO'METER, an instrument for determining the quantity of sugar in liquids, especially brewers' and distillers' worts. In principle, it resembles the hydrometer, used for ascertaining the strength of alcoholic liquids. It consists of a hollow sphere or oval of thin brass, with a graduated stem and a hook so placed opposite each other, that when placed in water, it floats, and the graduated stem stands upright on the top, and the hook is below, for the purpose of appending weights. The degree to which the stem sinks gives the means of calculating, by tables prepared on purpose, the proportion of saccharine matter present in the liquid.

SA'CCHARUM. See SUGAR-CANE.

SACCOTOO. See SOKOTO.

SACHEVEREL, HENRY, D.D., was born in the year 1672, at Marlborough, where his father was minister of St Peter's Church, and noted for his attachment to the High Church principles, which were afterwards embraced by his son. The youth was educated at the grammar-school of his native place, and at Magdalen College, Oxford, where he occupied chambers along with the celebrated Addison, who then and for many years afterwards seems to have entertained for him a warm regard. He obtained a fellowship in his college, and took successively the degrees of M.A. (1696), of B.D. (1707), and of D.D. (1708). In 1705, he became preacher of St Saviour's, Southwark; and in 1709, he delivered the two sermons—one at the assizes at Derby, the other on the 5th November at St Paul's—which have given him a place in the history of his country. The rancour with which he attacked in these sermons the principles of the Revolution Settlement, asserted the doctrine of non-resistance, and decried the Act of Toleration, excited the indignation of the Whig government of the hour, and led to his impeachment for high crimes and misdemeanours. His trial before the House of Lords took place in the spring of 1710, and resulted in his being found guilty, and suspended from preaching for three years, the obnoxious discourses being ordered to be publicly burned by the hangman. Of the rage of factions on the occasion, the fury of the popular excitement, and the excesses of the High Church party, an account in detail will be found in any history of the period. S. became for the time the most popular man in the kingdom, and the general election which followed was fatal to the government which had prosecuted him. When, in 1713, his suspension as by sentence expired, as a special mark of honour he was appointed by the new House of Commons to preach before them the sermon on the anniversary of the Restoration, and specially thanked on the occasion. A more substantial token of favour was his presentation to the rectory of St Andrew's, Holborn. Subsequently—except that there is some reason to believe he was more or less concerned in a plot to restore the Stuarts—he disappears from the sphere of history. He is said, in his later years, to have sought the excitement which may in some sort have become necessary to him, in a series of paltry and undignified squabbles with his parishioners. Nor in this is there anything improbable. His character was essentially a weak, vain, and shallow one, and he remains notable merely as one of those men, intrinsically insignificant, who have had a spurious notoriety and importance thrust upon them by the accident of foolish activity in a special concurrence of circumstances.

SACHS, HANS, the most prolific and at the same time the most important German poet of his time was born on the 5th of November 1494, at Nürnberg, where his father was a tailor. While at school, he learned the rudiments of Latin, but at no time of his life could he be called a scholar in the strict sense of the term, although he was certainly a well and widely-informed man. About the age of

15, he was sent to learn the craft of shoemaking; his love of verse, however, also led him to become a disciple of Leonhard Nunnenbeck, weaver and *meistersinger* in his native town. On finishing his apprenticeship, S., as was the custom of craftsmen in those days, made a sort of tour or pilgrimage through Germany, frequenting assiduously the verse-making schools or corporations organised by the trade-guilds in the different cities, the members of which, known as *meistersingers*, had, since the disappearance of the older *minnesingers*, or minstrels of chivalry, become the chief representatives of German poetry. On his return to Nürnberg, he commenced business as a shoemaker, prospered in his calling; and after a long, cheerful, and happy life, died on the 25th of January 1576, at the age of 82. S. was twice married—first to Kunegunda Kreutzer, who bore him five sons and two daughters; and afterwards, in his 66th year, to Barbara Harscher. His grave is still to be seen in St John's churchyard, Nürnberg. S.'s career as an author is divided into two periods. In the first, he shews an interest mainly in the occurrences that were then agitating Germany. It was the epoch of the Reformation of Luther, whose praises he celebrated (1523) in an allegorical tale entitled *Die Wittenbergisch Nachtigal*, while his poetical fly-sheets (of which about 200 are known) furthered in no small measure the Protestant cause. In the second period, his poetical activity was turned more to the delineation of common life and manners. His poetry is distinguished by its heartiness, good sense, homely genuine morality, and freshness; its clear and healthy humour, and its skilful manipulation of material. It is, on the other hand, deficient in high imagination and brilliant fancy, and contains large tracts of dry, prosaic, insipid verse. S.'s best productions are his *Schwänke*, or Merry Tales, the humour of which is sometimes unsurpassable; but his serious tales, allegorical and spiritual songs, and his dramas, also shew a great advance on his predecessors. His special *meistergesänge*, on the other hand, are of little or no value. Manuscript copies of S.'s poems —some in his own handwriting—are to be seen in the libraries at Zwickau, Dresden, Leipzig, and elsewhere. When S. had reached the 52d year of his career as a poet, he took stock of his work, and found that he had written 34 vols., containing upwards of 6200 pieces, among which were 4275 meistergesänge, 208 comedies and tragedies, about 1700 merry tales, secular and religious dialogues, proverbs, and fables, 7 prose dialogues, and 73 songs, secular and devotional. The first edition of his works was published at Augsburg in 1558, but the best is that of Willer (5 folio vols. 1570—1579); a later quarto edition, known as the *Kemptener*, appeared in 1612—1617, and was republished at Augsburg in 1712. After the middle of the 17th c., when a deep stupor seized the German mind, and it could produce nothing but tomes of idle theology, varied by an occasional hymn of more or less merit, S., with all his poetic brethren, suffered a total neglect, from which he did not recover till Goethe wrote his pleasant poem, *Hans Sachs, Erklärung eines alten Holzschnitts vorstellend Hans Sachs's poetische Sendung* (1776), since which time partial collections of S.'s works have frequently appeared.

SACK, a large bag made of a coarse hempen cloth called sacking or sackcloth. Such bags are used for the conveyance of corn, flour, and other bulky articles. A corn-sack is usually made to contain four bushels, hence it is constantly spoken of as a measure of quantity, two sacks being equal to one quarter of corn

SACK. A name in common use in the time of Shakspeare, and occurring down to the middle of the 18th c. as denoting a kind of wine. The exact nature of this famous wine, the favourite beverage of Falstaff, and the origin of the name, have been much discussed. Sack or seck seems to be simply an English disguise of the Spanish *seco* (Fr. *sec*), applied to wines of the sherry genus, as distinguished from the sweet wines; a term which we now translate by 'dry.'

SA'CKBUT (Fr. *saquebute*), the name under which the Trombone (q. v.) was known on its first introduction to England.

SA'CKETTS HARBOR, a village and port of entry in Jefferson County, New York, U. S., on the south shore of Black River Bay, 8 miles east of Lake Ontario, 170 miles west-north-west of Albany, having a navy-yard, barracks, mills, &c. It is the best harbour on the lake for ship-building. In the war of 1812, it was an important port, where the frigate *Superior*, of 66 guns, was built in 80 days, and the *Madison* in 45 days, from timber standing in the forest. It is a military post of the United States, named Madison Barracks, but is not at present garrisoned. The trade is on the decline. The population of the town is now but 2000 or 3000.

SACKVILLE, Thomas, Earl of Dorset, an English poet and statesman, was born at Buckhurst, Sussex, in 1536. He was the only son of Sir Richard Sackville; studied at Oxford and Cambridge, where he acquired a high reputation as a poet both in Latin and English, and afterwards became a student of the Inner Temple. While a member of this society, he wrote, along with Thomas Norton, a blank-verse tragedy, called *Ferrex and Porrex* (afterwards called *Gorboduc*), which was performed before Queen Elizabeth at Whitehall in 1561—1562. This work, the plot of which is founded on a British legend, claims particular notice as the earliest tragedy in the English language. It is moulded to some extent on the classic drama, the incidents being moralised at intervals by a chorus. It has no dramatic life or energy, but the style is pure and stately, evincing eloquence and power of thought. S.'s other productions (first published in 1563) are the *Induction*, a poetical preface to the *Mirrour for Magistrates*, and the *Complaint of the Duke of Buckingham*, which was designed to conclude the work. The *Induction* is a noble poem, uniting, as Hallam says, 'the school of Chaucer and Lydgate to the *Fairy Queen*,' and almost rivalling the latter in the magnificence and dignity of its allegoric personifications. The influence of Dante is very perceptible. S. now abandoned literature, and after travelling in France and Italy, returned to England, and entered public life. Soon after his father's death in 1566, he was created Lord Buckhurst, became a favourite with the queen, who employed him in foreign diplomacy, and on the death of Burleigh, succeeded him in his office of Lord High Treasurer (equivalent to Prime Minister in those days), in which capacity he shewed himself not inferior in sagacity and fidelity to his great predecessor. On the accession of King James, his patent of office was renewed for life; and in the following year, he was created Earl of Dorset. S. died April 19, 1608, and was buried with ceremony in Westminster Abbey. His works are edited by the Rev. Sackville West, in Smith's *Library of Old Authors* (Lond. 1859).

SA'CO, a river of New England, U.S., rises in the White Mountains of New Hampshire, runs south-easterly through the south-western portion of Maine, through Saco Bay, to the Atlantic Ocean. Its course of 160 miles is almost a continuous

succession of falls, the last being but 4 miles from its mouth, affording water-power to numerous factories.

SACO, a town in Maine, U.S., is built on the east bank of the Saco River, at its last falls, 4 miles from its mouth, 14 miles south-west of Portland. It has numerous manufactories, including 5 cotton-mills, which produce 7,000,000 yards annually, 4 saw-mills, and several ship-yards. Pop. (1860) 6223.

SA'CRAMENT (Lat. *sacramentum*, *mysterium*, Gr. *mysterion*), the name given by theological writers to certain religious rites, the number as well as effects of which are the subject of much controversy between various bodies of Christians. The word *sacramentum*, in primitive classical usage, meant either the oath taken by soldiers on their first enrolment, or the sum of money deposited by suitors on entering upon a cause, and forfeited 'to sacred uses' by the unsuccessful party; and the corresponding classical Greek word *mysterion* meant not merely the secret religious ceremonies practised in the worship of certain gods, but also any revealed secret. It is certain, nevertheless, that at a very early period of the Christian Church, both the Latin word and its Greek equivalent came to be applied specially to certain rites of the Christian ceremonial, and chiefly (or as is commonly held by Protestants, exclusively) to those of baptism and the Eucharist. Of the catechetical lectures of St Cyril of Jerusalem, the lectures devoted to the subject of baptism and the Eucharist are called 'mystagogic lectures.' For our purposes, it will be enough to state concisely what are the views of the several religious communities on this much controverted subject, which formed one of the earliest grounds of division between the Roman Church and the Reformers of the 16th century.

In the Roman Church, it is held that there are seven sacraments, viz.: Baptism, Confirmation, the Eucharist, Penance, Extreme Unction, Holy Orders, and Matrimony. The special teaching of Catholics on each of these rites will be found under the several heads; but there are certain general principles regarding them all, on which the Roman Catholic doctrine differs widely from that of the Reformed communities. Catholics define a sacrament to be a visible or sensible sign permanently instituted by God, and conveying real interior grace to the recipient, and they teach that all sacraments contain within themselves, as instruments, and, when they are received with proper dispositions, produce such grace by the virtue imparted to them by God, and not merely through the faith of the recipient; although they hold that proper dispositions on the part of the recipient, as sorrow for sin, love of God, pious resolves, &c., are conditions indispensable for the efficacy of the sacramental rite. See OPUS OPERATUM. They divide the sacraments into two classes, 'sacraments of the living,' and 'sacraments of the dead.' The first class comprises the Eucharist, Confirmation, Holy Orders, and Matrimony—all which sacraments can only be received fruitfully by persons in a state of grace or justification. The second includes Baptism, Penance, and Extreme Unction, the special purpose of which is to remit sin, and which therefore can be received by persons in a state of sin, but penitent for that sin, and resolved to amend their lives. Of three of the sacraments, viz., Baptism, Confirmation, and Holy Orders, it is held that they imprint a 'character,' and therefore that they can only be received once. The others may be repeatedly received, but under conditions which will be learned under each separate head. Two things are held to enter into the constitution of the sacrament—viz., the 'matter' and the 'form.' By the former is meant the material element or the physical action whereby that element is applied to the recipient of the sacrament; as water in baptism, oil in extreme unction, and in both the act of washing or of anointing. By the latter is understood the form of words employed by the minister in communicating to the recipient the external rite in which the sacramental act consists. The minister of a sacrament is the person who is supposed to be divinely authorised to impart it. The minister is different for different sacraments, as will be found under each separate head.

The Reformed Churches have for the most part discarded these views. By the majority of them, the sacraments are held to be merely ceremonial observances, partly designed as a solemn act, by which each individual is admitted to membership, or desires to make solemn profession thereof; partly intended to stimulate the faith and excite the fervour and the pious dispositions of the recipient, to which dispositions alone all the interior effects are to be ascribed. As to the number of rites called by the name, almost all Protestants agree in restricting it to two—viz., Baptism and the Lord's Supper; although some of the rites which Catholics regard as sacramental are retained by some of the Protestant communities as religious observances. In the English Church, however, there has always been a school in which opinion tending towards the Catholic view has prevailed. Not only has this school ascribed to the two rites of Baptism and the Eucharist or Lord's Supper (q. v.) the power of producing an interior grace (which in the former is called regeneration); but many of them have been willing to call the other rites, especially confirmation, penance, and holy orders, by the name of sacrament, although of a secondary character, and not 'generally necessary to salvation.' See TRACTARIANISM. The controversy on these questions has been recently the subject of more than one proceeding in the ecclesiastical courts and in the Privy Council of Great Britain.

SACRAMENTA'RIAN, the name given in the 16th c. to the party among the Reformers who separated from Luther on the doctrine of the Eucharist. Luther (q. v.) taught the doctrine of the real presence of the body and blood of Christ along with the bread and wine (see LORD'S SUPPER; REAL PRESENCE). The first of his followers who called this doctrine in question was Andrew Carlstadt; and notwithstanding the protest of his leader, Carlstadt had many followers, the most active of whom were Capito and Bucer. The party became so considerable, that in the diet of Augsburg they claimed to present a special confession distinct from that put forward by the general body. The sacramentarian confession is known in history by the name of the Tetrapolitan Confession—so called from the four cities, Strasburg, Constance, Lindau, and Memmingen. The Tetrapolitan Confession rejects the doctrine of a corporeal presence, and although it admits a spiritual presence of Christ which the devout soul can feel and enjoy, it excludes all idea of a physical presence of Christ's body. Simultaneously with this German movement, yet independent of it, was that of the Swiss reformer Zwingli, whose doctrine on the Eucharist was identical with that of Carlstadt, and who himself presented a private confession of faith to the Augsburg diet, in which this doctrine is embodied. The four cities named above continued for many years to adhere to this confession presented to the diet of Augsburg in their name; but eventually they accepted the so-called Confession of Augsburg, and were merged in the general body of Lutherans.

On the contrary, the article of Zwingli upon the Eucharist was in substance embodied in the confession of the Helvetic Church.

SACRAME'NTO, a city and port of entry and capital of California, is built on the east bank of the Sacramento River, 120 miles from the sea, lat. 38° 33′ N., long. 121° 20′ W. The streets cross each other at right angles on a level plain, only 30 feet above the sea. The stores and shops are built of brick, the dwellings of wood, with shade-trees and gardens. The principal public buildings are the state capital, custom-house, and post-office, public schools, a high school, and library. The chief trade is furnishing supplies to the mining districts. S. was settled in 1839 by Captain Sutter, a Swiss, who built a fort. In 1848, the first town-lots were sold, and the first house was built in 1849. It is the S. W. terminus of the Central Pacific R. R., and of the California and Oregon R. R., and is connected with San Francisco by rail. In 1854, it became the state capital, and in 1870 had a population of 16,283.

SACRAMENTO, a large river in California, U.S., which, with the San Joaquim, drains the Great Central Valley. It rises in the north-eastern part of the state, in the Sierra Nevada, by North and South Forks, where, during its south-westerly course of 200 miles, it is called Pitt River and Upper Sacramento; thence it flows nearly due south, receiving numerous branches from the Sierra Nevada on the east, and the coast-range of mountains on the west, until it unites with the river San Joaquim, and flows westerly through San Pablo and San Francisco bays to the Pacific Ocean. It is navigable to Sacramento, 50 miles from San Pablo Bay, and for small vessels 150 miles further, its entire length being about 500 miles.

SACRA'RIUM, a sacred apartment in Roman houses.

SACRED HEART OF JESUS, FEAST OF, a festival of comparatively modern institution in the Roman Catholic Church, and for a time the subject of much controversy among Roman Catholics themselves. Its origin is traced to a vision which is recorded of a French nun, of the order of the Visitation, named Mary Margaret Alacoque, who lived at Paray la Moniale, in Burgundy, in the latter half of the 17th c., and whose enthusiasm led her to practise a special devotion to the heart of the Saviour. This devotion was gradually propagated in France, and at length was approved by Pope Clement XII. in 1732 and 1736, and by Clement XIII. in 1765. The festival is held on the Friday after the octave of Corpus Christi. Confraternities of the Sacred Heart are disseminated through all parts of the church.

SACRED MUSIC. Music has, from very early times, been connected with religious rites. It entered into the worship of the Jews, and both sacred and profane history tell us that, in the primitive Christian Church, the service consisted partly of music. Little is known regarding the kind of music used by the early Christian converts; it has been supposed to have been partly Greek, with an intermixture of Hebrew melody. As early as the time of Ignatius, who was a disciple of St John, the Psalms of David were sung *antiphonally*, as practised at the present day—i. e., by two choirs responding to each other, which had doubtless been formerly the practice among the Jews. At first, the whole congregation, clergy and laity, joined in the psalm; but difficulties and abuses having arisen from the growing neglect of musical culture, the Council of Laodicea, in 363, found it necessary, for the securing of decency and order in worship, to prohibit the laity from singing in church except in certain chants of a very simple and popular character. From that period down to the Reformation, the music of the church was almost entirely surrendered to the clergy and trained musicians. See PSALMODY.

The first name of importance in the history of the music of the Western Church is St Ambrose, (q. v.), whose musical service (see AMBROSIAN CHANT) was reformed by Pope Gregory (see GREGORIAN CHANT). The use of the organ in churches dates from about the 9th c., and some centuries later, Counterpoint (q. v.) was introduced to a limited extent into the music of the church. Among the corruptions which followed it, some are of a nature the very mention of which startles us. Not merely were popular melodies of a secular nature often taken and worked up into church music, but the secular words were actually transplanted into the religious compositions, being habitually given out by the tenor voice, while the actual solemn words of the church service were being sung by soprano, alto, and bass. Papal bulls having sought in vain to combat this abuse, it was brought under the cognizance first of the Council of Basel, and then of that of Trent. The Council of Trent prohibited the performance of any mass or motett of which profane words formed a part, and also of music founded on secular themes. Some compositions of Palestrina were singled out for praise, and their author was intrusted with the task of remodelling this part of religious worship. He composed three masses on the reformed principle, one of which, known as the *Missa papæ Marcelli* (so called as being a tribute of gratitude to the memory of that pontiff), may be looked on as having saved music to the church, by establishing a type far higher than anything that had preceded it, and still revered by all lovers of music. The *mass* (including the *offertory* and *gradual*) has always continued to be an important part of the sacred vocal music of the Roman Catholic Church, and affords large scope for the display of the higher qualities of musical composition.

Various new types of music sprang up in the different Protestant churches after the Reformation. The solemn and measured *chorale* (q. v.), or melody to which psalms or hymns are sung in unison, though generally associated with the Lutheran Church of Germany, was in reality handed down from a very early period. Psalmody in its modern sense may be considered to have originated in the 16th c., when Clement Marot, the court poet of Francis I., translated fifty-two of the Psalms into French verse. Psalm-singing was at first a fashionable amusement of the gay courtiers of Francis; but being taken up by the Reformers, was soon discountenanced by the Roman Catholics, and looked on as a badge of Protestantism. See PSALMODY.

In the full choral service of the Church of England, as performed in cathedrals and collegiate churches, the greater part of the prayers and the litany are *intoned* or read in monotone (see INTONING), the monotone being occasionally varied by harmony at the close. The Psalms and *Gloria Patri* are chanted with the accompaniment of the organ, as also are the various canticles; the latter, however, particularly the *Te Deum*, being often sung to rhythmical music of a more elaborate kind, called *services*. The form of the Anglican chant now used for the Psalms seems to have been invented by Tallis. In the single chant, each verse is sung to the same music; in the double chant, the whole occupies two verses. The antiphonal chanting, with the Anglican double chant, has sometimes been objected to as repugnant to the proper expression of the words, as coupling verses between which there

is a full stop in the sense, and as placing a full stop when the sense runs on; and among the High Church party there has been a disposition to recur to the Gregorian chants, whose indefinite musical expression, absence of rhythm, and uncertain accent, give them a power of bending to the requirements of the words. The Gregorian chant has, however, not succeeded in making its way into the service of any of the English cathedrals. The *anthem* forms a part of the complete musical service. It is somewhat similar in character to the motett of the Roman Catholic and Lutheran churches; a sacred cantata, in which the words are taken from the Psalms or other portions of Scripture; and the music is for solo, parts, or chorus, or a mixture of the three.

In the Presbyterian churches of Scotland, psalmody has formed almost the entire music; while hymns—sometimes not of a very solemn or devotional character—predominate among the English dissenters. Some years ago, church music in Scotland had fallen to the lowest state of degradation; but efforts have lately been made, with some success, to raise its character. Even organs, which were proscribed by the early Scottish reformers, and have ever since been in disfavour, have begun to be introduced; and chanting has been admitted into some few Presbyterian churches.

Of sacred musical compositions not intended to form part of the service of the church, the most important is the *Oratorio* (q. v.), a composition either entirely dramatic, or combining the drama and epic, where the text is illustrative of some religious subject, and the music consists of recitatives, airs, part-songs, and choruses, accompanied by orchestra and organ.

SA'CRIFICE, one of the most important elements of divine worship, common to all nations of antiquity, and therefore traced by some to a primeval revelation. The powers of nature, palpable in their effects for good and evil, could not but inspire man, even in his rudest stage, with gratitude or fear towards the unseen being or beings by whom he conceived them to be actuated. The next and most natural step was the outward manifestation of these feelings by a token which bespoke either thankfulness or the wish of conciliation on the part of the donor. The supreme numina being conceived merely as superior men with exaggerated human wants, the means taken to gratify them were adapted to this conception. The best and first fruits of the soil, the finest and most immaculate animals of the flock, were offered to the gods, that they might either partake of them bodily, or at least enjoy the sweet smell arising from the altar on which they were burned in their honour; and the deity was supposed emphatically to express its readiness to accept the offering by sending down the fire that was to consume the animal prepared. The more the divine favour was sought for some special purpose, the costlier and more precious became the gift; and nothing short of the most startling proofs of self-abnegation seemed, at times, to satisfy the devotion of man in his uncultivated state. From the simple and child-like notion of establishing a certain kindly and permanent relation between the invisible powers and man, by the yielding up on the part of the latter a certain more or less precious portion of what the former had given him, there grew up such horrible monstrosities, that, in honour of humanity, we should feel inclined to doubt them, were they not so well attested, and did they not, to a certain extent, still prevail in our own days. Method and system took in hand that undeveloped child-like instinct which touchingly offered the deity a flower, a blooming bough, a golden fruit; and degraded it into mysticism and superstition; ending at last in the theory that the divine revenge was to be gratified, the divine vanity flattered, and the deity made as generally pleased as could be by holocausts of human beings, friends or foes—nay, the dearer the being to the offerer, the more the self-abnegation must become patent, and the more the god must smile upon the donor. The Moloch worship—the mother placing her babe in the arms of the monstrous idol, and seeing it slowly burned before her own eyes—seems well nigh to exhaust all the horrors of human ingenuity.

Turning first of all to those most ancient and hallowed records of humanity contained in the Old Testament, we find the custom of sacrifices almost on its first pages, and spoken of as a rite already established. Sacrifice is the cause of the first murder on record. Abraham is prevented by a voice from heaven from carrying out the slaughter of Isaac, into which he had been 'tempted' by Jehovah; all the patriarchs, in fact, sacrifice, either independently or in ratification of a covenant; and the exodus itself was brought to pass under the pretence of the people having to offer up their wonted sacrifice in the desert.

According to the highest ancient authorities, both Jewish and Christian—of whom we will only mention Maimonides and Ephraem Syrus—the Mosaic sacrifices were neither more nor less than a kind of divine concession to the sensual nature of an uncultivated people, full of Egyptian reminiscences on the one hand, and surrounded by Canaanitish modes of worship on the other. It was, as Ephraem Syrus says, only at a very late period that Moses, by the command of God, in whose eyes the rites of priests and sacrifices have but little value, prescribed these observances to his people, on account of their weakness and hardness of heart—lest they might despise a 'naked' religion, and attach themselves to false gods, whose magnificent and dazzling cultus surrounded them on all sides. In corroboration of this view, the prophets are appealed to, who never cease to inveigh against sacrifice as such, when, according to their view, the people were educated enough to do without this symbol and to worship God in truth and in spirit. (Compare Jeremiah vii. 22; I Samuel xv. 22; Psalms l. 8—10; li. 18, 19; Isaiah i. 11, &c.) But the institution being deemed necessary for the time, legislation had to circumscribe it rigorously, so as to make it as little hurtful as possible. Ceremonies contrary to morals and decency, such as were practised in the temples of Canaan, the abominations of phallic rites, the sacrifices of virginity, and, finally, the offering up of human beings, were punished with instant death by the Mosaic law.

How the principal modes of sacrificial offerings, such as they had naturally developed, nearly alike everywhere throughout antiquity, and as they had obtained in the pre-Mosaic times among the Hebrews, were adopted in the Mosaic legislation, and adapted to its exalted religious character, we can only indicate here in the briefest outlines. These pre-Mosaic sacrifices were chiefly of three kinds: first, the 'propitiatory,' i. e., an offering enjoyed by the deity in any form that would be grateful to him, conciliate him, procure his aid and blessing in times of need or for some special undertaking, and would further obtain his forgiveness, if something had been done unwittingly that might have offended him. This kind of sacrifice, whether bloody or unbloody (e. g., harvest sacrifice), appears to have been fully burned (*Olah*). The second kind partook more of the nature of sacrificial meals, in which both the divinity, the priest, the man who offered the sacrifice, together with his

friends, took a part. It was a solemn and joyous oblation, expressing the thanks of the individual for some obtained favour, in which he wished others to join. Only the parts supposed to be the choicest were burned upon the altar; the priests received some other parts, and the rest formed the grateful sacrificial repast (*Sebach Shelamim*). The last was the expiatory sacrifice, intended as an equivalent for some deadly crime, which either was not punishable by the existing laws, or which had been committed under circumstances that would not have warranted capital punishment. From the notion that the blood of the murderer was necessary for 'the cleansing of the blood that is shed' (cf. Numb. xxxv. 33), sprang that other, it would appear, that there was expiatory power in the blood itself; and that further, the blood of an animal was a fitting representative of, and equivalent for that of the human criminal, who had only to transfer, as it were, his sin to the animal by placing his hand upon its head, and perhaps using a formula to that effect. The flesh of this animal was not deemed fit for the altar, and was probably burned at some other place (*Chattath, Asham*). The Mosaic legislation finding such general elements ready, proceeded eclectically. They were partly embodied with considerable alterations, and partly rejected unconditionally. The anthropopathic idea of the 'agreeable smell,' as well as the notion of the expiatory power of the blood, were retained—the latter, however, with this modification, that the poor were allowed to use flour instead of meat for their sin-offerings. But the principal alterations introduced were the abolition of all polytheistic rites from the sacrificial service, of all the immoral, obscene, and horrible ceremonies connected with the heathen practice, and finally, the totally different definition and limits given to the 'sin-offering.' While formerly, everything could be expiated by a sacrifice, henceforth, only unpremeditated sin could by this means be effaced; while there was no expiation for any premeditated crime; the law simply took its course in that case.* Further, many things till then permitted were prohibited, and thus fell under the denomination of 'sin;' and certain purifications—beneficial in themselves—were connected with the expiatory sacrifice, and their practice thus strongly enforced. This extension of the notion of 'sin-offering' rendered a subdivision of it necessary; the more venial, or rather unconscious transgressions, were treated differently from the less pardonable ones in the ritual.

While Mosaism thus seemed, in its adoption of the rite of sacrifice, to make one of the most important concessions to heathenism, this very rite was, on the other hand, calculated to attract the early Hebrews to the worship of Jehovah, and at the same time to wean them from the horrible practices connected with it among the Canaanites. But more; during the primary stages of the people's existence, it served, by inculcating observances which were at once hygienic and symbolic of purity and holiness, as a powerful means of education and culture. In order, however, that these beneficial consequences premeditated by the lawgiver should not be frustrated, it was necessary, above all things, to keep the strictest possible supervision over it; and this was best established by the legal transfer of the whole sacrificial service to one single spot of the land, finally, the temple at Jerusalem. The 'heights' and their 'heathen abominations' were thus theoretically abolished, and the sacrifice that only at one central point could in reality be said to be offered up for the 'whole community of Israel,' went far, under these circumstances, to awaken and to strengthen a common spirit of nationality and patriotism, which was further aided by the periodical pilgrimages. For the details of the Jewish sacrifices, we must refer to the Old Testament generally.

As to the different opinions held by Jewish and Christian authorities regarding sacrifice, when offered up in expiation of a sin either by the people or by individuals, suffice it here to mention that they are divided between the various notions of the offering being either a present to the offended deity, a civil punishment (*mulcta*), or, finally, a kind of substitute for the sinners themselves. The latter is the view held by many of the rabbinical writers as well as church Fathers. The life (Nephesh) of the animal or its blood (Lev. xvii. 11) was distinctly said to make 'the atonement for the soul.' This notion of a representative victim is one that belonged to the whole ancient world, and often finds its expression in the Old Testament. The sacrifice of the covenant (Jer. xxxiv. 18, &c.), the scapegoat (Lev. xvi. 21), and the like, are so many embodiments of this idea; which by Christian divines is held to have found its acme and final fulfilment in the sacrifice of God himself, as the 'Man Christ,' who united in himself the priest, the offerer, and the sacrifice. In fact, the whole institution of sacrifices is throughout the New Testament and the Fathers held to have been merely typical of this final act, by which the sin of man was expiated. See ATONEMENT, MASS.

The Jewish sacrifices, rejected already by the Essenes, ceased with the downfall of the Temple in Jerusalem; although the Samaritans, who claim to retain exclusively the Mosaic covenant, still continue this rite on Mount Gerizim on the Passover. The orthodox Jews, however, include in the prayers for the restoration of the visible sanctuary on Zion, also that of the restoration of the sacrifices 'in their order and proper rule,' 'of the priests to their service, and the Levites to their songs and hymns,' and each day, Sabbath, or Feast, the sacrifice incumbent upon it is mentioned in the prayers; and on fast-days, especially on the day of atonement, the diminution of bodily substance supposed to arise from the abstinence, the 'fat and blood' may, it is supplicated, be considered by God as tantamount for that of the sacrificial animals which, through their sins, the people are not now deemed worthy of offering up. The modern (extreme) party of reformed Jews, however, repudiate, together with the literal interpretation of the Messianic prophecies, also that notion of the sacrifices ever being restored again.

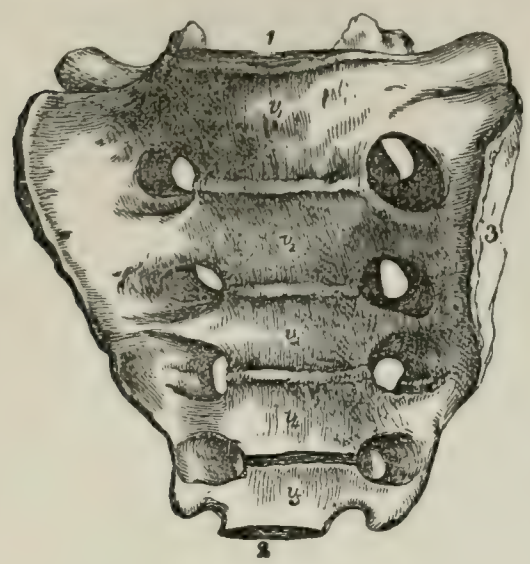
We can only very briefly touch upon the sacrificial customs among other nations of antiquity. The same feeling of dependence upon supreme, invisible, but ever-present powers, engendered, as we said at the beginning, everywhere nearly the same expressions of awe, gratitude, and the like. The gifts proffered differed, according to the degree of culture, the mode of life, and the products of the soil among the different peoples. No less was the significance attached to the gift different in proportion to the mental development of those who offered; at one time considered as a present to be taken and sensually enjoyed, as it were, by the Deity, it at others assumed a higher and purely symbolical aspect, as an expression of gratitude, love, repentance. In the same proportion, the gifts themselves varied, not only respecting their nature, but also

* One of the most characteristic exceptions, however, was that in favour of those who had denied the possession of some pledged article, or who had wilfully cheated or robbed their neighbours. If they were eager to make voluntary and ample restitution, 'the door of repentance was opened to them,' and they were allowed to make public expiation through sacrifice.

respecting their value. While Mongols and Tartars, Lapps and Negroes, most of the ancient nomad tribes in fact, generally sacrificed the milk and the uneatable parts of the animal only, its bones, horns, skin, &c.; the Greeks and Romans offered not unfrequently thousands of the choicest, most immaculate animals, and the sacrificial vessels were with them, as with the Hebrews, wrought of the most precious metals. Votive offerings—arms, spoil, garments, tools, locks, poems, &c.—customary in the better days of Rome and Greece; and the sacrifice of chastity on the part of maidens and women—chiefly the custom of Babylon, Phœnicia, Cyprus, &c., likewise fall under the denomination of sacrifice in its wider sense. Among the Indians, Bactrians, Medes, and Persians, the sacrifices consisted of fruits, libations, animals, and the like, and were of many degrees and numbers. Among the first-named, the study of the Vedas was reckoned as the first round in the sacrificial ladder. With the Persians (see GUEBRES, PARSEES), the priests at the Daruns sacrifice, instituted in honour of Zerdusht the lawgiver, eat small unleavened cakes, and drink Hom-juice, which is to represent the blood of the prophet. They also have sacrifices for the souls of the deceased. The Buddhists offer flowers and first-fruits only; their animal sacrifices are represented by small animal figures kneaded of dough, offered up on certain occasions. Of the 'classical' peoples and their sacrificial debauches, which followed the primeval frugality in their offerings no less than in their lives, we need not speak here, save as far as they, too, indulged in the rite of human sacrifice from their very earliest period to their decadence. Among the Greeks, the legendary tales of the daughters of Erechtheus, and of Iphigeneia in mythical times, the sanctuary of Zeus Laphystius at Halos and at Lycæa, in Arcadia, the offering up of three Persians by Themistocles before the battle of Salamis, are tokens sufficiently indicative of the generality of the practice. Among the Romans, human sacrifices, in use during the Republic—either enthusiastic voluntary deeds of patriotism, or simply a kind of execution in punishment of a deadly sin—were prohibited in later times by the senate; but both Augustus and Sextus Pompeius committed wholesale murders by way of political sacrifice to the gods. That this abomination of slaughtering men in honour of God at stated periods, flourished to an awful extent among our northern ancestors—Scandinavians and Germans, as well as among Gauls and other Celts—need hardly be added. At Upsala, every ninth year, a great sacrifice of expiation was offered up, consisting of nine human beings and sixty-three animals. The Danes, in the same manner, held a sacred sacrifice every ninth year, of ninety-nine men, besides horses, dogs, cocks, and other domestic animals (see the EDDAS; Muller, *Sagenbibliothek;* Pertz, *Mon. Germ. Hist.; Script. passim*, &c.). The German tribes, even after their conversion to Christianity, continued to offer up their prisoners of war, as of yore, just as the Franks brought their sacrifices both to their ancient gods and to Christ. Any illness, danger, sickness—the slightest inducement, in fact, sufficed to move the Gauls towards a human holocaust, in the fashion of the worshippers of Baal and Moloch. At the death of a man, all his possessions, movable and immovable, including slaves, clients, wives, and all, were offered up to his manes. See SUTTEE. That the ancient Mexicans, the negroes, and other wild tribes, were highly proficient in this sort of wholesale slaughter, need hardly be added: the king of Dahomey's practices, and the fruitless remonstrances of our own government, are a too well-known illustration of the firm hold this kind of murder in honour of the Deity has of the human mind. In conclusion, may we not consider the cruelties and massacres committed upon the Jews in the middle ages, in the name of Christ, as a last offspring of that Moloch or Baal worship which seems to be an instinct in the superstitious mind, whether Pagan or Christian?

SA'CRILEGE is not now a legal, but is a popular term used to denote the breaking into a place of worship, and stealing therefrom. In England, whoever breaks and enters any church, chapel, meeting-house, or other place of divine worship, and commits any felony therein; or whoever, being in such places, shall commit any felony therein, and break out of the same, is guilty of felony, and liable to penal servitude for life, or for not less than three years, or to imprisonment for a term not exceeding two years, with hard labour. The legal offence comes generally under the head of burglary or housebreaking. A less punishment applies to the offence when committed in dissenting chapels.—In Scotland, there is no increase of severity in the punishment, by reason of the sacred character of the things stolen.

SA'CRISTAN (Lat. *sacra*, sacred things), an official attached to a church, who is charged, under the priest or ruler of the church, with the care of the church, and of all its appurtenances. It is his duty to open and close the church, to take care of the sacred vestments and utensils, and to prepare what may be required for public service. In some Roman Catholic churches, the sacristan is a clerk in minor orders. The English name sexton is derived from this word.



SA'CRISTY, an apartment attached to a church, in which are kept the sacred objects used in the public worship, and in which the clergy and other functionaries who take part in the service assemble and prepare for the ceremonies on which they are about to enter. In many foreign churches, the sacristy is a spacious and costly building.

SACROBOSCO, JOANNES DE (Anglicè, *John of Holywood*), was an English mathematician of the 13th c., entered the university of Paris in 1221, and afterwards became professor there. He died at Paris in 1256 S. was one of the first doctors of the middle ages who made use of the astronomical writings of the Arabians. His treatise, *De Sphæra Mundi*, is merely a paraphrase of a portion of Ptolemy's *Almagest*. No book enjoyed greater renown as a manual among the scholastics. First published in 1472, it passed through more than 20 editions—some even say 65—with as many commentaries. Other works of S. are *De Computo Ecclesiastico* and *De Algorithmo*, one of the first works on arithmetic in which the numerical notation of the Arabs is employed.

SA'CRUM, or OS SACRUM, is a triangular bone situated at the lower part of the vertebral column (of which it is a natural continuation), and wedged between the two innominate bones so as to form the keystone to the pelvic arch. It is readily seen to consist of five vertebræ with their bodies and processes, all consolidated into a single bone. Its anterior surface (as shewn in the figure) is concave, not only from above downwards, but also from side to side. The posterior surface is convex, and presents, in the middle vertical line, a crest, formed by the fusion of the spines of the vertebræ, of which the bone is composed. The last sacral vertebra has, however, no spine, and the termination of the vertebral canal is here very slightly protected.

Various reasons have been assigned for the peculiar name assigned from very olden times to

this bone. One of the reasons assigned is, that it was the part used in sacrifices. Another reason is based on the view maintained by the Jewish rabbins,

Sacrum.

1, Surface articulating with last lumbar vertebra; 2, surface articulating with coccyx; 3, surface articulating with the os innominatum; v_1, v_2, v_3, v_4, v_5, the bodies of the five sacral vertebræ.

who held that this part of the skeleton, which they called 'luz,' resisted decay, and became the germ from which the body would be raised:

> 'From whence the learned sons of art
> *Os sacrum* justly call the part.'
> Butler's *Hudibras*, cant. ii. part iii.

SACY, Antoine Isaac, Baron Silvestre de, one of the most celebrated orientalists, was born at Paris in 1758. After being grounded in the classics, he commenced at the age of 12 the study of Hebrew, to which, as he advanced in years, he added the other branches of Semitic—Syriac, Aramaic, Samaritan, and finally Arabic. Persian and Turkish he acquired still later; but though one of the greatest masters of Arabic and Persian that ever lived, he never made much progress in Turkish. Modern European languages and jurisprudence formed collateral branches of his stupendous acquisitions. From 1781, he held various appointments under government, chiefly in the Mint. His first appearance in the world of letters dates from 1780, when he commenced to contribute to Eichhorn's celebrated *Repertorium*. In 1785, he was elected a member of the French Academy; and a number of monographs by him followed each other in quick succession in the Transactions of this body, chiefly on Arabic and Persian history, literature, and antiquities. In 1793, he published his first great work, the *Annales de Mirkhond*, translated, with an extensive commentary, from the Persian. In 1792, he retired from the service of the government, to devote himself exclusively to his favourite studies; in 1795, he was appointed to a Chair in the newly-founded Ecole des Langues Orientales; but refusing to take the oath of hatred against royalty, he was not allowed to teach. In 1803, when the Institute was completely reorganised, he took his seat there again; and shortly after was nominated Professor of Persian at the Collége de France. In 1808, he became a member of the Corps Législatif, and was subsequently attached to the Commission and Council of Public Instruction. In 1822, he was made Administrator of the Collége de France and the Ecole Spéciale des Langues Orientales; and in the same year he founded, with Abel Rémusat, the Société Asiatique. Under the new Orleans government, to which he soon attached himself, he was nominated Inspector of the Oriental Type of the Oriental Printing-office, and Perpetual Secretary of the Académie des Inscriptions. Yet, with these numerous offices on his shoulders, to all of which he attended most conscientiously, he never for one instant relaxed in his studies; and the number of his essays, memoirs, pamphlets, papers, &c., besides his larger works, is perfectly prodigious. He died, full of years and honours, in 1838, and was buried in the Père Lachaise. The Academy had a medal struck in his honour, and his bust was placed in the library of the Institute. Oriental studies owe to him more, almost, than to any other orientalist of our age. Irrespective of his own brilliant and numerous labours, he furthered and promoted his favourite science in every possible way—founding, or causing to be founded, oriental chairs in France; and forming such disciples as Freitag, Kosegarten, Rasmussen, Chézy, Quatremère, Jaubert, Saint-Martin, and others of more or less eminence as orientalists.

Among his works we would chiefly enumerate his *Grammaire Arabe*, the most classical work of its kind, and which has given Arabic studies an entirely new impulse, forming, as it were, the turning-point between the ancient and modern oriental philology. Next to this stands his *Chrestomathie Arabe*, with the *Anthologie Grammaticale Arabe*. Among his other writings are *Mémoires sur Diverses Antiquités de la Perse;* the translation of Abdollatis's *Egypt*, with notes; his editions of *Calila ve-Dimnah;* of the *Pendnâmeh*, with a French translation; the *Makamat* of Hariri; his *Mémoires sur l'Etat Actuel des Samaritains; Exposé de la Religion des Druses;* and his manifold contributions (above 400 in number) to the *Magasin Encyclopédique*, *Mémoires de l'Institut*, *Recueil de l'Académie des Inscriptions*, *Fundgruben des Orients*, *Annales des Voyages*, *Journal de la Société Asiatique*, *Biographie Universelle*, and Eichhorn's *Repertorium für biblische und orientalische Literatur*, *Revue des Deux Mondes*, *Moniteur*, &c.

SACY, Samuel Ustazade Silvestre de, son of the foregoing, a journalist, was born in 1801. In 1828, he became attached to the staff of the *Journal des Débats*, and has ever since remained faithful to its columns. His has been chiefly the polemical part; and it is supposed that, not omitting to take part in almost every public question, he has written about two-thirds of the political articles that have appeared for the last quarter of a century in that paper. In 1852, when the Empire was re-established, he relinquished politics, and became the principal reviewer of the paper. In 1854, he was elected member of the Academy. He is also administrator of the Mazarin Library. In 1858, he published a collection of his literary articles (*Variétés Littéraires, Morales, et Historiques*, 2 vols.), which are chiefly distinguished by sober judgment and facility and purity of style. He has also edited a number of works of a religious nature, with introductions; and recently published the Letters of Madame de Sevigné.

SA'DDENING, a peculiar method of applying certain mordants in dyeing and printing cloths, so as to give duller shades to the colours employed than those they ordinarily produce.

SA'DDLEBACK, one of the well-known mountains of Cumberland, is situated 4½ miles north-east of Keswick. It is 2787 feet high.

SA'DDLERY. Saddlery is next in importance to human clothing, being essential to the employment of horses, therefore its manufacture is carried

on in almost every town and village. England, however, exports large quantities of saddlery, nearly all of which is made at Walsall, in Staffordshire, or in the neighbourhood. The value of the exports of saddlery and harness amounts to nearly £400,000 per annum. A saddle consists of the wooden frame or *saddle-tree*, the *skirts* or padded *under-flaps*, the *upper-flaps* and *seat*, which are generally made of tanned pigskin, the *girth* or *belly-band*, the *stirrup-straps*, the *stirrups*, and the *crupper-loop*.

SA'DDUCEES (*Zedukim*), a Jewish school or party—not a 'sect,' as they have been generally denominated since Josephus—of the times subsequently to the Syrian wars, and often mentioned in the New Testament, the Talmud, and the Midrash. Their origin, as well as their name, has given rise to many speculations and suggestions, but none can be considered satisfactory. Modern investigators have derived the name from Zadikk, righteous man, a denomination which the S. are supposed to have assumed in contradistinction from the Pharisees, the Separatists, as designating their own rejection of all superfluous and exaggerated religious practices, and their stand upon the words of the law itself.

The tenets of the S. are noticed as contrasted with those of the Pharisees (q. v.).

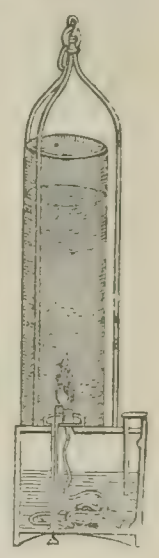
A misconceived notion of some Church Fathers, to the effect that the S. rejected all the canonical books of the Old Testament, with the sole exception of the Pentateuch, hardly requires refutation. They held the whole of the Old Testament as sacred as the Pharisees, and they quote equally from all its portions in support of their views. They would, if this or any other of those exaggerated accounts of their 'unbelief' had any foundation, not have remained in the Sanhedrim, their members would not have been high-priests, and the Pharisees would not have fought against them about mere trifles and casuistically. But, on the other hand, their sober rationalism could not, apart from their aristocratic tendencies, at a time in which the immense struggle for liberty was still fresh in the people's minds, gain for them that popular sympathy which the Pharisees —eager, jealous, patriotic, pious, learned men of the people, enthusiastic men of progress—so easily acquired and held. Thus Sadduceism, of which we hear so much in the New Testament, and which was combated as 'the leaven of Herod' by Christ, while he only inveighs, as does the Talmud, against the hypocrites among the Pharisees, died out soon after the 1st c. A. D. The term under which they are once mentioned in the Mishna, viz., Karaim, became, at a later period, the name of a Jewish sect, still in existence, who reject all tradition, simply holding by the Written Law as their guide. See KARAITES, JEWISH SECTS. The Talmud speaks of certain writings of the S., but nothing has survived. A criminal code of theirs, of a somewhat arbitrary nature, is mentioned in *Mes. Taan*, iv.

SÂDI, SHEIKH MUSLIH ADDIN, one of the most celebrated Persian poets, was born at Shiraz, about the year 1184. Little is known of the circumstances of his life. His father's name was Abdallah, and he was a descendant of Ali, Mohammed's son-in-law; notwithstanding his noble lineage, however, he held but an insignificant position. S. was early left fatherless. He received his education in science and theology at Bagdad, and from here he undertook, together with his master, his first pilgrimage to Mecca; a pilgrimage which he subsequently repeated no less than 14 times. He travelled for a great number of years, and is said to have visited parts of Europe, Barbary, Abyssinia, Egypt, Syria, Palestine, Armenia, Asia Minor, Arabia, Persia, Tartary, Afghanistan, and India. Near Jerusalem, 'where,' he says, 'I associated with the brutes,' he was taken prisoner by the Crusaders, not while fighting against them, but while practising religious austerities in the desert. He was ransomed for ten dinars by a merchant of Aleppo, who recognised him, and gave him his daughter in marriage: this union, however, did not prove happy. He married a second time, and lost his only son from that marriage. The latter part of his life S. spent in retirement near his native town, and he died, at a very old age, in 690 H., or 1263 A. D.; according to others, however, he did not die until 1291 or 1292 A. D. In person, he is described as having been of rather insignificant appearance, short, slim, and spare, nor is there much to be said for his personal prowess. His was a contemplative, pious, and, so to say, philosophical disposition. The years of his retirement from life he occupied in composing those numerous works which have made him justly famous through East and West. Although European critics would hardly be inclined to endorse to the full the judgment passed upon him by his countrymen, that he was 'the most eloquent of writers, the wittiest author of either modern or ancient times, and one of the four monarchs of eloquence and style,' yet there is no doubt that this 'nightingale of thousand songs' is deservedly held among the foremost masters of poetry, and that he fully merited the honours showered upon him by princes and nobles, both during his lifetime and after his death. A magnificent mausoleum, with a mosque and college attached to it, was erected in his honour at the gates of Shiraz, and the people, who soon wound a halo of legend around his life, flocked thither in pilgrimage; and so carefully is his tomb guarded, that when visited by Colonel Franklin in 1787, it was in the same state as when S. was buried.

The catalogue of his works comprises 22 different kinds of writings in prose and verse, in Arabic and in Persian, of which *ghazels* and *kassidas* (odes, dirges) form the predominant part. The most celebrated and finished of his works, however, is the *Gulistan*, or Rose-garden, a kind of moral work in prose and verse, consisting of eight chapters, on Kings, Dervishes, Contentment, Taciturnity, Love and Youth, Decrepitude and Old Age, Education, and the Duties of Society, the whole intermixed with a number of stories, maxims, philosophical sentences, puns, and the like. Next to this stands the *Bostan*, or Tree-garden, a work somewhat similar to the *Gulistan*, but in verse, and of a more religious nature. Third in rank stands the *Pend-Nameh*, or Book of Instructions. Elegance and simplicity of style and diction form the chief charm of S.'s writings. In wit, he is not inferior to Horace, with whose writings he, according to one source, may not have been unacquainted, since he is said to have known Latin. The first complete edition of his works, called the *Salt-cellar of Poets*, by Harrington, was published in Calcutta, 1791—1795, and has been reprinted since by native presses in India. The *Gulistan*, first edited with a Latin translation by Gentius (Amsterdam, 1651), has been reprinted very frequently, and has been translated into a number of European tongues, into English chiefly by Gladwin, Ross, and Eastwik. The *Bostan* was first published complete in Calcutta, 1828 (Vienna, 1858), and has likewise been translated into other languages.

SAFE-CONDUCT, a passport granted, on honour, to a foe, enabling him to pass where it would otherwise be impossible for him to go with impunity. Safe-conducts are granted in war for the purposes of conference, &c.; and to violate the

provisions of such a pass has always been esteemed a disgraceful breach of the laws of honour.



SAFE'D, a small town of Palestine, in the pashalic of Acre, and in the ancient province of Galilee, stands on a mountain 2500 feet high, twelve miles north of Tiberias. The inhabitants, about 5000 in number, are engaged in the manufacture of cloth and in dyeing, and the country in the vicinity is largely productive of wine and oil. It is an ardent wish of the Jews to die here, because they believe that the expected Messiah will make this place his capital. The Jews possess about thirty synagogues in the town, also a college for instruction in Hebrew and the Talmud. Prior to 1837, S. was a handsome town; but in that year it was partially destroyed by an earthquake, and 2000 Jews, 300 Mohammedans, and a number of Christians, were killed.

SAFES, Fireproof. The manufacture of iron safes for the preservation of money and valuable papers has become one of great importance. Thief-proof safes have been in use for ages; but no really successful attempt at making safes to resist fire was made until Mr John Milner of Liverpool patented, in 1840, an ingenious invention by which steam was generated inside the safe upon the outside becoming intensely heated, and the saturation of the contained papers, &c. with the steam was found to be a protection from most ordinary fires. In order to effect this, the safes were made of thick plate-iron, with a lining of thinner iron from three to six inches from the outer plates; thus giving the whole safe, including the door, which was made to fit very exactly, a thickness of a good many inches. The interval between these outer and inner walls was filled up with hard wood sawdust, in which were packed a number of small tubes filled with water, and hermetically sealed, or crystals of alum or soda, containing 50 per cent. of water of crystallisation. In case of fire, and the safe becoming heated, the tubes burst, or the crystals melt, and saturate the sawdust with water, which becomes steam, and passes into the inner chamber of the safe, and thus protects the contents, if inflammable, from fire. These safes, in order to be effectual, must be made with very great care; and to make them secure against thieves, as well as fire, the locks must be of very superior construction.

SAFETY-CAGE. See Mining.

SAFETY-FUSE, a species of fuse invented by Messrs Bickford for use in the Cornish mines, and now generally employed in the chief mining districts, consists of a hollow cord of spun yarn or hemp, tarred on the outside to render it waterproof, and filled with tightly rammed gunpowder. This fuse ignites steadily at the rate of about two feet per minute, so that the time which elapses between the igniting of the fuse and the explosion of the powder in the chamber can be easily regulated by the length of the fuse. The use of this contrivance has contributed to prevent those accidents arising from premature explosions, which were formerly of very common occurrence in mines. The fuse-tube is sometimes made of gutta-percha.

SAFETY-LAMP. It has been long known that when marsh-gas or light carburetted hydrogen, which is frequently disengaged in large quantities from coal-mines, is mixed with seven or eight times its volume of atmospheric air, it becomes highly explosive, taking fire at the approach of a light, and burning with a pale blue flame. Moreover, this gas in exploding renders ten times its bulk of atmospheric air unfit for respiration, and the *choke-damp* thus produced is often as fatal to miners as the primary explosion. With the view of discovering some means of preventing these dangerous results, Davy instituted those important observations on flame which led him to the invention of the safety-lamp. He found that when two vessels filled with a gaseous explosive mixture, are connected by a narrow tube, and the contents of one fired, the flame is not communicated to the other, provided the diameter of the tube, its length, and the conducting power for heat of its material, bear certain proportions to each other; the flame being extinguished by cooling, and its transmission rendered impossible. In this experiment, high conducting power and diminished diameter compensate for diminution in length; and to such an extent may this shortening of length be carried, that metallic gauze, which may be looked upon as a series of very short square tubes arranged side by side, completely arrests the passage of flame in explosive mixtures. The following are Davy's directions regarding the structure of his lamp: 'The apertures in the gauze should not be more than $\frac{1}{22}$d of an inch square. As the fire-damp is not influenced by ignited wire, the thickness of the wire is not of importance; but wire from $\frac{1}{40}$th to $\frac{1}{60}$th of an inch in diameter is the most convenient. Iron-wire and brass-wire gauze of the required degree of fineness, are made for sieves by all wire-workers, but iron wire gauze is to be preferred: when of the proper degree of thickness, it can neither melt nor burn; and the coat of black rust which soon forms upon it superficially defends the interior from the action of the air. The cage or cylinder should be made of double joinings, the gauze being folded over so as to leave no apertures. When it is cylindrical, it should not be more than two inches in diameter; for in larger cylinders, the combustion of the fire-damp renders the top inconveniently hot, and a double top is always a proper precaution, fixed at the distance of half or three-quarters of an inch above the first top. The gauze cylinder should be fastened to the lamp by a screw of four or five turns, and fitted to the screw by a tight ring. All joinings should be made with hard solder; and the security depends upon the circumstance, that no aperture exists in the apparatus larger than in the wire gauze.' The cylinder is protected by three external, strong, upright wires, which meet at the top; and to their point of junction a ring is attached, by which the lamp is suspended. The oil is supplied to the interior by the pipe projecting from the right side of the figure, and the wick is trimmed by a wire bent at the upper end, and passed through the bottom of the lamp, so that the gauze need not be removed for this process. The wire is not shewn in the figure.) When a lighted lamp of this kind is introduced into an explosive mixture of air and fire-damp, the flame is seen gradually to enlarge as the proportion of light carburetted hydrogen increases, until at length it fills the entire gauze cylinder. Whenever this pale enlarged flame is seen, the miners should depart to a place of safety, for although no explosion can occur while the gauze is sound, yet at that high temperature the metal becomes rapidly oxidised, and might easily break; and a single aperture of sufficient size would then occasion a destructive explosion. In a strong current of air, the heated gas may be blown through the apertures of the

Safety-Lamp

gauze before its temperature is sufficiently reduced to prevent an explosion; but such a contingency may be guarded against by placing a screen between the draught and the lamp. It was in the year 1815 that Sir Humphry Davy presented his first communication to the Royal Society respecting his discovery of the safety-lamp; and at the meeting held on January 11, 1816, the lamp was exhibited. Sir Humphry Davy's claim as an original discoverer was immediately challenged by various persons, amongst whom may be especially noticed the late Dr Reid Clanny of Newcastle, and the great engineer George Stephenson. Clanny's safety-lamp (which is described in the *Philosophical Transactions* for 1813) was based on the principle of forcing in air through water by bellows; but the machine was ponderous and complicated, and required a boy to work it; moreover, he had been anticipated by Humboldt in 1796 (Weld's *History of the Royal Society*, vol. ii. p. 288, note). Notwithstanding a report of the Royal Society, dated November 20, 1817, and signed by Joseph Banks, P.R.S., William Thomas Brande, Charles Hatchett, and William Hyde Wollaston, which is totally adverse to Stephenson's claims, there is undoubted evidence that, during the very months Davy was at work on the experiments which led to his invention, Stephenson's (familiarly called the *Geordy*) lamp was actually in use at the Killingworth mines. In its general principle it was the same as Davy's, the main difference being that the Stephenson lamp had a glass cylinder inside the wire-gauze cylinder, and that inside the top of the glass-cylinder was a perforated metallic chimney; the air being supplied through a triple circle of small holes in the bottom. On the subject of this controversy, the reader is referred to Smiles's *Life of George Stephenson*. Our limited space prevents us from noticing the various reports on 'Accidents in Mines' that have been published by different committees of the Houses of Lords and Commons, or from entering into any details regarding the modified forms of safety-lamps that have been since introduced. The best of these modifications are described in the article LAMP, SAFETY, in the 'Arts and Sciences Division' of *The English Cyclopædia*, from which we extract the following paragraph: 'Amidst much diversity of opinion concerning the relative merits of these various kinds of safety-lamp, there is a pretty general agreement that the gauze cylinder should be accompanied by one of glass, to resist the action of strong currents of air; and that the glass without the gauze is not sufficiently protected against fracture.'

Closely connected in its objects with the safety-lamp is a most ingenious invention which has been just patented by Mr Ansell of her Majesty's Mint. Its object is to determine, by a simple application of the law of osmotic force, the presence of light carburetted hydrogen in coal-mines; and the apparatus which Mr Ansell has devised promises to indicate the accumulation of fire-damp before it becomes dangerous, and either to give the miner notice of it, or to convey that notice to the surface by its connection with some simple electro-telegraphic arrangement. Mr Ansell gives two or three forms to his apparatus, of which the following is the most simple: A thin india-rubber ball is filled with atmospheric air, and is placed on a stand under a lever which slightly presses its upper surface. This lever is connected with a spring, which it liberates when, from any cause, the lever is raised; and the liberation of the spring sets a bell in vibration. If this trap for the discovery of fire-damp is set where that gas is present to any material extent, the noxious gas enters the ball by virtue of osmose, causes it to swell, and when the swelling has attained a certain point, the warning bell rings.

Attempts have at various times been made to use electricity as an illuminating agent in dangerous coal-mines, but until the recent discovery of Ruhmkorff's induction coil, none of them have been successful. MM. Dumas and Benoit have now constructed an electric lamp founded on the advantages presented by Ruhmkorff's machine and Geisler's vacuum-tube; and they have made some trials with the lamp in several of the French collieries, which are stated to be successful; and M. Alphonso Dumas exhibited it at a meeting of the North of England Institute of Mines on February 4, 1865. For a description of the lamp, which, from its delicacy and weight (about 14 lbs.), can never supersede the ordinary safety-lamp, we must refer to the *Quarterly Journal of Science*, No. 6, April 1865, p. 387. Under circumstances of extreme danger, this lamp may, however, be very useful, as an explosive atmosphere may be entered in safety, with the advantage of a sufficient light for the purpose of examination. The light is by no means brilliant, but presents the character of a rich phosphorescent glow.

SAFETY-VALVE is a circular valve placed on an opening in the top of a steam-boiler, and kept in its place either by means of weights piled above it, by a lever of the second kind, with a weight capable of sliding along the arm, or by a lever and spring. In stationary engines, one valve is frequently found sufficient, and the pressure on the valve is produced in the first or second of the methods indicated above. In locomotive engines, on the contrary, there are always two loaded valves: one, called the *lock-up valve*, from its being out of the engineman's reach and control, is placed well forward on the top of the boiler, and kept down by weights; the other, on the hinder part of the top of the boiler, is for safety subjected to a less pressure than the lock-up valve, and is acted on by a lever and spring. The term 'safety-valve' is particularly appropriate to this invention; for whenever the tension of the steam rises above a certain amount (=the weight in pounds with which the valve is held down divided by the area in inches of the undersurface exposed to the steam), the valve is forced upwards by the superior pressure beneath, steam escapes, and the pressure on the boiler being thus relieved, the valve sinks to its place. The only precaution necessary is to be sure that the valves are not too heavily loaded or fastened; and wilful indifference, or disregard of this caution, has, especially in the case of American river-steamers, been productive of the most serious casualties.

SA'FFI, AZAFFI, or ASFI, a seaport of Northern Africa, in the kingdom of Morocco, and 107 miles west-north-west of the city of that name. It is surrounded by waste and desert land; and its inhabitants, about 12,000 in number, of whom 3000 are Jews, are said to be the wildest, greediest, and most fanatical of the kingdom. It was at one time the chief seat of the trade with Europe, and though it has declined with the rise of Mogadore, it still exports silk, wool, leather, gum, and goat-skins.

SA'FFLOWER (*Carthamus tinctorius*), a plant of the natural order *Compositæ*, allied to Thistles (q. v.), but distinguished by its heads of flowers having only hermaphrodite florets, and the fruit having four ribs, and no pappus. It is an annual, 2—4 feet high, branching towards the top; flowers dark orange, or vermilion. It is a native of the East Indies, from which it was probably introduced

!c a remote age into Egypt and the Levant, where it is now naturalised. It is extensively cultivated in France, and the more southern parts of Europe, and even in some parts of South America, chiefly on account of the corollas of the florets, which are used in dyeing yellow and red. In France, it is drilled or sown broadcast in the beginning of May. The plants are thinned to five or six inches apart; and the flowers are picked by the hand in dry weath r, and very carefully dried on a kiln, under pressure, and are thus formed into small round cakes, in which state S. appears in the market. The S. of Persia is generally esteemed the best; but India yields the chief part of that imported into Britain. From its resemblance to saffron, S. is sometimes called *Bastard Saffron*, and it is used to adulterate saffron. The yellow colouring matter of S. is a kind of extractive. The red colouring matter is Carthamine (q. v.). The colouring matter of Rouge (q. v.) is derived from Safflower.

The seeds of S. are bitter and very oily. They are greedily eaten by parrots and many other birds They are sometimes used as a purgative. In 1870, Safflower and its extract, valued at $35,903, were imported into the U. States.

SA'FFRON, a colouring material, consisting of the dried stigmas of the common yellow crocus, so abundant in our gardens in early spring. It was introduced into Europe from Asia Minor, and is largely cultivated in several countries, but chiefly in Spain. In England, the crocus was unknown until 1339, when it was introduced from the East by a pilgrim; and in 1582 it was extensively cultivated for yielding S., especially in Essex, at the place now called, in consequence, Saffron-Walden. Its cultivation in Britain has almost entirely ceased, and the S. used is imported. S. is not only valuable as a colouring material, but has from very early ages had a great medicinal reputation. Homer mentions it, and Solomon associates it with spikenard and other precious drugs and spices. A large portion of the supply in ancient times was yielded by Cashmere, where it is still extensively cultivated. In addition to its other properties, it is often used as a perfume, and in flavouring as well as colouring confectionery and other articles of food. These latter are now its chief uses in Britain, where its medicinal value has long been declining. The colour yielded by S. is a bright golden yellow, and is due to a peculiar principle called *Polychroite*. Its great solubility in water prevents its being used as a dye for fabrics; but its agreeable flavour, and the absence of all injurious qualities, render it of great service in colouring articles of food.

The *S. Crocus* (*Crocus sativus;* see CROCUS) differs from most of the species of that genus in flowering in autumn, not in spring. It has large deep purple or violet flowers, with the throat bearded, and the long drooping trifid stigma much protruded from the tube of the perianth. The stigmas are the only valuable part of the plant.

In its cultivation, the corms are planted in the beginning of summer in rows six inches apart, and three inches from bulb to bulb; the most suitable soil being a sandy loam, very thoroughly tilled. The stigmas are gathered by women and children, and are spread out on cloth or paper, and dried in the sun, or in kilns or drying-houses. The produce of an acre of S. is about 5 pounds the first year, and 24 pounds the second and third year, after which the plantation must be renewed. But an ounce of S. sells for at least £2.

SA'FFRON-WA'LDEN, a market-town and municipal borough of England, in the county of Essex, 24 miles north-north-west of Chelmsford. The church is an elegant specimen of late Perpendicular. The free grammar-school has an income of £60 a year. The chief trade is in barley, malt, and cattle. Pop. (1861) 5474.

SA'GA, an old Norse word, used to denote a tale which, originally dependent on, and gradually elaborated by, oral tradition, had at last acquired a definite form in written literature. Such sagas (Norse *Sögur*), along with poetical and legislative writings, constitute the chief part of the old Norwegian-Icelandic literature. They have been divided into historical and legendary. The latter embrace partly stories universally current about heroes of the Teutonic race (e. g., the *Völsunga-Saga*), and partly stories peculiar to the Norse or Scandinavian peoples (e. g., the *Frithjofs-Saga*); while the former handle the events and personages of Norwegian and Icelandic history from the 9th to the 13th c., in numerous biographies and family records. To Danish history belong the *Knytlinga-Saga* and *Jomsvikinga-Saga;* to Swedish, the *Ingvars-Saga;* to Russian, the *Eymunds-Saga*. The Faröe Islanders and the Orcadians have also their own sagas. After the middle of the 14th c., when the motley literature of the church began to exercise an influence, tales were translated from foreign languages into Norse, e. g., the story of *Barlaam and Josaphat* (q. v.), which also received the name of sagas. Bishop P. E. Müller, in his *Sagabibliothek* (Copenh. 1817—1820), was the first who subjected the whole subject of saga-literature to a critical treatment. Since his time, collections both of the historical and legendary sagas, with critical apparatus more or less complete, have appeared in all the countries of the north.—The German *Sage* is the same word, and expresses fundamentally the same idea as the Norse *saga*. The difference is this, that the Germans do not restrict its application to the legendary or traditional literature of their own country, but extend it to that of others.

SA'GAN, a town of Prussian Silesia, 48 miles north-west of Liegnitz, on the Bober and on the Hannsdorf and Glogau Railway. Pop. (1867) 10,062, who manufacture cotton and woollen cloths, and paper, and trade in yarn, cattle, and corn. In the manufacture of woollen cloths alone, 1600 men are employed.

SAGE (*Salvia*), a genus of plants of the natural order *Labiatæ*, and containing many species, herbaceous and half-shrubby. There are only two perfect stamens, the filaments of which bear at their summit a cross thread—the much elongated *connective*—fastened by a joint, and having one cell of the anther at the upper end, and the other but imperfect cell at the other end. The seeds of many of the species, when steeped in water, become covered with a mucilaginous slime, like quince seeds.—COMMON S., or GARDEN S. (*S. officinalis*), grows on sunny mountain slopes and rocks in the south of Europe, and has long been in general cultivation in gardens. It is a half-shrubby plant, seldom more than two feet high, with ovate-oblong or lanceolate, finely notched, curiously wrinkled, whitish-gray leaves, and racemes of purplish blue, rarely white or red flowers. The whole plant has a peculiar, strong, penetrating aromatic smell, somewhat resembling that of camphor, and a bitterish, aromatic, somewhat astringent taste. It contains much essential oil (*Oil of S.*), which has been sometimes used in liniments for rheumatism. *S. leaves* are much used in flavouring dishes, and in sauces, &c. The leaves and young shoots are used for astringent tonic gargles. *S. tea*, made of the dried

leaves and shoots, is a popular astringent and tonic. S. grows best in a dry soil, and is easily propagated by slips or cuttings.—CLARY (q. v.) is a species of sage.—MEADOW CLARY, or MEADOW SAGE (*S. pratensis*), is a common ornament of meadows and borders of fields in most parts of the continent of Europe, and in the south of England. It has bluish purple flowers. It is sometimes fraudulently put into beer, to make it more intoxicating.—The APPLE-BEARING S. (*S. pomifera*) is a native of the south of Europe and of the East, remarkable for its very large reddish or purple bracts, and for the large gall-nuts which grow on its branches, as on the leaves of the oak, and which are known as *S. Apples*, have an agreeable aromatic taste, and are brought to market and eaten. The *Artemisia ludoviciana*, which is widely spread over the arid interior of the central basin of N. America, is known as *Sage*.

SAGHALI'EN, spelled in all Russian accounts Sakhalin (q. v.).

SA'GINAW BAY, an arm of Lake Huron, extends south-west, and forms an important indentation of the shore of Michigan State, U.S. It is 60 miles long by 30 wide, with several fine harbours and picturesque islands. The water, like that of the whole lake, is of wonderful clearness and purity. The bay is named from the river Saginaw which falls into it.

SAGO is the starch produced by several species of palms, prepared in a peculiar manner. The species from which it is chiefly prepared are *Sagus lævis*, *S. genuina*, and *Saguerus saccharifer*, in the Indian Archipelago; *Caryota ureus*, in Assam; *Phœnix farinifera*, on the Coromandel coast; and the Talipot Palm (*Corypha umbraculifera*), in Ceylon. Several other species are occasionally used; and there is some reason to believe that some plants of the genus *Cycas* (natural order *Cycadaceæ*) also yield sago. It is in all cases produced from the large mass of pith which fills the interior of the stems, therefore the trees require to be cut down. The stems are cut into lengths, split open, and the pith dug out, cut small, paced in a trough, and worked with clean water, to wash out the fecula; this makes the water white and turbid, and it is then run off into another vessel. Fresh washings of the pith take place, until it ceases to yield any starch. The water of the separate washings being all added together, is allowed to settle, and the starch is soon deposited; the clear supernatant water is then run off, and the deposit dried. This is the ordinary *Sago Flour* of commerce, of which large quantities are now imported for use as starch in the calico and other manufactures. When prepared for food, it is either in the state called *Pearl Sago*, or *Granulated*. The former is in little spherical grains of a pearly-white lustre, varying in size from that of a poppy-seed to a grain of millet. Granulated sago is also in round grains, but of a larger size, sometimes nearly as large as a pea. There are several varieties, differing much in colour—some quite white, others having the peculiar reddish-brown of radish-seed, which they strikingly resemble in appearance. One kind of granulated sago from India has lately been introduced into our shops under the erroneous name of Tapioca, from its having been called by the French *Sagou-tapioka*.

The exact method employed by the Malays in pearling and granulating their sago, is not known to Europeans; but there are strong reasons to believe that heat is employed, because the starch is partially transformed into gum. It is not entirely soluble in hot water, like ordinary starch, hence it can be employed in making puddings, &c., and in this way forms a valuable article of food, being cheap, light, nutritious, and easy of digestion. The quantity of Sago and Sago-flour imported into the U. States in 1870 was 1,394,855 pounds, valued at $43,889. The quantity imported into Britain in 1866—1867 was 8249 and 8206 tons respectively, most of which was consumed at home.

SAGOU'IN (*Callithrix*), a genus of American monkeys, having a long but not prehensile tail, a small and rounded head, short muzzle, and large ears. They are of small size, and remarkably active and graceful in their movements. They are sometimes called *Squirrel Monkeys*. They are of very gentle disposition, and when tamed, become strongly attached to their masters. Both body and tail are covered with beautiful fur. The SIAMIRI or TEE-TEE (*C. sciureus*), native of Brazil and Guiana, is one of the best known species.

SAGU'NTUM, a wealthy and warlike town of ancient Spain, in Hispania Tarraconensis, stood on an eminence near the mouth of the Pallantias (modern Palancia). Its site is now occupied by the town of Murviedro (q. v.). Founded (according to Strabo) by Greeks from Zacynthus, it became at an early period celebrated for its commerce, and attained to great wealth. But it owes its historical vitality to the circumstance of its siege and destruction by the Carthaginians, under Hannibal, in 218 B.C. Having withstood the siege for the greater part of a year, against an army amounting to about 150,000 men, led by a general of consummate ability and indomitable resolution, the Saguntines, now most severely pressed by famine, concluded, with an act of heroic defiance and self-sacrifice, a resistance that had been characterised by the most brilliant valour. Heaping their valuable effects into one vast pile, and placing their women and children around it, the men issued forth for the last time against the enemy; and the women, setting fire to the pile they had prepared, cast themselves upon it, with their children, and found in flames the fate their husbands met in battle. The destruction of S. directly led to the second Punic war.

SAHA'RA. The immense tract of country to which this name is commonly given, has already been described under the heading AFRICA (q. v.). But the term Sahara is more correctly applied to a region of much more limited extent. The natives divide Africa north of the line into three portions —the Tell, the Sahara, and the Desert. The Tell extends from the Mediterranean to the Atlas Mountains; the Sahara, from the Atlas to the southern region where all regular supply of water fails; and the Desert, from the southern. and not very clearly-defined frontier of the Sahara, southward almost to the water-shed of the Niger, comprising a district salt and arid, inhospitable to man and beast, although the camel may even here snatch a scanty subsistence. As to physical geography, the S. may be subdivided into the following districts—1. The Hauts Plateaux, or Steppes, a series of high levels skirting the base of the Atlas Mountains. 2. The land of the Dayats or waterless oases, stretching south to the high lands on the south bank of the Wed Mzi or Djidi. 3. The region of the southern oases, to the south of the former, and extending south till it loses itself in the Desert. The principal feature of the S. is the Wed Mzi, which rises in the Djebel Amour, and after an east, north-east, and finally south-east course, falls into the Chott Melr'hir. Throughout almost the whole of its course, which is about 400 miles long, it flows under ground. Its waters seem to rest on a bed of hard limestone from 30 to 60 feet below the surface. —Tristram's *Great Sahara* (John Murray, Lond. 1860).

SÂHIB (an Arabic word meaning a companion, a master, a lord) is, in Hindustani, the usual designation and address of a respectable European, equivalent to Mister, Sir, &c. Hence, *Sahibâ* is the term for Lady, Madam. In Bengali and Mahrati, the word assumes the form *Saheb*.

SAI'DA. See SIDON.

SAIGA. See ANTELOPE.

SAÏGON, one of the finest river-ports in Asia, the capital of the French possessions in Lower Cochin China, stands on a small river of the same name, about 35 miles from the Chinese Sea. The city is fortified, and its value as a strategical position is unquestionable. By land it is defended from attack by many miles of jungle and swamp, and the approach from the sea on the south, by the fine river Donnai, could easily be rendered impassable to the strongest fleet. The entrance to the Donnai is at Cape St Jacques, and its winding course to S., through a rich level country, is from 50 to 60 miles in length, and might be defended by fortifications at every point. It is of easy navigation, and is of sufficient depth to allow vessels of the heaviest burden to sail close to its banks under the overhanging foliage. The breadth of the river from S. to the sea varies little, but it is never narrower than the Thames at London. It is joined on both sides by many large affluents, and it is the main channel of a river-system that covers the whole country to the south of the capital with a network of watercourses. The city of S. is fortified, and is defended by a permanent force of several large ships of war and a garrison of 10,000 men. At the beginning of the year 1865 the law of conscription, by which one man in seven is chosen from among the natives for military service, was put into operation. S. consists of two parts, the Chinese town, four miles inland, filled with an active population busily engaged in trade; and the European, or fortified town on the banks of the Saïgon. The latter, with its fleet of vessels riding at anchor in mid-stream, is already of considerable size. Good roads have been constructed for many miles around, and there are barracks, hospitals, official residences, and other buildings for public purposes. The soil, only about one-fourth of which is under cultivation, is abundantly fertile, and is admirably suited to the production of cotton, sugar, indigo, and tobacco, besides rice, which is at present the principal, and almost the only, exported product. Its forests contain magnificent timber, and abound in woods rich in dyes. There is a naval yard and arsenal, and shipbuilding is carried on. Pop. estimated at 180,000.

S., together with the territory of which it is the capital, was taken by the French in 1860. Treaties of peace and commerce have been concluded with the Anamite government, from which the colonial government derives great advantages. These treaties, signed 15th July 1864, provide that the protectorate of the six provinces of Lower Cochin-China shall remain in the hands of France; that three important ports on the coast of Anam shall be opened; and that a space of nine kilometres on the shore of each port shall be conceded to the French for the establishment of factories; that French merchants and missionaries shall be allowed to traverse the kingdom of Anam without hindrance, and that an indemnity of 100 millions of francs shall be paid. By these treaties the French still protect, though they do not *formally* at least possess the six provinces of Cochin-China, but they retain vast tracts of territory at S., at Cape St Jacques, and at Mytho, and remain masters of the rivers Saïgon and Cambodia.

SAIL. A sail is an expanse of canvas, matting, or other strong material, on which the wind may exert its force and propel the vessel. A sail is extended by means of a mast or yard, or both. It may be of various shapes, and of any size, according to the carrying power of the vessel. A vessel of shallow draught or of narrow beam can bear comparatively little sail; while a vessel of proportionately deep draught and heavily ballasted—as a

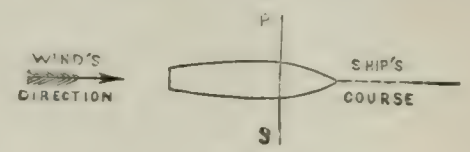


Fig. 1.

yacht—or a vessel of great breadth of beam, can carry sail of great area. A sail acts with the greatest power when the wind is directly astern, as in fig. 1; but it can be applied, though with less strength, when on either beam. The action of the wind on an oblique sail is a good example of the resolution of forces. See COMPOSITION AND RESOLUTION OF FORCES, &c. Let TD, fig. 2, be a ship, PAS its sail, WA the direction of the wind, and let the length of WA represent the pressure of the wind on the sail. WA can be resolved into AB perpendicular to the sail, and BW parallel to it, the latter of which has no effect in pressing on the sail; therefore AB is the effective pressure on the sail. Were the vessel round, it would move in the direction BA. Let BA be resolved into CA and BC, the former, CA, acting in the direction of the keel or length of the vessel, or in the direction CAD, and the latter perpendicular to it, or in the direction of the breadth. The former pressure, CA, is the only pressure that moves the vessel forward, the other, BC, makes it move sideways. From the form of the vessel, however, this latter force, BC, produces comparatively little lateral motion; any that it does occasion is called *leeway*. It results, therefore, that with the wind exerting an oblique pressure, the actual progress will be to the power of the wind only as CA to WA.

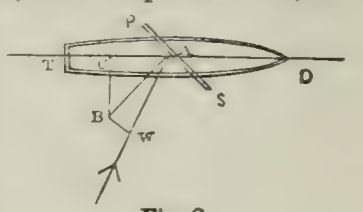

Fig. 2.

In the East and the Mediterranean, sails are frequently made of strong matting; but among northern nations, and for ocean navigation, very strong cloth, or canvas, called *sailcloth*, is usually resorted to. It is woven narrow; and the many breadths in the sail are joined by carefully made double seams.

Sails are nearly always either triangular or quadrilateral, but not necessarily equiangular. The

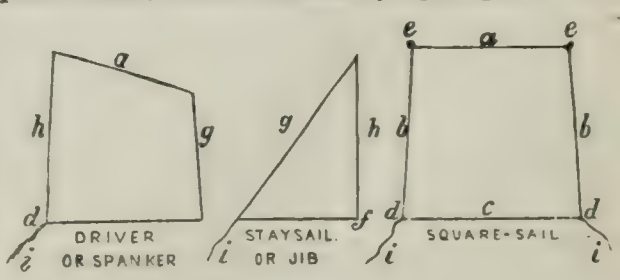

Fig. 3.

a, head; *b*, leech; *c*, foot; *d*, clew; *e*, earrings; *f*, clew; *g*, fore-leech; *h*, after-leech; *i*, sheet.

commoner forms are shewn in fig. 3. To give greater strength, a strong rope or cord is sewn into

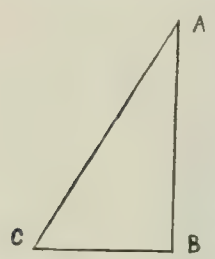
the outer edge all round the sail; this rope has eyes in it, to which the various ropes employed in connection with the sail are fastened. The top of a sail is its *head*; the bottom, its *foot*; and the sides are *leeches*; the upper corners are termed *earrings*; the lower corners of a square sail, and the after lower corner of other sails, *clews*; the front lower corner of a fore-and-aft sail is the *tack*. The ropes from the lower corners, used in tightening the sail against the wind, are the *sheets*.

The sails of a ship are either 'square' or 'fore-and-aft.' The square-sails—beginning from below—are, the *course*, the *topsail*, the *topgallant-sail*, the *royal*, and, though very rarely used, the *sky-scraper*. Each has the name of the mast on which it is set prefixed, as 'fore-topsail,' 'main-royal,' &c. The square-sails are made fast by their heads to yards, the foot being drawn to the extremity of the yard below. Fore-and-aft sails are the *spanker* or driver, extended by the gaff at its head, boom at its foot, and mast on its fore-leech; the *staysails*, which are suspended by rings to the stays, and the *Jibs* (q. v.). In a three-masted vessel, the sails of most importance are the main-course, the spanker, the topsails, the fore-staysail, and the jibs, which can usually be all distended to the full without taking wind from each other. In very light winds, when every breath is of consequence, the area of the sails is increased by setting the *studding-sails*, which are oblong sails set on each side of the

Fig. 4.

Main-topgallant-sail; 6*a*, Studding-sails; 7, Mizen-topgallant-sail; 8. Fore-royal-topsail; 8*a*, Studding-sails; 9. Main-royal-topsail; 9*a*, Studding-sails; 10. Mizen-royal-topsail; 11, Fore-skysail-topsail; 12, Main-skysail-topsail; 13, Mizen-skysail topsail; 14, Fore-topmast-staysail jib; 15, Jib; 16, Flying jib; 17, Mizen spanker; 18, Spenser; 19, Main-royal-staysail; 20, Main-topgallant-staysail; 21, Mizen-royal-staysail

square-sails, on short booms run out beyond the yards of the latter. Fig. 4 represents a square-rigged ship with the whole of her canvas shewn.



In small craft and boats, the most common sail is a lugsail (see LUGGER), which is a small square-sail, occasionally supplemented by a shoulder-of-mutton (triangular) sail on a shorter mast at the stern. Cutters or sloops carry a large spanker, with a topsail of similar shape, and jibs; some having the power of setting a large course when the wind is astern; but it is obvious that the course and spanker cannot be used together. A schooner uses the same sails as a cutter, except that, in one form, she carries a square topsail and topgallant-sail on the foremast.

Sails are furnished with rows of short ropes for the purpose of *reefing* them, when their area is too large for the wind. The effect of a sail is increased by wetting it, as the pores of the canvas close more tightly through the swelling of the hemp.

SAILCLOTH, a very strong fabric, woven generally with linen yarn, but in America it has been made wholly of cotton; and in Great Britain, under Armitage's patent, of cotton and linen mixed. Hair—such as of the ox, horse, and deer—has also been used, under Taylor's patent, in 1832, but without success. Linen and hempen cloths are those generally used in all parts of Europe.

SAILINGS, the technical name in Navigation for the various modes of determining the amount or direction of a ship's motion, or her position after having sailed a given distance, in a given direction. The direction of a ship's motion is her *course*, and is expressed in terms of the angle between the line of direction and the meridian; the length of her

path is the *distance;* the distance in nautical miles, made good to the east or west, is the *departure*, and is measured along a parallel; the *difference of latitude* is an arc of the meridian intercepted by the parallels, one of which passes through the place sailed from, the other through the place sailed to; and the *difference of longitude* is an arc of the equator intercepted by meridians through the same two places. It will at once be seen that if a ship sails along a meridian, the difference of latitude becomes the course, and there is no departure or difference of longitude; and that if it sails along a parallel the departure will be the same as the course, and there will be no difference of latitude. The two general questions which present themselves to the navigator for solution, are—1. Given the course and distance from one place in given latitude and longitude to another place, find the latitude and longitude of the other; and 2. Given the latitude and longitude of two places, find the course and distance from the one to the other. The simplest way in which such problems can be solved is by the method known as *plane sailing*, a method, however, which is only roughly approximate, assuming, as it does, that the surface of the sea is a plane; it is consequently applicable only to short distances and low latitudes where the meridians are nearly parallel. According to 'plane sailing,' the elements of a ship's path are represented by a right-angled plane triangle, as ABC (fig.), where AB is the distance, the angle BAC the course, AC the difference of latitude (AC being a portion of a meridian, and BC of a parallel of latitude), and BC the departure. The two problems given above are in this method merely simple cases of the resolution of a right-angled plane triangle (see TRIGONOMETRY), for if the course and distance are given, the *dif. of lat.* = distance × cos. of course, and *dep.* = dist. × sin. of course; while the idea of *dif. of long.*, as distinct from dep., is quite inadmissible, since the method presupposes that the ship is sailing on an absolutely flat plain. If the ship does not stand on one course, but changes from time to time, the calculation of her final position may be effected, either by the previous method, repeated for each change of course, or more conveniently, by the method of *traverse sailing.* This method consists in the resolution of a ship's course and distance into two courses and distances, the courses being in the direction of some of the four cardinal points of the compass; thus, a ship which has sailed S.-W.-by-S. for 24 miles, has made 20 miles of *southing*, and 13·3 miles of *westing.* The *traverse table* has consequently six columns, the first containing the courses; the second, the corresponding distances; while the third and fourth contain the difference of latitude for each course, which, if N. is put in one column, and if S. into the other; the fifth and sixth columns, marked respectively E. and W., contain in a similar manner the departure for each course. When the table has been made out for the various courses and distances, the columns of dif. of lat. and departure are summed up, and the difference between the third and fourth, and between the fifth and sixth columns, gives the dif. of lat. and departure between the place sailed from and the place arrived at, from which the course and distance made good can be calculated as before. When a current interferes in any way, either by accelerating or retarding the ship's motion, its effect is estimated as in traverse sailing, as if it were one course and distance, the *set* of the current being the course, and its *drift*, i. e., its rate per hour multiplied by the number of hours it has affected the ship, the distance.

Parallel Sailing may be employed when a ship sails between two places, on the same parallel of latitude, in which case, if her head be kept accurately and constantly in an east and west direction, she will describe an arc of the parallel between the two places. As in this sailing the departure is the same arc of the parallel that the difference of longitude is of the equator, the *dep.* (which is now the *distance*) = *dif. of long.* × *cos. of lat.* The other elements are found as in plane sailing.

Middle Latitude Sailing is the application of the principle of parallel sailing to the case in which the ship's course is not perpendicular but oblique to the meridian; it is merely an approximate method, coming very close to a true estimate in low latitudes for any course, and in all latitudes for a course nearly E. and W. (i. e., one in which the distance is large as compared with the difference of latitude), but erring widely under other circumstances, though errors may be diminished as much as we please by dividing the distance into portions, and calculating the dif. of long. for each. The object of this sailing is to deduce the dif. of long. from the dep., and *vice versâ*, on the supposition, that the whole departure has been made good along the parallel of latitude which is equidistant from each extremity of the course, a method which, at first sight, would seem to give a correct result, and would do so if the parallels of latitude increased uniformly, which they do not. The dep., when laid off along the parallel of middle latitude, always gives the dif. of long. too small, and hence the limitations above noticed. When the latitudes are of the same name, the middle latitude is half their sum; but when of contrary names, it is better to find the dif. of long. for the portion on each side of the equator separately, the two middle latitudes being respectively half the latitude of the place sailed from, and half that of the place sailed to. The formulas are the same as for parallel sailing and plane sailing.

Mercator's Sailing is a perfect method of obtaining the same result as is found approximately by parallel sailing, but in the former case the dif. of long. is found from the departure, while in this method, the difference of latitude is employed for the same purpose. A table of meridional parts, as it is called, is necessary; this table shews the number of minutes in Mercator's projection (see MAP) corresponding to each degree and minute of latitude up to 78°, and is employed as follows. The latitude sailed from, and that reached, being known or found, the meridional parts for each are obtained, and their difference, if the latitudes are of the same name, or sum if of opposite names, gives the dif. of lat. We have then a right-angled triangle, with the dif. of lat. and dif. of long. forming the two smaller sides, and the vertical angle representing the course, whence *dif. of long.* = *dif. of lat.* × *tan. of course.* This sailing is the one most generally employed by navigators, but is inferior in practice to middle-latitude sailing, in the cases noticed under that head, for though it be a perfect, and the other merely an approximate method, yet a small error in the course (if large), or in the dif. of lat., becomes greatly magnified in the dif. of long.; while in the case of the latter, a considerable error in departure is hardly magnified, and a large error in the course (if nearly E. and W.) becomes imperceptible in the dif. of long. It is, however, better to work the problem according to both methods, and then estimate the true result as nearly as possible.

Great Circle Sailing (q. v.), the most perfect of all methods for finding a ship's course, is separately noticed. See also SPHEROGRAPH.

The obstacles that interfere with the correctness of the mariner's calculations are chiefly those which affect his data, the course and distance, the more important being the magnetic deviation of the compass produced by the attraction of the ship, errors in the estimated leeway or in the set and drift of currents, &c.; all of which require to be taken into account. The necessity for frequently checking the *Dead-reckoning* (q. v.), by means of astronomical observations, is sufficiently apparent.

SAI'NFOIN, or SAINTFOIN (*Onobrychis sativa*), a plant of the natural order *Leguminosæ*, suborder *Papilionaceæ*, of a genus nearly allied to *Hedysarum* (see FRENCH HONEYSUCKLE), but having one-seeded pods, which are marked with wrinkles or pits, and are more or less prickly-toothed at the margin. It is a spreading perennial, about 2 or 3 feet high, with leaves of 9—15 smooth acute leaflets, and spikes of

Saintfoin (*Hedysarum onobrychis*).

beautiful flesh-coloured flowers, striated with rose-red, on long stalks. It is a native of the continent of Europe and of the south of England, and is much cultivated as a fodder-plant in dry, and particularly in calcareous soils, to which it is admirably adapted. Its cultivation was introduced into England in 1651; and before the introduction of turnip-husbandry, the sheep-farmers of the chalk districts depended almost entirely upon it, as they still do to such a degree, that in many leases there is a stipulation for the tenant's leaving a certain extent of land in sainfoin. It is, however, a very local crop, being scarcely cultivated on any but the most calcareous soils, where nothing else is nearly equal to it, although it has been found to succeed well on any soil sufficiently dry. There is no more nutritious fodder than S., whether for sheep, oxen, or horses. Even the dry stems of a crop which has produced seed are readily consumed by cattle, if cut into small pieces. S. sometimes endures for 10, or even 15 years on the same land—more generally only for 4 to 7 years; and in the eastern counties of England it is often sown instead of clover on light and somewhat calcareous sands and sandy loams, and the ground is ploughed again in two or three years.—The name S. is perhaps rather *Sang-foin*, from the blood-colour of the flowers, than *Saint-foin* (Holy Hay).

SAINT A'LBANS. See ALBANS, SAINT. (Other names beginning with *Saint*, and not given under that word, will similarly be found under the other part of the name).

SAINT AMAND, a town of France, in the dep. of Cher, stands on the right bank of the river of that name, 27 miles south-south-east of Bourges. It carries on a trade in iron, and contains important iron-works. Pop. 8607.

SAINT AMAND, a town of France, in the dep. of Nord, 8 miles north-west of Valenciennes. The town contains hot sulphur-springs; flax of a superior quality is cultivated; and lace, clay-pipes, and porcelain are manufactured. Pop. 10,210.

SAINT ANTHONY'S FIRE. See ANTHONY, SAINT.

ST ARNAUD. See LEROY.

SAINT AU'GUSTINE, an ancient Spanish town on the east coast of Florida, U.S., is built on the western shore of an estuary 2 miles from the Atlantic, 160 miles south of Savannah. It enjoys a mild and equable climate, and is a resort for consumptive invalids. It was founded in 1565, and is the oldest town in the United States. Pop. (1870), 1717.

SAINT AU'STELL, a small town of Cornwall, 13 miles north-east of Truro by railway. Woollen goods are manufactured, and at the bay of Saint Austell, from which the town is about a mile distant, there is a pilchard-fishery, and tin and copper are exported. Pop. (1861) 3825.

ST BEES, an ancient village of Cumberland, pleasantly situated on the bay formed by *St Bees Head*. It is 4 miles south of Whitehaven, and about 10 miles beyond the limits of the Lake district. St Bees is a station on the Whitehaven and Furness Junction Railway. The parish is very large, comprising town and port of Whitehaven, village of St Bees, and several chapelries and townships. The village of St Bees contains about 1000 inhabitants. According to tradition, preserved by the early chroniclers, St Bees originated in a nunnery founded here, 650 A.D., by an Irish saint named Bega, of whom Sandford's MS. (in the Dean and Chapter Library, Carlisle) records a very pretty legend. It appears to have been destroyed before the reign of Henry I., in whose time we find that Ranulph Earl of Cumberland reconstituted it as a priory; but after the dissolution of the monasteries, it went to ruin. The institution known as ST BEES COLLEGE was established in 1816 by Dr Law, then Bishop of Chester, to supply a systematic training in divinity to young men desirous of ordination, whose means were inadequate to defray the expenses of a university education. The bishops of the province of York had previously been compelled to ordain a number of such men as literates, the poverty of many of the northern benefices not securing a sufficient supply of graduates. A portion of the ruined priory of St Bees was fitted up by the Earl of Lonsdale as lecture-rooms, library, &c. On the recommendation of the bishop, an incumbent was selected for the perpetual curacy of St Bees (value, £100 per annum) by the patron, the Earl of Lonsdale, with a view to his holding the position of Principal of the College in connection with the living. The following persons have held this office—viz., Rev. W. Ainger, D.D., Fellow of St John's College, Cambridge, appointed 1816; Rev. R. P. Buddicom, M.A., Fellow of Queen's College, Cambridge, appointed 1840; Rev. R. Parkinson, D.D., Canon of Manchester, appointed 1846; Rev. G. H. Ainger, D.D., Fellow of St John's College, Cambridge, appointed 1858. The Principal selects his own staff of lecturers. The expenses are defrayed from the fees paid by the students—£10 each term. The College

course extends over two years, each divided into two terms, from about January 28 to May 5, and August 25 to December 5. During this period, the standard English divinity works, with the Greek Testament, are chiefly studied, and the composition of sermons, &c., practised. The students reside in lodgings in the village, under the control of the Principal, and attend the service daily in the parish church, the transepts of which were restored in 1855 for their accommodation. A new lecture-room and library were built in 1863, adjoining the ancient structure. Students are admitted at the age of 21, on producing testimonials of character, &c., satisfactory to the Principal. Graduates of a university where there is no divinity course, are admitted to the second year's course on producing their diploma, along with the usual testimonials as to their fitness for the ministry. Students who have passed the course are not now confined to the northern province, as was the original design, but are admitted into most of the southern dioceses. The average number of students on the boards is about 80, and the total number ordained, up to 1864, is about 1500. The *College Calendar* is published by Messrs Rivington, London.

SAINT CA'THERINE'S, a thriving town of Canada West, stands at the mouth of the Welland Canal, on the south shore of Lake Ontario, 34 miles south-south-east of Toronto. The canal supplies unlimited water-power, and the town contains a number of excellent mills. Iron-wares, cloth and pottery, are manufactured, and ship-building and a flourishing general trade are carried on. Pop. (1861) about 7000.

SAINT CROIX, an American river, called also the Passamaquoddy, which, flowing out of Grand Lake, on the eastern border of Maine, runs east-south-east 75 miles to Passamaquoddy Bay, and forms a portion of the boundary between the United States and New Brunswick.

SAINT DOMI'NGO. See HAYTI.

SAINT DOMINGO BARK. See CARIBBEE BARK.

SAINTE-MARIE-AUX-MINES, a manufacturing town of Alsace, in what was formerly the French dep. of Haut-Rhin, 14 miles north-west of Colmar. In former times, it owed its prosperity to the silver mines in the vicinity; these, however, are now exhausted. Dyeing, yarn-spinning, manufactures of cotton, paper, and cherry-brandy are now the principal branches of industry. Pop. 12,332.

SAINTES, an old town of France, in the dep. of Charente-Inférieure, on the left bank of the Charente, 43 miles south-east of La Rochelle. In ancient times, this town, under the name of *Mediolanum*, was the capital of the Santones, from whom the subsequent province derived the name of Saintonge. It contains interesting Roman remains, as a triumphal arch, and the ruins of an amphitheatre, circus, &c. Pop. 10,962.

SAINT GEORGE'S ENSIGN is the distinguishing flag of the British navy. It consists of a red cross on a white field, with a union-jack in the dexter chief corner, as shewn in fig. 2 of the article FLAG. Under FLAG OFFICER, it is implied that an admiral, vice-admiral, or rear-admiral may have his flag red, white, or blue, according to the squadron to which he belongs. By a regulation of 1864, this old custom was altered; the squadrons are abolished, and the white Saint George's ensign is the badge of all ships in the navy. The red and blue ensigns are now left to government vessels—not being ships of war—and merchant vessels respectively. The ensign is borne at the peak, or, in harbour, on a flagstaff at the stern; in boats, the latter is the only mode of flying it. A full-dress ensign is the largest flag used, being often but little smaller than the quarter-deck of the ship which hoists it.

SAINT-GERMAIN-EN-LAYE, a town of France, in the dep. of Seine-et-Oise, on an elevation on the left bank of the Seine, 14 miles by railway west-north-west of Paris. It contains three handsome squares, a parish church, with a monument erected by George IV. over the remains of James II., several learned and other societies, and some factories. Pop. 15,708.

S.-G. had its origin in a monastery built by King Robert in the beginning of the 11th c., on the summit of the hill which was surrounded by the forest of Lyda (*Laye*), and dedicated to St Germain. The town, as well as the royal château, which was built either during the reign of King Robert, or soon after, was sacked by the English in 1346, in 1419, and in 1438. At S.-G. the marriage of Francis I. was celebrated, and this king rebuilt the château in 1547. From before the time of Philippe-Auguste, S. G. had been the residence of the French court during a portion of the year, but Louis XIV. transferred the court to Versailles, and from this time the fortunes of S.-G. declined. Later, the château of S.-G. was assigned by Louis XIV. as the residence of the dethroned James II. of England, and here in exile that monarch held his morose court, devoting almost the whole day to religious observances. The château is now used as barracks and for other purposes. The Forest of S.-G. comprises 10,873 English acres.

SAINT HE'LENS, a flourishing town of Lancashire, on a small affluent of the Mersey, 3½ miles north-east of Prescot by railway. It is a straggling, ill-built, but thriving town, with an extensive trade in coal, and containing plate-glass, copper, bottle, and other works. The town also contains potteries, breweries, tan-yards, iron and brass foundries, and chemical works. Pop. (1861) 18,396.

SAINT HE'LIERS, capital of Jersey (q. v.), the chief of the Channel Islands, is situated on the south shore of the island, and on the east side of St Aubin Bay, lat. 49° 11′ N., long. 2° 6′ W. It is defended by Elizabeth Castle, on a rocky island off the shore, approached by a causeway at low water; and by Fort Regent, on the south-east side of the town, built about 1806, on a scarped granite rock, at an enormous expense. The harbour is large, and the pier commodious, but steamers cannot enter at all times of the tide. At spring tides, the water rises 40 feet. Victoria College—a handsome edifice, built on an eminence, in 1851—the hospital, the theatre, and the churches, are the chief buildings. The area of the town has rapidly increased within recent years. An active trade is carried on with England, France, and India. Pop. 30,000, including a garrison of upwards of 500 men.

SAINT IGNA'TIUS' BEAN. See NUX VOMICA and STRYCHNOS.

SAINT-JEAN-D'ANGÉLY, a small town of France, dep. of Charente-Inférieure, 15 miles north-north-east of Saintes. Pop. 6392.

SAINT JOHN'S BREAD. See CAROB.

SAINT JOHN'S WORT. See HYPERICUM.

SAINT JOSEPH, a city of Missouri, U. S., on the left bank of the Missouri River, on the eastern border of Kansas, 496 miles by water from St Louis. It is connected by railway with Hannibal, on the Mississippi, and is the chief dépôt for the emigrant and supply trains to the western settlements. It has a court-house, ten churches, a

convent, several large hotels, eight newspapers, three of which are dailies, steam-mills, and factories, and a large trade with the interior of the continent. Pop. (1870) 19,565.

SAINT JUST, Louis Antoine de, a notable figure in the first French Revolution, was born at Decize, in Nivernais, 25th August 1767, educated at Soissons by the Oratorians, and afterwards went to Rheims to study law, but soon returned to his native village, where he devoted himself exclusively to literature. When the revolution broke out, S. J. was transported with enthusiasm, and became one of its most ardent apostles. Probably no man in France was a more genuine fanatical believer in the brilliant delusions of the period. Spotless, even austere, in his morals, reserved in manner but eloquent in speech, and rigorously earnest in his convictions, he rapidly rose into consideration among the inhabitants of his native commune, who elected him lieutenant-colonel of the National Guard, sent to Paris in 1790 to assist at the Fête of the Federation. In 1791, appeared his *Esprit de la Revolution et de la Constitution de la France*, in which the various causes of the revolution are sketched in a calm, keen, precise sort of way; and in the following year he was chosen deputy to the convention by the electors of Aisne. S. J. entered Paris on the 18th of September, fifteen days after the frightful massacres, which Lamartine in his *Histoire des Girondins* with melodramatic inaccuracy represents him as ordering in conjunction with Robespierre! He voted for the death of the king, and in an oration full of stern but exaggerated republican sentiment, gave his 'reasons.' It was this speech that made him famous and influential. The Girondins tried to win him over, but in vain. In all the fierce debates of this period, S. J. took a leading part; but he also displayed a great capacity for administrative organisation, and on the 11th of February 1793, carried his project for the formation of a committee to superintend the war. After the fall of the Girondins in June (S. J. took no part in their overthrow, and never once spoke during the disastrous struggle between the two sections), the civil war broke out, and it is from this point that we date the exhibition of that intense and merciless republicanism which fitted him so well to be the associate of Robespierre. It is commonly thought that S. J.—perhaps because he was so young—was merely an instrument in the hands of Robespierre; but the known facts of his career lead to a very different conclusion, and some writers have not scrupled to make S. J. the real head of the extreme party who exercised government in France during the *Reign of Terror*. Almost all the energetic, or, as some would prefer to say, sanguinary, measures drawn up to repress the royalists and timid republicans at home, and to repel the forces of the allied monarchs on the frontier, were devised by him. On the 19th of February he was elected president of the convention. He drew up the terrible report which led to the arrestment and execution of Hebert, Danton, and their adherents. S. J. had no scruples in cutting off his opponents. The intensity of his convictions rendered him indifferent to deeds of cruelty, however appalling. When the political reaction set in, and the party of moderation had got the upper hand in the convention, Robespierre and S. J. were seized and imprisoned (27th July 1794), and ordered to be guillotined next day. S. J. suffered with sullen calmness—not a word escaping his lips. See Ern. Hamel's *Histoire de Saint Just* (Par. 1859).

SAINT LO, an old town of France, capital of the dep. of Manche, built on a rocky elevation on the right bank of the river Vire, 55 miles by railway south-east of Cherbourg. From the high central part, several streets, more or less steep, branch off in different directions. The town, which is said to owe its origin and its name to a St Lô, bishop of Coutance, who caused a church to be built here in the 6th c., was destroyed by the Normans in 888, and taken by the English in 1346, and again, in 1417. Noteworthy are the beautiful churches of Sainte-Croix, founded in 805, and of Notre Dame, which dates from the 15th century. Flannels, druggets, and cotton fabrics, cutlery, and leather, are manufactured, and a considerable supply of horses for cavalry are here obtained. Pop. (1862) 9810.

SAINT LOU'IS, a port of entry of Missouri, U.S., the chief city and commercial metropolis of the central Mississippi valley, stands on the right bank of the Mississippi, 18 miles below its confluence with the Missouri, and 174 miles above the mouth of the Ohio. It is regularly built upon the limestone bank of the river, on two terraces, rising 20 and 40 feet above high water, with wide and well-built streets running parallel to the river, crossed by others at right angles. The principal structures are a city hall, court house, custom house, arsenal, merchants' exchange, mercantile library, city hospital, marine hospital, university, cathedral, and several of the largest hotels in the world. There are 76 churches, of which 19 are Roman Catholic; 3 general hospitals, 10 orphan, and numerous other asylums, and 7 convents; the St Louis University, under charge of the Society of Jesus, with 18 professors; the Washington University, Academy of Sciences, German Institute, normal and high schools, 53 periodical publications, 11 daily papers, 9 German papers, an opera house, and 5 theatres. Several city railways have replaced the omnibusses, and the water supply is pumped from the Mississippi. Among the manufactories are flour and lumber mills, sugar refineries, lard and linseed-oil factories, provision packing-houses, manufactories of hemp, whisky, tobacco, and vast iron foundries and machine shops, which produced in 1866 goods valued at $87,000,000. S. L. has a vast trade by steam-boats to the whole Mississippi valley, 80,000 tons being owned there, and extensive railway connections. It is also the chief centre of the American fur trade, and seat of a vast traffic in agricultural products. There are 7 banks, and 24 insurance companies. In 1764, S. L. was the dépôt of the Louisiana Indian trading company; in 1768, it was captured by a detachment of Spanish troops; in 1804, was ceded with the whole country west of the Mississippi to the United States; the first brick house was erected in 1813; in 1820, its population was 4590; in 1860, 160,773; in 1870, 310,864.

SAINT LUCIE BARK. See Caribbee Bark.

SAINT MALO, a fortified seaport of France, in the dep. of Ille-et-Vilaine, at the mouth of the river Rance. It stands on a small island less than three miles in circumference, called *Le Rocher d'Aaron*, which lies close off-shore, and is connected with it by a causeway, 650 feet long, called *Le Sillon*. The island is completely covered by the town; the streets are narrow, filthy, and ill-ventilated, and the houses are built to the height of five and six stories. The harbour is spacious and secure, but its entrance is narrow, and is thickly set with rocks and shallows. It is perfectly dry at ebb-tide, but the flood-tide rises here from 45 to 50 feet. Numerous strong forts, both on the mainland and on the small islands that stud the roads, protect the harbour and town. A floating

basin has been constructed recently,—the work of a number of years. Ship-building is the principal branch of industry. On the island of Grand-Bé, a short distance from the ramparts, is the tomb of the poet Chateaubriand (q. v.). Many vessels are employed in the mackerel, cod, and whale-fisheries, and active commerce is carried on. S. M. communicates with Rennes (the capital of the department) by a railway opened in 1864. Population 10,886.

SAINT MI'CHAEL'S, the largest and most important of the Azores (q. v.), and, with the exception of St Mary's, the most eastern island in the group. Area, 224 sq. m., or 143,000 acres; pop. about 81,000. The island is mountainous, and rises in its highest summit to 3560 feet. Of the whole acreage, 40,000 acres are arable, and about 5000 acres are pretty equally divided between orange gardens and vineyards. In 1863, the total value of the exports, the larger portion of which goes to Great Britain, was £136,397; and the total value of the imports, of which more than a third consisted of general merchandise from Great Britain, amounted to £145,770. The crop of oranges, which form the staple article of the commerce of this island, was a large one in 1863; 189,686 boxes, representing a value of £67,141, were exported, and all to Great Britain. Ponta Delgada (pop. upwards of 20,000) and Ribeira Grande (pop. about 12,000) are the principal towns.

SAINT MICHAEL'S MOUNT, a conical and isolated rock in Mount's Bay, Cornwall, 3 miles east of Penzance. It communicates with the shore by a causeway 400 yards long, which, however, is covered with water 8 hours out of the 12. The Mount is 195 feet high, is about one mile in circumference, and is crowned by an old and picturesque castle—now used as a manorial residence—surmounted by a tower, on one angle of which there is a projecting stone lantern, popularly called *St Michael's Chair*. At the base of the Mount is a fishing village, of about 80 houses. This hill is to the geologist one of the most curious of localities, and, indeed, it is said to have 'excited more geological controversy than any mountain of the world.' At a very early period, S. M. M. was the seat of a religious house, and the apparition of St Michael is said to have appeared on one of its craggy heights. At the Conquest, the monastery of St Michael was annexed to the abbey of St Michael in Normandy. It long remained in the possession of the monks, and afterwards became the residence of several families in turn, until it was sold in 1660 to its present proprietors, the *St Aubyns*.

SAINT MICHEL, Mont, an extraordinary rock in Cancale Bay, in the north-west of France, 7 miles south-west of Avranches. It is a solitary cone of granite, 5 miles in circumference at the base, and rising to the height of 400 feet. It rises sheer out of a level expanse of sand, and though its elevation is not great, its perfectly flat environment and its pointed crest render it a most striking feature in the landscape. It is crowned by a church and castle, under which are conventual buildings, with their lofty turrets and high walls, and lower down still are the houses of the small town, which seem to adhere to the steep rock like limpets. A good road leads from the shore to the wide sands which surround the mount, and which are covered with water at every tide, except at neap-tides. At low-water there is a dry and firm track, about a mile in length, across the sands; but on both sides of it are dangerous quicksands. In the 8th c. an abbey which replaced an ancient temple of Jupiter was founded on the summit of the rock. A church, and an almost impregnable fortress, were afterwards founded by the Normans. After the Revolution the main building was changed into a prison. The castle was being restored in 1864.

SAINT NAZAIRE, a thriving seaport of France, in the dep. of Loire-Inférieure, at the mouth of the Loire, on the north bank of that river, and 38 miles west of Nantes, with which it is connected by railway. Almost unknown till within recent years, it is now one of the most important ports on the west coast of France. In 1851, it contained 2391, in 1861, 6500, and in 1865, it is stated to contain 15,000 inhabitants. In addition to the old basin, the French government has constructed another for the accommodation of the large Transatlantic steamers which leave this port for the Antilles, Cuba, and Mexico. One cause of the rapid rise of this port is, that the navigation of the Loire is becoming year by year more difficult, owing to the sand brought down by the river; so that the chief shipowners of Nantes prefer to leave their vessels at S. N., and have the cargoes transported inland by railway.

SAINT NE'OT'S, a small market town in the county of Huntingdon, 8 miles south-south-west of the town of that name, occupies low ground on the banks of the Ouse, by which it is sometimes partially inundated. Its parish church, with a tower 156 feet high, is a remarkably beautiful building. Pop. (1861) 3090.

SAINT NI'CHOLAS, a flourishing manufacturing and market town of Belgium, in East Flanders, 20 miles east-north-east of Ghent, on the Ghent and Antwerp Railway. It stands in the midst of the Pays de Waes, a densely peopled and productive agricultural district, and is said to be the seat of the largest flax-market in the world. The market is held in the great square of the town, one of the largest in Belgium, but which, however, is too small to accommodate comfortably the immense numbers who crowd hither on market-days. S. N. is a manufacturing town of the first class; and among the articles largely manufactured are cotton, woollen and silk stuffs, carpets, hats, lace, tobacco, and pipes. There are print-fields, dyeworks, and tanneries, and a flourishing trade is carried on in shawls, linens, and other manufactured goods, as well as in flax, corn, hops, &c. Pop. 23,388.

SAINT OMER, a town of France, and fortress of the third rank, in the department of Pas-de-Calais, on the Aa, 26 miles south-east of Calais by railway. It is surrounded by irregular but well-appointed fortifications, is well built amid marshes, and contains numerous fountains and more than one important ecclesiastical edifice. Woollen cloths, blankets, pottery, and clay pipes are manufactured, and there is considerable general trade. Pop. 22,011. A college for the education of English and Irish Catholics was opened at S. O. during the penal times. It was closed, however, during the Revolution, and the community was afterwards transferred to England.

SAINT PA'NCRAS, one of the northern suburbs of London (q. v.).

SAINT PAUL, a city, port of entry, and capital of Minnesota, U. S., is on the east bank of the Mississippi River, 2080 miles from its mouth, and 9 miles below the Falls of St Anthony; lat. 44° 52′ 46″ N., lon. 93° 5′ W. It is built upon a plain 80 feet above the river, and 800 feet above the Gulf of Mexico. Hills near the city abound with springs of excellent water. S. P. is at the head of navigation for the large steamboats of the Lower Mississippi and its branches, and the centre of a large

and growing trade in flour, lumber, furs, &c. It has a state-house, cathedral, college, 14 churches, as many hotels, a daily newspaper, and educational and charitable institutions. In 1846, there were 10 white inhabitants. Pop. in 1860, 10,331; in 1870, 20,030.

SAINT PAUL DE LOA'NDA, a considerable seaport on the south-west coast of Africa, the principal Portuguese settlement in Lower Guinea, stands at the mouth of the river Bengo, in lat. about 8° 54′ S. It is the largest and most important European settlement on this coast, and contains 12,000 inhabitants, of whom 830 are white, 2400 mixed, and 9000 black. The climate is comparatively healthy, the harbour is beautiful, and protected by one large and two small forts. The houses are good, the streets unpaved, and there are three churches and three market-places. Abundance of fruit and vegetables, bullocks, and goats are obtainable in the markets. Ivory and bees-wax are the principal exports.

SAINT PE'TERSBURG, a maritime government of Russia, one of the Baltic Provinces, between Lake Ladoga on the north-east and Lake Peipus on the south-west. Area, 17,260 sq. m.; pop. 1,174,174. The soil is damp and thin, and woods and marshes cover two-thirds of the level surface. In the vicinity of the capital, much ground is laid out in market-gardens. The usual crops are grown, but the quantity of corn produced is greatly less than the quantity consumed. The chief town is the capital, *Saint Petersburg* (q. v.).

SAINT PETERSBURG, the capital of the Russian empire, and of the government of the same name, stands upon, and around the lower branches of, the Neva, and on the shores of the eastern extremity of the Gulf of Finland, 16 miles east of Cronstadt, its port. Lat. 59 56′ N., long. 30° 19′ E. The Great Neva, the most southern branch of the Neva, divides the city into two great sections—the Petersburg Side on the north, and the Great Side on the south. The former is built on the islands which are formed by the delta of the Neva, the chief of which are the Vassili Ostrov, the Citadel Island, and the islands Aptekarskoi, Kammennoi, Petrovskoi, Krestovskoi, and Elaghinskoi. The Great Side, south of the Great Neva, is compactly built, and contains the residences of the court and of the nobility, and more than half the population. The city covers an area of 42 sq. m., stands 56 feet above the level of the sea, upon plains which were formerly malarious marshes, but are now for the most part drained and laid out in meadows and gardens. Pop. 667,026.

The climate, severe in winter, is as pleasant and mild as that of Scotland in summer. The mean temperature in summer is 62°; in winter, 14° F. The extremes of temperature are 99° and —51°. Fourteen arms of the Neva, irrespective of the smaller branches, ramify through S. P., and there are seven canals.

General View of Saint Petersburg.—Approaching the city from Cronstadt (q. v.), the port and fortress of the Russian capital, the first indications of the great city are the gilded dome of the church of St Izak, and the lofty spire of the Admiralty, which are seen rising apparently from the water's edge. The Admiralty Square, faces the English Quay on the south bank of the Great Neva, and may be considered the centre of the city. From the spire, with its numerous galleries, the whole plan of the city can be clearly seen. Right opposite it is the populous Vassili Ostrov, on the south shore of which are the Bourse, Academy of Sciences, Corps of Cadets, &c. To the north is the Citadel Island, and further north the densely-peopled Aptekarskoi Island, and the Kammennoi, and other islands, which are for the most part studded with wood-embosomed villas, and laid out in charming gardens. Considering the river on the north as the chord, and the Admiralty as the centre, the semicircle that might be drawn with a radius of 2½ miles, would pretty nearly describe what is called the Great Side of Saint Petersburg. This section of the city is divided into three or four portions by the Moika, St Catharina, Fontanka, and New Canals; and it is intersected by three spacious streets, which radiate east-south-east, south-east, and south from the great centre, the Admiralty. The streets are named respectively the Nevski Prospekt (Neva Perspective), Gorokhovaia Oulitza (Peas Street), Vosnosenskoi Prospekt (Resurrection Perspective). Extensive suburbs also are rising on the eastern bank of the Neva, seven miles above its mouth.

Streets, Squares, Monuments, Bridges, Churches, &c.—The street architecture of S. P., unlike that of Moscow, with its pale-yellow walls and red and green roofs, is almost destitute of colour. Here the rigid, military aspect of the streets, with the houses drawn up in long regular lines of gray, or massed together in blocks like the squares of battalions, is one of the first features of the Russian capital that impress themselves upon a traveller. Except in the more fashionable quarters, the greater number of the houses are built of wood; but owing to the liability of such houses to catch fire, building in this material is very much discouraged. S. P. contains 500 streets, and among these, lanes and alleys are unknown, as, while the finest streets have a breadth of 120 feet, the narrowest are 42 feet broad. The Nevski Prospekt is the most splendid street in S. P.; and for architectural grandeur, as well as for natural beauty, for proportions, and for variety, is considered the finest street in Europe. It is 130 feet broad, and about 4 miles long, is planted on both sides with trees, contains a large number of the most beautiful palaces, of highly ornamented churches, and splendid warehouses, and increases in breadth and magnificence as it advances from the Admiralty. For the first mile, it does not contain more than about 50 mansions, each of which, however, is of colossal magnitude. The houses are built of brick faced with stucco, are three and four stories high, and are in many cases furnished with ornamental porches, colonnades, gilded balconies, and parapets that gird the flat roofs. About ten of the other streets of the city are distinguished for their grandeur, though none of them equals the Nevski Prospekt. There are 64 squares in the city, and of these the Admiralty Square is one of the most famous. It contains one mass of buildings, presenting to the Neva a fine façade, nearly half a mile in length, while its sides are 650 feet long. In the Palace Square, adjoining the Admiralty, stands Alexander's Column, an immense monolith, erected in 1834. It consists of a shaft of red granite, standing on a pedestal of the same material, and supporting a capital, above which rises the figure of an angel and a cross. The length of the shaft is 80 feet, and that of the whole column 150 feet. Peter's Square contains the noble and well-known equestrian statue of Peter the Great, 18 feet high, and erected 1768—1782. The Field of Mars, with an area large enough to allow of 40,000 men being put through military evolutions, contains the colossal bronze statue of the famous Suwaroff.—*Bridges.*—Of the 150 bridges that unite the islands, cross the canals, and span the Neva, the Annitchkoff Bridge, leading across the Fontanka Canal, consists of five arches, is 110 feet long, and is decorated with four spirited groups, in

bronze, of wild horses and their tamers, by a native artist. The Nikolayevski Bridge, a magnificent structure in granite, and the only permanent bridge that crosses the Neva—the others being merely temporary bridges supported on boats, and removed every autumn and spring—was completed in 1850. It crosses the Neva from the English quay on the south bank to the Vassili Ostrov shore, is 1200 feet long, and consists of 7 elegant arches, supported upon ponderous piers of granite. At the northern end of the bridge, there is a drawbridge which affords a passage to ships. No part of S. P. affords a foundation solid enough to support weighty structures. The foundation for the Nikolayevski Bridge was not obtained until three sets of piles had been driven into the oozy bed of the river, the one on the top of the other, and so close, that all the timbers touched each other all the way across.—*Palaces, &c.*—S. P. might be called a city of palaces, from the number of the edifices of that description which it contains. The Winter Palace, destroyed by fire in 1837, but soon after rebuilt, is certainly the largest, and, in one sense, most probably the most magnificent palace in the world. It is 700 feet long on every side, has an imposing façade, and contains 800 inhabitants, and, during the residence of the emperor within it, is inhabited by 6000 people. It has numerous ample halls, decorated in the most artistic manner, and containing collections, furniture, and articles of *vertu* of immense value. The Hermitage, situated on the Neva like the Winter Palace, is connected with that structure by several galleries. Its gallery of 2000 paintings is famous for its specimens of the Spanish school. The library of this palace contains the collections of Diderot, Voltaire, &c., and contains in all 120,000 vols. The Annitchkoff Palace is the usual residence of the emperor. The Imperial Library, one of the first in Europe, contains 450,000 volumes and 25,000 MSS. The gilded tower of the Admiralty buildings, which is said to be visible from Cronstadt, and certainly forms in these flats a most conspicuous landmark, is 230 feet high. The Old and New Arsenals are surrounded by cannon taken from the Turks and Persians.—*Churches.*—S. P. contains 177 churches, besides 140 private chapels (*hauskapellen*). Within the Citadel stands the church of St Peter and St Paul, finished in 1727. It is surmounted with a slender tower, crowned by a gilded spire, the whole being 345 feet high. The cathedral of St Izak, though destitute of architectural beauty, is remarkable for its rude magnificence, and is one of the most considerable buildings of modern times, is 330 feet long, 290 feet broad, and 310 feet high. It is surmounted by a great gilded dome, and by four smaller domes. The domes are made of bronze, and the value of the plate-gold by which they are overlaid is stated at £50.000. Each of its four sides is adorned with a peristyle of 12 or 16 pillars, each consisting of one block of red Finland granite. These pillars are 53 feet high, and are seven feet in diameter at the base.

Academies, Scientific Institutions, &c.—The Academy of Sciences, with a library of 100,000 volumes, was founded by Peter the Great in 1725. In the Institute of Technology, founded in 1829, 200 pupils are taught silk-spinning, the manufacture of cloth, silk, and woollen stuffs, wood-cutting, and engraving on copper. The University, founded in 1829, is attended by 500 students, and has a staff of 60 professors. The New National Museum of Antiquities, Painting, and Sculpture, completed in 1851, is a noble structure, built entirely of marble and metal. Other institutions, as the School of Mines, the Gostinoi Dvor or Bazaar, are worthy of mention. There are numerous benevolent institutions, a number of splendid theatres, and an Italian opera, a magnificent structure.

Manufactures.—Of the manufacturing cities of Russia, S. P. is one of the most important. The principal private factories are mills for spinning and weaving cotton. The immense imperial establishments produce the most admired specimens of Gobelin tapestry, mirrors, articles in bronze, playing-cards, crystal, and porcelain.

S. P. is little more than a century and a half old, and yet it takes rank among the first capitals in the world. It was founded by Peter the Great, May 27, 1703. After a long struggle against the severe climate, insalubrious from the exhalations of wide-extended marshes, and from the arctic rigour which even yet can cover the Neva with ice a yard and a half thick, at length the town was founded and declared the capital in 1712. Under the successors of Peter, the improvement, embellishment, and extension of the city were carried on. Catharine II. constructed the great canals which, while they afford means of ready communication, serve also to drain the marsh-lands, to render the atmosphere more healthy, and to mitigate the rigours of winter. The city suffered great damage and the loss of several hundred lives in 1824 from an inundation of the Neva; and every April, when the ice breaks up, the lower regions of the city are threatened with a similar disaster. At S. P., all the ministers from foreign courts are bound to reside.

SAINT PETER'S LE PORT, or commonly *St Peter's*, the chief town of Guernsey, one of the Channel Islands. See GUERNSEY.

SAINT PIERRE, the chief town, though not the seat of government, of the island of Martinique (q. v.), belonging to France, stands at the head of a bay, 16 miles north-west of the capital, Fort Royal. It is said to be the largest town in the Antilles, containing, according to the most recent authorities, 25,000 inhabitants.

SAINTS, a name applied in the New Testament to the members of the Christian community generally, but restricted by ecclesiastical usage from very early times to those who, whether under the old or under the new dispensation, have been specially remarkable for their personal virtues and their eminent services to the cause of religion. Of the old dispensation, the 'patriarchs and prophets' are commonly designated as saints. But the word is used much more of the Christian Church. In the ages of persecution, the quality which most of all challenged the admiration and reverence of the faithful was naturally courage and constancy in the profession and the defence of the Christian faith; and thus the earliest of those whom the church reverences for sanctity of life, are also, for the most part, reverenced as champions of the faith. In general, however, the saints are distributed into several classes, chiefly in relation to the special services which the church has appropriated to their honour. Thus we find enumerated (1.) Apostles and Evangelists; (2.) Martyrs; (3.) Confessors, a name applied primitively to those who had exhibited great constancy in professing the faith, although without the final crown of martyrdom, but in later times understood of all who, without being martyrs, were eminent for sanctity of life; (4.) Doctors or men eminent for sacred learning; (5.) Virgins; (6.) Matrons and Widows, distinguished for holiness of life. Anciently the character and appellation of saint were bestowed upon individuals, as it were, by acclamation, and by the common voice of the members of the particular Christian community to which the individual belonged, or to which his merits were most familiar. The earliest

examples, as may be seen in the letter of the Church of Smyrna on the martyrdom of Polycarp, of such judgments as to individuals were in the case of the martyrs. Altars were erected at their tombs, and the people assembled for worship on the anniversary of their martyrdom. Even then, however, the letters of St Cyprian (Epp. 37 and 39) shew that caution was observed by the bishops to guard against the recognition of undeserving individuals. The honours of the martyrs, even before the age of persecution had passed, were extended to confessors of the faith, and eventually to all who were eminent for holiness of life, and especially to those who obtained the reputation of performing miracles. The names of those who were so honoured were placed in the register (or diptych) of each church. It was not, however, till a comparatively late period that a regular form of procedure was established in the Roman Church for the purpose of testing the claim of individuals to the authentic reputation of sanctity. From the 4th c. downwards, examples of reference to Rome—as, for instance, in the Acts of Virgilius, Bishop of Trent—are cited by Catholic writers. But the first recorded example of a solemn and public decree is in the case of Udulric or Ulric, Bishop of Augsburg, to whom the honours of sanctity were adjudged by Pope John XVI. (see Hardouin, Concil. VI. P. I., p. 727) in the end of the 10th c. (993). Since that time the procedure of the Church of Rome as to the public recognition of the saints has been matured and methodised. It consists of two stages, that are called respectively 'Beatification' and 'Canonisation.' The former is but a preliminary process, and consists in a declaration by the pope that the 'beatified' person is entitled, by reason of his (or her) eminent virtues, attested by miracles, to be regarded as a saint, and as such honoured and invoked. This authorisation, however, is not in beatification extended to the entire church, but is always limited to a particular church, or province, or religious order; and the nature of the honours permitted to be paid to the beatified person is strictly defined either by the terms of the decree, or by local usage, if such have already existed. But although the effect of a decree of beatification is less comprehensive than that of the subsequent and final declaration in canonisation, the preparatory inquiry is in all substantial particulars the same. The details of both are explained at great length and with curious minuteness by the learned Pope Benedict XIV. (Lambruschini) in a special work on the subject, which has the further interest of containing as an appendix the minutes of the entire proceedings in the canonisation which took place during his own official connection with that department. The inquiry in both procedures is conducted by the congregation of cardinals, called the Congregation of Rites, and consists first in an examination of the writings (if there be any) of the individual, then of the holiness of his life and conversation, and finally of the miracles alleged to have been performed by him in life, or obtained through his relics and intercession after death. Two such miracles at least must be established by what is considered satisfactory evidence. Upon all these points sworn depositions are required, and all are subjected to a most rigorous scrutiny, in which the office of impugnant is discharged by an advocate called Promotor Fidei, and popularly nicknamed the Devil's Advocate, his duty being to raise every possible difficulty in the way of the acceptance of the evidence of sanctity. This inquiry is generally a very protracted one; and after it has been completed, and its results recorded in writing, the acts are submitted to the cardinals, who meet three times in private congregations, and finally, if all appears satisfactorily established, in a public congregation, by which the decision is made known to the pope. Should the decision be approved by the pope, the solemnisation is proceeded with. The solemnity takes place in the Vatican Church. The cardinal prefect of the congregation of rites hands the pope's brief to the cardinal, arch-priest of the Vatican, by whom it is read; the *Te Deum* is intoned; the image of the beatified individual is uncovered, to receive the veneration of the assembly; high mass, with the Collect, in his honour, is sung; and in the afternoon the pope goes solemnly to the church to pay reverence to the image. The procedure, in case of a martyr, is somewhat different. In both, however, the process is but preliminary to the solemn canonisation. The effect of the latter comprises (1.) a declaration that the canonised person is to be recognised as a saint throughout the entire church; (2.) that he is to be invoked in the public prayers; (3.) that churches and altars may be erected in his honour; (4.) that he may be invoked in the mass and public service; (5.) that a festival may be celebrated in honour of him; (6.) that his image may be set up in public; and lastly, that his relics may be preserved and publicly honoured. The solemnity of canonisation, which is preceded by a new inquiry similar to that of the beatification, and a new judgment of the congregation of rites confirmed by the pope, is one of the most gorgeous in the entire ceremonial of the Roman Church. It takes place in the Vatican Church (St Peter's), and is generally attended by a large assembly of bishops from various parts of the church. In many respects it resembles that of the beatification, but its distinctive characteristic is the solemn publication, by order of the pope in person, after the hymn of invocation of the Holy Ghost has been sung, of the decree of canonisation. This is followed by mass, also celebrated by the pope in person, and sometimes by a homily of the pope in honour of the newly canonised. The Church of St Peter's is specially decorated at a vast cost for the ceremonial, and the entire expenditure on such occasions has been estimated at not less than £20,000. Roman Catholics hold that in such decrees the judgment of their church is infallible; and to deny that any particular canonised individual is really a saint, is held to involve, if not actual heresy, at least a grievous act of contumacy against the faith of the church. On the doctrine of saint worship, see INVOCATION OF SAINTS; and on that regarding the honour paid to relics of saints and martyrs, see RELICS.

SAINTS' DAYS, days set apart in honour of particular saints and martyrs. The practice dates from the times of persecution, when the people were wont to assemble at the tombs of martyrs on the anniversary of the martyrdom. In the multiplication of such celebrations, a record of the days fixed for each saint or martyr became necessary. This was called *calendarium*. The days so appointed were celebrated with more or less solemnity, according to the dignity of the saint, or the degree of devotion with which he was regarded. In some cases the saint's day was kept as a holiday of obligation, in which no servile work was permitted to be done. Other days are of various minor degrees of solemnity, and are called double (greater or lesser), semi-double, and simple, from the peculiar form of the office set apart for each. In particular countries, provinces, dioceses, or parishes, the day of the patron saint is specially celebrated; and in all churches the festival of the saint to whom the church is dedicated.

SAINT SERVAN, a seaport of France, in the

dep. of Ille-et-Vilaine, stands at the mouth of the Rance, opposite St Malo (q. v.), to which there is communication by land at low-water. The harbour, called Port Solidor, is secure. S. S., which is frequently spoken of as a suburb of St Malo, is much frequented as a watering-place, and carries on ship-building and considerable commerce, especially in timber. Pop. 12,709.

SAINT SIMON, Louis de Rouvroi, Duc de, whose family claimed to be descended from Charlemagne, was born in January 1675. After receiving a careful education under the superintendence of his mother, he entered the army in 1693, but considering his promotion not equal to his deserts, he resigned his commission in 1702, and devoted the remainder of his life to a sort of court statesmanship. S.'s position was as singular and as anomalous as his character. Profoundly ambitious, his pride was yet greater than his ambition. His ideas of aristocratic rights and privileges were perhaps more outrageously fanatical than any ever entertained in modern ages; and the whole aim of his life was to nullify the influence of the parliament, and to place the government of France in the hands of the *grands seigneurs*—the great territorial lords. The middle class he abhorred; and the rise to distinction of any one belonging to that order—any *novus homo*, tortured his patrician soul almost beyond endurance. We have not space (nor would it be worth our while, if we had) to recount his career of haughty and insolent conspiracy against the political rights of commoners, which marks him out as the most thoroughgoing oligarch in principle of whom we have any record. During the latter part of Louis XIV.'s reign, and the regency of the Duke of Orleans, he enjoyed much consideration, and his aristocratic policy more than once enjoyed a temporary triumph; but with the accession to the regency of the Duke of Bourbon he fell into disgrace, and withdrew from public life. He died at Paris, 2d March 1755. S.'s last years were occupied chiefly in the composition of his famous *Mémoires*, a work of incalculable historical value. Though the style is far from faultless, it so admirably expresses the meaning of the author, that one would not wish it other than it is. The *Œuvres Complètes de Louis de Saint Simon* appeared at Strasburg in 1791, in 13 vols., but the best edition is that of M. Cheruel (20 vols. Paris, 1856, et seq.). See A. Lelèvre Pontalis, *Discours sur la Vie et les Œuvres de Saint Simon* (Paris, 1855).

SAINT SIMON and SAINT SIMONIANISM. Claude Henri, Comte de Saint Simon, a French social philosopher, founder of the sect named after him, *Saint Simonians*, belonged to a different branch of the same family as the preceding, and was born at Paris, 17th October 1760. Although destined to become the propagator of the most revolutionary and democratic ideas of modern times, he was reared in a perfect hotbed of aristocratic prejudice. Nevertheless, from his earliest years, S. exhibited a decided hostility to the established system of things, mainly, however, it would seem (according to the anecdotes in vogue) from a certain puerile vehemence and obstinacy of nature. He was cursed, moreover, with a precocious vanity. What are we to think of a lad scarcely 16 giving his servant orders to rouse him every morning with such a flattering summons as *Levez-vous, Monsieur le Comte, vous avez de grandes choses à faire*, especially when, in point of fact, he had *nothing* to do? S. was pretty well educated in philosophy, like most of the young nobles of his time, and had D'Alembert among others for his tutor. At 18 he entered the army, served in America, and distinguished himself on the day when Lord Cornwallis surrendered at York (17th September 1781) with all his forces. Captured by the British on his return home, he was taken to Jamaica, where he remained till the peace in 1783 restored him to liberty and France. But the monotony of garrison life did not suit his restless and impatient spirit, and in 1785 he quitted the service, and travelled in Holland and Spain, busying himself with various industrial schemes, such as connecting Madrid with the sea by means of a canal, and introducing *diligences* into Andalusia—the latter of which proved successful. The great revolution found in him—noble though he was—an enthusiastic disciple, and he voted in his patrimonial canton for the abolition of titles of nobility, but did not take any part in the political events that followed. His energies were devoted to matters more profitable than patriotic—viz., the purchase of confiscated property—and it is unhappily not at all doubtful that when France was labouring in the agony of a mighty struggle after new life, S. was consumed by an ignoble passion for enriching himself. But then, as his disciples have naïvely observed, it was necessary that he should acquire a fortune in order that he might be able to devote himself satisfactorily to ideas. It was during the revolution, and while suffering a temporary imprisonment in the Luxembourg, that visions of a new social system, based on scientific principles, and not on political conventionalities, first unfolded themselves before his ardent imagination. His ancestor Charlemagne appeared to him one night in a dream, and said: *Depuis que le monde existe aucune famille n'a joui de l'honneur de produire un héros et un philosophe de première ligne. Cet honneur était réservé à ma maison. Mon fils, tes succès comme philosophe égaleront ceux que j'ai obtenus comme militaire et comme politique.* S., though now 38 years of age, commenced to study 'science,' of which he was as yet quite ignorant. The plan he adopted was pleasant and ingenious. He took a house opposite the *Ecole Polytechnique*, and invited to his table the professors of mathematics, of physics, and of astronomy, from whose lips—in the intervals of their feeding—he acquired the necessary information. Then he changed his lodgings, and fixed himself near the *Ecole de Medicine*, where, pursuing the same method with the physiologists, he learned from them something of the structure of organised bodies. In 1801, he married, and threw open his *salons* to all the savans and artists of Paris; but his lavish hospitalities—prodigalities, perhaps, they ought rather to be called—soon dissipated the fortune he had amassed during the revolution. Meanwhile a notable social idea seized him. Hearing that the husband of Madame de Stäel had just died, he resolved to marry the widow, whom he considered to be the only woman fit to associate with him in his great project for the regeneration of society. To be sure there was a little impediment in the way—viz., his being already married; but in France there is never any difficulty in getting a divorce; and S. was soon as good as a bachelor again. Betaking himself to Coppet, he unfolded his plan to the lady, and begged her concurrence, urging his suit (it is said) by the most impressive considerations: *Madame, vous êtes la femme la plus extraordinaire du monde comme j'en suis l'homme le plus extraordinaire; à nous deux nous aurions, sans doute, un enfant plus extraordinaire encore.* Madame de Staël, however, declined to further the philanthropic projects of S. in the way he wanted, and the reformer—now beginning to be in straits—published at Geneva a *Lettre d'un Habitant de Genève à ses Contemporains* (1803), in which he proposes (among other things)

that there should be an annual subscription for the benefit of men of genius—mathematicians, physicians, chemists, physiologists, litterateurs, painters, and musicians—that spiritual power should be in the hands, not of the clergy, but of savans, and temporal power in the hands of the landed proprietors, while the privilege of choosing 'chiefs of humanity' should belong to everybody; finally, he asserts that religion is only a human invention. S.'s proposal (so obstinately prejudiced are men against what is right) was not adopted—was not even noticed, either by 'men of genius' or others, and in the course of a few months he was glad to accept the office of copyist at the Mont-de-Piété. Even this humble means of making a livelihood he had to resign from ill-health, and he would probably have died of starvation had he not fallen in by chance with an old revolutionary friend called Diard, who took him into his house and furnished him with means to publish one of his most important works, the *Introduction aux Travaux Scientifiques du Dix-neuvième Siècle* (Par. 1807). The death of Diard, in 1810, once more plunged S. into misery. Soon after, we find him writing to Lacépède, Cuvier, Degérando, Cambacérès, &c., in this style: '*Monsieur*,' *soyez mon Sauveur, je meurs de faim . . . . Depuis quinze jours, je mange du pain et je bois de l'eau; je travaille sans feu et j'ai vendu jusqu'à mes habits pour fournir aux frais des copies de mon travail.* There is nothing ludicrous here—it is the plain unaffected agony of utter want. In 1812, his wretchedness came to a crisis; he left Paris, betook himself to Peronne, where he fell dangerously ill, but recovered through the attentions of his family, who now settled a small pension on him; he then returned to Paris. After the Restoration, he began—in spite of his extravagant vanity—to reap the never-failing reward of enthusiasm and perseverance—a crop of disciples. Of these the most distinguished was Augustin Thierry, who assisted him in the redaction of his *Réorganisation de la Société Européenne*—a work intended to demonstrate the inutility of the Congress of Vienna, and the incapacity of all mere political congresses to establish a durable peace. He proposes the institution of a European parliament, having the right to arbitrate in cases of difference among the various nations, and adds that the first step towards the reorganisation of Europe is the union of France and England. In 1817—1818, he published *L'Industrie, ou Discussions Politiques, Morales, et Philosophiques*, partly written by himself and partly by his disciples. The third volume is the work of the celebrated Auguste Comte (q. v.). By this and other literary enterprises S. had exhausted all his funds, and as he saw no prospect of getting any more, he resolved to commit suicide, and actually discharged a loaded pistol at his own head (9th March 1823), which, however, only deprived him of an eye, and not of life. The last, and by far the most remarkable work of S., is his *Nouveau Christianisme* (Par. 1825), which contains his final and matured convictions. According to him, Christianity has been diverted from its original design. Progressive by nature, and meant to be modified by the changing circumstances of times and countries, it has been stiffened into unalterable dogmas by ecclesiastical conclaves. The clergy, whose mission is to instruct, are ignorant of the thoughts and manners of modern times, and have exhibited a complete and deplorable incapacity. Protestantism is no wiser than Catholicism. It has set its face against the fine arts, and has shewn a cruel and fatal indifference to the physical amelioration of the poor. But genuine Christianity embraces in its consideration all the needs of humanity. From its grand principle, 'Love one another,' it derives the proposition, that 'religion ought to direct all the social forces towards the moral and physical amelioration of the class which is at once the most numerous and the most poor.' From this premiss is deduced the idea of a social hierarchy based on capacity and labour—the new spiritual church comprising all functions and professions, sanctifying science and industry, regulating vocations, fixing salaries, dividing heritages, and taking the best measures to make the labours of each conduce to the good of all. S. did not live to carry out his principles in detail as far as they would have logically carried him, dying on the 19th May 1825; but in the writings of Comte we find the legitimate terminus and result of his sweeping speculations. Much in the character and system of S. is unquestionably false, exaggerated, and even laughable, but the man who reckoned among his disciples names like MM. Augustin Thierry, Auguste Comte, Olinde Rodrigues, Bailly (de Blois), Léon Halévy, Duvergier, Bazard, Enfantin, Cerclet, Buchet, Carnot, Michel Chevalier, Henri Fournel, Dugied, Barrault, Charles Duveyrier, Talabot, Pierre Leroux, Jean Reynaud, Emile Péreire, Félicien David, Saint Cheron, Guéroult, Charton, Cazeaux, Dubochet, and Stéphane Mony—is one whom posterity will not willingly forget.

SAINT THO'MAS, one of the Danish West Indian Islands, forms one of the group of the Virgin Islands (q. v.), and lies 38 miles east of Puerto Rico. Area (official statement), 25 sq. m.; pop., 15,500. The surface is hilly and the soil poor. Water is exceedingly scarce; the chief town of the island, Charlotte Amalie (q. v.), being dependent for its supply upon tanks of collected rain-water. The cultivation of vegetables, grass, and a small quantity of cotton, employs the scanty rural population; but the products are small, and nothing is exported. In 1863, 751 British vessels, including schooners and sloops, and carrying 95,819 tons, arrived at the island. The value of manufactured and other goods imported from Great Britain in 1866 was about £700,000. The port, Charlotte Amalie or St Thomas, is a station for steam-packets, and is an important entrepôt of West Indian produce. The proposed sale of St T. to the United States in 1868 was not consummated.

SAINT THOMAS, an island off the west coast of Africa, in the Gulf of Guinea, belonging to Portugal, 260 miles south-west of Fernando Po. Area about 120 sq. miles. Of its inhabitants, 1000 are white and mulattoes, 2000 are free blacks, and about 10,000 are slaves. Sugar was formerly grown extensively; coffee is now the chief article of export. The chief town is St Thomas or Chaves, a bishop's see, with about 4000 inhabitants, who live in miserable wooden huts, and few of whom can write or even read.

SAINT VI'NCENT, one of the British islands in the West Indies, 90 miles west of Barbadoes, at the mouth of the Orinoco. Area, 131 sq. m.; pop. (1861) 31,755, of whom 2347 were white, 6553 coloured, and 22,855 black. The island is one of the most beautiful of the group to which it belongs. It is traversed from north to south by a chain of volcanic mountains, which rise in the volcano called the Souffrière to the height of 3000 feet. Many of the valleys are fertile, and the shores are rich and productive. About 2-5ths of the entire area, or 35,000 acres of the 84,000, are under cultivation. Much rain falls, often to the serious injury of the crops and of the roads, but the climate is nevertheless healthy. In 1860, the island contained only 31 schools, attended by 2189 scholars, and the standard of the morality, as well as of the

culture, of the inhabitants, was low. In the year 1868 the revenue amounted to £25,204, and the imports to £130,376. The exports in 1869, chiefly sugar, arrow-root, and rum, amounted to £283,387. In the year 1860, 702 vessels, of 39,296 tons, entered and cleared the ports, the chief of which, and the capital of the island, is Kingston (q. v.).

SAINT VINCENT, Cape, in Portuguese *Cabo da São Vicente*, a promontory forming the south-western corner of Portugal and of Europe, off which several important naval battles have taken place. On June 16, 1693, Admiral Rooke, with 20 English men-of-war, was here attacked by a vastly superior French fleet, and defeated with the loss of 12 men-of-war, and 80 merchantmen which were sailing under his convoy; on January 16, 1780, Admiral Rodney here destroyed several Spanish ships; on February 14, 1797, the great battle of Cape St V., between 15 British line-of-battle and 6 frigates, under Admiral Jervis (afterwards created Earl St Vincent), and 27 Spanish line-of-battle and 12 frigates, resulted in the total defeat of the latter and capture of 6 of their largest ships (of which, however, 4 only were ultimately secured). The effect of this last victory was to frustrate the formidable Spanish-French scheme of invading England. The fourth naval fight off Cape St V. took place between the fleet of Queen Maria of Portugal, commanded by Sir Charles Napier (q. v.), and that of Dom Miguel, in which a portion of the latter was destroyed, and the rest captured, 5th July 1833.

SAINT VITUS DANCE. See Chorea.

SAIS, an ancient Egyptian city, called in the hieroglyphs *Sa*, and existing at the time of the old monarchy, was situated on the right bank of the Canopic branch of the Nile, in 31° 4′ N. lat. It is at present called Sa el Hagar, or Sa of the Stone, from some modern stone buildings in the neighbourhood. There are, however, no remains of temples or palaces on the site; all that remains being a wall of unburnt brick 70 feet in thickness, perhaps the peribolos of the temple. Traces of the Temenos, 720 feet long, still exist, and of the citadel, but the temples and tombs which stood within the city walls have been completely stripped; many fine statues of basalt of the 26th or Saite dynasty, from this spot, being found in the different collections of Europe. S. gave its name to a nome, and also to two Egyptian dynasties, the 24th and 26th, founded by natives of the city. The goddesses principally worshipped there were Neith or Minerva, and Ceres or Isis. Neith was said to be the mother of the sun, and is constantly called in the hieroglyphical legends the mistress of S.; and an inscription in the temple of Neith is said to have declared of her, 'I am past, present, and future, no one has lifted my veil, the fruit I have brought forth is the sun.' At S. there was also a sepulchre of Osiris. The tombs of the kings, contrary to Egyptian and resembling the Greek custom, were within the walls. The tomb of Amasis consisted of a stone edifice with columns, and a chamber with doors. S. was important as a religious capital. Towards the decline of the monarchy, it rose to great splendour. The 26th dynasty transferred hither the capital of the kingdom. Amasis transported a monolithic shrine of granite from Elephantine to S. after three years' labour, employing 2000 men in the undertaking. Solon and Pythagoras visited S., and Plato was instructed in its colleges. There seems to have been a considerable Greek population in the city; but although S. continues to be mentioned after the 26th dynasty, its political importance then declined, and Memphis became the seat of government. The intercourse between S. and Athens subsequently gave rise to the idea of Athens having been colonised from it. Lepsius, *Briefe*, p. 12; Wilkinson, *Modern Egypt*, vol. i. p. 183; Herodot. ii. 28, 59, 169; Strabo, xvii. p. 801; Champollion, *L'Egypte*, ii. p. 219; *Lettres*, p. 50.

S'AIVAS is the name of one of the three great divisions of Hindu sects. See India. The word designates the votaries of S'iva, and comprises different special sects, which varied in number at different periods of medieval Hinduism. To judge by the number of shrines dedicated to S'iva in his form as Linga, it would seem that the worship of this deity was the most prevalent of all the modes of adoration; but these temples are scarcely ever the resort of numerous votaries, and they are regarded with comparatively little veneration by the Hindus. In Upper India, the worship of S'iva has, indeed, never assumed a popular form. No legends are recorded of this deity of a poetic or pleasing character; the S., unlike the Vaishnavas, have no works in any of the common dialects, such as the *Râmâyan'a*, the *Vârttâ*, or the *Bhaktamâlâ*; no establishments in Hindustan, like S'rînâth or Purî; and their teachers of repute, like S'ankara (q. v.), are too philosophical and speculative to be really popular. The worship of S'iva seems, therefore, to have been, from a remote period, more that of the learned and speculative classes, than that of the masses of the people. In a renowned work called the *S'ankara-dig-vijaya*, or the victory of S'ankara over the world, composed by Anandagiri, one of the disciples of S'ankara, several subdivisions of the S. are named—viz., the *S.*, properly so called—who wore the impression of the Linga on both arms—the *Raudras*, who had a trident stamped on the forehead; the *Ugras*, who had the drum of S'iva on their arms; the *Bhâktas*, with an impression of the Linga on their foreheads; the *Jangamas*, who carried a figure of the Linga on their head; and the *Pâs'upatas*, who imprinted the same symbol on the forehead, breast, navel, and arms. The present divisions of the S., however, are the following: the Dan'd'ins and Das'nâmi-Dandins; the Yogins; the Jangamas; the Paramahansas; the Aghorins; the Urdhabâhus; Âkâs'mukhins and Nakhins; the Gûdaras; the Rûkharas, Sûkharas, and Ûkharas; the Kârâlingins; the Brahmachârins; and the Nâgas.

The *Dan'd'ins*, or staff-bearers, properly so called, are the representatives of the fourth order, or mendicant life, into which a Hindu is to enter after he passed through the stages of a religious student, householder, and hermit. The Dan'd'in is distinguished by carrying a *dan'd'a*, or small staff, with several projections from it, and a piece of cloth dyed with red ochre—in which the Brahmanical cord is supposed to be enshrined—attached to it. He shaves his hair and beard, wears only a cloth round his loins, and subsists upon food obtained ready-dressed from the houses of the Brahmans once a day only, which he deposits in the small clay-pot that he always carries with him. He should live alone, and near to, but not within a city; this latter rule, however, is rarely observed. The genuine Dan'd'in is not necessarily of the S'aiva sect; but those who worship S'iva, especially in his form as Bhairava, or the Terrific, have, at the ceremony of initiation, a small incision made on the inner part of the knee, the blood drawn by this process being deemed an acceptable offering to the god. The *Das'nâmi-Dan'd'ins* are included in this class; but they admit none but Brahmans into their body, and are considered to be the descendants of the original members of the fraternity, who refer their origin to the celebrated *S'ankara* or *S'ankarâ*

châryа (q. v.). He is said to have had four disciples, who are called Padmapa'da, Hastâmalaka, Sures'wara or Mandana, and Trot'aka. Of these, the first had two pupils, Tîrtha and Âs'rama; the second two, Vana and Âran'ya; the third had three, Saraswatî, Purî, and Bhâratî; and the fourth had also three, Giri or Gir, Pârvata, and Sâgara. These ten constitute collectively the Das'nâmi (from *das'an*, ten, and *na'man*, name); and when a Brahman enters into either class, he attaches to his denomination that of the class of which he becomes a member; as Tîrtha, Giri, &c. The philosophical tenets of this sect are mainly those of the *Vedânta* (q. v.), as taught by S'aukara and his disciples; but they generally superadd the practice of the *Yoga* (q. v.), and many of them have adopted the doctrines of the *Tantras* (q. v.).

The *Yogins* are, properly speaking, followers of the *Yoga* (q. v.) system; and the term implies a class of men who practise the most difficult austerities, in order to become absorbed into the universal spirit, and thus liberated from repeated births. The votaries of S'iva, so called, hold that, by dint of these practices—such as continued suppressions of respirations, sitting in 84 different attitudes, fixing the eyes on the top of the nose—they will be finally united with S'iva, whom they consider as the source and essence of all creation. The principal sect of this class is that of the *Kânphât'â Yogins*, who trace their origin to a teacher named *Gorakhnâth*, who seems to have lived in the beginning of the 15th c., and, according to his followers, was an incarnation of S'iva. A temple of Gorakhnâth exists at Gorakhpur; a plain, called Gorakhkhetr, is near Dwârakâ, and a cavern of his name at Haridwâr. The Yogins of Gorakhnâth are called Kânphâtâs, from having their ears bored and rings inserted in them at the time of their initiation. They may be of any caste; they live as ascetics, single or in colleges; officiate as priests of S'iva in some places; mark the forehead with a transverse line of ashes, and smear the body with the same substance; they deal in fortune-telling, profess to cure diseases with drugs and spells; and some play and sing, and exhibit animals.

The *Jangamas*, or *Lingavats*, are likewise not an important division of the S'aiva sect. Their essential characteristic is the wearing of the Linga emblem on some part of their dress or person.

The *Paramahansas* are ascetics who pretend to be solely occupied with the investigation of Brahman, and to be equally indifferent to pleasure or pain, insensible of heat or cold, and incapable of satiety or want. In proof of this, they go naked in all weathers, never indicate any natural want, and receive from their attendants what is brought to them as their alms or food.

The same apparent worldly indifference characterises the *Aghorins;* but they seek occasions for its display, and demand alms as a reward for its exhibition. Their practices, too, seem to betray that originally their worship was not of an inoffensive kind, but required even human victims for its performance. They eat and drink whatever is given to them, even ordure and carrion; and in order to extort money from the credulous, they resort to the most disgusting devices.

The *Urdhabâhus* are solitary mendicants; they extend one or both arms above their heads till they remain of themselves thus elevated. They also close the fist, and the nails being suffered to grow, completely perforate the hand. They usually assume the S'aiva marks, and twist their hair so as to project from the forehead, in imitation of the matted hair of S'iva.

The *Âkâs'mukhins* hold up their faces to the sky till the muscles of the back of the neck become contracted and retain it in that position.

The peculiarities of the other sects we cannot afford space to specify; they are equally trifling, and sometimes disgusting.—For fuller details of the Sa'ivas, see H. H. Wilson, *A Sketch of the Religious Sects of the Hindus;* Works, vol. i. (edited by Dr R. Rost, Lond. 1862), pp. 188, ff.

S'ÂKA. See S'ÂLIVÂHANA.

S'ÂKAT'ÂYANA is the name of a celebrated Hindu grammarian, who preceded Pân'ini (q. v.) and Yâska (q. v.), for he is quoted by both these authors. His grammatical work, however, seems to be lost, for no portion of it has as yet been forthcoming; and an attempt recently made to identify with it a grammar of a S'âkat'âyana, copies of which are met with at the India Office Library, London, and at Madras, has signally failed. The latter S'âkat'âyana is a Jaina (q. v.), who is not only later than Kâtyâyana (q. v.), but, in all probability, a modern writer.

SAKHALI'N, commonly written SAGHALIEN, native name TARAIKA, a long and narrow island, partly belonging to Russia and partly to Japan, runs from north to south close off the shores of Asiatic Russia in the south-west of the Sea of Ochotsk. Area 32,000 sq. m., of which 18,000 sq. m., forming the whole northern portion, belong to Russia, and the remainder to Japan. Pop. about 8500. It is 588 miles in length, and about 120 miles in extreme breadth. Lat. 45° 54′—54° 24′ N. In lat. 52° the island approaches to within six miles of the mainland, from which it is separated by the shallow Mamia Strait. A mountain-chain with craggy summits, which in lat. 52° are covered with snow throughout the year, traverses the island from north to south. There are no important natural harbours. The chief rivers are the Ty, falling into Patience Gulf, and 90 feet wide and 7 feet deep at its mouth, and the Tymy flowing north-east. The rivers and the coasts swarm with fine fish. Immense stores of fish are preserved in a frozen state during winter, and upon these the natives and their dogs in great part subsist. On the east coast of the island the vegetation, especially in the north, has a stunted appearance. On the west coast luxuriant grass clothes the valleys, and forests of pine, fir, birch, larch, oak, and maple trees cover the mountains. Among the animals are the reindeer, the stag, roe, elk, and musk ox. In the northern part of S. the climate is even more rigorous than at Nikolaevsk (q. v.). At Aniva Bay in the south, the coldest day in the winter of 1853—1854 shewed a temperature of —13° F. The inhabitants carry on an inconsiderable barter trade with their fish, furs, and seals. Coals have been discovered in several localities and explored by the Russians. Ravenstein's *Russians on the Amur* (Trübner & Co., Lond. 1861).

SAKHALIN ULA HOTUN, now commonly and more properly called Aigun, a town of Manchuria, on the right bank of the Amur, 14 miles below the junction of the Dzeya with that river. Lat. 50° 15′ N., long. 127° 40′ E. It is the chief place of the Manchu on the Amur, and is sombre in appearance, though it contains many gaily painted temples. The great quadrangle, containing the government and other buildings, is 230 yards square, and is surrounded by double rows of palisades. Paper lanterns hang across the streets, and fantastic figures—dragons, &c.—cut in paper, are fixed to poles above the shops. Millet, tobacco, and other products, are grown in the vicinity for export. Pop 15,000.

SAKI, a kind of beer which the Japanese make

from rice. It is the common alcoholic liquor of Japan. It is clear, and has a peculiar taste, which Europeans generally reckon unpleasant. The Japanese usually heat it before drinking, and pour it into flat cups or saucers of lacquered wood. It produces a very speedy and transient intoxication.

SAKI (*Pithecia*), a genus of American monkeys, having the tail, which is not prehensile, covered with very long hair, whence they are often called *Fox-tailed Monkeys*. The head is round, and the muzzle short, the ears not unlike those of the human race. The whole body is covered with long hair.

S'ÂKTAS is the name of one of the great divisions of Hindu sects (see INDIA). The term is derived from the Sanscrit *s'akti*, which means 'power, energy;' but, in its special application, denotes the energy of the deity, and particularly that of the gods of the Hindu triad, Brahma, Vishn'u, and S'iva. This energy, originally spoken of as the wish or will of the Supreme Being to create the universe, and afterwards dilated upon in metaphorical and poetical speech, assumed at the Pauranik period (see *Hindu Religion* under INDIA) the form of a separate deity, thought of as the wife of the god to whom it belongs. Accordingly, Saraswatî (q. v.) became the S'akti or wife of Brahman; Lakshmî (q. v.), the S'akti or wife of Vishn'u; and Devî, or Durgâ, or Umâ (q. v.), the S'akti or wife of S'iva. *S'âkta*, properly speaking, means, therefore, a worshipper of any of these female representations of the divine power; but, in its special and usual sense, it is applied to the worshipper of the female energy or wife of S'iva alone; and the S., properly so called, are, therefore, the votaries of Durgâ, or Devî, or Umâ (q. v.). Since S'iva (q. v.) is the type of destruction, his energy or wife becomes still more so the type of all that is terrific; and, in consequence, her worship is based on the assumption that she can be propitiated only by practices which involve the destruction of life, and in which she herself delights. That such a worship must lead to the brutalisation, and degenerate into the grossest licentiousness, of those addicted to it, is but natural; and it will easily be understood that the S'âkta religion became the worst of all forms which the various aberrations of the Hindu mind assumed. Appealing to the superstitions of the vulgar mind, it has its professors, chiefly amongst the lowest classes; and, amongst these again, it prevails especially in Bengal, where it is cultivated with practices even scarcely known in most other provinces. The works from which the tenets and rites of this religion are derived, are known by the collective term of *Tantras* (q. v.), but as in some of these works the ritual enjoined does not comprehend all the impure practices which are recommended in others, the sect became divided into two leading branches, the *Dakshin'âchârins* and *Vâmâchârins*, or the followers of the right-hand and left-hand ritual.

The *Dakshin'âchârins* are the more respectable of the two. They profess, indeed, to possess a ritual as pure as that of the Vedas. Nevertheless, they annually decapitate a number of helpless animals, especially kids, and in some cases pommel the animal to death with their fists, or offer blood without destroying life—practices contrary to the Vedic ritual. The *Vâmâchârins*, on the other hand—the type of the S.—and amongst these especially that branch called Kaula or Kulina, adopt a ritual of the grossest impurities. Their object is, by reverencing Devî, who is one with S'iva, to obtain supernatural powers in this life, and to be identified after death with S'iva and his consort. 'According to the immediate object of the worshipper,' Professor Wilson says, 'is the particular form of worship; but all the forms require the use of some or all of the five letters M—viz., Mânsa, Matsya, Madya, Maithuna, and Mudrâ—i. e., flesh, fish, wine, women, and certain mystical gesticulations. Suitable *mantras* (or formulas) are also indispensable, according to the end proposed, consisting of various unmeaning monosyllabic combinations of letters, of great imaginary efficacy. Where the object of the ceremony is to acquire an interview with, and control over, impure spirits, a dead body is necessary. The adept is also to be alone, at midnight, in a cemetery or place where bodies are burned or buried, or criminals executed; seated on the corpse, he is to perform the usual offerings, and if he does so without fear, the Bhûtas, the Yoginîs, and other male or female goblins, become his slaves. In this, and many of the observances practised, solitude is enjoined; but all the principal ceremonies comprehend the worship of S'akti, and require for that purpose the presence of a female as the living representative and type of the goddess. This worship is mostly celebrated in a mixed society, the men of which represent Bhairava (or S'iva as the Terrific), and the women, Bhairavî (S'akti or Devî as the Terrific). The S'akti is personated by a naked female, to whom meat and wine are offered, and then distributed amongst the assistants; the recitation of various Mantras and texts, and the performance of the Mudrâ, or gesticulations with the fingers, accompanying the different stages of the ceremony; and it is terminated with the most scandalous orgies amongst the votaries.' The same author adds that, 'in justice to the doctrines of the sect, it is to be observed, that these practices, if instituted merely for sensual gratification, are held to be as illicit and reprehensible as in any other branch of the Hindu faith;' but full assent must be given to his remark which follows a text quoted by him in support of this view, for he says: 'It is only to be added that if the promulgators of these doctrines were sincere, which is far from impossible, they must have been filled with a strange frenzy, and have been strangely ignorant of human nature.'

'The members of this sect are very numerous, especially amongst the Brahmanical caste; all classes are, however, admissible, and equal at the ceremonies of the sect. The particular insignia of these S'âktas are a semicircular line or lines on the forehead, of red sanders or vermilion, or a red streak up the middle of the forehead, with a circular spot of red at the root of the nose. They use a rosary made of the seeds of the eleocarpus, or of coral beads, but of no greater length than may be concealed in the hand; or they keep it in a small purse, or a bag of red cloth. In worshipping, they wear a piece of red silk round the loins and decorate themselves with garlands of crimson flowers.' Two other sects are likewise mentioned as belonging to the S., the *Kânchuliyas* and *Karârins*, but it is doubtful whether they are still in existence. The former are said to have belonged to the south of India; and the latter seem to have been worshippers of Devî in her terrific forms, the offering to her of human sacrifices being the principal feature of their ritual. If there are still any votaries of this sect, Professor Wilson believes that they are the miscreants who, more for pay than devotion, at certain festivals, inflict upon themselves bodily tortures, such as piercing their flesh with hooks or spits, reclining upon beds of spikes, gashing themselves with knives, &c.—See H. H. Wilson, *A Sketch of the Religious Sects of the Hindus;* Works, vol. i. (edited by Dr R. Rost, 1862), pp. 240, ff.

S'AKUNTALA is one of the most pleasing

female characters of Hindu mythology. She is mentioned as a water-nymph in the *Yajurveda* (see VEDA); she is the subject of a beautiful episode of the *Mahâbhârata* (q. v.), and is spoken of in the *Purâṇ'as;* but her name has become especially familiar in Europe through the celebrated drama of Kâlidâsa (q. v.), which, introduced to us by Sir William Jones in 1789, became the starting-point of Sanscrit philology in Europe. The principal features of the legend of S., as narrated in the *Mahâbhârata*, are the following: S. was the daughter of the saint Vis'wa'mitra (q. v.) and the Apsaras, or water-nymph, Menakâ. Abandoned by her parents, she was adopted by the saint Kan'wa, who brought her up in his hermitage as his daughter. Once upon a time, King Dushyanta went a-hunting in the forest, and accidentally coming to the hermitage of Kan'wa, saw S., and fell in love with her. He persuaded her to marry him according to the rite of the Gandharva marriage, and promised her that the son she would bear him should be the heir to his throne, and that he would take her home as his queen to his royal city. Kan'wa, who had been absent while this event happened, returned to the hermitage, and through his divine knowledge, knew the whole secret, though it had not been confessed to him by S'akuntalâ. She in due time was delivered of a son, and remained at the hermitage until the boy was six years old; but as Dushyanta, unmindful of his promise, did not send any messenger for her, Kan'wa directed her to proceed with her boy to the residence of Dushyanta. This she did; but when she arrived at his residence, she was repudiated by the king. Nor did her speech, however touching and eloquent, move his heart, until at last a heavenly voice assured him that S. had spoken the truth, and that he saw before him his lawful son. Thereupon, Dushyanta recognised S. as his queen, and her son as his heir. The latter was named Bharata, and become the founder of the glorious race of the Bhâratas. In the drama, Kâlidâsa's genius had full scope to work out the incidents of this legend, so as to display the accomplished female character of S., and likewise to shew that the obstacle which arose to her recognition was not the fault of Dushyanta, but the consequence of a curse which S. had incurred from a wrathful saint who, when once on a visit to Kan'wa's hermitage, had considered himself neglected by her. Since, in the drama, Dushyanta recognises S. by means of a ring he had given her at the hermitage, the name of the drama is *Abhijnâna-S'akuntala*, or 'the drama in which S'akuntalâ (is remembered) by a token.' There are two versions in which this drama now exists—an older and a more recent one. The latter was first edited at Calcutta, 1761, then at Paris, 1830, by A. L. Chézy, who also gave a French translation of it; later and better editions of it (Cal. 1860 and 1864) were prepared by the Pandit Prem Chunder Tarkabâgish, under the superintendence of Professor Edward B. Cowell, the Principal of the Sanscrit College at Calcutta. The older version has been edited by Dr O. Boehtlingk (Bonn, 1842), by Professor M. Williams (Hertford, 1853), and by a Bombay Pandit at the Induprakâs'a press (Bomb. 1861). The first English translation of it is that by Sir William Jones (Cal. 1789); the second was made by Professor M. Williams (Hertford, 1856); it deserves the highest acknowledgment, on account of the consummate taste with which it has rendered the metrical part of the original. Among the various German, Italian, Danish, and other translations of this drama, the German translation by Ernst Meyer (Stutt., 1852) is worthy of especial notice.

S'ÂKYAMUNI, or the SAINT S'ÂKYA, is a name of *the* Buddha, the founder of the Buddhist religion. See BUDDHISM.

SAL (*Vateria robusta*), a tree of the natural order *Dipteraceæ*, one of the most valuable timber trees of India. Great sal forests exist along the southern base of the Himalaya Mountains, but in many places they have been nearly cut down. The care of government is now extended to their preservation.

SALAA'M (*Selâm*, Arab. = Heb. *Shalom*, peace), the general term of salutation among the Mohammedans. They are generally very formal in their social manners, although their demeanour and conversation are unrestrained enough, both among men and women. Several of their social usages in this respect are founded upon religious precepts; among these is the custom of greeting each other with the words: 'Es-selâmu aleikum' (Peace be with you), which is answered by: 'With you be peace, and the mercy of God, and His blessings!' This salutation is neither to be addressed to nor to be received from any non-Mohammedan. The reply, when one Moslem salutes another, is obligatory, while the address itself is rather arbitrary. Should the saluted refuse to reply, then the other may revoke his salutation, as he does in the case of his discovery that the person saluted is not a true believer, with the words: 'Peace be on us and on all the righteous worshippers of God.' Generally, the rider salutes the person on foot, the passer-by those who sit down or stand still; the smaller party salutes the larger, the young the older, &c. Salutation is to be the first and the last thing on entering a house. The following is the rising scale of the different modes of obeisance with the Moslem: 1. Placing the right hand upon the breast; 2. Touching the lips and the forehead or turban (or forehead and turban only) with the right hand); 3. Doing the same, but slightly inclining the head during that action; 4. The same, but inclining the body also; 5. The same, previously touching the ground with the right hand; 6. Kissing the hand of the person to whom the obeisance is paid; 7. Kissing his sleeve; 8. Kissing the skirt of his clothing; 9. Kissing his feet; 10. Kissing the ground. This, however, is to be understood (against De Sacy) as merely touching the ground previous to touching the lips and forehead with the right hand. The first five modes are accompanied by the 'Peace be with you,' and the reply given above. The sixth mode is observed by servants or pupils to their master, wife to husband, and children to father, and sometimes mother, by the young to the aged, and the less learned to the learned and pious (Lane, *Notes to Arab. Nights*, &c.).

SA'LAD, the name given to a preparation of raw herbs for food. It derives its name from the fact that salt is one of the chief ingredients used in dressing a salad. The principal salad herbs are lettuce, endive, chicory, celery, mustard, and cress; water-cress, onions, radishes, chervil, and a few savory herbs used to give flavour. They are usually cut up, and mixed with salt, vinegar, oil, and other condiments, according to taste. Sugar is also frequently added. Cresses, seed-leaves of mustard, &c., are often eaten without any addition. Salad has always been a favourite food with civilised nations, and has very little varied in its composition. The Romans used it, and made it thus: Cultivated endive was cut small after careful washing and draining, then gravy and oil were poured over it; and finely-minced onions were strewed over the whole; then a little vinegar and honey was added, and the salad served up. The great value of salads is in the fact that they are uncooked,

and consequently contain a larger quantity of mineral matter, such as potash, soda, &c., than if boiled. Salads are sometimes prepared with animal food, such as boiled lobsters, crabs, eggs, &c.

SALADIN, the name given by western writers to SALAH-ED-DIN YUSSUF IBN AYUB, the sultan of Egypt and Syria, and the founder of the Ayubite dynasty in those countries. As the great Moslem hero of the third crusade, and the beau-idéal of Moslem chivalry, he is one of the most interesting characters presented to us by the history of that period. He belonged to the Kurdish tribe of Ravad, and was born at Tekreit (a town on the Tigris, of which his father Ayub was *kutwal* or governor under the Seljuks) in 1137. Following the example of his father and uncle, he entered the service of Noureddin (q. v.), prince of Syria, and accompanied his uncle in his various expeditions to Egypt in command of Noureddin's army. S. was at this time much addicted to wine and gambling, and it was not till, at the head of a small detachment of the Syrian army, he was beleaguered in Alexandria by the combined Christians of Palestine and Egyptians, that he gave indications of possessing the qualities requisite for a great captain. On the death of his uncle, Shîrkoh, S. became grand-vizier of the Fatimite calif, and received the title of *El-melek-el-nasr*, 'the Victorious Prince;' but the Christians of Syria and Palestine, alarmed at the elevation of a Syrian emir to supreme power in Egypt, made a combined and vigorous attack on the new vizier. S. foiled them at Damietta, and transferred the contest to Palestine, taking several fortresses, and defeating his assailants near Gaza; but about the same time his new-born power was exposed to a still more formidable danger from his master, Noureddin, whose jealousy of the talents and ambition of his able young lieutenant, required all the skill and wariness at S.'s command to allay. On Noureddin's death, in 1174, S. began a struggle with his successor, which ended in his establishing himself as the sultan of Egypt and Syria, a title which was confirmed to him by the calif of Bagdad. The next ten years were occupied in petty wars with the Christians, and in the arrangement and consolidation of his now extensive dominion. The plundering by the Christians of a rich pilgrim caravan on its way to Mecca, an infringement of the treaty with S., brought down upon them the latter's vengeance; their army suffered a dreadful defeat at Tiberias (4th July 1187); the king of Jerusalem, the two grand-masters, and many other warriors of high rank were taken captive; Jerusalem was stormed (2d October), and almost every other fortified place in Palestine was taken. The news of this great success of the infidels being brought to Western Europe, aroused the enthusiasm of the Christians to its highest pitch, and a powerful army of crusaders, headed by the kings of France and England, speedily made their appearance on the scene of strife. They captured Acre in 1191, and Richard Cœur-de-Lion, at the head of that portion of the crusading army which adhered to him, continued the war with success, twice defeated S., took Cæsarea and Jaffa, and finally obtained a treaty for three years (August 1192), by which the coast from Jaffa to Tyre was yielded to the Christians. In the following year, S. died at Damascus of a disease under which he had long suffered. S. was not a mere soldier; his wise administration left behind it traces which endured for centuries; and the citadel of Cairo and sundry canals, dikes, and roads are existing evidences of his careful attention to the wants of his subjects. In him the warrior instinct of the Kurd was united to a high intelligence; and even his opponents frankly attribute to him the noblest qualities of medieval chivalry, invincible courage, inviolable fidelity to treaties, greatness of soul, piety, justice, and moderation.

The Ayubite dynasty of which he was the founder ruled over Syria till 1259, when it was dispossessed by the Perso-Mongols, and over Egypt till the rise of the first Mameluke kingdom under Ibeg in 1250.

SALAMA'NCA, one of the three modern provinces of Spain, into which the ancient kingdom of Leon (q. v.) was divided. Area about 4876 sq. m.; pop. (1864) 274,421.

SALAMANCA, a famous town of Spain, capita of the modern province of the same name, stands on three rocky hills, on the right bank of the Tormes, 50 miles east-north-east of Ciudad Rodrigo. Prior to its almost total destruction by the French in 1812, it was renowned for the number of its splendid edifices and institutions, and even yet it is a rich mine for the architect, abounding as it does in magnificent specimens of simple and florid Gothic, as well as of the richest cinque-cento. It is surrounded by a wall, pierced with nine gates, and a part of which is very old. The narrow, crooked, dark, and steep streets, containing many old and stately structures, the residences of the old nobility, give to the town an antique and venerable look. Besides the old cathedral, a simple and massive edifice, it contains five other churches of the 12th century. The new cathedral, begun in 1513, is a magnificent structure in florid Gothic, in the adornment of which painting, gilding, and sculpture have been largely and most successfully used. At the close of the 18th c., S. contained 27 parish churches, 39 convents, and 25 colleges. Of the colleges, 20 were destroyed by the French while the town was in their possession, as well as about 20 of the convents, for the purpose of obtaining materials for the erection of fortifications, and for firewood. The university of S., with which the university of Palencia (q. v.) was incorporated in 1243, was founded in 1200. It consisted of a number of colleges, divided into *Mayores* and *Menores*, or larger and smaller colleges. Of the former, there were only six in Spain, and four of these were at S.: the other colleges were 21 in number. In the 14th c., the university was attended by 17,000 students; the attendance is now only 500. The library, according to an official statement of 1835, contains 24,000 volumes and 1500 MSS. The school of S. is interesting to British subjects as having, from an early period, included a college for Irish students, which supplied many of the ecclesiastics who continued to minister to their countrymen during the penal times, and which is still in existence. One of the most highly-prized works in Roman Catholic divinity is the great collection of Controversial and Moral Theology, by the members of the college of Carmelite friars in S., who are known by the name of *Salmanticenses*, or the *Salamanca Theologians*. The *Plaza Mayor* is the largest square in Spain, and when fitted up as a bull arena, which it occasionally is, it offers accommodation to from 16,000 to 20,000 persons. The bridge across the Tormes rests on 27 arches, and is of Roman foundation. Manufactures of cloth, leather, and earthenware are carried on. Pop. 17,700.

S., the ancient *Salmantica*, was a Roman *municipium*. In the vicinity was won one of the most famous victories of the Peninsular War, by the British under Wellington against the French under Marmont, 22d July 1812.

SALAMA'NDER, in the superstitions of the middle ages, denoted a being possessing the shape of a man, whose element was the fire, or who at

least could live in that element. Paracelsus placed salamanders among the elementary spirits.

SALAMANDER (*Salamandra*), a genus of Batrachians, of the family *Salamandridæ*, to which Newts (q. v.) also belong. The name is sometimes extended to the whole family (see SIREDON, SPELERPES, THORIUS); newts being called *Aquatic Salamanders*, and the name *Terrestrial S.* being given to this genus, which inhabits water only in its tadpole state, and returns to it only to deposit its eggs, generally living in moist places, as under stones, roots of trees, &c. The general form is very similar to that of newts, but the tail is round, not flat as in newts. Several species are found in Europe; none of them, however, in Britain. The SPOTTED S. (*S. maculosa*), six or eight inches long, black, with bright yellow

Spotted Salamander (*S. maculosa*).

stripes on its sides, and livid blue beneath, is widely spread throughout Europe. The BLACK S. (*S. atra*) is much smaller, black, the body and tail ringed, the tail almost as if formed of beads. It is abundant in the Alps and mountains of Southern Germany. Other species are found in Spain, Italy, &c.; Asia and North America also produce numerous species. Salamanders feed on worms, slugs, snails, and insects. They are inert and sluggish creatures, and timid to the utmost extent that their stupidity permits. The brain is very small. They are perfectly harmless, although exuding, when alarmed, from pores on the back and sides, a milky humour, which is injurious to very small animals. But they have long had, and still retain, a popular reputation of extreme venomousness, and are therefore objects of the utmost dread to the vulgar in almost all countries which they inhabit. Strange fables have been current concerning them from remote ages, particularly concerning the icy cold which envelops their body, and enables them not only to endure fire without burning, but to extinguish fire. Pliny, indeed, records that he tried the experiment, and the poor S. was burned to powder; yet the fable continued to be credited until very recent times.

SA'LAMIS (modern name, *Koluri*), in ancient times called also *Pityoussa* (Island of Pines), an irregularly-shaped, mountainous island of Greece, off the coast of Attica, and forming with it the Bay of Eleusis. Its area is about 30 sq. m., and it has a modern population of about 5000, the chief town being Koluri, on the west coast. It had anciently two principal towns, Old and New Salamis, the former on the south, and the latter on the north-east coast. S. is remembered chiefly on account of the great naval battle between the Greeks and Persians, which was fought (480 B.C.) a few days after the battle of Thermopylæ, in the narrow strait between the east coast of S. and the west coast of Attica. The Grecian fleet, consisting of about 360 vessels, was drawn up at the entrance of the bay forming the harbour of New Salamis, Themistocles being leader of the Athenian contingent, and Adimantus of the Corinthian, while the whole was under the command of the Spartan Eurybiades. Great dissensions prevailed among the Grecian leaders, which would probably have led to a general break-up, had not Themistocles by a stratagem induced Xerxes, king of the Persians, to bring up his fleet, and give immediate battle to the Greeks. Xerxes drew up his ships, numbering at least 1000, during the night previous to the battle, opposite the Grecian fleet, along the coast of Attica, almost completely blocking up both entrances to the straits; and confident of victory if he himself superintended operations, he took his seat on a throne erected on a lofty height on the Attic coast, almost opposite New Salamis. Both Greeks and Persians fought with great bravery, but the latter were entirely defeated, owing, perhaps, chiefly to their immense, unwieldy fleet being compressed into so small a space, which rendered it almost unworkable, and completely at the mercy of their opponents. The only name mentioned on the Persian side with distinction is that of Artemisia, queen of Halicarnassus, who is said to have fought with desperate bravery. The loss of the Greeks is said to have been 40, and that of the Persians 200 ships, exclusive of those which were captured.

SAL AMMO'NIAC (known in Chemistry as HYDROCHLORATE OF AMMONIA) is an article of considerable importance in the Materia Medica. It is obtained on a large scale by decomposing with common salt (chloride of sodium) the sulphate of ammonia, which is formed in the manufacture of coal gas, or the carbonate of ammonia, obtained by the distillation of bones. It is sold in large, crystalline, grayish-white, semi-transparent cakes, convex on one side, and concave on the other. It is inodorous, but possesses an acrid, bitter, and nauseous taste. Its specific gravity is 1·45; it volatilises without decomposition when heated, and is freely soluble in water. Its aqueous solution, when heated with caustic potash, evolves gaseous ammonia; and when treated with nitrate of silver, yields a white, curdy precipitate of chloride of silver. This salt is largely given in France and Germany in cases of pneumonia and of inflammation of the serous membranes, in mucous diarrhœa, in chronic rheumatism and gout, and in passive dropsies. Neligan recommends it in cases of low fever, in subacute laryngitis, in chronic affections of the liver, and in facial neuralgia. It may be given in doses varying from 10 to 30 grains, dissolved in some aromatic water. As a local external application, it is of great value in promoting the absorption of effused blood; and there is probably no remedy so effectual for that common but disfiguring affection popularly known as a *black eye*, as a moderately strong solution of this salt, kept constantly applied as a lotion. If it is desired to apply cold to any part of the body, an excellent Refrigerant (q. v.) may be obtained by dissolving five parts of this salt and five parts of nitre in sixteen parts of water.

S. A. is employed for various purposes in the arts. It is used in soldering, and in the tinning of copper and iron to prevent the oxidation of the surface to be tinned. It is exported from Britain to Russia, where it is used by dyers.

It occurs as a mineral, as an efflorescence on the surface of rocks, or as a sublimate in fissures, crystallised in small crystals, or forming crusts, stalactites, &c. It is found in volcanic regions, but is produced during the time of the quiescence of active volcanoes, rather than during their eruptions. It occurs in Britain, near burning beds of coal. It is found in Persia, Tartary, Siberia, and many other countries, where there are no active volcanoes.

Formerly all Europe was supplied with it from the neighbourhood of the temple of Jupiter Ammon in Egypt, whence its name.

SALDA'NHA BAY. See CAPE OF GOOD HOPE.

SALE, GEORGE, an eminent oriental scholar, was born towards the end of the 17th c., and died at London in 1736 under forty years of age. Almost nothing is known of his private life. He is supposed to have been born in Kent; and he received his education at the King's College, Canterbury. Brought up to the law, he is believed to have practised it almost to the end of his life. That he spent five-and-twenty years in Arabia, as Voltaire and many after him asserted, is a complete fiction. He assisted in getting up the *Universal History*—together with Swinton, Shelvocke, Campbell, George Psalmanazar, and A. Bower, each remarkable enough in his way—for which he wrote the cosmogony and several portions of oriental history. He was also one of the authors of the *General Dictionary;* but he is best known by his unrivalled translation of the Koran, 'with explanatory notes taken from the most approved commentators, to which is prefixed a preliminary discourse' (1734). This 'preliminary discourse,' which is of great value, and proves S. to have been deeply versed in oriental literature, treats, among other things, 'of the Arabs before Mohammed, or, as they express it, in the "time of ignorance"—their history, religion, learning, and customs; of the state of Christianity, particularly of the Eastern churches, and of Judaism, at the time of Mohammed's appearance; and of the methods taken by him for establishing his religion, and the circumstances which concurred thereto; of the doctrines, precepts, and peculiarities of the Koran, and of the principal Mohammedan sects.' S.'s work was translated into French by Duryer (Antw. 2 vols. 1770). This translation formed a new epoch in the study of Islam and its literature; and though many other translations have been attempted since, in nearly all European and oriental languages, it still bears the palm. See KORAN. That his contemporaries fastened the charge of heresy upon one who spoke philosophically and humanely of other creeds, is not to be wondered at. After his death, a catalogue of his oriental MSS. was published, and the contents are now in the Radcliffe Library, Oxford.

SA'LEM, a town in the south of India, capital of the collectorate of the same name. The collectorate is the chief seat of the Indian *steel manufacture*—a branch of industry as curious as it is ancient. The town stands in an elevated valley, 1070 feet above sea-level, bounded on the north and south with hills, 193 miles south-west of Madras. It is well built, contains a number of handsome two-storied houses, and is surrounded by land in a high state of cultivation. Cotton is grown in the vicinity in quantity more than sufficient for the use of the numerous cotton weavers, who, together with the silk weavers, form the great mass of the non-agricultural inhabitants of the town. Population 19,000.

SALEM, a city and port of entry of Massachusetts, U. S., 14 miles north-east of Boston, on a peninsula 2 miles long by ¾ of a mile broad, with irregular but well-built streets, and a fine harbour, from which was formerly carried on a large trade with China, the East Indies, and Eastern Africa. The principal institutions of S. are: the East India Marine Society, whose unique museum of oriental curiosities is now united with that of the Peabody Academy of Science; the Essex Institute, with a library of 18,000 vols., and a picture-gallery; and the Salem Athenæum. There is a normal school for females, grammar school, 6 newspapers, 7 banks, 21 churches, a cotton-mill, with 65,000 spindles, and manufactures of chemicals, varnishes, leather, shoes, machinery, &c. S. was settled in 1626, and is the oldest town, except Plymouth, in New England. The first church was organised in 1629. In 1692, a great witch-mania broke out, and 19 persons were hung for 'witchcraft.' In the war of the revolution, S. sent out 153 privateers, which took 455 prizes. Pop. in 1860, 21,974; in 1870, 24,117.

SALE OF GOODS is a contract by which the seller, in consideration of a price, transfers the property in the goods to the purchaser. Where the consideration is not money but goods, the contract is called exchange or barter. The law on the subject is not the same in England and Scotland. In England, when the bargain is struck, and the sale relates to specific goods—that is, goods already made, and existing, and identified—the property vests at once in the purchaser, so that in the event of any damage or destruction happening to the goods, the loss is that of the purchaser and not of the seller, even though the goods have not been delivered, and whether the price has been paid or not. The contract may be made either by word of mouth or by writing; but when the price exceeds £10, the statute of Frauds enacts that the contract shall not be binding unless it is in writing. If, however, the buyer shall have accepted part of the goods sold, and actually received the same, or if he shall have given something in earnest to bind the bargain, or in part payment, then a verbal contract will be binding though the price exceeds £10. Many nice questions have occurred and constantly recur as to what amounts to an acceptance and delivery of the goods, so much so, that the general policy of restricting the proof of the contract to writing in any case has been much complained of in late years; and efforts have been made, but as yet in vain, to repeal the statute of Frauds, which, it is said, encourages rather than discourages fraud. When a contract of sale is made, the duty of the seller is to deliver the goods as soon as the buyer has performed all the conditions agreed upon. If no time was specified for delivery, then he must deliver the goods in a reasonable time. In general, if nothing is agreed to the contrary, the seller need not deliver till the price is paid; but he must do so if the bargain was, that delivery was to take place before payment, in other words, if the sale was on credit. On the other hand, it is the duty of the buyer to accept the goods and pay for them. If either party fail at any stage in his performance of the duties arising out of the contract, the other may bring an action which varies according to the nature of the breach of contract. One valuable right of the seller, when he has sent his goods to the buyer, and they are in course of delivery, but not already delivered, is to stop them *in transitu*, this stoppage *In Transitu* (q. v.) being chiefly resorted to when the seller hears of the bankruptcy of the buyer after he has sent away the goods.—In Scotland, the chief points of difference from the law of England as to sale are these. The rule is, that no writing whatever is necessary to make the contract binding, whether the price exceeds ten pounds or not. Again, the rule is, that the property in the goods does not pass until they are either actually or constructively delivered to the buyer.—See Paterson's *Compendium*, 2d ed. ss. 520—544.

SALE OF LAND differs from sale of goods in several respects. An agreement for the sale of land must be in writing, otherwise it cannot be enforced. When once a contract for the sale of land has been entered into, a Court of Equity will, contrary to the general rule which prevails when a contract is

broken, enforce specific performance of the contract; that is, will compel the seller or buyer to carry out his contract, and transfer or accept conveyance of the land. When a sale of land is agreed upon, and nothing is said as to the matter, it is understood, as part of the contract, that the vendor shall be able to make a good title; and a doubtful title cannot be forced on the vendee even though it is accompanied with an indemnity. The rule is, that the abstract of title—i. e., a short account of the series of former transactions relating to the possession and property—must go back for sixty years. The expense of making searches into registers during that period falls on the purchaser. It is the duty of the purchaser's solicitor to prepare the draft of the conveyance, and tender it for approval to the vendor's solicitor; and unless there is an agreement to the contrary, the purchaser pays the expense of the conveyance. When the vendor has delivered possession of the estate to the purchaser without receiving the purchase-money, he still retains a lien on the estate for the unpaid price. In England there is no general register which contains copies of all the deeds relating to land, so that everything depends on the preliminary inquiries between the two parties, and the certainty that the purchaser has obtained all the material information that exists. The consequence is, that the sixty years' title or previous history of the estate involves the parties in great expense. This expense requires to be renewed on every fresh sale, for a solicitor who neglects to go through the same train of inquiries as his predecessor at the time of the last preceding sale would be personally liable for any loss that occurred thereby. The great expense attending the conveyance of land has of late years been loudly complained of, and the manufacturing interest, familiar with the rapidity of similar transactions relating to goods, have demanded a simplification of the process. In order to meet this demand, which has been largely shared by the public in general, two acts of parliament were passed in 1862, for the purpose of founding a Land Registry, and enabling an owner of land to have his title examined and registered once for all, so that in the event of future transactions he may be saved the expense and delay required under the old system. These acts of parliament, however, not being compulsory, and the interest of solicitors being opposed to their being resorted to, little progress is likely to be made in making the new practice universal. In Scotland, the law relating to the sale of land has always been on a more satisfactory footing, for there are registers in which an intending purchaser can with certainty find all the deeds, and nearly every burden that can attach to the land he wishes to buy; so that he can almost at a glance ascertain what are the dangers and drawbacks attending the transaction. See Registration of Deeds and Writs. In Scotland the expense of the conveyance of land falls on the vendor, if there is no agreement to the contrary, and the vendor's solicitor prepares and tenders the draft conveyance, while the purchaser pays his own solicitor for perusing and approving the draft conveyance; but in practice the expenses of conveyance are usually equally divided between vendor and purchaser.

SA'LEP, the tubers of many species of *Orchis* and other *Orchideæ*, dried and used as an article of food. Of the two tubers usually found at the roots of these plants, only one is gathered for salep, the younger and more solid of the two. The tubers are gathered when the stalk is about to fall. They vary from the size of a cherry-stone to that of an olive. They are cleaned, dipped for a few minutes in boiling water, and dried as quickly as possible, by which process they are rendered hard and horny. The greater part of the salep of commerce is brought from the East, and much of it from Persia; it is supposed to be obtained from species of *Eulophia*; but most of the European species of *Orchis* are used for it.

Before coffee became so common in Britain, salep was an article of considerable importance, and large quantities were imported from Turkey, Persia, and India. In France it is still in considerable request. For use it is ground into a fine powder, and mixed with boiling water, sugar and milk being added according to taste. As a diet drink, it was considered very nutritious and wholesome, and thirty years ago it was sold, ready prepared, to the working-classes of London, early in the morning, from numerous street stalls. Its principal constituents are *bassorine*, starch, and phosphate of lime.

SALE'RNO (ancient *Salernum*), a city of Southern Italy, chief town of the Principato-Citra, on the northern side of the gulf of Salerno, 32 miles east-south-east of Naples, with a population of 29,000. A Gothic wall, built of huge stones without mortar, encircles it; the streets are paved with lava, and, with the exception of the two principal ones, are narrow, irregular, and dirty. It has a strong castle, and a very small harbour. The old and beautiful Gothic cathedral was erected by the Normans, and has around it a portico of porphyry and granite pillars brought from Pæstum by Robert Guiscard. It has many famous sepulchres, among others, those of Robert and Guillaume Guiscard, of Margaret of Anjou, and of Gregory VII. It was celebrated in the middle ages for its school of medicine (the *Schola Salernitana*), founded by Robert Guiscard about the end of the 11th c., and which was long the first medical school in Europe. The university has fallen into decay. In its neighbourhood, which produces excellent wine, are the ruins of Pæstum, which was destroyed by the Saracens in the 9th century. Of ancient Salernum or Salurnum, there still exist the Temple of Neptune, that of Ceres, and the ruins of an amphitheatre and of a theatre. S. was founded by the Greeks; it became important under the Roman empire, then passed into the possession of the Goths, and of the Lombards. Robert Guiscard made himself master of it in 1076. Charles V. united it to the kingdom of Naples.

SALERNO, Gulf of (anc. *Sinus Pæstanus*, on whose shores, in early times, the Greek city of Pæstum [q. v.] stood), is a nearly semicircular indentation on the western shores of Southern Italy, south-east of the Bay of Naples, from which it is separated by the promontory ending in Point Campanella. The Gulf is 36 miles wide at its entrance, and sweeps inland for 24 miles. On its shores are the towns of Amalfi and Salerno.

SALES, Francis de, a most distinguished saint of the Roman Catholic Church, was born August 21, 1567, at the family castle of Sales, near Annecy in Savoy. He was the heir of the family honours, and his education was designed by his father to fit him for the career of distinction to which his position seemed to entitle him. From the provincial colleges of La Roche and Annecy, he was sent to Paris in 1578, where he entered the then brilliant school of the Jesuits, and completed under their care the course of rhetoric and philosophy. In 1584, he went to Padua, for the course of civil law, and pursued his studies there with great distinction till 1591. At this time, his father, who had obtained for him a place in the senate, proposed to him a very brilliant and advantageous marriage, but he had already resolved to devote himself to the ministry, and with

much difficulty obtained his father's consent to enter into orders in the diocese of Geneva. He soon became distinguished as a preacher, and the zeal with which he discharged the ordinary duties of his ministry was no less remarkable. Very soon after his ordination, he was employed by his bishop in a mission for the conversion of the Calvinistic population of Chablais, which had been recently annexed to the duchy of Savoy, and in which the duke was desirous of having the Catholic religion re-established. The success of this mission was almost unprecedented. With a companion equally devoted, he travelled on foot from town to town, and in a short time he succeeded in reclaiming many to the church. One of the most remarkable incidents of his mission was a conference with the celebrated Calvinist leader, Theodore de Beza. Of this interview, very different accounts are given by the rival partisans; but all agree in admiration of the gentleness and enlightened liberality of Francis de Sales. At the termination of this mission, Francis was, in 1596, appointed coadjutor to the Bishop of Geneva, Mgr. Granier, with the title of Bishop of Nicopolis. It was with much difficulty that the pope, Innocent IX., induced him to accept this dignity. Some time afterwards, having occasion to go to Paris, he was invited to preach the Lent in the chapel of the Louvre; and his lectures, which were partly controversial, were reputed to have had so much influence in bringing about the conversion of several of the Huguenot nobles, that the king tried to induce him to accept a French bishopric; but in vain. He returned to his diocese; and soon afterwards, on the death of Mgr. Granier, he succeeded to the bishopric of Geneva. His administration of this charge, upon which he entered in December 1602, was beyond all praise. Being again invited to preach the Lent at Dijon, in furtherance of the plans of Louis XIV. for the conversion of the Huguenots, he was again pressed by that monarch to accept a French bishopric. But he again declined this honour, as he also declined in 1607 the offer of the cardinalate from the pope Leo XI. It was about this time that he published his well-known *Introduction to a Devout Life*, which has continued to the present day one of the most popular manuals of piety and the ascetic life. Among his measures for the renovation of the monastic spirit, a very important one was the establishment of a congregation of nuns of the order of the Visitation, under the direction of the now celebrated Madame de Chantal, with whom he long maintained a correspondence on every subject connected with the spiritual and religious life, which was published in 1660, and which still remains a subject of almost undiminished interest for the spiritualist. In 1608, his infirmities compelled him to solicit the assistance of a coadjutor in the charge of his diocese. He continued, however, to labour to the last. His last sermon was delivered at Lyon on Christmas eve in 1622; on Christmas-day he was seized with paralysis, and on the 28th of the same month, he expired. He was buried in the church of the Visitation in that city, but his remains were afterwards translated to Annecy. More than forty years after his death, in 1665, he was solemnly canonised as a saint by Alexander VII. His festival is held on January 29, the day of the translation of his relics to Annecy. His works were published in a collected form in 2 vols. folio at Paris in 1641; but the separate works (especially the *Devout Life*, which has been translated into almost every European language), have passed through innumerable editions, and still retain their popularity.

SALEY'ER ISLANDS, The, lie in the Indian Ocean, to the south of Celebes. Upwards of thirty of the group are small, hilly, densely wooded, and, with few exceptions, uninhabited. Great Saleyer, in 5° 44′—6° 26′ S. lat., and 120° 23′—120° 37′ E. long., is upwards of 40 miles in length, and 7 in breadth, the area being 336 sq. miles. The mountains on the east coast rise abruptly out of the sea, and along the west is a slip of level land planted with cocoa-nut trees. Pop. 60,000. Great Saleyer and the smaller islands produce fine timber, including ebony and teak. Indigo, coffee, and mustard are grown; but millet, maize, earth-fruits, and cotton are the staple cultures, the grounds being carefully fenced. Agriculture is the chief employment, and fishing, making salt, &c., are also carried on. The exports are cocoa-nuts, cocoa-nut oil, cotton, and cotton fabrics. Imports—rice, gambir, tobacco, yarns, iron and copper wares. Since the Netherlands government made Macassar a free port, sea-going ships are not permitted to anchor at Saleyer; and the trade is carried on by small vessels, which sail between that island, the Bight of Boni, Sumbawa, Bali, Borneo, Java, Macassar, and Singapore. The sea is rich in various kinds of fish—a long and thin species, the Saleyer, giving a name to the island.

The S. I. are governed by fourteen rajahs, superintended by a Netherlands agent. The natives are Mohammedans, each large village having a mosque and priest. The high priest resides near the political agent, has a seat in the council, and is consulted on religious questions. Some of the rajahs and notables have tables and chairs, tea and dinner services, silver spoons and forks, mattresses, cushions, and even satin bed-curtains.

SA'LFORD, a municipal and parliamentary borough, Lancashire, is considered as virtually a portion of the city of Manchester (q. v.).

SA'LICIN ($C_{13}H_{18}O_7$) is a member of the group of organic compounds to which the term *glycosides* has been recently applied by chemists—a group which is specially characterised by the fact, that each of its members, when exposed to certain chemical agencies, breaks up (usually after the absorption of water) into glycose (or grape-sugar) and other compounds. It occurs in the bark of the various species of willow and poplar, in the blossoms of several species of *spiræa*, and also in the animal secretion known as *castoreum*. It may be obtained in small, colourless, glistening prisms of an intensely bitter taste, which are readily soluble in hot water and in alcohol, and moderately soluble in cold water, and are insoluble in ether and oil of turpentine; and its solutions exert a left-handed rotatory action upon a ray of polarised light. When heated to 248°, salicin fuses; and at a higher temperature, it is entirely decomposed. It dissolves in strong sulphuric acid, the solution being of a purple or blood colour. Salicin is manufactured to a considerable extent as a cheap substitute for quinia. There are various modes of extracting it from the macerated bark; and 1 lb. of the bark of *Salix pentandra* yields, according to Erdmann, 5 drachms of salicin. If it is not so certain in its action as a febrifuge as quinia, there can be no doubt that it is an excellent tonic; and it possesses this advantage over the latter substance, that it is less liable to irritate the stomach. Dr Neligan, in his excellent work on *Medicines*, states that he has used it very extensively as a tonic in the debility following acute diseases, particularly in cases accompanied by irritability of the digestive organs, and considers its powers to be fully equal to those of sulphate of quinia. As a tonic, two grains may be given three or four times a day; as a febrifuge, from one to two scruples in divided doses, during the

intermission. It may be prescribed as a powder mixed with sugar, or dissolved in water, with the addition of some agreeable syrup.

SA'LIC LAW. The code known as the *Salic Law* is a collection of the popular laws of the Salic or Salian Franks (see FRANKS) committed to writing in barbarous Latin in the 5th c., while the people were yet heathens. There exist several texts of this code, and considerable obscurity rests over its history. It relates principally to the compensation and punishment of crimes, and there is a chapter containing provisions regarding the succession to what are called *Salic Lands*, which seems to have been inserted at a later date. It is difficult to determine precisely what these lands were. The *terra salica* was probably so called from its being more especially attached to the *sal* or hall of the lord or proprietor (some derive *salic* as applied to the people from the same word); it thus came to designate inherited land as opposed to property acquired otherwise. Although the Frankish law did not in general exclude females, the succession to these salic lands, whatever they were, was confined to males, probably from the importance of securing the military service of the chief proprietors. It was but a doubtful analogy that led the rule of succession to Salic lands to be extended to the succession to the French crown, and it seems to have been only in the 14th c. that the exclusion of females from the throne became an established principle. The accession of Philip the Long was probably the first occasion on which it received public sanction, and the fact that Edward III. rested his claim on female succession, doubtless led to that instance being regarded as an unquestionable precedent for all future time.—See Hallam's *Europe in the Middle Ages* (ch. ii. pt. 1, and notes); Guizot, *Essais sur l'Histoire de France*, p. 94.

SA'LIENT, in Heraldry, an attitude of a lion or other beast, differing but slightly from *Rampant* (q. v.). He is supposed to be in the act of springing on his prey, and both paws are elevated. Two animals *counter-salient* are represented as leaping in opposite directions.

SALIENT, in Fortification, is that which points outwards from the interior of any work. For example, the central angle of a bastion, pointing towards the enemy, is a salient angle.

SALIFEROUS SYSTEM, the name given by the earlier English geologists to the New Red Sandstone (q. v.) formations, because the deposits of salt in England occur in these strata. As, however, this substance has been found associated with strata of all ages in different parts of the world, the name has been given up.

SA'LIFIABLE BASE, a term applied in chemistry to any substance capable of uniting with an acid to form a salt.

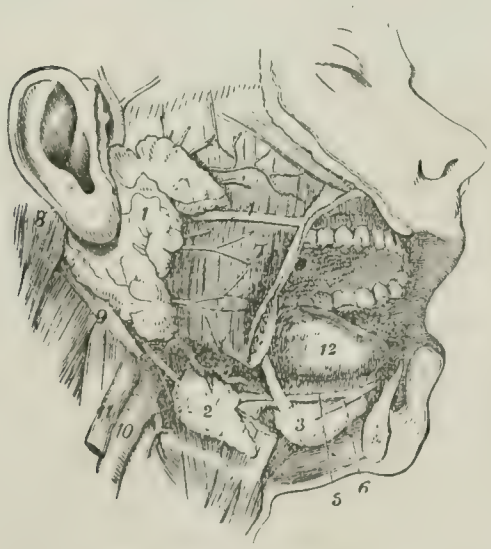
SALI'NA, or SALINI, one of the Lipari Islands (q. v.).

SA'LINE PLANTS are those which require for their healthy and vigorous growth a considerable supply of *chloride of sodium* (common salt) and other salts, and which are therefore limited to peculiar situations. Few of them are strictly aquatic plants, except the marine Algæ, or Sea-weeds, which grow immersed in salt water, either always or in certain states of the tide, and derive their nourishment from it through their fronds, and not by roots from the rock to which they are attached. Grass-wrack (q. v.), however, is an instance of a phanerogamous plant living entirely and always immersed in salt-water. Other phanerogamous plants grow chiefly or only on the sea-shore and in salt marshes. Some of these, however, as the sea-kale, may be cultivated in gardens remote from the sea, but they succeed best when liberally supplied with salt. Asparagus is another well-known garden-plant, which derives much benefit from similar treatment. Some of the Saltworts (q. v.) and other saline plants yield much soda when collected and burned, and the produce was at one time largely imported into Britain from Spain and other countries under the name of Barilla (q. v.). The dry steppes of Russia and Tartary, having in many places a strongly saline soil, are covered with a very peculiar vegetation. Among the ornaments of these steppes is *Halimodendron argenteum*, a shrub of the natural order *Leguminosæ*, often cultivated in gardens for its beautiful rose-coloured flowers and silvery gray leaves. Saline plants have their whole tissues impregnated with salt.

SALINE POWDER, COMPOUND, is a very popular and harmless form of aperient medicine. The ordinary method of preparing it is by drying, at a gentle heat, and then pulverising 4 oz. of pure chloride of sodium (common salt), 4 oz. of sulphate of magnesium (Epsom Salts), and 3 oz. of sulphate of potassium. These salts must then be mixed and triturated together, and kept in an air-tight vessel. Two or three drachms dissolved in half a pint of water, and taken before breakfast, usually act efficiently. Dr Neligan states that if 4 oz. of sulphate of sodium be used instead of the sulphate of potassium, and a sufficiently high temperature be employed to expel all the water of crystallisation from the different ingredients, one drachm of the resulting compound acts as energetically as two or three drachms of the ordinary powder.

The following is a more agreeable form than the preceding, and equally efficacious. Take half an ounce of carbonate of magnesium, and an ounce of each of the following substances—viz., sulphate of magnesium, bicarbonate of sodium, tartrate of sodium and potassium, and tartaric acid. Expel all the water of crystallisation, and mix. This powder, if kept dry, effervesces when mixed with water, and one or two teaspoonfuls form the average dose. The addition of a drop of oil of lemon and a little powdered white sugar to each dose makes this one of the most agreeable laxatives that can be prescribed.

SA'LISBURY, or NEW SARUM, the capital of Wiltshire, is an episcopal city, and a municipal and parliamentary borough, and stands in a fertile valley on the Avon, at the junction of that river with two of its affluents, 83 miles south-west of London by the South-western Railway, and 23 miles north-west of Southampton by a branch of the same. Its several parts are connected by three bridges. The town dates from 1220, in which year the cathedral was founded, and the inhabitants of Old Sarum (see SARUM, OLD) two miles to the north, removed to S., attracted to the new site by the abundant supply of water. At the foundation of the town, the ground was divided into squares, or 'chequers' as they are called, to which the town is indebted for its appearance of airiness and regularity. The cathedral, the principal building of S., is one of the finest specimens of Early English in the country. It was begun in 1220, and was finished in 1258. The spire, which was added after the building was completed, is the 'most elegant in proportions and the loftiest in England.' Its height from the pavement is 400 feet, or 30 feet higher than St Paul's. The cathedral is 449 feet long; height in the interior, 81 feet; width of great transept, 203 feet. It is in the form of a double cross, is perfect in its plan and proportions, and in the main uniform in style. The west front



is still rich, beautiful, and graceful, though now denuded of statues, upwards of 100 in number, with which it was once enriched. S. contains many schools and useful institutions. The manufactures of cutlery and cloth, for which it was once famous, have long declined, and its trade is now chiefly in retail. Pop. (1871) 12,867. It returns two members to parliament.

SALISBURY PLAIN, an extensive tract of undulating chalk country, in Wiltshire, between Salisbury and Devizes, about 20 miles long from north to south, and about 14 miles broad. Its rolling surface resembles that of the ocean heaving after a storm. On this plain, about 8 miles north of Salisbury, is Stonehenge (q. v.). Until within recent years, the expanse of S. P. remained in a state of nature, and was covered with a fine turf, which afforded pasture to sheep. The natural features of the plain, however, are now much changed. North and south of Stonehenge, wild slopes of thistle-covered turf still extend; but both east and west of it, the country is laid out in cultivated fields; and within gun-shot of the desolate old relic, is a neat modern farm-house.

SÂLIVÂHANA is the name of a Hindu prince who is said to have reigned in Magadha or South Behar. He instituted an era which bears his name, and the beginning of which took place when 3179 years of the Kali-yuga, or the present mundane age, had expired; that is, 78 years after the beginning of the Christian era. This era is called S'âliyâhana S'âka, or simply S'âka. Thus 1865 of the Christian era would be tantamount to S'âka (i. e., in the S'âka era) 1787. The S'âka year is the same as, and begins with, the common solar year.

SA'LIVARY GLANDS. Under this name we designate three pairs of glands—the parotid, the submaxillary, and the sublingual, each gland having an efferent duct, which conveys the glandular secretions into the mouth, where, when mixed with the mucus secreted by the follicles of the mucous membrane lining the mouth, they constitute the ordinary or mixed saliva.

The *Parotid Gland*, so called from the Greek

The Salivary Glands.

1, the parotid gland; 2, the submaxillary gland; 3, the sublingual gland; 4, Steno's duct; 5, Wharton's duct; 6, Bartholin's duct; 7, masseter muscle; 8, mastoid process; 9, digastric muscle; 10, internal jugular vein; 11, external carotid artery; 12, the tongue.

words *para*, near, and *ous*, the ear, is the largest of the three glands occurring on either side. It lies upon the side of the face immediately in front of the external ear, and weighs from half an ounce to an ounce. Its duct is about two inches and a half in length, and opens into the mouth by a small orifice opposite the second molar tooth of the upper jaw. The walls of the duct are dense and somewhat thick, and the calibre is about that of a crow-quill.

The *Submaxillary Gland* is situated, as its name implies, below the jawbone (part of which is cut away in the figure), and is placed at nearly equal distances from the parotid and sublingual glands. Its duct is about two inches in length, and opens by a narrow orifice on the top of a papilla, at the side of the *frænum* of the tongue.

The *Sublingual Gland* is situated, as its name implies, under the tongue, each gland lying on either side of the *frænum* of the tongue. It has a number of excretory ducts, which open separately into the mouth.

The minute structure of the parotid gland is described in the article GLANDS, and the other salivary glands are similarly constituted. True salivary glands exist in all mammals, except the cetacea, in birds, and reptiles (including amphibians), but not in fishes; and glands discharging a similar function, occur in insects, many molluscs, &c. The chemical and physical characters of the saliva are sufficiently described in the article DIGESTION.

The most common disease of the parotid gland is a specific inflammation, which has been already described in the article MUMPS. The term *Parotid Tumours* is given to tumours of various kinds occurring in front of the ear and over the parotid gland. With regard to surgical interference, Liston recommends that 'if there be reason to suspect that the disease is of a malignant nature, and not thoroughly limited by a cellular cyst, no interference is admissible; if, on the contrary, it be at all movable, has advanced slowly, possesses a smooth surface, and is firm, then an operation may be contemplated.'

Certain functional disorders of the salivary glands require notice, of which the most important is that known as *Salivation* (q. v.), or *Ptyalism*, which consists in a much increased secretion of saliva. *Deficient Secretion* is indicated by clamminess or dryness of the mouth, and is common in low forms of fever. It is important as indicating the condition of the system, and seldom requires treatment. If it should occur as an original affection, it must be treated by local Sialogogues (q. v.), such as liquorice, horse-radish, pellitory, &c. *Alteration of the Saliva* is not unfrequent in disease. For example, it sometimes loses its alkaline character, and becomes acid, as in acute rheumatism, diabetes, &c.; whilst in other cases, it becomes so fœtid as to be a source of annoyance both to the patient and his friends, as, for example, in scurvy, various forms of dyspepsia, salivation, &c. The undue acidity may be corrected by the administration of carbonate or bicarbonate of soda, while the fœtor may be relieved by attention to diet, and by the use, both local and general, of creosote, nitromuriatic acid, charcoal, chlorate of potash, &c.

Ordinary Inflammation of these glands (distinct from mumps) may proceed from cold or local injury, but it is often produced by decayed teeth.

SALIVA'TION, or PTY'ALISM (from the Gr. *ptyalon*, the saliva), is the term employed to designate an abnormally abundant flow of saliva. It most commonly arises from a specific form of inflammation of the parotid glands, induced by the action of mercury, in which case it is termed mercurial salivation; but it occasionally arises from the action of other drugs, especially iodide of potassium; and sometimes it occurs without any apparent cause

in which case it is said to be *idiopathic* or spontaneous.

Mercury, in some form or other, is so common an ingredient in the quack medicines whose advertisements are unfortunately allowed to occupy a large space in many of our newspapers (especially in those medicines which are falsely stated to be of purely *vegetable origin*), that a popular knowledge of the most remarkable manifestations of this powerful mineral should be as widely diffused as possible. When this medicine is given in such a way as to excite salivation, a metallic taste in the mouth is soon recognised by the patient, and a remarkable but indescribable smell, known as the mercurial fœtor, may be detected in his breath; the gums become swollen and spongy at their edges, and usually present a few slight ulcers; and an increased flow of saliva takes place, accompanied by pain in the teeth on pressure. If these symptoms be not checked (and *a fortiori* if more mercury be given), the tongue, cheeks, and throat swell and ulcerate, and the saliva that flows away amounts to several pints in the course of the day. This peculiar action of mercury varies extremely in different persons. Dr Watson, in his 14th Lecture, records several remarkable cases in which a single small dose of mercury produced the severest salivation. Cases of the opposite kind, in which no impression on the gums or salivary glands can be made by the freest use of mercury, are by no means uncommon. It is worthy of notice that salivation is rarely produced in children below the age of ten years. Until a comparatively recent period, profuse salivation was deemed the only certain indication that the system was duly under the influence of mercury (and, indeed, it was believed that the cause of the disease was carried out of the body with the saliva); but now it is well known that all that is requisite is, that the gums should become distinctly tender, and that the mercurial fœtor should be unmistakably present, and that those symptoms should be kept up for a certain time. Unfortunately, however, the physician cannot always stop the action of the mercury at that definite stage, and salivation to a distressing extent often occurs, even when the greatest care has been taken in the administration of the medicine. To check this excessive salivation, the internal administration of chlorate of potash in scruple doses, three times a day, together with the frequent use of a gargle of the same salt, has been recommended by several high authorities. Dr Watson strongly advocates the use of a gargle composed of one part of brandy to four or five of water, and the application of moistened tannin to the gums; and when there is much external swelling, he applies eight or ten leeches beneath the edges of the jaw-bones, followed by the application of a soft hot poultice to the neck.

It is worthy of notice that, in the confluent form of small-pox, there is almost always more or less abundant salivation, which lasts for several days; and if it cease abruptly, the peril is usually great. Moreover, there is a more or less marked tendency to salivation in scurvy, hysteria, hydrophobia, some forms of mania, and not unfrequently in pregnancy.

Various cases of spontaneous salivation have been collected by Dr Watson in his 44th Lecture. In one instance of a girl ten years old, under his own care, no less than three pints of saliva were excreted in twelve hours. Medicine had no effect; but the salivation finally ceased spontaneously after a severe attack of influenza. In these cases, astringent washes, as a solution of alum, or the infusion of catechu, or a few drops of creosote suspended by mucilage in water, are deserving of trial.

SA'LIX. See WILLOW.

SA'LLOW, the popular name of a number of species of Willow (q. v.), trees or low shrubs with downy branches, and generally ovate or obovate, wrinkled leaves, having stipules. The GRAY S. (*Salix cinerea*) is one of the most common British species, growing in moist and swampy places. Other common species are the ROUND-EARED S. (*S. aurita*) and the GREAT ROUND-LEAVED S. (*S. caprea*), the latter remarkable for preferring a dry soil, and

Gray Sallow (*Salix cinerea*).

becoming a small tree, the wood of which is used for the handles of agricultural implements. The LONG-LEAVED S. (*S. acuminata*) differs from the other kinds in its lanceolate leaves. It is frequent in Britain. None of the sallows produce such long and slender twigs as the osiers, nor are they adapted for any but the coarsest wickerwork, and some of them are so apt to break that they cannot easily be used in that way. But shoots of two years' growth are split up, and used for making hoops of barrels.

Sallow-thorn (*Hippophaë rhamnoides*):
a, Branch of the female plant, in fruit; *b*, branch of male plant, in flower.

SALLOW-THORN (*Hippophaë*), a genus of plants of the natural order *Elæagnaceæ*, consisting

of large shrubs or trees with gray silky foliage, and entire leaves. They have dicœcious flowers: the perianth is tubular, becomes succulent, encloses an achenium, and forms an acid fruit. Few species are known: one only is European, *H. rhamnoides*, sometimes called the SEA BUCK-THORN, a large shrub or low tree, a native of the sandy sea-coasts of England and the continent of Europe. It is found also throughout great part of Tartary. It is sometimes planted to form hedges near the sea, growing luxuriantly where few shrubs will succeed. The berries are orange-coloured. They are gratefully acid. They are used for making a sauce in the south of France: a rob or jam is made of them on the shores of the Gulf of Bothnia, to impart flavour to fresh fish; and a preserve or jelly made from them is a favourite luxury of the Tartars. The *stellate* hairs of the underside of the leaf, covering it like scales, are a beautiful microscopic object.

SA'LLUST, CAIUS CRISPUS, a Roman historian, was born 86 B.C., at Amiternum, in the Sabine country. Though of a plebeian family, he rose to official distinction, first as quæstor about 59, and afterwards as tribune of the people in 52, when he joined the popular party against Milo, who in that year had killed Clodius. His reputation for morality was never high; and his illicit connection with Milo's wife is assigned as the cause of his being expelled in 50 from the senate, although his attachment to Cæsar's party is a more plausible reason of his expulsion. In the civil war, he joined the camp of Cæsar; and in 47, when Cæsar's fortune was in the ascendant, he was made prætor-elect, and was consequently restored to his former rank. When in Campania, at the head of some of Cæsar's troops, who were about to be thence transhipped to Africa, he nearly lost his life in a mutiny. In 46, however, we find him engaged in Cæsar's African campaign, at the close of which he was left as governor of Numidia. His administration was sullied by various acts of oppression, particularly by his enriching himself at the expense of the people. He was, for these offences, accused before Cæsar, but seems to have escaped being brought to trial. His immense fortune, so accumulated, enabled him to lay out those magnificent grounds, still known as the gardens of Sallust, on the Quirinal, to retire from the prevailing civil commotion into private life, and to devote his remaining years to those historical works on which his reputation rests. He died 34 B.C., four years before the battle of Actium. His histories, which seem to have been begun only after his return from Numidia, are: 1st, The *Catilina*, or *Bellum Catilinarium*, descriptive of Catiline's conspiracy in 63, during the consulship of Cicero; 2d, The *Jugurtha*, or *Bellum Jugurthinum*, commemorating the five years' war between the Romans and Jugurtha, the king of Numidia. These, the only genuine works of S. which have reached us entire, are of great but unequal merit. The quasi-philosophical reflections which are prefixed to them are of no value, but the histories themselves are powerful and animated, and contain effective speeches of his own composition, which he puts into the mouths of his chief characters. With its literary excellence, however, the value of the *Jugurtha* stops, as in military, geographical, and even chronological details, it is very inexact. His now lost work, *Historiarum Libri Quinque*, is believed to have described the events occurring between Sulla's death, 78 B.C., and the year of Cicero's prætorship, 66. The *Duæ Epistolæ de Republica Ordinanda*, and the *Declamatio in Ciceronem*, are of doubtful authenticity.

Apart from his literary qualities, which are rather those of an artificial than a natural writer, and which are not enhanced by his affectation of brevity, and his love of archaic expressions, S. has the merit of having been the first Roman who wrote what we now understand by 'history.' In official public life, he was more of a politician than a statesman, and the views which he supported were liberal, not so much because he loved the people, as because he hated the nobility. The best editions of his literary remains are those of Corte (Leip. 1724), Gerlach (Basel, 1823—1831), and Kritz (Leip. 1828—1834), which have each a special value.

SA'LLY-PORT, a gate or passage by which the garrison of a fortress may make a sally (through Fr. from Lat. *salio*, I leap or spring) or sudden attack on the besiegers. The name is applied to the postern leading from under the rampart into the ditch; but its more modern application is to a cutting through the glacis, by which a sally may be made from the covert-way. When not in use, sally-ports are closed by massive gates of timber and iron.

SALMASIUS, CLAUDIUS, the Latinised name of a celebrated French scholar, CLAUDE DE SAUMAISE, who was born at Semur, 15th April 1588. His father, Benigne de Saumaise, a man of superior erudition, was his first teacher. At the age of ten, young S. translated Pindar, and composed Greek and Latin verses. He studied philosophy at Paris, under the superintendence of Casaubon. From Paris he proceeded to Heidelberg, where he devoted himself to the science of jurisprudence, and publicly professed Protestantism, to which form of the Christian religion he had been secretly attached for many years. So insatiable at this time was his thirst for knowledge—book-knowledge, at least—that he was wont to devote two whole nights out of three to hard reading, in consequence of which he brought himself to within an inch of the grave. In 1608, he published from MSS. two treatises of the sectary, Nilus, Archbishop of Thessalonica; and a work of the monk Barlaam on the primacy of the pope. In 1629, appeared his chief work, *Plinianæ Exercitationes in Caii Julii Solimi Polyhistora* (2 vols., Par. 1629); after the publication of which, he set himself vigorously, and without the help of a master, to acquire a knowledge of Hebrew, Arabic, Coptic, and other oriental tongues. In 1631, he was called to Leyden, to occupy the chair that Joseph Scaliger had held there, and it is from this period that his European reputation as a scholar and critic dates. Various efforts were made (1635—1640) to induce S. to return to France, but he declined them on the ground that his spirit was too 'liberal' for his native land. Queen Christina of Sweden, however, managed to bring him to Stockholm, and fix him there for a year (1650—1651), after which he returned to Holland. He died of a fever caught by imprudently drinking the waters at Spa, 6th September 1658. S. was certainly a great scholar of the old-fashioned clumsy sort; but neither his wit nor his acumen was sufficiently keen to give an intellectual and critical value to his lucubrations; and though all his distinguished contemporaries, Casaubon, Gronovius, Grotius, Vossius, &c., deluged him with praise; though Balzac pronounced him *infallible;* though the curators of the university of Leyden declared that 'their university could no more do without Salmasius than the world without the sun;' though Queen Christina went the length of saying, with truly royal flattery, 'that she could not live without him'—he is remembered not for his inexhaustible stores of erudition, his editions of the classics, or his treatises on classical antiquities, but for his controversy with John

Milton, scarcely his inferior in scholarship, and infinitely his superior in power of brain, and in all the arts of literary warfare. The question at issue was the lawfulness of the execution of Charles I. Apart altogether from the merits of the case, the great poet utterly overwhelmed his adversary, partly by the magnificence of his language and sentiments, and partly by the unscrupulous fury of his invective. S. also is grossly abusive and acrimonious in his treatise (*Defensio Regia pro Carolo I.*, 1649): *asinus* (ass), *pecus* (beast), and such-like expressions being showered about quite freely; but he is deficient in logic, in real force of sarcasm, and in intellectual vigour generally.

SA'LMON (*Salmo*), a genus of fishes of the family *Salmonidæ* (q. v.), which, as characterised by Cuvier, has teeth on the vomer, both palatine bones, and all the maxillary bones; and includes numerous species more recently divided by Valenciennes into three genera, *Salmo*, *Fario*, and *Salar*: the first characterised by a few teeth at the end of the vomer; the second, by a single line of teeth running down the vomer; the third, by two rows of teeth on the vomer, without any remarkable group at its upper end. To many naturalists, however, this division seems too artificial; and the characters, although excellent for distinguishing species, not such as ought to divide genera; an opinion confirmed by the fact, that the teeth are numerous along the vomer in the young of the species, as the Common S., which finally retain only a group of them at the end. The division made by Valenciennes separates the S., the Salmon Trout, and the Gray or Bull Trout, the only British species which ascend rivers from the sea, into the two genera *Salmo* and *Fario;* whilst the Common Trout is referred to *Salar*. A much more natural division, having regard to characters really conspicuous and important, and to the habits of the species, is the simple one of Mr Pennell (*The Angler Naturalist*, 1863), which is really nothing more than a formal recognition of groups practically recognised by every one acquainted with the fishes which compose them: '1. The Silver, or Migratory species (i. e., those migrating to and from the sea); 2. The Yellow, or Non-migratory species; 3. The Charrs, or Orange and Red-coloured species.' The present article is devoted to the first of these groups. The second is noticed in the article TROUT; the third, in the article CHARR.

By far the most important of the three *Salmonidæ* which ascend the rivers of Britain from the sea is the SALMON (*Salmo salar*), in commercial importance far superior to any other fresh-water fish, both on account of the abundance in which it is procured in the northern parts of the world, and of its rich and delicious flavour. From ancient times it has furnished important supplies of food; and the S. fisheries of Britain have long been a subject of anxious attention to the legislature. The rivers of Iceland and other regions regularly supply the British market with S., fresh, in ice. Salmon frequent the rivers of Labrador, Canada, Nova Scotia, and New England, and those of New York communicating with the St Lawrence. They also especially abound on the North Pacific coast, in Puget Sound, and in the Columbia and Frazer's rivers. The S.-fishing in the gulf of St Lawrence is valued at about $500,000 annually, and its fish are delivered, packed in ice, to the markets of Boston, New York, and Philadelphia.

The S. is one of the largest species of the genus, having been known to attain the weight of 83 lbs., whilst S. of 40 or 50 lbs., and even upwards, are occasionally brought to market. Very large S., however, are not common, owing to the eagerness with which the fishery is prosecuted. No fish is more symmetrical or beautiful than the S.; and its form is admirably adapted to rapid motion even against powerful currents, by the regular tapering from the front of the first dorsal fin both to the snout and to the tail, but more suddenly in the

Salmon (*Salmo salar*).

former direction, by the nearly equal convexity of back and belly, and by the perfect smoothness and want of angularity. The head is about one-fifth of the whole length of the fish. The under-jaw of the male becomes hooked during the breeding season with a kind of cartilaginous excrescence, which is used as a weapon in the combats then frequent, wounds so severe being inflicted with it that death sometimes ensues. The lateral line is nearly straight. The scales are small, and the colour a rich bluish or greenish-gray above, changing

Salmon Trout (*Salmo trutta*).

to silvery-white beneath, sprinkled above the lateral line with rather large black spots. The opercular bones shew a rounded outline at the hinder edge of the gill-covers, which at once distinguishes this species from the only other British species that can be confounded with it, the Salmon Trout and the Gray or Bull Trout. The tail is forked in the young

Gray, or Bull Trout (*Salmo eriox*).

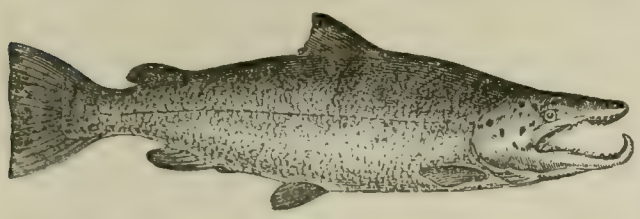
S., but becomes nearly square in the adult. The mouth of the S. is well furnished with teeth; a line of teeth on each side of the upper jaw; an inner line on the palatine bone, two or three in the adult state at the end of the vomer, two rows on the tongue, and one row along the outer edge of each lower jaw-bone. This array of teeth indicates voracity, and the S. seems to prey readily on almost any animal which it is capable of capturing, though it is a somewhat singular fact, that the stomach when opened is rarely found to contain the remains of food of any kind: two or three herrings of full size have, however, been found in its stomach; the sand-launce and other small fishes seems to constitute part of its food; and when in fresh water, the minnow, trout-fry, or the fry of its own species worms, flies, &c. The angler catches S. with the artificial fly, or with the minnow or the worm; and no bait is more deadly than the roe of the S. itself, the use of which is indeed prohibited in

British acts of parliament intended for the protection of the S. fisheries. The eggs of crustaceans have also been found in the stomach of the S. in such quantities as to shew that they form a very considerable part of its food.

The S. is found on the coasts of all the northern parts of the Atlantic, and in the rivers which fall into that ocean, as far south, at least, as the Loire on the European side, and the Hudson on the American. Slight differences can be noted between the American and the European S., but they are not generally thought sufficient to distinguish them as species. The S. frequenting one river are, indeed, often characteristically different from those of another river of the same vicinity. The S. is not found in the Mediterranean nor in the Black Sea, nor in any of the rivers falling into them; and in the Arctic Ocean and its rivers, as well as in the northern parts of the Pacific Ocean, other species of the same genus take its place. The preservation of S. in a fresh state by means of ice, being an invention of recent times, this fish never appeared at the luxurious tables of ancient Rome except dried or salted, although its excellence was well known, the Romans having become acquainted with it in their northern conquests. S. is in perfection for the table only when recently taken from the water; whilst the fatty 'curd' remains between the flakes of its flesh, which, however, begins to disappear within 12 hours, although otherwise the fish is quite fresh. Hence the peculiarly high value formerly ascribed in London to *Thames salmon*.

The S., after its first migration to the sea, passes a great part of its life in it, although under the necessity of periodically ascending rivers, in which the S. that ascend to spawn or for other causes in autumn, often remain during most of the winter. S. return, in preference, to the same rivers in which they have passed the earliest part of their existence; as appears both from records of marked S., and from the characteristic differences already alluded to. S. ascend rivers to a great distance from the sea, as the Rhine to the Falls of Schaffhausen, and the Elbe to Bohemia. The speed with which they glide through the water in their most rapid movements is very great; it is said to be not less than 1500 feet in a minute, or at the rate of 400 miles a day; but this, of course, is sustained only for a few moments, and the ordinary rate of progress in ascending rivers is supposed to be from 10 to 25

Salmon-ladder.



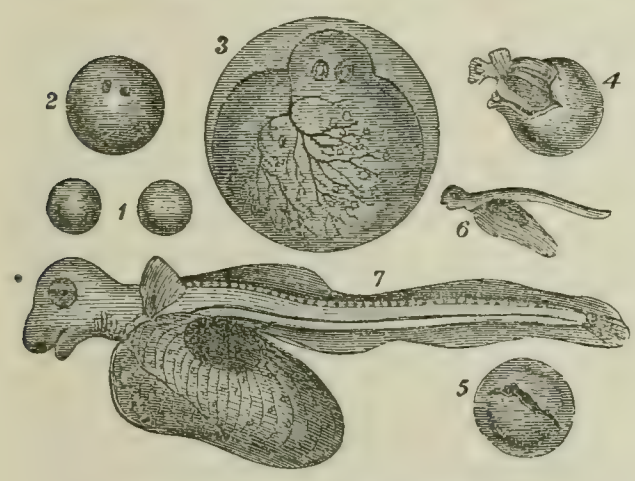
miles a day. The fish, also, almost always chooses to lie for a time in some spot, waiting a fresh flood in the stream. The perpendicular height which the S. can pass over by leaping, when there is abundance of water in the river and sufficient depth in the pool below the fall, seems to be not more than 12 or 14 feet; they attempt higher leaps, but often fall back exhausted, or fall on adjacent rocks, where they die or are captured. They do, however, rush up steep and broken cataracts of much greater height. The ascent of many rivers by S. has been stopped by high weirs and other obstructions; but very simple and effectual means have been devised for preventing this by *fish-stairs* or *fish-ladders*, which are often very conveniently formed by partitioning off a portion of the fall, and intersecting it from alternate sides, two-thirds of its width, by transverse steps of wood or stone, so as partially to divide it into a succession of falls. The S. soon find out the ladder, and leap up from one step to another. By this, the interests of manufacturers and of fishery proprietors are in some measure reconciled.

As the time of spawning approaches, S. undergo considerable changes of colour, besides the change of form already noticed in the snout of the male. The former brilliancy of the hues gives place to a general duskiness, approaching to blackness in the females, much tinged with red in the males; and the cheeks of the males become marked with orange stripes. S. in this state are 'foul fish,' being considered unfit for the table, and the killing of them is prohibited by British laws, notwithstanding which, however, multitudes are killed by poachers in some of the rivers, nor do those who eat them either fresh or 'kippered' (i. e., dried) seem to suffer from any unwholesomeness, such as is sometimes alleged to belong to them, although they are greatly inferior in quality to S. in other states. S., which have completed their spawning, continue for some time, at least if in fresh water, very unfit for the table. Their capture is prohibited by British laws. They are called '*foul fish*,' or more distinctively, '*spent fish*,' or *Kelts;* the males are also called *Kippers*, *kip* being a name for the cartilaginous hook of the under jaw, and the females *Shedders* or *Baggits*. Such names, originally local, have become of more general use from having been introduced into acts of parliament. The name *Kelt*, in particular, is now very commonly employed. When they remain for a considerable time in fresh water after spawning, kelts recover very much, and increase in weight, whereas, before spawning, there is a diminution of weight. 'A well-mended kelt' approaches in quality to a good or 'clean' S., although far from being equal to it.

The time of spawning is from the end of autumn to the beginning of spring, or even the beginning of summer; differing considerably in different rivers, whilst in each river it is prolonged throughout months, the elder and stronger fish of the former year probably ascending to spawn first. The difference of season in different rivers is probably to be accounted for by the temperature of the water, as affected by latitude, and by the relations of the river to lakes, to low warm plains, and to snow-covered mountains.

S. spawn on beds of fine gravel, in shallow parts of rivers, such as are used for the same purpose by trout. Some beds of this kind, in salmon-frequented rivers, have been notable from time immemorial as favourite spawning-places; and large numbers of fish, both the S. and its congeners, deposit their spawn in them every year. The spawning female approaches the bed, attended by at least one male fish, sometimes by more than one, in which case fierce combats ensue; she makes a furrow in the gravel with her tail, and deposits her spawn in it, on which the male afterwards pours the vivifying melt. It was formerly believed that the furrow

was in part made by the snout of the fish, and to this the snout of the male at the spawning season was supposed to be particularly adapted; but it has been found by observation that the snout is not



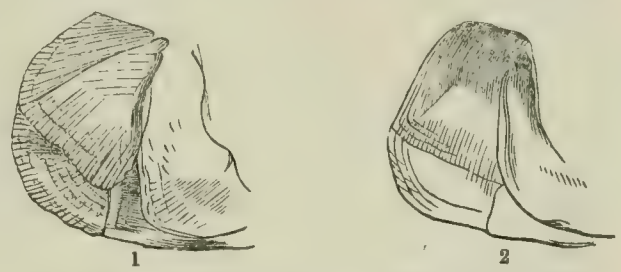
Old Male Fish, or Kipper, during the Spawning-season.

used in this work. The eggs, when deposited and vivified, are covered by the action of the tail of the female; the male doing nothing but depositing his melt, and fighting with any other of his sex that may attempt to dispute his place.

The time occupied by a female S. in spawning is from three to twelve days. After spawning, the S. generally soon descends to the sea. The descending *kelts* are very ravenous, and therefore a great annoyance to anglers who desire to take none but *clean* fish, and must return the kelts to the water.

The eggs deposited in the spawning bed are liable to be devoured by trouts and other fishes, which are ever ready, and by insect larvæ of many kinds, which work their way even through the gravel; ducks and other waterfowl also search there for their food; and sometimes a flood changes the bed so much as either to sweep away the eggs, or to overlay them with gravel to a depth where they are never hatched, or from which the young can never emerge. The number of eggs hatched in ordinary circumstances must be small in proportion to the number deposited, and by far the greater part of the fry perish before the time of descent to the sea.

In from thirty to sixty days after the deposition



Salmon Ova, and Newly Hatched Fish.

(Copied from the *Field* newspaper.)

1, egg of salmon, natural size, just taken from the parent fish; 2, the same, with the eyes of the young fish just becoming apparent; this takes place about the thirtieth or thirty-fifth day, according to the temperature; 3, the young fish coiled up in the egg, and just ready to be hatched; 4, the young fish emerging from the shell; 5, the empty egg-shell, shewing longitudinal rent made by the young fish; 6, young salmon about two days old, natural size; 7, the young salmon (about two days old), magnified; the umbilical vesicle, containing the yelk and the oil globules, and blood-vessels ramified on its surface; also the head, with the huge eyes and badly-developed mouth (a portrait); the fins and the thin transparent body, the fins not as yet being developed into their proper shape, are carefully delineated.

of the eggs in the spawning bed, they begin to shew signs of life, and the eyes appear as small specks. The time which elapses before the egg is hatched varies according to the temperature of the water, and therefore is generally shorter in England than in Scotland, 140 days being sometimes requisite in cold climates and late springs; whilst it has been found that in a constant temperature of 44° F. sixty days are enough, and in a higher temperature eggs have been hatched even in thirty days. A temperature above 70° F. is, however, fatal to them. S. eggs are easily hatched in an aquarium, in which proper care is taken to prevent stagnation of the water, so that the conditions may resemble those of a bed of gravel in a running stream, and many interesting observations have thus been made by Mr Frank Buckland on the development of the young S., of which the results have from time to time been given to the world through the columns of the *Field* newspaper, and his excellent work on *Fish-Hatching*.*

The young fish lies coiled up in the egg, which it finally bursts in its struggles to be free, and it issues with a conical bag (umbilical vesicle) suspended under the belly, containing the red yolk of the egg and oil globules, which afford it nourishment during the first five or six weeks. The mouth is at first very imperfectly developed, as are the fins, and the whole body has a shape very different from what it is soon to assume, and is very delicate, and almost transparent. The slightest injury is fatal. The length, at first, is about five-eighths of an inch. About the seventh or eighth week, the

Gill-covers of Salmon (1), and Salmon Trout (2).

young S. has changed into a well-formed little fish about an inch long, with forked tail, the colour light brown, with nine or ten transverse dusky bars, which are also more or less distinctly visible in the young of other species of this genus, just as the young of many feline animals exhibit stripes or spots which disappear in their mature state. The fry, previously very inactive, now begin to swim about, and seek food with great activity, and are known as PARR, or SAMLET, and also in some places by the names *Pink*, *Brandling*, and *Fingerling*. The Parr was formerly supposed to be a distinct species (*S. salmulus*), an opinion to which many anglers, eager to enjoy their summer holidays, and catching parr by scores with the artificial fly or worm when they can catch nothing else, have clung tenaciously, after it has been shewn to the satisfaction of all naturalists that the parr is nothing else than the young salmon. The honour of proving this belongs to Mr Shaw, of Drumlanrig, Dumfriesshire, whose observations and experiments, first made in 1834—1836, we have not space to detail. They have, however, been fully confirmed at the salmon-breeding ponds of Stormontfield, on the Tay.

Gill-covers of Bull Trout.

* London: Tinsley Brothers, 1863.

It was long urged, to prove the parr a distinct species, that the male parr is very often found with the milt perfect, to which, however, it was replied that the female parr is almost never found with perfect roe. But the remarkable fact has now been abundantly proved that the male parr is capable of impregnating the roe of the female S., and thus a provision seems to be made in nature to prevent an otherwise possible loss of roe. And, indeed, ridiculous little parrs seem to be always ready at hand to perform this service during the combats of the great fish, or in their absence. Another remarkable fact has been discovered, that some parrs descend to the sea in their first year, whilst others remain in the fresh water, and in the parr state, without much increase of size for another year, and a few even to the third year. At Stormontfield it has been found that about one half of the parrs migrate when a year old. No reason can be assigned for these things; the facts alone are known to us, and have but recently been established.

The parr attains a size of from 3½ to 8 inches. When the time of its migration comes, usually in May or June, it assumes brilliant silvery hues, the fins also becoming darker, and is then known as a *Smolt*. Groups of smolts, 40 to 70 in a group, now descend, not very rapidly, to the sea. They remain for a short time in brackish water, and then depart from the estuary. Of their life in the sea nothing is known, except that they increase in size with wonderful rapidity; for it has been found that smolts which had been marked, returned to the same river in six or eight weeks as *Grilse* of three to five pounds, or, after a longer period, even of eight or nine pounds. Some reascend the rivers when only a pound and a half or two pounds weight, and these are in some places known as *Salmon Peal*. Grilse are captured in great numbers in the latter part of summer and in autumn, but very few are seen in the earlier part of the fishing season. The grilse usually spawns on its first return to the fresh water—often remaining there for the winter, and on again descending to the sea assumes the perfect characters of the mature salmon. Little increase of size ever takes place in fresh water; but the growth of the S. in the sea is marvellously rapid, not only on its first migration, but afterwards. A kelt caught by the late Duke of Athole on 31st March weighed exactly ten pounds. It was marked, and returned to the Tay, in the lower part of which it was again caught, after five weeks and two days, when it was found to weigh twenty pounds and a quarter.

The statistics of S. fisheries are, like those of other fisheries, very imperfect. It is impossible to ascertain the total annual value of the S. fisheries even of Great Britain and Ireland; but it must be reckoned by hundreds of thousands of pounds. 'From the Reports of the Irish Commissioners, we learn that, in 1862, apparently an ordinary year, three Irish railways conveyed 400 tons, or about 900,000 lbs. of salmon, being equal in weight and treble in value to 15,000 sheep, or 20,000 mixed sheep and lambs. In Scotland, the Tay alone furnishes about 800,000 lbs., being equal in weight and treble in value to 18,000 sheep [and lambs]. The weight of salmon produced by the Spey is equal to the weight of mutton annually yielded to the butcher by each of several of the smaller counties. The diminution in the supply of food caused by the decay of the Tweed fisheries is about 200,000 lbs. a year. The quantities of salmon received in London in 1868, from various sources, were as follows, viz.: Scotch, 28,020 cwt.; Irish, 3487 cwt.; Dutch, 807 cwt.; Norwegian, 407 cwt.; Welsh, 1725 cwt.; total, 34,446 cwt.; valued at about £200,000. In 1870, 10,519 barrels of foreign salmon, valued, with the preserved salmon, at $140,589, were imported into the United States. By Buckland's Report, March, 1868, it appears that 3790 men were then employed in the salmon fishery of England and Wales.

The S. fisheries of the British rivers have in general much decreased in productiveness since the beginning of the present century, which is very much ascribed to the introduction of fixed or standing nets along the coast, by which S. are taken in great numbers before they reach the mouths of the rivers to which they are proceeding, and in which alone they were formerly caught; it having been discovered that S. feel their way, as it were, close along the shore for many miles towards the mouth of a river, feeding, meanwhile, on sand-launces, sand-hoppers, and other such prey. It is also partly owing to the destruction of spawning fish by poachers; and in no small measure to the pollution of rivers consequent on the increase of population and industry, and to the more thorough drainage of land, the result of which has been that rivers are for a comparatively small number of days in the year in that half-flooded condition in which S. are most ready to ascend them. The last of these causes is the most irremediable; but if the operation of the others were abated, it would not of itself be sufficient to prevent a productiveness of our rivers much greater than the present. The efforts which have begun to be made by breeding-ponds (see PISCICULTURE) to preserve eggs and fry from destruction, and so to multiply far beyond the natural amount the young S. ready to descend to the sea, promise also such results as may yet probably make the supply of S. *far* more abundant than it has ever been. There is reason to think that the productiveness of the waters may be increased as much as that of the land.

The stake net is the most deadly of all means employed for taking S.; and its use is prohibited in estuaries and on some other parts of the coast. It consists of two rows of net-covered stakes so placed between high and low water marks, that S. coming up to them, and proceeding along them, are conducted through a narrow opening into what is called the *court* of the net, from which they cannot find the way of escape. The *cruive*, which is now illegal in all parts of Britain, is an enclosed space formed in the wall of a dam or weir, into which the S. enter as they ascend the stream, whilst a peculiar kind of grating prevents their return. The nets employed for catching S. in rivers and estuaries are of many different kinds. In many places a small boat, or *salmon coble*, is used to carry out a seine net from the shore, setting (*shooting*) it with a circular sweep, the concavity of which is towards the stream or tide, and men stationed on shore pull ropes so as to bring it in by both ends at once with whatever it may have enclosed. Coracles (small boats of basket-work or a light wooden frame covered with canvas and tar, or other waterproof material) are used in S. fishing in the Severn and other Welsh rivers. Nets which a single man can carry and work are also used in many rivers and estuaries, as those called *halves* on the Solway, which may be described as a bag attached to a pole. Dogs have sometimes been trained to drive S. into nets, and some dogs have attained great expertness in catching S. without any assistance.

The SALMON TROUT (*S. trutta*, or *Fario argenteus*), also very commonly called the SEA TROUT, is rather thicker in proportion to its length than a S. of the same size, and has the hinder free margin of the gill-cover less rounded. The jaws are nearly equal; the teeth strong, sharp, and curved, a single row running down the vomer, and pointing alternately in opposite

directions. The colours are very similar to those of the S.; the sides, chiefly above the lateral line, are marked with numerous X-shaped dusky spots, and there are several round dusky spots on the gill-covers. The salmon trout does not attain so large a size as the S., but has been known to reach 24½ lbs. The flesh is pink, richly flavoured, and much esteemed, although not equal to that of the salmon. Great quantities of salmon trout are brought to market in London and other British towns; this fish being found from the south of England to the north of Scotland, and plentiful in many rivers, particularly those of Scotland. Its habits are generally similar to those of the salmon. Large shoals sometimes congregate near the mouth of a river which they are about to enter, and sometimes afford excellent sport to the angler in a bay or estuary, rising readily to the fly. The young are not easily to be distinguished from parr. *Phinock*, *Hirling*, and *Whitling* are local names of the salmon trout on its first return from the sea to fresh water, when it has its most silvery appearance, in which state it has sometimes been described as a distinct species (*S. albus*).

The Gray Trout or Bull Trout (*S. eriox*), the only other British species migrating like these, is already noticed in the article Bull Trout. The gill-cover in this species is more elongated backwards at the lower angle than in the other two. On the banks of the Tweed and some other rivers, it is often called the sea trout, a name quite as appropriate to it as to the salmon trout. The seasons at which the gray trout ascends rivers are partly the same with those of the S. and salmon trout, and partly different. The laws relative to the fishing of S. apply equally to the bull trout.

Of other species of S. our notice must be very brief. Cuvier has described as a distinct species a S. with hooked lower jaw, known in France by the name of *Becard*. Agassiz and Bloch regard it as merely the old male of the Common Salmon. The hooked lower jaw of the male of the Common S. in the spawning season has been already noticed. But Valenciennes adheres to the opinion of Cuvier that the *Becard* is a distinct species, and insists on the greater length of the intermaxillary bones as a sure distinctive character; asserting also that the colours are always different from those of the common S.; a general reddish-gray, the belly dull white, the back never blue, nor the belly silvery. The subject seems to require further investigation.—The Hucho of the Danube, called *Reo* in Galicia (*S. Hucho*), attains a weight of 30 lbs., and it is said even of 60 lbs. The body is longer and rounder, the head more elongated than in the Common Salmon. The colour is grayish-black, tinged with violet on the back, the sides and belly silvery. The tail is forked. The hucho spawns in June, making holes for the purpose in gravelly bottoms; and these holes are so deep that the fish lying in them often escape the nets of the fishermen. The flesh is white, but very pleasant. The same, or a very similar species, is found in the Caspian Sea, and in rivers which flow into it.—The rivers of North America which flow into the Arctic Ocean, produce several species of S., of which perhaps that most nearly resembling the Common S., in the quality of its flesh, is *S. Hearnii*. In these regions, Ross's *S.* (*S. Rossii* or *Fario Rossii*) is extremely abundant. It is of a more slender form than the S., with remarkably long lower jaw and truncated snout; the scales separated by naked skin; the back greenish-brown, the sides pearl-gray, the belly orange or red. In the quality of its flesh it is very inferior to the salmon.—*S. Scouleri*, or *Salar Scouleri*, ascends the Columbia and other rivers of the north-west coast of North America in vast multitudes. In arms of the sea on that coast it is sometimes impossible for a stone to reach the bottom without touching several; and the channel of a river or a brook is often densely crowded with them. The flesh is excellent. The same species seems to ascend the rivers of Kamtchatka; but that country, the Kurile Isles, and Siberia have also species of their own. Concerning many of the species which have been named and partially described, there is still, however, great uncertainty.

Angling for Salmon.—The capture of the salmon by rod and line affords the most exciting sport of the kind. The pleasures of it have been descanted on by numerous writers, and whole treatises have been written in the minutiæ of the art. Among the more modern writers on the subject, we may name Davy, Stoddart, Colquhoun, Younger, Stewart, Francis, and Russel. The tackle used is sufficiently described in the article Angling; and the general principles of fly-fishing there laid down are applicable in this case. The chief specialty in salmon angling is to be able to maintain perfect coolness and vigilance when the fish is hooked. The rod must be kept at such an elevation as to bring its elasticity into play; and by allowing the line to run out as the fish dashes off, and winding it up as he returns, or by following his motions, if need be, in person, a constant and equal strain must be maintained; a sudden tug at an unyielding line, or a momentary slackening, being equally fatal. After struggling for from a quarter to half an hour (sometimes, though rarely, for two or three hours) against a steady pull, the fish generally yields to his fate and allows himself to be drawn into the shallow and landed. This is done either with the gaff; or the fisher, winding his line up within rod length and holding the top landwards, without slackening, seizes the fish with one hand by the root of the tail, and lifts, or rather slides him head-foremost on to the gravel or grass.

Those rivers of Britain where the fishing is strictly preserved, still afford good sport; but of late years the take of fish, by rod as well as by net, has greatly fallen off, and many fishers now betake themselves annually to the rivers of Norway and Sweden. In Scotland the Tay, Tweed, Don, Spey, Dee, Thurso, and some others are still preserved in many places, and command high rents from salmon anglers.

Salmon-fishery Laws.—Owing to the peculiar excellence of the salmon, it is singled out from all other fish, and protected by peculiar laws in the United Kingdom, but those laws are not the same in the three kingdoms. I. As to England.—The right to fish salmon in the sea and navigable rivers belongs to the public as a general rule; and the right to fish salmon in rivers not navigable belongs to the riparian owner on each bank, the right of each extending up to the centre line of the stream. But though the public have, as a rule, the right to fish in the sea and navigable rivers, there are various exceptions, which arose in this way. Previous to Magna Charta, the crown, whether rightly or wrongly, assumed power to make grants to individuals—generally the large proprietors of lands adjacent—whereby an exclusive right was given to such individuals to fish for the salmon as well as all other fish within certain limits. This right, when conferred, often applied to the shores of the sea, but generally prevailed in navigable rivers and the mouths of such rivers. The frequency of such grants was one of the grievances redressed by Magna Charta, which prohibited the crown thenceforth from making like grants. But the then existing grants were saved, and hence every person who at the present day claims a several or exclusive

fishery in navigable rivers, must shew that his grant is from the crown, and is as old as Magna Charta. It is not, however, absolutely necessary that he be able to produce a grant or claim of grants of such antiquity; for if he has been in undisturbed possession for a long time—say thirty years and upwards—it is presumed that such title is as old as Magna Charta, and had a legal origin. When a person is entitled to a salmon fishery (and if he is entitled to a salmon fishery he is entitled also to the trout and other fish frequenting the same place), he is nevertheless subjected to certain restrictions as to the mode of fishing salmon. These restrictions are imposed by the Salmon Fishery Act, 24 and 25 Vict. c. 109 (1861), which repealed prior acts of parliament. No person is now entitled to use lights, spears, gaffs, strokeballs, snatches, or other like instruments for catching salmon; nor can fish roe be used for the purpose of fishing. All nets used for fishing salmon must have a mesh not less than two inches in extension from knot to knot, or eight inches measured round each mesh when wet. No new fixed engine of any description is to be used. A penalty is incurred for violating these enactments, and also for taking unseasonable salmon, or for taking, destroying, or obstructing the passage of young salmon, or disturbing spawning salmon. The close time, during which no salmon shall be fished, extends from 1st September to the 1st February following, except that for rod fishing the close season shall not commence till 1st November. These periods may, however, be slightly varied for each locality. During close time no salmon can be legally sold or be in the possession of any person for sale; and such fixed engines as are still legal shall be removed or put out of gear during close time. Moreover, throughout the year, there is a weekly close time—that is to say, no person can, except with rod and line, lawfully fish salmon between 12 A. M. (noon) of Saturday to 6 A.M. of Monday following. In all dams fish-passes must be attached by the proprietors, and free gaps made in fishing weirs of a certain width. For the purpose of supervising the enforcement of the act, fishery inspectors are appointed for England, and powers of assessing proprietors in each district were conferred by a statute of 1865 in imitation of the Irish acts. As to poachers of salmon, see POACHING.

II. In Scotland, there are various important differences from the law of England as regards salmon fisheries. In Scotland, the general rule is that no person is entitled to fish with nets or engines except he can shew a grant or charter from the crown. Though, however, this right to catch salmon by nets is vested in the crown, or in some grantee of the crown, the right to angle for salmon is not derived from the crown, but belongs to the riparian owner, who may angle for salmon as far as his doing so does not prejudice the net fishing—and it can seldom do so. All fixed engines for catching salmon are illegal; but a mechanical contrivance which enables the fisherman to go a little further into the river with his coble or boat, which is to drag the net, is not illegal. Stake nets, however, are not illegal if they are not in a river or the mouth of a river. In 1862, a statute, 24 and 25 Vict. c. 97, passed for regulating the Scotch salmon fisheries. By this act fishery districts are constituted under the management of boards. These boards consist of the large proprietors of fisheries. The boards appoint constables, water-bailiffs, and watchers, forming a kind of river police. The board has power to assess the various proprietors in sums so as to raise funds for paying the expenses of working the act—a power which was not given by the English acts till 1865. The annual close time for salmon fishing is fixed by the commissioners, and varies in each district, but it generally extends from 27th August to 10th February following; the angler's close time commencing about 16th October. The commissioners fix the limits of fishery districts, make general regulations as to close time, cruives, nets, &c. The Scotch act imitates the English act in prohibiting fishing with lights or salmon roe, with nets having small meshes, selling fish during close time, &c. And there is a weekly close time from 6 P. M. on Saturday to 6 A. M. on Monday following.

UNITED STATES.—Thirty years ago the rivers of Maine abounded in salmon, but since the ascent to the head-waters has been cut off by high dams, the markets of the East have been supplied from the British Provinces. The Canadians, by wise legislation, have re-peopled their streams, which they had exhausted. Efforts are now making to re-stock the streams of New England with salmon, shad, &c., and of the Middle States with shad and blackbass, which promise to be eminently successful.

The laws of Massachusetts and Pennsylvania prohibit the erection of dams without sufficient pathways for the passage of salmon, shad, &c. to the upper waters, or fishing for them within certain periods. The reader will consult with advantage an article by Prof. Theodore Gill, entitled *Pisciculture with Reference to American Waters*, published in the *Rep. of the Commissioner of Agriculture* for 1866, Washington, 1867. For salmon of North-western America, see SUPPLEMENT, Vol. X.

SALMO'NIDÆ, a very large and important family of malacopterous fishes, of the suborder *Abdominales* (having the ventral fins on the abdomen, and behind the pectorals), nearly allied to *Clupeidæ* (the Herring family), but at once distinguished by the second dorsal fin, which they all have, and which is merely a fold of the skin, enclosing fat, whence it is called the *adipose fin*, and destitute of rays. They were all included by Linnæus in the genus *Salmo*, although now divided not only into numerous genera, but by many naturalists into several families, of which one retains the name of S., and the other principal ones are *Characinidæ* and *Scopelidæ*. The S. are generally very muscular, and possess great strength, swimming with great rapidity, even against strong currents, and some of them are capable of leaping up falls of considerable height, when there is sufficient depth of water beneath. Some of them are sea-fishes, never entering rivers, although, like the herring, pilchard, &c., they approach the shore to spawn; others are generally inhabitants of the sea, but ascend rivers to spawn, and some of them also on other occasions not yet well understood; others, again, are constant inhabitants of fresh-water lakes, or of rivers and streams. Most of them are esteemed for the table, and some are among the most esteemed of fishes.

The restricted S. of those naturalists who divide the family, are all scaly fishes, but with the head destitute of scales, and the cheeks fleshy; the upper part of the mouth is formed by the premaxillary and maxillary bones together; the branchiostegal rays are numerous; the air-bladder is large and simple; the teeth are usually small, sometimes very numerous, the tongue being furnished with them, as well as the other parts of the mouth, although others have the teeth few and small, or even wanting. They are generally voracious fishes, feeding chiefly on other fishes, crustaceans, worms, &c. The Salmon, Salmon Trout, Tullibee, Red Char, Trout, Eulachon, Grayling, and Smelt, are familiar American examples. The White Fish of North America is one of the most important species, and to the same genus (*Coregonus*) belong many others, inhabiting the lakes and rivers of the northern parts

of the world, some of them, from their herring-like appearance, known as *Herring-salmon* and *Fresh-water Herring*. The Capelin (q. v.) is a sea-fish, never entering fresh waters. The restricted or true S. are found only in the northern parts of the world, and chiefly in the colder regions.

The *Characinidæ* also have the body scaly, and the head destitute of scales; the upper part of the mouth is formed by the premaxillaries and maxillaries together; there are only four or five branchiostegal rays; the air-bladder is divided by a constriction in the middle; the teeth are very various, wholly wanting in a few, numerous in most of the genera, present on the tongue in some, and not in others; small and feeble in some, in others large and strong; in many conical and sharp, in some flat. Most of the species feed on animal food, but a few on vegetable food alone; whilst some are omnivorous, eating with equal readiness worms or other soft animals and fruits which fall into the water. One of those feeding exclusively on vegetable substances is the Pacu (*Myletes Pacu*), a fish scarcely excelled by any as an article of food, which has teeth very like the molar teeth of sheep, and employs them in browsing on the plants that grow on rocks covered with water, near the cataracts of the rivers of Guiana, and in some of the tributaries of the Amazon. In form, it is very unlike the trout or salmon, being short, thick, and clumsy. This, however, is not unfrequent in the *Characinidæ*, which exhibit much greater variety of form than the S. proper. Thus, in some of the genus *Serrasalmo* (see PIRAYA), of which there are many species, voracious carnivorous fishes with sharp trenchant teeth, the depth of the body is almost as great as its length. The species of *Serrasalmo* are sometimes called *Saw-bellied Salmon*, from their keeled and serrated belly. The *Characinidæ* are all inhabitants of fresh waters; some of them African, but the greater number South American. Their flesh is generally much esteemed.

The *Scopelidæ* differ from both the previous sections of S. in the structure of the mouth, which is formed entirely of the premaxillary bone, the maxillary lying behind. Few of them have an air-bladder. Some are scaly, and some destitute of scales. The form of the body is salmon-like in some, but deep and compressed in others. They are generally marine, as the Argentine (q. v.), the only British species. They abound chiefly in the warmer seas; the Mediterranean produces some; but the greater number belong to the Chinese and East Indian seas. Some are in high repute for their fine flavour.

Australia produces none of the Salmonidæ. The rivers and streams of that region, however, as well as those of New Zealand, Patagonia, and the Falkland Islands, produce a number of species of *Galaxias*, a genus of very trout-like form, but with no scales and no adipose fin. They are called *trouts* by the colonists in Australia and New Zealand, but are of very inferior quality for the table.

SALOMON, JOHANN PETER, an eminent musician, violin-player, and composer, born at Bonn in 1745. When young, he was attached to the service of Prince Henry of Prussia, for whom he composed several operas. In 1781, he visited Paris, and afterwards London, where he met with so warm a reception, that he was induced to settle there. His series of subscription concerts in London, in 1790, form an era in the history of music, in so far as they led to the production of Haydn's twelve grandest symphonies, known as the Salomon set. In 1800, S. retired from public life, but continued to compose songs, glees, and violin solos and concertos. He died in 1815, and was interred in Westminster Abbey.

SALONI'KI (anc. *Thessalonica*, Turk. *Selanik*), a town of European Turkey, in the eyalet of the same name, and, next to Constantinople, the greatest emporium of commerce in the empire, is situated on the Gulf of Saloniki, and rises from the shore along the face of a hill. The city is enclosed by white walls, partly ancient and partly medieval, about five miles in circuit, and is surrounded by cypresses and other evergreens. As seen from the sea, it presents a bright and beautiful appearance; but its internal aspect is miserable in the extreme. The principal buildings are mosques, most of which were previously Christian churches. The *Citadel*, called by the Turks Vedi-Kuleh, or 'the Seven Towers,' is the ancient Acropolis; within it are to be seen the ruins of a triumphal arch belonging to the time of Marcus Aurelius. Other relics of antiquity are the Propylæum of the Hippodrome, a magnificent Corinthian colonnade of five pillars; the triumphal arch of Augustus, erected after the battle of Philippi (now forming the gate of Vardar or Vardari); the arch of Constantine, &c. S. exports the corn, cotton, wool, tobacco, bees-wax, and silk of Macedonia. In 1856, the value of the exports was more than £1,350,000, and that of the imports more than £1,000,000. Pop. 100,000, of whom 30,000 are Turks, 20,000 Greeks, and 20,000 Jews. There is regular steamboat communication with Constantinople.

S. was at first called Therma, under which designation it is mentioned in connection with the march of Xerxes through Greece. It was rebuilt by Cassander about 315 B.C., who probably named it Thessalonica in honour of his wife; and during the Roman-Macedonian Wars, it figures as the principal station of the Macedonian fleet. After the close of the civil wars, its prosperity rapidly increased, and for three centuries it was the first city in Greece. It was early the seat of a Christian church. During the barbarian invasions, it proved the great bulwark of the Eastern empire. It was thrice taken in the middle ages—first, by the Saracens in 904; secondly, by the Sicilian Normans in 1185; and thirdly, by the Turks under Amurath II. in 1430.

SALOO'P. See SASSAFRAS.

SA'LOP. See SHROPSHIRE.

SA'LPA, a genus of Mollusca, of the division *Tunicata*, in which there is no shell, but a leathery tunic with two apertures; the type of the family *Salpidæ*, which float in the sea, and have the tunic transparent and elongated. They are allied to *Ascidia* (q. v.), although not fixed like them, and have two openings, through the hinder of which the water enters, and is expelled through the anterior by a regular contraction of the mantle, so that the animal is impelled through the water in a backward direction, without any apparent voluntary action. The *Salpæ* are sometimes solitary, and sometimes united in long chains, those in chains having the contractions of the individuals simultaneous; but the solitary *Salpæ* appear to be the parents of those which are in chains, and they in turn give birth to solitary individuals very different from themselves. The whole texture is very delicate, so that the animal is sometimes scarcely to be discerned, except from its iridescent hues in the sunshine, which make chains of *Salpæ*, when very numerous, a conspicuous feature in the surface of the great deep in tropical regions. The orifices of the alimentary canal are not near together, as in *Ascidia*, but at opposite extremities of the body. The branchial chamber of *Ascidia* is represented by a wide membranous canal, traversed by a long vascular ribbon, which is continually exposed to the

water that passes through the canal. The *Salpæ* united in chains have no organic connection, but apparently adhere together by little suckers.

SAL PRUNELLE. See NITRE.

SA'LSAFY, or SALSIFY (*Tragopogon porrifolius*), a biennial plant growing in meadows throughout Europe, not common, and perhaps not truly indigenous, in Britain; cultivated in gardens for the sake of its root, which is used in the same manner as the carrot, and is very delicate and pleasant,

Salsafy (*Tragopogon porrifolius*).

with a flavour resembling asparagus or scorzonera. The root is long and tapering, and in cultivation white and fleshy, with much white milky juice; the stem 3—4 feet high, with smooth and glaucous leaves, which resemble those of the leek; the flowers are of a dull purple colour. The seed of S. is sown in spring, and the root is ready for use in winter. In the following spring, when the flower-stalks are thrown up, they are used like asparagus. Owing to a peculiar mode in which the roots are sometimes dressed, so as to have a flavour somewhat like that of oysters, S. is sometimes popularly called the *Oyster Plant*.—The genus *Tragopogon* belongs to the natural order *Compositæ*, suborder *Cichoraceæ*, and is distinguished by one row of 8—10 bracts united at the base, a punctured receptacle, feathery pappus, and striated achenia with long beak.—The PURPLE GOAT'S BEARD (*T. pratensis*), a native of Britain, was formerly cultivated in England for its roots, which are similar in quality to salsafy.

SALSE'TTÉ (native name *Sáshti*), an island on the west coast of British India, in the presidency of Bombay, lies immediately north of Bombay, with which it is connected by a long peninsula, and by an artificial embankment called Zion's Causeway. It is 18 miles long, and 11 miles in extreme breadth. Pop. about 50,000. It is beautiful, picturesque, and densely wooded, is diversified by mountain and hill, and contains many fertile tracts. Sugar, indigo, cotton, flax, and hemp are grown. Thanah, the chief town, stands on the east coast, 20 miles north-north-west of Bombay by the Great Indian Peninsular Railway, which, after traversing the islands of Bombay and S., crosses to the continent half a mile to the south of this town. Pop. about 12,000. A number of remarkable caves, called the Caves of Kánhari or Kenery, are found in the middle of the island, five miles west of Thanah. They are nearly a hundred in number, are all excavated in the face of a single hill, and contain elaborate carving. The caves are in six stories, on the ledges of the mountain, and the stories are connected by stairs cut in the rock. The cave first approached consists of three chambers, one unfinished, and dates from the 9th or 10th C. A.D; it contains no figures or carvings. The other caves contain numerous carved representations of Buddha, many of them of colossal size. Relics and inscriptions are also found. There are caves in several localities of the island, besides those at Kánhari—e. g., those of Montpezir, Magatani, and Jageshwar. The caves are frequently the haunts of serpents and tigers. On the north, on the coast, is the small watering-place of Ghorá Bandar, which has been designated the Montpellier of Bombay. The fort of Thanah and the island of S. were taken by the English in 1774.

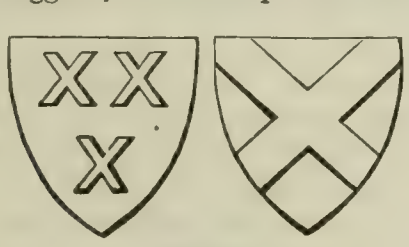
SALT, MANUFACTURE OF. See SODIUM. Common salt is either procured in the solid crystalline state, called *Rock-salt* (q. v.), as a natural brine from wells or springs, or by the evaporation of sea-water. In the first case, it is obtained by mining, often at great depths, as at Northwich in Cheshire; at Salzburg, Magdeburg, Berchtesgaden, and Wimpfen in Germany; Wieliczka in Poland; in the Punjab and other parts of the world.

Natural brine or salt springs abound at Syracuse, New York, in Western Pennsylvania, Ohio, West Virginia, Michigan, and in the Western States and territories. The works at Syracuse alone produced, in 1869, 8,662,237 bushels.

Natural brine is also obtained at Droitwich and Stoke in Worcestershire, and Nantwich in Cheshire. The brine from these wells or springs sometimes overflows into the reservoirs made for it, and from which it is distributed to the various works, which are little more than large sheds, with numerous openings in their roofs, to allow the steam free egress. Flues run from end to end of the floors, and on these rest the iron evaporating-pans, which are about 65 feet long by 25 broad, and about 18 inches in depth. In other places, very deep shafts have been sunk, and the brine requires to be pumped from a great depth. The salt wells in America are often sunk from 400 to 700 feet, and sometimes deeper. The flues heat the brine nearly to the boiling-point, and, as a large surface is exposed, the evaporation is very rapid, and the crystals are small, as in the fine table-salt. If, however, the heat is more gentle, the salt is coarser, and is fit for curing meat, fish, &c.; and when very slow, a much coarser kind, called *bay-salt*, is produced. Salt is obtained from sea-water in many parts of the world, and this is effected by simply evaporating it in brine-pits or shallow square pools, dug on the shore for the purpose. When the evaporation has proceeded to a certain extent, the liquid assumes a reddish colour; a pellicle of salt forms on its surface, which soon breaks, and sinks down, to be followed by another; and the crystallisation then proceeds rapidly. When complete, the salt is removed to sheds open at the sides, and then piled in heaps, in order that the chloride of magnesium may be removed by deliquescence or liquefaction, which takes place rapidly on exposure to the atmosphere. The salt is then redissolved and crystallised, if great fineness is required. Salt to the amount of 300,000 tons, valued at $1,300,000, was imported into the United States in 1870.

SA'LTA, a town in the north-west of the Argentine Confederation, capital of a state of the same name, and about 150 miles distant from the Araucanian and Bolivian frontiers. It stands on the banks of the upper waters of the Salado, at the height of upwards of 3900 feet above sea-level; but even with this elevation its climate is unhealthy.

It is well built, contains a number of good edifices, and about 11,000 inhabitants.



SALT-CAKE is the term employed to designate the crude sulphate of soda made from oil of vitriol and common salt, and used in the preparation of carbonate of soda.

SA'LTCOATS, a seaport on the Firth of Clyde, county of Ayr, 25 miles by railway south-west of Glasgow. Muslins are woven, chemical works are in operation, salt is manufactured, and coal is exported. Pop. (1861) 4778.

SALTI'LLO, a city of Mexico, capital of the state of Coahuila, 250 miles west-south-west of Matamoras. It is regularly laid out, contains a public square and fountain, and carries on manufactures of blankets and ponchos. Pop. 8105. Seven miles south is Buena Vista, famous for the battle fought there, February 1847, when the Mexican forces were repulsed by an inferior United States army.

SALTING, the process by which animal and vegetable substances are preserved for food by the aid of common salt. This is either done by rubbing dry salt into the flesh to be preserved, and repeating the process from time to time, until it has absorbed sufficient to arrest decomposition; or the salt is liquefied with a little water, and made into brine, in which articles are placed until required for use, when a little soaking and washing removes the superfluous salt. Vegetables are only salted in the latter way; and continental nations use it extensively for the preservation of various kinds of vegetable food for winter consumption. A little saltpetre is often added, and very much increases the efficiency of the common salt. See ANTISEPTICS, FOOD.

SA'LTIRE, one of the ordinaries in Heraldry, its name of uncertain etymology, representing a bend sinister conjoined with a bend dexter, or a cross placed transversely like the letter X. Like the other ordinaries, it probably originated, as Mr Planché suggests, in the clamps and braces of the

Saltire.

shield. The form of the saltire has been assigned to the cross on which St Andrew is said to have been crucified; hence the frequency of this ordinary in Scotch heraldry. A saltire is subject to the variations of being engrailed, invected, &c., and may be *couped*. When two or more saltires are borne in a shield, they are couped, not at right angles, but horizontally; and as they are always so treated, it is considered superfluous to blazon them as couped. Charges disposed in the form of a saltire are described as placed *saltireways*, or *in saltire*. The former term is more properly applied to two long charges, as swords or keys, placed across one another (in which case the rule is, that the sword in bend sinister should be uppermost, unless otherwise blazoned); and the latter to five charges placed two, one, and two.

SALT LAKE CITY, the chief town and ecclesiastical capital of the Mormon territory of Utah, U. S., is on the east bank of the river Jordan, between Lake Utah and Great Salt Lake, 20 miles south of the latter, and 4350 feet above the level of the sea, 650 miles east-north-east of San Francisco, and 1100 west of the Mississippi. It was settled by the Mormons (q. v.) in 1847, and contains 260 blocks of 10 acres each; 4 public squares; shaded streets 128 feet wide, through each of which flows a stream of pure water from the neighbouring mountains, 10,000 feet high, from which the gardens are irrigated. The houses are chiefly built of adobes, or sun-dried bricks, each wife in the polygamic families having a separate entrance. The principal edifices are the Mormon Temple, the Tithing-house or Treasury, and the Social Hall, which serves for ball-room and theatre. Pop. in 1860, 8218; in 1870, 12,854.

SALT OF SATURN, an old name for acetate of lead.

SALT OF SORREL, the common name for binoxalate of potash.

SALT OF TARTAR, a commercial name for carbonate of potash in a very crude form.

SALT OF TIN is the term employed by the dyer and calico-printer for protochloride of tin, which is extensively used as a mordant, and for the purpose of deoxidising indigo and the peroxides of iron and manganese.

SALT RANGE, or KALABAGH MOUNTAINS, a mountain range in the Punjab, India, lies in an east and west direction, in lat. 32° 30′—33° 20′. The range rises on the west bank of the Jhelum, runs west to the Indus, and after affording a passage to the river, reappears on its west side, and pursues the same direction till it meets with the Suleiman Mountains. The S. R. is about 200 miles in length, and rises to the height of 2500 feet. Its appearance is exceedingly bleak and barren; vegetation is seldom met with; there are no trees; and the bold and bare precipices which frequently occur, give to the range a forbidding aspect. Rock-salt is found in inexhaustible quantities, and so pure, that after being pounded, it is ready for use. Alum, iron ore, coal, gypsum, and limestone abound; gold-dust is washed down in the sands of the rivers, and graphite is also found.

SALT, SPIRITS OF, the old name for muriatic or hydrochloric acid.

SALTS, SMELLING, a preparation of carbonate of ammonia with some of the sweet-scented volatile oils, used as a restorative by persons suffering from faintness. The pungency of the ammonia is all that is useful, and the oils are added to make it more agreeable. Oils of lavender, lemon, cloves, and bergamot are those chiefly used. The celebrated Preston smelling-salts are scented with oils of cloves and pimento. The manufacture of ornamental bottles to contain this preparation is an important branch of the glass and silversmith's trades.

SALTS, THEORY OF. Any substance which is produced by the combination of a base with an acid, is commonly termed a *salt*. The base is in most cases a metallic oxide, which is capable of uniting with an acid, and of more or less completely neutralising the distinctive properties of the latter; in some cases, however, the base is non-metallic and organic in its nature, as in the case of ammonia, morphia, quinia, strychnia, creatinine, &c.

The salts derive their generic name from common salt, now known as chloride of sodium, but till the time of Davy regarded as a compound resulting from the union of hydrochloric (or as it was then termed, *muriatic*) acid and soda. See SODIUM. Davy, however, shewed that during their action upon each other, both the acid and the alkali undergo decomposition, and that while water is formed by the union of the oxygen of the alkali (NaO) and the

hydrogen of the acid (HCl), the sodium of the former combines with the chlorine of the latter to form choride of sodium (NaCl). Hence, strangely enough, the very substance from which the salts derive their name as a class, was the means of overthrowing the old idea that a salt, as a matter of necessity, must result from the union of a base with an acid. It was then proposed to divide salts into two classes—those formed by the union of a base with an oxyacid, such as nitrate of potash (KO,NO_5), formed by the union of oxide of potassium with nitric acid, sulphate of soda (NaO,SO_3), carbonate of lime (CaO,CO_2), &c., which were termed *oxysalts;* while the other class consisted, like chloride of sodium, of a metal combined with the characteristic element (chlorine, iodine, bromine, fluorine) in a hydrogen acid or hydracid (as, for example, hydrochloric, hydriodic, hydrobromic, or hydrofluoric acid). The salts of this second class, of which chloride of potassium (KCl) and fluoride of calcium (CaF) may be quoted as examples, being constructed on the same plan or type as sea-salt, were termed *Haloid Salts* (q. v.), from the Greek word *hals*, the sea. The chlorine, iodine, bromine, or fluorine, which, in combination with a metal, forms a haloid salt, is by some writers termed a *salt-radical.*

'The great resemblance in properties between the two classes of saline compounds, the haloid and oxysalts, has very naturally led to the supposition, that both might possibly be alike constituted; and that the latter, instead of being considered compounds of an oxide and an acid, might with greater propriety be considered to contain a metal in union with a compound salt-radical, having the chemical relations of chlorine and iodine. On this supposition, sulphate and nitrate of potash will be constituted in the same manner as chloride of potassium, the compound radical replacing the simple one.

Old View.	New View.
$KO + SO_3$	$K + SO_4$
$KO + NO_5$	$K + NO_6$

Hydrated sulphuric acid will be, like hydrochloric acid, a hydride of a salt-radical, $H + SO_4$. When the latter acts upon metallic zinc, the hydrogen is simply displaced, and the metal substituted. No decomposition of water is supposed to occur, and consequently the difficulty of the old hypothesis is at an end. When the acid is poured upon a metallic oxide, the same reaction occurs as in the case of hydrochloric acid; water and a haloid salt are produced. All acids must be, in fact, hydrogen acids; and all salts haloid salts, with either simple or compound radicals.'—Fownes's *Manual of Elementary Chemistry*, 9th ed., 1863, p. 269.

This view, which is frequently termed *the binary theory* of salts, was originally suggested by Davy, but it remained for many years nothing more than (to use the words of Professor Miller) 'an elegant hypothesis,' till it was further illustrated by certain of Liebig's researches in organic chemistry, and till, in certain special cases, it received direct confirmation from the voltaic researches of Daniell and Miller, who found that when a current from two or three of Grove's cells was transmitted through fused nitrate of silver (AgO,NO_5), the latter was resolved into crystals of silver (Ag) at one pole, and NO_6 (which at once broke up into red fumes of peroxide of nitrogen and free oxygen) at the other.

The binary theory serves to explain in the most satisfactory way many chemical changes, as, for example, the modifications of phosphoric acid and phosphate of sodium (see Miller's *Inorganic Chemistry*, 2d ed., 1860, p. 333; or Galloway's *Second Step in Chemistry*, 1864, pp. 128—130), and though some chemists see many objections to it, as a few difficulties still present themselves, it is probable that the progress of discovery will ultimately lead to its universal adoption, which would greatly simplify many parts of the science. The definition of acids as *salts of hydrogen* was first clearly enunciated by Gerhardt, and is an accurate statement of the relations which exist between acids and other chemical substances. The term *salt* is now commonly and most appropriately applied to those bodies of which the reaction of double decomposition is the most characteristic property, and which exhibit such reactions under the most familiar conditions.

The salts have been thus arranged (the old nomenclature is here retained):

1. *Neutral* or *Normal Salts;* 2. *Acid Salts;* and 3. *Basic Salts.* A salt is *neutral* which is composed of as many atoms or equivalents of the acid as there are of oxygen in the metallic base. If the base is a protoxide, or contains 1 atom of oxygen, 1 atom of the acid is combined with it. Sulphate of potash (KO,SO_3), nitrate of copper (CuO,NO_5), and carbonate of potash (KO,CO_2) are all neutral in their composition, each consisting of one atom of the acid in combination with one atom of a metallic protoxide. But all these salts are not neutral, if we judge of their neutrality by their exerting no action on litmus or turmeric paper, for while the first is neutral to test-paper, the second exhibits an acid, and the third an alkaline reaction; and hence the use of the term *normal*, in preference to that of *neutral*, as applied to this class, has been judiciously advocated by Miller and other chemists. If the base is a sesquioxide, three atoms of the acid combine with one atom of the base to form a neutral or normal salt: thus, the sulphates of alumina and of sesquioxide of iron are represented by the formulæ $Al_2O_3,3SO_3$ and $Fe_2O_3,3SO_3$; and as these salts not only redden litmus, but have an acid taste, they afford an additional reason for our preference to the term *normal* over *neutral* salts.

Acid Salts are generally formed by dissolving normal salts in the same kind of acid which they contain, by which means a new salt is often, but by no means always formed. Thus, if normal sulphate of potash (KO,SO_3) be dissolved in hot sulphuric acid, tablets of a new and strongly acid salt will appear as the solution cools. These crystals consist of bisulphate or acid sulphate of potash, and their composition is represented by the formula $KO,HO,2SO_3$, or $KO,SO_3 + HO,SO_3$, in which the atom of water may be regarded as acting in the character of a weak base. If a similar experiment is made of dissolving nitrate of potash in hot nitric acid, no new salt will be formed, the nitre crystallising out unchanged. Why some acids should have the power of forming acid salts, and others should not possess the property, is unknown.

In *Basic Salts*, or *Sub-salts*, as they are often termed, the proportion of base predominates over that of the acid, there being two or three or more atoms of the basic oxide combined with one atom of the acid. Thus, nitric acid forms with oxide of lead not only the normal salt, PbO,NO_5, but three basic salts—viz., $2PbO,NO_5$, $3PbO,NO_5$, and $6PbO,NO_5$. Sulphuric acid forms with oxide of mercury not only the normal salt, HgO,SO_3, but the basic salt commonly known as *turpeth mineral*, and represented by the formula $3HgO,SO_3$.

There is one other class of salts requiring a brief notice—viz., the *Double Salts.* Many neutral salts containing the same acid, but different bases,

may be made to combine so as to form salts of the class now under consideration. Thus, sulphate of potash and sulphate of alumina (both of which are neutral sulphates) by combining, give rise to the double salt popularly known as alum, and represented by the formula $KO,SO_3 + Al_2O_3,3SO_3 + 24$ Aq. Similarly, double salts of silicic acid are of common occurrence. Thus, the varieties of felspar are double silicates of alumina with potash, soda, lithia, or lime, but most commonly with potash, and they may be represented by the general formula $MO,SiO_3 + Al_2O_3,3SiO_2$, where MO stands for potash, soda, &c.

The salts at ordinary temperatures are solid bodies, with a strong tendency to crystallisation, although a considerable number are amorphous. They may be either colourless or coloured. When a colourless acid combines with a colourless base, the resulting salt does not exhibit colour. A coloured base combining with a colourless acid transmits its colour to the resulting salts, and if a coloured acid combine with a colourless base, a similar but less marked result ensues. The salts usually have a decided taste, which is usually dependent on the base; the sulphites are, however, an exception to this rule, as their taste resembles that of the acid. They are variously influenced by high temperatures: some remain unchanged; while others volatilise, fuse, and either simply lose their water of crystallisation, or become decomposed. Most salts are soluble in water, and some, as, for example, carbonate of potash and chloride of calcium, have so strong a tendency to dissolve in that fluid, that they abstract the moisture of the atmosphere. Such salts are termed *deliquescent*. As a general rule, hot water exerts a far more powerful solvent action than cold. There are, however, some remarkable exceptions to this law. Thus, the solubility of common salt (chloride of sodium) is very nearly the same, whatever be the temperature of the water, and certain salts of lime are more soluble in cold than in hot water.

It has been already shewn that an atom of water enters into the composition of certain salts in precisely the same way as an atom of potash or any other base. Such water is termed *basic water*, and is an integral constituent of the salt, from which it cannot be expelled by an ordinary heat. This water is quite distinct from the *water of crystallisation*, which is taken up by many salts in a definite quantity, when crystallising from water, and which is readily expelled by a gentle heat without altering the chemical properties of the salt. The crystalline form of salts which contain water of crystallisation is much influenced by the proportion in which the latter occurs. Thus, green vitriol (sulphate of iron) crystallises in two different forms and with two different proportions of water according to the temperature at which the salt separates from its solution. The number of equivalents of water of crystallisation may vary from 1 to 24, which is the highest number yet observed. In order to distinguish the water of crystallisation from water acting as a base, we characterise it by the symbol Aq. (from the Latin *aqua*, water). The ordinary phosphate of soda is represented by the formula $2NaO,HO,PO_5 + 24$ Aq. Many salts which contain water of crystallisation (for example, sulphate or carbonate of soda) give off the whole or a part of their water of crystallisation in a dry atmosphere, and crumble to powder; such salts are said to *effloresce*. Salts which contain no water of crystallisation are termed *anhydrous;* of which nitre (KO,NO_5) is an example. All salts, when dissolved in water, are readily decomposed by the electric current, the base going to the negative, and the acid to the positive pole. In consequence of this result, the acid is termed the electro-negative, and the base the electro-positive constituent of the salts. When a haloid salt is similarly treated, the halogen (chlorine, &c.) is separated at the positive pole, while the metal is liberated at the negative pole.

SALTWORT (*Salsola*), a genus of plants of the natural order *Chenopodiaceæ*, having hermaphrodite flowers, with 5-parted perianth, and a transverse appendage at the base of each of its segments, five stamens and two styles, the seed with a simple integument. The species are numerous, mostly natives of salt-marshes and sea-shores, widely

Prickly Saltwort (*Salsola kali*).

diffused. One only, PRICKLY S. (*S. kali*), is found in the United States. It has herbaceous prostrate much-branched stems, awl-shaped spine-pointed leaves, and axillary solitary greenish flowers. It was formerly collected in considerable quantities on the western shores of Britain, to be burned for the sake of the soda which it thus yields. *S. sativa* is the chief Barilla (q. v.) plant of the south of Spain.

SALU'TE. The United States national salute is one gun for each state composing the Union. The President of the United States alone is to receive a salute of 21 guns; Vice-president, 17; heads of departments, the general commanding, governors of states and territories within their respective jurisdictions, 15; a major-general, 13; a brigadier, 11; foreign ships-of-war, in return for a similar compliment, gun for gun on notice being officially received of such intention. If there be several ports in sight of or within six miles of each other, the principal only shall reciprocate compliments with ships passing. Officers of the navy are saluted according to relative rank. Foreign officers invited to visit a fort or post may be saluted according to their relative rank. Envoys and ministers of the United States and foreign powers are to be saluted with 13 guns. A national salute is to be fired at noon on the anniversery of the independence of the United States at each military post and camp provided with artillery and ammunition.

SALU'ZZO, an episcopal city of Northern Italy, in the province of Cuneo, at the foot of the Alps, 22 miles east of Mount Viso. It is a fine old city, and contains a semi-Gothic cathedral built in 1480, with pillars of rare marbles, and colossal statues exquisitely sculptured, a seminary for priests, a royal college, and several elementary and infant schools. The Tower of the Commune, an ancient and singular

building, is worthy of notice; also the Abbey of Staffarda, founded in 1135 by the Marquis Tommaso I., and destroyed in 1341; an ancient civic palace, and the old castle, formerly the residence of the marquises of Saluzzo, now a penitentiary. Its products are grain, hemp, and wine; and its manufactures are silk fabrics, iron goods, and hats. Pop. 16,208.

SA'LVAGE (from Lat. *salvare*, to save) is the payment due by the owner of a ship or cargo to persons who may have been instrumental in saving it from extraordinary danger—from the sea, fire, or an enemy. The propriety of this allowance as an incentive to the saving of life and property, has always been admitted; and though the correctness of the principle which allows salvage to government ships for saving ships of their own nation, may be questioned on the ground that their duty is to protect such ships under all circumstances, yet it is admittedly expedient to offer a fair pecuniary reward as an additional incentive to what may often be an irksome duty. See *Tillman* v. *Sch. Waring* (1862).

Salvage was recognised in the earliest maritime codes—as in the laws of Rhodes, Oleron, and Wisby. The law of England divides it into two classes, civil and hostile salvage. *Civil Salvage* is saving a vessel or her cargo, or part thereof, from the perils of the deep; hostile salvage recovers it from an enemy or pirate after capture. No proportion is laid down in civil salvage, as generally applicable. Each case must be decided on its own merits, the ingredients for decision being, 1st, the degree of danger incurred by the salvors; 2d, the degree of peril in which the property rescued stood; 3d, the degree of skill, labour, and time evinced in the salvage; 4th, the value and nature of the property. Except where the assistance rendered has been trifling, the salvage usually ranges from a third to a half of the property saved. A contract to render assistance negatives any claim to salvage on account of such assistance. A passenger can only claim salvage when, having had the opportunity, while the danger existed, of quitting the ship, he voluntarily remains to render help. A government ship is bound to aid a merchantman in distress; but it can still claim salvage.

When the parties in British waters cannot agree as to the amount of salvage, the British Admiralty Court has jurisdiction over all cases which occurred at sea, or between high and low water mark. The British rules for trying salvage cases are fixed by the statute 16 and 17 Vict. c. 131 (1853).

Hostile Salvage is fixed by 43 Geo. III. c. 160 (1803) at one-eighth the value of the property saved for royal ships, and one-sixth for private vessels. Ships and merchandise taken from pirates pay one-eighth as salvage, 6 Geo. IV. c. 19 (1826).

In the case of saving a vessel belonging to an allied or neutral power, reference is made in awarding salvage to the laws of such power, and to the degree of reciprocity it grants to British or American vessels.

SA'LVE REGI'NA, the first words of one of the most popular prayers in the Roman Catholic Church, addressed to the Blessed Virgin Mary. It forms part of the daily office of the Roman Breviary, and is recited at the end of 'Lauds' and of 'Complin.' But it is still more in use as a prayer of private devotion, and concludes with an earnest and tender appeal for the intercession of the Blessed Virgin with her Son, 'that we may be made worthy of the promises of Christ.'

SA'LVO is a concentrated fire from a greater or less number of pieces of artillery. Against a body of men, a salvo is generally useless, as the moral effect is greater in proportion to the area over which devastation is spread; but with fortifications, the case is otherwise. For the purpose of breaching, the simultaneous concussion of a number of cannon-balls on masonry, or even earth-work, produces a very destructive result. At Almeida, after the French had fired a few salvos of 65 guns, the castle sunk in a shapeless mass. The effect of a salvo of modern artillery, with its enormous steel shot, against iron-plated ramparts, has never yet been tried in actual war. The concentrated fire of a ship's broadside forms a powerful salvo.

SA'LZBRUNN, the name of three villages, NEU NIEDER, and OBER S., in Prussian Silesia, 37 miles south-west of Breslau. The villages are dull, and worthy of notice only from their eight mineral springs, and their much-frequented baths. About 2,500,000 bottles of alkalo-saline water are annually exported. Pop. in all, from 2000 to 3000.

SA'LZBURG, a crown-land in the west of Austria, bounded on the west partly by Bavaria, and partly by the Tyrol. Area, 2730 sq. m.; pop. 151,410. The principal mountain-ranges are the Noric Alps, which traverse the south of S. from west to east, and rise in the Grossglockner to the height of 12,360 feet; and branches of the Rhætian Alps, which separate the Tyrol from S., and ramify throughout the middle districts of the latter, rising in the Ewiger Schneeberg to 9580 feet. Snow-fields and glaciers occur in the more elevated regions. The chief river, the Salza, drains the greater part of the crown-land, flows first east, then north, and is 147 miles in length. The climate is cold and variable, but healthy, and although, of the whole area, 2000 sq. m. are capable of bearing crops, this crown-land is inferior to most of the provinces of the monarchy in quantity and value of products. The rearing of cattle and horses is an important branch of industry. Salt is obtained in large quantities, especially at Hallé (q. v.). Salzburg is the capital.

SALZBURG (anc. *Juvavia*), perhaps the most charmingly situated town in Germany, is the capital of the Austrian crown-land of the same name, and stands on both banks, but chiefly on the left bank of the Salza, 190 miles west-south-west of Vienna by railway. Here the river, banked on both sides by precipitous crags, rushes through what seems to be a natural gateway, and flows northward to its junction with the Inn. The picturesque situation of the city is thus described by Wilkie: 'It is Edinburgh Castle and the Old Town brought within the cliffs of the Trosachs, and watered by a river like the Tay.' The heights on either bank of the Salza are crowned with edifices. That on the left, called the Mönchsberg, is surmounted by the castle, called Hohen-Salzburg, an irregular feudal citadel of the 11th c., and, during the middle ages, the residence of the archbishops of S., who combined the dignity of princes of the German empire with their ecclesiastical rank. The castle itself is now dismantled, but still serves as a barrack. A statue of Mozart (q. v.) adorns one of the squares. Opposite Mönchsberg is the Capuzinerberg, with a convent. The cathedral, a large and beautiful Italian edifice, was built in the early part of the 17th century. The architectural taste of the archbishops has adorned the city with many beautiful edifices, chiefly in the Italian style. The city is surrounded by walls, here and there dismantled, and the bastions are for the most part in a state of decay. The city is the seat of an archbishop, and contains numerous libraries, museums, and educational and other institutions, among which is an upper gymnasium, and the *Mozarteum*. It carries on manufactures to some extent, is in communication

with Vienna by railway, and is the seat of considerable transit trade. Pop. 18,550.

SALZKA'MMERGUT, called also the *Austrian Switzerland*, one of the most picturesque districts of Europe, forms the south-west angle of the crown-land of Austria ob der Enns, between the crown-lands of Salzburg on the west, and Styria on the east. Area, 249 sq. m.; pop. (1864) 17,000, of whom 6500 are Protestants. The scenery combines in rare beauty the usual features of valley, mountain, and lake. The vales are clothed with a rich verdure, and are studded with clumps of fruit and forest trees; the mountains are covered with beeches and oaks; higher up with pines and larches, and in some instances are topped with everlasting snow. The highest peak, Grosse Priel, reaches an altitude of 7931 feet. But the district derives its reputation for beauty chiefly from its lakes, the largest and most famous of which are the Hallstadt and the Traun, or Gmunden lakes. They are bordered with lofty mountains, which rise sheer from the surface of the water; and their pit-like character, and the strong light and shade thrown on them from the mountains, combine to render the scenery, of which they form the centre, unusually sublime. The Hallstadt and Traun lakes are connected, and indeed formed by the river Traun. The district of S. derives its name from the salt which is obtained in enormous quantities from its springs and mines. Salt being a government monopoly in Austria, the works are under the management of the *Kammer*, or exchequer. From 6000 to 7000 of the inhabitants are employed in the salt-works, and the amount annually obtained is 39,375 tons. The chief seats of the salt-works are Ischl (q. v.) and Hallstadt. Little or no agriculture is carried on in the S., and the inhabitants not engaged in the main industry of the district are engaged in cattle-breeding and in the timber trade.

SA'LZWEDEL, a small manufacturing town of Prussian Saxony, 54 miles north-north-west of Magdeburg, on the Jeetze. It carries on sugar-refining, and manufactures of linen, woollen, and cotton fabrics. Pop. 8117.

SAMANI AND DILEMI were two dynasties which divided between them the kingdom of Persia towards the beginning of the 10th century. They both rose to power through the favour of the califs, but they speedily threw off the yoke. The Dilemi, divided into two branches, exercised sovereign authority in Kerman, Irak, Fars, Khuzistan, and Laristan, always acknowledging their nominal dependence on the calif; and during the whole period of their rule, one of the southern branch of this family was vested with the dignity of *emir-ul-omra*, or vizier, and managed the affairs of the califate. Several of the Dilemi were able and wise rulers, as the remains of their works of irrigation and other structures amply testify; but Mahmud of Ghizni put an end to the rule of the northern branch in 1029, and the Seljuks subjugated the southern one in 1056, by the capture of Bagdad, their last stronghold. Their more powerful rivals, the *Samani*, had obtained from the calif the government of Transoxiana in 874 A.D.; and to this, Ismail, the most celebrated prince of the family, speedily added Khaurezm, Balkh, Khorassan, Seistan, and many portions of Northern Turkestan. Rebellions of provincial governors distracted the Samanide monarchy towards the end of the 10th c., and in 999 A. D., their dominions north of Persia were taken possession of by the khan of Kashgar, the Persian provinces being added by Mahmud of Ghizni to his dominions.

SAMAR, one of the Philippine Islands (q. v.).

SAMARA', a frontier government of Russia, bounded on the east by the Kirghiz Steppes, and on the W. by the governments of Saratov, Simbirsk, and Kazan. Area, 61,210; pop. 1,690,779. It was erected into a government by ukase of December, 1850, and was formed out of portions of the governments of Simbirsk, Orenburg, and Saratov. The Volga, which forms the western boundary, and its affluent, the Samara, are the chief rivers. The country is very fertile, and agriculture and fishing are among the chief employments of the inhabitants. Only a comparatively small portion of the country is colonised. Chief town, Samara (q. v.).

SAMARA, capital of the Russian government of the same name, on the left bank of the Volga, at the junction of that river with the Samara. It is the chief grain-market on the Volga, and it contains numerous storehouses, especially for grain. A good trade in salt, fish, caviare, and tallow is also carried on. From S. comes a great number of lambs' skins, which are famous for their fineness. Pop. 34,131.

SAMARA'NG, an important seaport on the north of Java, 385 miles (by steamboat course), east of Batavia, in 6 57′ 20″ S. lat., and 110° 26′ 30″ E. long., is the capital of the Residency, and the point to which the produce of Middle Java is brought for exportation to Europe. Pop. 30,000. The city lies on the right bank of the river Samarang, a shallow, muddy stream 90 feet in breadth. The Chinese, Malays, and Arabians have their own captains, and separate quarters of small, dark, dirty houses. The 1600 Europeans dwell partly along the sea-shore, but chiefly on the left side of the river, by the shady road to Bodjong, the resident's house, which is two miles from the city. The Protestants and Roman Catholics have each a church, orphan-house, and school. There are 3 public and 12 private schools, an excellent hospital for 550 patients, and other charitable institutions.

Only small vessels can enter the river. The roadstead is exposed to the west wind, and is dangerous during the rainy season. Besides the usual trades, the natives work in gold, silver, copper, and tin. Coffee, rice, sugar, tobacco, and indigo are the chief exports, an agent of the Netherlands Trading Company (q. v.) being established at S. to attend to the government trade.

In 1860, the pop. of the residency of S. amounted to 970,201 souls, 3765 being European, and 10,730 Chinese.

SAMA'RIA (Heb. *Shomerôn*, Chald. *Shamrayin*, Septuagint, *Samareia*, *Semerōn*, &c.), anciently a city of Palestine, the chief seat of the Ephraimitic Baal-worship, and, from the seventh year of Omri's reign, the capital of the kingdom of Israel. It was beautifully situated on a hill about six miles north-west of Shechem, and probably derived its name (which may be interpreted 'pertaining to a watch' or a 'watch-mountain') from the position of the hill, which rises from the centre of a wide valley, and commands an extensive prospect; but an eponymous etymology is adopted by the writer of 1st Kings, who says (chap. xvi. verse 24): 'And he [Omri] bought the hill Samaria of Shemer for two talents of silver, and built on the hill, and called the name of the city which he built, after the name of Shemer, owner of the hill, Samaria.' The date assigned to Omri's purchase is 925 B.C., from which time S. became the seat of government, which had been formerly at Thirsa. It was twice besieged by the Syrians (901 B.C., and 892 B.C.), under Ahab and Joram, on both occasions unsuccessfully; but in 721 (720) B.C., it was stormed by Shalmaneser, king of Assyria, after a three years' siege. Its inhabitants, together with those of all the other

cities of Samaria' (which had become the general name for the country itself in which the city stood), i. e., the kingdom of Israel—or the 'ten tribes'—were then carried off into a captivity from which they never returned. Their place was supplied, after a time, by colonists, planted there by Shalmaneser and Esarhaddon, from Babylon, Cuthah, Ava, Hamath, and Sepharvaim (according to 2d Kings, chap. xvii. verse 24; Media and Persia, Josephus's *Antiquities*, x. 9, 7), who constituted the original body of the people subsequently known as Samaritans, but whose bulk was gradually increased by accessions of renegade Jews and others. The question has been much, and on the whole unprofitably, discussed, whether these so-called 'Samaritans' were a mixed race of remanent Israelites and heathen Assyrians, or whether they were exclusively the latter. The mere language of Scripture, strictly construed, seems to favour the second of these views, unless the term 'cities' of 2d Kings, xvii. 24, is intended to imply that the ancient inhabitants dwelt in the open country. On the other hand, we find, apart from the other reasons against so unparalleled a wholesale deportation, Israelitish inhabitants under Hezekiah and Josiah, both in Ephraim and Manasseh. Modern authorities therefore assume that they were, to a certain extent, what they always insisted on being, Israelites—(not Jews), i. e., a people largely intermixed with Israelitish elements, that, during the exile, had adopted the worship of Jehovah. The returning Jews, however, would not recognise their claims to the participation in the national *cultus* and temple, and a bitter antagonism sprang up between the two nationalities. In 409 B.C., a rival temple was erected on Mount Gerizim, and a rival priesthood and ritual organised, and henceforth the breach, for some periods at least, became apparently irreparable—'the Jews had no dealings with the Samaritans,' and *vice versâ*. At other periods, however, a more friendly intercourse seems to have taken place between them. The rabbinical laws respecting the 'Kushites' (Cuthim), as they were called by the later Jews, are therefore strangely contradictory, and their discrepancies can only be explained partly by the ever-shifting phases of their mutual relations, and partly by the modifications brought about in the Samaritan creed itself. The later history of the city of S. is somewhat checkered. It was captured by Alexander the Great, when the 'Samaritan' inhabitants were driven out, and their place supplied by Syro-Macedonians. It was again taken (109 B.C.) by John Hyrcanus, who completely destroyed it. Soon rebuilt, it remained for the next 50 years in possession of the Jews; but Pompey, in his victorious march, restored it to the descendants of the expelled Samaritans, who had settled in the neighbourhood, and it was refortified by Gabinius. Herod the Great rebuilt it with considerable splendour, and called it Sebaste, in honour of the Emperor Augustus, from whom he had received it as a present. In the 3d c., it became a Roman colony and an episcopal See. Its prosperity perished with the Mohammedan conquest of Palestine; and at present, it is only a small village called Sebustieh, an Arab corruption of Sebaste, but contains a few relics of its former greatness. 'Samaritans,' as a religious sect, still exist at Nablus (anc. Shechem), as they have existed in the district uninterruptedly through all the vicissitudes of war and conquest from the time of Christ. Their present creed and form of worship agree in many particulars with that of the so-called 'rabbinical' Jews, although the Samaritans pretend utterly to reject the 'Traditions.' They alone, however, have retained the paschal sacrifice of a lamb. The language of the ancient Samaritans is a Hebræo-Aramaic dialect, but contains a number of non-Semitic (Cuthæan) words. It only survives in a few fragments of ancient literature, a translation of the Pentateuch, and some liturgical pieces. The present inhabitants speak Arabic.—See Dr Robinson's *Biblical Researches*, Raumer's *Palästina*, and Dean Stanley's *Sinai and Palestine*, &c.

SAMA'RITAN PENTATEUCH, a recension of the commonly received Hebrew text of the Mosaic law, in use with the Samaritans, and their only canonical book of the Old Testament. Some vague allusions in some of the Church Fathers (Origen, Jerome, Eusebius), and one or two more distinct, but less generally known Talmudical utterances respecting this recension, were all the information available up to the early part of the 17th c. (1616), when Pietro della Valle acquired a complete codex from the Samaritans in Damascus. Since then, the number of manuscripts of the Samaritan Pentateuch, with and without translations (in Arabic), has considerably increased in European libraries; and fragments, consisting of special books or chapters, are of the most frequent occurrence. In fact, writing portions of Samaritan Pentateuch on the oldest of skins, would, in the face of the great demand for the article on the part of ignorant European, especially English, travellers, appear to be a favourite and lucrative pastime, if not an established trade and business, among the modern Samaritans.

These MSS. are written in the Samaritan character, a kind of ancient Hebrew writing, probably in use before, and partly after the Babylonish exile, and vary in size from octavo to folio, the writing being proportionately smaller or larger. Their material is vellum, or cotton paper, and the ink used is black, with the exception of the Nablûs MS., which is written in gold. There are neither vowels, accents, nor diacritical points, the single words are divided from each other by dots. None of the MSS. that have reached Europe are older than the 10th century. The Samaritan Pentateuch was first edited by J. Morinus in the Paris *Polyglott* (pt. iv. 1632) from *one* codex (whence it found its way into Walton), and was last re-edited, written in the square Hebrew characters, by B. Blayney, Oxford, 1790. The first publication of this strange document, and principally the *Exercitationes Ecclesiasticæ*, with which J. Morinus accompanied it, mark a certain epoch in modern biblical investigation; for, incredible as it now appears, it was placed by Morinus and his followers far above the received Hebrew text, which was said to have been corrupted from it. As reasons for this, were adduced its supposed superior 'lucidity and harmony,' and its agreement with the Septuagint in many places. This opinion, which could only have been entertained by men devoid of knowledge, was zealously cherished, and fiercely combated for exactly 200 years, when the first proper and scientific investigation (by Gesenius) set it at rest, once for all, among the learned world at least. This absurd notion chiefly owed its popularity to the anti-Jewish as well as anti-Protestant tendency of its supporters, to whom every attack against the received form of the text—that text upon which alone the Reformers professed to take their stand, was an argument in favour of the Roman Catholic dogma as to the 'Rule of Faith' (q. v.). This boasted superiority *en bloc*, gradually dwindled down to two or three passages, in which the Samaritan reading seemed preferable, and even these have now been disposed of in favour of the authorised Masoretic text. The variants, which Gesenius was the first to arrange systematically, present simply the ordinary aspect of partly conscious, partly unconscious corruptions. They

arose, for the greatest part, from an imperfect knowledge of the first elements of grammar and exegesis. Others owe their existence to a studied design of conforming certain passages to the Samaritan mode of thought, speech, and faith, more especially to shew that Mount Gerizim was the spot chosen by Jehovah for his temple. There are, however, only two essential alterations respecting the Mosaic ordinances themselves to be found, one, Exod. xiii. 7, where the Samaritan Pentateuch has six days shalt thou eat unleavened bread,' instead of 'seven;' and Deut. xxiii. 17, where our 'shall be no' is altered into 'shall not live.' A chronological peculiarity deserves special mention—viz., that on one in the antediluvian times begets his first son in the Samaritan Pentateuch after the age of 150, either the father's or the son's age being altered in proportion; after the Deluge, however, the opposite method is followed of adding 50 or 100 years to the father's years before the begetting of a son. We will only further add that anthropomorphisms, as well as anthropopathisms, are most carefully expunged, and that in Deut. xxvii. 4, Gerizim is wilfully substituted for Ebal.

It is, in the absence of a critical edition, exceedingly difficult to do more than speculate on the age and origin of the Samaritan Pentateuch, and opinions remain indeed widely divergent. The principal opinions on the subject are, briefly, either that it came into the hands of the Samaritans as a natural inheritance from the Jewish people, whom they succeeded at the time of the Babylonish exile; or that it was brought to them by Manasse (Jos. *Ant.* xi. 8, s. 2. 4), when the Samaritan sanctuary on Mount Gerizim was founded; or, again, that the Israelitish priest sent by the king of Assyria to instruct the new settlers in the religion of the country, brought it with him. Of other more or less isolated opinions, only that one deserves further notice, that it was a late and faulty recension, into which glosses from the LXX. (Septuagint) were received. This agreement between the LXX. and the Samaritan Pentateuch, to which we have already alluded, has likewise given rise to many speculations and suggestions. The foremost of these are, that the LXX. have translated from the Samaritan Pentateuch; that mutual interpolations have taken place; that both versions were formed from Hebrew codices, differing among themselves, as well as from the authorised recension; and that many wilful corruptions have been superadded at a later time; finally, that the Samaritan has been altered from the LXX. There is also a translation of the Samaritan Pentateuch (which is Hebrew) into the Samaritan idiom; it is ascribed by the Samaritans to their high-priest, Nathaniel, who died 20 years before Christ. It was probably a kind of popular version, like the Targums (q. v.), and was composed, very likely, shortly before the destruction of the second temple. The translation is done in the most slavish and incompetent manner. Another Arabic version is due to Abu Said, in Egypt (1070), based on Saadiah's translation; and to this Samaritan-Arabic translation, a Syrian, Abu Barachat, wrote, in 1208, a commentary, which is sometimes erroneously taken to be an independent Syriac version of the Samaritan Pentateuch. Among the principal modern writers on the Samaritan Pentateuch are Gesenius, Kirchheim, and Deutsch.

SAMARKA'ND, the most celebrated city of Central Asia, khanat of Bokhara, but annexed to the dominions of the Czar in 1868, is in lat. 40° 2′ N., and long. 67° 3′ E., 4 Eng. miles south of the Zer-Afshan (a river which 'loses itself in the sands'), and 145 miles nearly east-by-north from Bokhara. It is situated at the foot of Mount Chobanata, in a plain of exuberant fertility; and when seen from a distance, its glittering minarets, lofty domes, and prominent edifices and ruins, relieved by the brilliant green of the closely-planted gardens interspersed within the walls, present even to the European eye an imposing effect; while to the wild Turkoman, familiarised with the dreary expanse and barren aridity of the pathless desert, it seems the very image of paradise. This favourable impression is, however, considerably weakened on a closer acquaintance, the interior of the city presenting too many of the distinctive features of Asiatic cities in general. S. is equal in extent to Teheran, and far excels it in picturesqueness, but much of it is now in ruins, and almost uninhabited; the remainder, which constitutes the 'new city,' is surrounded with walls, pierced with six gates, and has in the *righistan*, or market-place, a number of bazaars, at which a retail trade in leather goods (held in high esteem), enamelled wooden saddles, and other articles of general utility, is carried on. The old or 'ruined city' is, however, the portion more exclusively interesting to Europeans, as the capital of the great Tartar empire, and the seat of that mighty conqueror who wielded the sceptre of Asia from China to the Hellespont, and the terror of whose name caused the rulers of Eastern Europe to tremble on their thrones. Many of the ruins belong to this epoch, among which are the Hazreti Shah Zinde, which Timur used as a summer palace; the Messjidi Timur ('mosque of Timur'), the walls of which are adorned with fine inscriptions in gold lettering, and which contains a sword and breastplate said to have belonged to the great emir; the citadel, containing his reception-hall, in which is seen the celebrated Köhtash, or 'green stone,' on which his throne was placed; and the Turbeti-Timur ('sepulchre of Timur'), a small neat chapel crowned with a splendid dome, in the floor of which, directly under the dome, are two tombstones, one over the grave of Timur, and the other over that of his teacher and spiritual guide. The remains of Timur are placed in a vault underneath, access to it being had by means of a long narrow staircase, though this is a favour rarely granted. The tomb is, by the terms of his last testament, constantly guarded by a body of Nozai Tartars. The other ruins, of later date, are chiefly *medresse*, or sacred colleges, some of them richly decorated; and still partially inhabited by students and teachers of Moslem theology. The resident population is now believed not to exceed 15,000 or 20,000, of whom two-thirds are Uzbegs, and one-third are Tajiks; though, from the constant passing and repassing of caravans from Persia, Afghanistan, and western Turkistan to Khokan and Kashgar, the actual population averages considerably more. S. is the residence of the emir of Bokhara during the heat of summer.—See *Travels in Central Asia during* 1863, by Arminius Vambery (Lond. 1864). S. was the ancient *Maracanda*, the capital of Sogdiana. It was seized by the Arabs 707 A. D., and from this time belonged either to the califate or to some of the dynasties which were offshoots from it, till 1219, when it was taken by Genghiz Khan. In 1359 it was captured by Timur, and ten years afterwards became the capital of his empire. On the division of his empire after his death, it continued the capital of Turkistan till 1468, when the attacks of the Uzbeks put an end to its prosperity.

S'ÂMAVEDA is the name of one of the four Vedas. See VEDA.

SAMBA'S. See PONTIANAK.

SAMBOO, or SAMBUR. See RUSA.

SAMMATÎYA is one of the four divisions of

the *Vaibhâshika* system of Buddhism; its reputed founder was *Upâli*, a disciple of *the* Buddha, S'âkyamuni.—See C. F. Koeppen, *Die Religion des Buddha* (Berlin, 1857); and W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St Petersburg, 1860).

SA'MNITES, an ancient Italian people of Sabine origin, who occupied an extensive and mountainous region in the interior of Southern Italy. They were surrounded on the north by the Peligni, Marsi, and Marrucini; on the west and south-west by the Latins, Volscians, Sidicini, and Campanians; on the south by the Lucanians; and on the east by the Apulians and Frentani. The S. were divided into four nations: 1. The *Caraceni* in the north, whose capital was Aufidena. 2. The *Pentri* in the centre, whose capital was Bovianum, and who constituted the most powerful nation of the Samnite stock. 3. The *Caudini*, in the south-west. 4. The Hirpini in the south, whose capital was Beneventum. For an account of their origin, ethnological affinities, and history, see ROME, HISTORY OF.

SAMO'AN ISLANDS. See NAVIGATORS' ISLANDS.

SA'MOS (Mod. Gr. *Samo;* Turk. *Susam Adassi*), an island in the Ægean Sea, is situated about a mile off the coast of Asia Minor, in the Bay of Scalanova, about 45 miles south-south-west of Smyrna. Its length is 30 miles; its mean breadth about 8 miles. A range of mountains, which may be regarded as an insular continuation of Mount Mycale, on the mainland, runs through the whole island, whence its name—Samos being an old Greek word for any height in the neighbourhood of the sea. The highest peak, Mount Kerkis (anc. *Cerceteus*), reaches an elevation of 4725 feet. S. is still, as in ancient times, well wooded. Between its eastern extremity and the mainland lies the narrow channel of Mycale (called by the Turks the *Little Boghaz*), where, in 479 B. C., the Persians were totally defeated by the Greeks under the Spartan Leotychides. Between the island and Nicaria (anc. *Icaria*), on the west is the *Great Boghaz*, from 3 to 8 miles broad, and much frequented by vessels sailing from the Dardanelles to Syria and Egypt. S. is well watered and very fertile, exporting considerable quantities of corn, grapes, wine, oil, valonia, &c.; its mountains furnish quarries of marble. The present capital, called Khora ('the town'), is situated on the south side of the island, at the base of a hill (about 2 miles from the sea), on which ruins of the ancient acropolis (*Astypalaia*) are still visible. On the north coast lies Vathy or Bathy, which derives its name from its deep (Gr. *bathys*) harbour. The pop. variously estimated at from 30,000 to 50,000.

Anciently, S. was one of the most famous isles of the Ægean. At a very remote period, it was a powerful member of the Ionic Confederacy, and (according to Thucydides) its inhabitants were the first, after the Corinthians, who turned their attention to naval affairs. Their energy and resources were soon seen in the numerous colonies which they established in Thrace, Cilicia, Crete, Italy, and Sicily. But the celebrity of the island reached its acme under Polycrates (q. v.) 532 B. C., in whose time it was mistress of the archipelago. Subsequently, it passed under the power of the Persians, became free again after the battle of Mycale, stood by Athens during the Peloponnesian War, and after several vicissitudes, became a portion of the Roman province of Asia, 84 B. C. Its later history is but the melancholy record of continuous decay, nor till the rise of the modern Greeks against the Turks did it ever again acquire distinction. When the war of independence broke out, none were more ardent and devoted patriots than the Samians; and deep was their disappointment when, at the close of the sharp and brilliant struggle, European policy assigned them to their former masters. They are not, however, incorporated, so to speak, with the Turkish empire, but are semi-independent, being governed by a Fanariot Greek, who bears the title of Prince of Samos, and pays tribute to the Porte.

SAMOTHRA'CE, or THRACIAN SAMOS (Mod. Gr. *Samothraki*), an island in the north of the Ægean, north-east of Lemnos (*Stalimene*). It is a rugged and mountainous mass, about 8 miles long by 6 miles broad, towering to the height of 5240 feet, and forming the loftiest land in the whole Greek archipelago. The traveller on the plains of Troy can see its white summit shining afar in the north-west over the intervening hills of Imbros—a proof that Homer drew from personal observation when he made Poseidon watch from his Samothracian throne the events of the war. The island has not a single good port, whence Pliny calls it 'the most harbourless of all isles' (*importuosissima omnium*), but there are some good anchorages. Its history is quite unimportant, and all the interest attaching to it is derived from its connection with the mysterious and gloomy worship of the Cabeiri (q. v.).

SAMOYE'DES, the name of a race widely spread over the extreme north of Europe and Asia, and forming one of the four families of the great Altaian stock. Originally, the S. inhabited the whole of the vast Siberian plain from the Altai to the Arctic Sea, but for many hundred years Mongolian peoples have forced themselves in among them. Their chief seat at present is the region lying between the Obi and the Yenisei. They have been very little influenced by Russian civilisation or Christianity, retain in great measure their old manners and customs, and live by fishing, or the rearing of reindeer. The most important researches concerning their ethnographic and linguistic relations have been made by Castren (q. v.).

SA'MPHIRE (*Crithmum*), a genus of plants of the natural order *Umbelliferæ;* having compound umbels, and an oblong fruit, rather flattened at the back, with five winged ridges, and many *vittæ* spread all over the seed. COMMON S.

Common Samphire (*Crithmum maritimum*).

(*C. maritimum*) is a perennial, native of Europe, growing chiefly on rocky cliffs near the sea. It is common in the south of England, but is rare in

Scotland. Its radical leaves are triternate; those of the stem have lanceolate and fleshy leaflets. The stem is about 1½ feet high, the flowers yellow. S. makes one of the best of pickles, and is also used in salads. It has a piquant, aromatic taste. It is generally gathered where it grows wild, but is sometimes very successfully cultivated in beds of sand, rich earth, and rubbish, occasionally supplied with a little salt.—*Inula Crithmoides*, a perennial plant, allied to Elecampane (q. v.), and of the natural order *Compositæ*, a native of the sea-coasts of England, is used in the same way as S., and is often called GOLDEN SAMPHIRE.—The young shoots of *Salicornia herbacea* (see GLASSWORT) are also substituted for it as a pickle, and sold under the name of MARSH SAMPHIRE.

SA'MSOE, a small island belonging to the kingdom of Denmark, is situated in the northern entrance to the Great Belt, between Zealand and Jutland. Area, 40 sq. m.; pop. 5500. There are no towns, and the inhabitants owe the considerable comforts they enjoy entirely to the unusual fertility of their island.

SAMSON (Heb. *Shimshon*, compare *Shemesh*, sun), the son of Manoah, of the tribe of Dan, for 20 years 'Judge' over the south-western tribes of Israel—perhaps only of Dan. It would appear, however, as if this title had only been bestowed upon him as a kind of reward for his daring and extraordinary exploits against the neighbouring Philistines, who at his birth held a great part of Palestine tributary. There is in the whole account of his deeds no sign of any superior authority vested in him. His history bears altogether more the general character of a popular tale, or saga, than that of a real historical account. His whole life is surrounded by a marvellous halo from his birth to his death. To his mother, long barren (cf. Gen. xviii. 10, 1 Sam. i. 2, &c., Luke i. 7, &c.), there appeared an angel, who promised her a son on the condition that he should become a Nazarite. He is born: his mother abstaining from all strong drink and unclean food before his birth. His hair, left to grow to its full length, in accordance with the Nazarite rules, endows him with a supernatural strength, which apparently increases with each manifestation. His first feat is his tearing a lion, when on his way to ask a Philistine woman in marriage. Returning the same road, to celebrate his wedding, he finds a swarm of bees in the lion's carcass, and forthwith propounds a riddle, which, through his wife's treachery, costs 30 Philistines their lives. We need not here recapitulate the many similar exploits composing his well-known career, which he ended by pulling down the house upon himself and his enemies the Philistines, so that 'the dead which he slew at his death were more than they which he slew in his life.'

It has been matter of most contradictory speculations, how far his existence is to be taken as a reality, or, in other words, what substratum of historical truth there may be in this supposed circle of popular legends, artistically rounded off, in the four chapters of Judges (xiii.—xvi.) which treat of him. To begin with, difficulties are raised respecting the time in which he is said to have lived. While some hold him to be a contemporary of Eli and Samuel, others see in Eli his successor; others again suppose an interregnum between him and Eli. Next comes the question how he, a Nazarite, could eat honey out of the lion's carcass—a fact, by the way, entirely ignored by Josephus. The miraculous deeds he performed have taxed the ingenuity of many commentators, and the text has been twisted and turned in all directions, to explain 'rationally' his slaying those prodigious numbers single-handed; his carrying the gates of Gaza, in one night, a distance of about 50 miles, the probable distance from Hebron to Gaza, and some have indeed assumed that he did not carry them there all at once, but piecemeal. But the principal difficulty seemed to lie in the well that sprung out of the jaw-bone, and the early Jewish interpreters (Targum, Josephus) take the word Lehi to be the name of a place; a notion countenanced, so far, by Gesenius, as he allows that it might have been 'derived etymologically from this myth.'

The close parallel between the deeds of S. and those of Hercules has caused some to identify the two heroes; yet whose might be the priority, is matter of contest between the different schools of biblical criticism. It is not necessary to enlarge upon this point. It is well known how Hercules slays the Nemean lion; another formidable lion at the Mount of Cithæron; how he catches the stag of Diana and the Cretan bull; how he is kept prisoner in Egypt; how he comes to his death by the agency of a woman; not to mention the extraordinary circumstances of his birth, and the like. See HERCULES. This once popular notion, however, of seeing nothing more in S. than the Tyrian sun-god Hercules (Baal-Shemesh, 'Lord of the Sun;' Baal-Chamon, 'Lord of the Heat,' &c.), and the attempt to explain the various 'myths' accordingly, is not countenanced by most modern critics. However embellished and overladen with legends, they say, the account in the Book of Judges may be, there is hardly any doubt as to the real existence of a man S., of extraordinary prowess, who turned his whole might and strength against the hereditary enemies of his people, whose land bordered on that of the tribe to which he belonged; who, with all his blemishes, was possessed by a noble, self-sacrificing patriotism, and never for one moment forgot the chief end and aim of his life, viz., to free his people from foreign yoke. Altogether, he is too human ever to have been an allegory or a parable, the moral of which would, indeed, hardly be perceptible, or to have, as some have conjectured, 'been intended through his whole career to be a living mockery of the Philistine Hercules.'

SAMUEL (Heb. *Shemuel*, heard by or asked from God), the last *Shofet* or Judge of Israel, the 'first of prophets,' the founder of the schools of prophets and of the monarchy in Israel. He was the son of Elkanah and Hannah, a woman of no ordinary gifts, and almost a Nazarite herself, who dedicated the long yearned-for child to the Lord even before his birth. Elkanah was of Levitic descent, living, however, not among his own tribe, but in Ephraim. S., brought up in the sanctuary at Shiloh, under the eyes of Eli, there received his first prophetic call, and from that time forth, his prophetic mission was decided. For about twenty years from the death of Eli and his sons, we hear nothing of Samuel. The first public manifestation of his assumption of the office of judge, is his convoking an assembly at Mizpeh, and routing, at the head of the people, the Philistines—his first and probably his only military achievement. His occupations generally were of a more peaceful character. Dwelling in his own native city of Ramah, where he had erected an altar, he annually went 'on circuit' to the three principal sanctuaries west of the Jordan—Bethel, Gilgal, and Mizpeh—there to instruct and judge the people, and break them from their idolatrous habits, to which they were wont to yield, in imitation of the peoples around them. For the better carrying out of this purpose, he organised special schools of teachers and prophets. These seem to have formed special colonies (Naboth, Bethel, Gilgal, Jericho), and to

have moved about in large numbers. These fraternities were destined to take an important place in the commonwealth, and to exercise the greatest possible influence upon the internal as well as the external affairs of the state, while at the same time they were the teachers of the people, expounding and developing the Mosaic law, and keeping the sacred traditions alive within the houses and hearts of Israel.

The peace S. had restored—for during his lifetime those harassing raids from the neighbouring tribes had entirely ceased—and the happy use he made of it by consolidating the religious institutions and the internal power and union of the people, must have impressed the latter with the advantage of being ruled by a firm and capable head and hand. It would have been easy enough for S. to have got himself elected king of Israel, but the establishment of a dynasty appeared to him utterly contrary to the theocratic character of the law. When, however, his two sons, Joel and Abiah, whom he had installed provisional or supplementary judges, 'turned aside after lucre, and perverted judgment,' and the complaints of the people were loud about them, S. was pressed by its representatives, who foresaw a time of terrible anarchy and lawlessness at his approaching demise, and he was obliged to yield to the general wish of installing a king to judge them 'like all the nations.' See JEWS and SAUL. The further events of S.'s life, as connected with Saul, and subsequently with David, are well known, and will be found indicated briefly under those two heads. As to his character, notwithstanding the reproaches that have been heaped upon him, we cannot but see in him one of the wisest, most sagacious, unselfish, patriotic heroes. He was, doubtless, severe and energetic in the extreme, following the path that seemed to him indicated by Jehovah as the only one leading to the common welfare. Gifted with both the spiritual and worldly supreme power over the people, at a time when they had neither political unity, nor laws, nor a *cultus*, he succeeded in rousing the public spirit, in uniting all the tribes under one banner, and in shaking off the Philistine yoke. He routed idolatry, and raised, by the institution of prophetic schools, the Mosaic religion to the highest eminence, while they at the same time formed a healthy counterpoise to priestcraft. That on finding Saul negligent to certain dicta of the law, for the protection of which alone he had been elected, he casts aside all personal love and fear, and for the sake of saving the country, and keeping its constitutions intact, chooses another more worthy head for the commonwealth, is not more than could be expected from this most zealous champion for Jehovah's commands. The people themselves gave him the most honourable testimony for his uprightness and justice, and later ages place him side by side with Moses.

S. seems, after having anointed David, to have retired from public action, and to have lived in comparative seclusion at Ramah—there is, at least, no further mention of him until his death. The time of his life and the period of his judgeship are not given. It may be presumed that he died not long before Saul. If the latter ruled for twenty years, it may well be that they governed together, as Josephus has it (*Ant.* vi. 14, 9), for eighteen years; his age, however, is not easily calculated, and the opinions about it vary between sixty and ninety years. He was buried at Ramah, and his tomb is still shewn at Nebi Samwil, although, according to Jerome, his remains were removed, under the Emperor Arcadius, to Thrace. All Israel mourned him as they had mourned none since Moses. For his apparition at En-Dor, &c., see SAUL.

SAMUEL (SHEMUEL), BOOKS OF, originally formed one work, but were by the LXX. and Vulg. (followed by the recent Hebrew editions since Bomberg) and the Authorised Version, divided into two books, the first closing with the death of Saul. The name they bear is derived from Samuel, as the principal figure in them. He not only stood at the head of the commonwealth at the period they treat of in a spiritual and worldly capacity, but also anointed Saul and David, and exercised an important influence upon their rule. Their contents beginning with the high-priesthood of Eli, the narrative concludes with the death of David, and thus three principal periods are noticeable—1. The restoration of the theocracy, of which Samuel assumes the leadership (I. i.—xii.); 2. The history of Saul's kingship till his death (I. xiii.—xxxi.); and 3. David's reign (II.).

The plan of the whole work is not, as has been stated, to represent one king as he ought not to be—viz., Saul, contrasted by a king after the heart of God, David; but simply to draw the development of the theocracy from the end of the period of Judges to the end of David's reign, its humiliation and its glory under Samuel and David, whose history is, to a certain extent, told with biographical minuteness, on account of their being the divinely-chosen vessels for this great work of the restoration. As to the composition and unity of the books, it has been the prevailing opinion of scholars to see in them not a loose compilation from a number of stray sources, but a consecutive narrative drawn upon ancient and authentic documents. The character of the narrative itself, occasionally dwelling at large upon biographical episodes, occasionally assuming the brevity of a mere chronicle, and at times repeating itself at length, is quite in accordance with ancient Semitic historiography. It has been supposed by some that the books of Samuel were composed by the same hand that wrote the books of Kings, but they belong to a much earlier period. The author appears to have lived after the separation of the kingdoms, but long before the Exile, the language being remarkably pure, and quite free from late forms and Chaldaisms. In all probability, the author was a prophet of the time of Solomon. The Talmudical notion of Samuel's authorship has been rejected by the critics, as inconsistent with the contents and circumstances of the book. There are glosses in the book due to later hands. Of sources, we only find the 'Book of Jasher' mentioned in the work. The author, if he did not use real annals of the empire, which were only first commenced under Solomon, had, at all events, a certain number of prophetical narratives of Samuel's, Saul's, and David's lives and doings before him. As regards the occasional verbal agreement between S. and Chronicles, which has often been commented upon, we may either assume that the latter drew upon the former, or that they both—which is more probable from internal evidence—drew upon the same source, and modified their accounts according to their special tendencies. Altogether, the work before us bears the character of a truly authentic record. Of modern commentators, we mention principally Hensler Königsfeldt, Kalkar, and Thenius.

SAMYDA'CEÆ, a natural order of exogenous plants, which are all trees or shrubs and all tropical, mostly American. The order contains about 80 known species, generally characterised by astringency in the bark and leaves. Some are used in medicine, to make poultices for wounds, lotions for

ulcers, &c. The foliage of *Casearia esculenta* is eatable.

SANÄA', the principal district in Yemen or Arabia Felix, corresponding to the ancient Sâba, or Sheba, the land of the Sabeans (q. v.). Its extent is very undefined, but it may be taken to include the country round the capital bearing the same name, to a distance of half a day's journey on the west, north, and east, and on the south it is bounded by the Tehâma and the districts of Lâhej and Yâffa.

While the dynasty of the Imâms existed, their sway extended over a much greater space, sometimes, indeed, over the whole of Yemen. Gradually it was encroached upon by the Sheikhs, who had been subject or tributary to them, and by the Turks. A bad system of government prepared the way for intestine strife; on the death of each sovereign, the succession was disputed, and the unsuccessful candidate seldom failed to retain some part of the territory, and to alienate many of the subjects of the legitimate prince, until at length the very shadow of regular government has passed away, and this, the garden of Arabia, which had been ruled by long lines of mighty kings, has been abandoned to anarchy and confusion.

The city of Sanäa is situated in a deep valley, about twenty or thirty miles in length, and six or seven in breadth, and 4000 feet above the level of the sea. This valley is bounded on the east by a high range of mountains called Jebel Nikkum, and is studded throughout its length with large villages.

The city and its suburbs are both surrounded by high walls, and, including the gardens, the circumference is about five and a half miles. The houses are of brick, well and strongly built, and most of them furnished with fountains, while the palaces of the Imâms almost approached magnificence. The Jews, of whom even now there are upwards of 20,000, have a quarter to themselves, distant about half an hour's walk from the Mohammedan town: it contains many buildings, once the abode of affluence and ease, but now bearing unmistakable signs of the devastation committed by the savage and fanatical Mohammedans of the city. The city walls are of unburned brick, and mounted with cannon, but they are in a very bad condition. There are four gates, and at both east and west end a castle containing a palace built in the Saracenic style with extensive gardens round them, and constructed with a view to defence, but now utterly neglected. See YEMEN.

SAN ANTO'NIO, called also San Antonio de Bexar, a city of Texas, U.S., is built near the sources of the San Antonio River, 110 miles south-west of Austin. It is one of the oldest Spanish towns on the continent, and in the Texan revolution of 1836 was the scene of the massacre of the Alamo, when a garrison of 150 men, led by Colonel Travis, and including David Crockett, was surrounded by several thousand Mexicans, and after a heroic resistance killed to the last man. It contains an arsenal, four churches, and (in 1870) 12,256 inhabitants.

SAN CASCIA'NO, a city of Central Italy, province of Florence, and ten miles south-west of the city of that name. Pop. 11,258. It is well built. The lands belonging to it produce a very strong wine, highly prized in Italy, also grain, oil, fruit, and mulberries.

SANCHUNIA'THON (SANCHONIATHON, SOUNIAITHON), the supposed author of a Phœnician history of Phœnicia and Egypt, called *Phoinikika*. He is supposed to have been a native of Berytus; and the accounts which speak of him as born at Sidon or Tyre, probably take these cities in their wider sense for Phœnicia itself. Our principal information about him is derived from Philo of Byblus, a Greek writer of the beginning of the 2d c. A. D., who translated S.'s history into his own tongue; but both the original and the translation are lost, save a few small portions of the latter, preserved by Eusebius, who uses them as arguments in a theological dispute against Porphyry. According to Philo, S. lived during the reign of Semiramis, queen of Assyria, and dedicated his book to Abibalus, king of Berytus. Athenæus, Porphyry, and Suidas, on the other hand, speak of him as of an ancient Phœnician, who lived 'before the Trojan war.' There is also a discrepancy between the various ancient writers respecting the number of books contained in the *Phoinikika*. Orelli (1826), and after him, C. Müller (1849), published the remaining fragments of S., and the hot discussion raised on their genuineness and value is far from being settled yet. Several critics went so far as to deny the fact of the existence of a S. point blank. According to some (Lobeck, &c.), it was Eusebius; according to others (Movers, &c.), Philo, who fathered his own speculations upon an ancient authority. The latter was actuated, Movers thinks, partly by the desire of proving that the whole Hellenistic worship and religion was simply a faint imitation of the Phœnician; partly by the desire of lowering the value of the Old Testament, by shewing the higher authority of the Phœnician writer; and partly, as was the fashion among the unbelieving philosophers of his age, to bring the popular creed into a bad reputation, by proclaiming his own views under the guise of an ancient sage. Yet even those who deny the authenticity of S., agree in allowing the fragments current under his name a certain intrinsic value, they being founded on real ancient myths. This, in fact, is now, with more or less modification on the part of the different investigators, Ewald, Bunsen, Renan, &c., the prevalent opinion. Ewald contends for the real existence of a S., in which he is supported by Renan. Even if there never was a S., it was not Philo who forged him. There seems no doubt that we have but a very dim and confused reproduction of what, after many modifications, misunderstandings, and corruptions, finally passed the hands of Philo and Eusebius, and was by the Church Father, as we said, quoted in a theological disputation. Yet, even assuming the person of a S., his age—and he insists upon a very remote one indeed—must be placed much lower: into the last centuries before Christ, at the earliest. He would then, it seems, have endeavoured to stem the tide of Greek superiority in all things, by collecting, grouping, and remodelling the ancient and important traditions of his own country, and thus proving to both his countrymen and to the Greeks their high importance, in comparison with the Greek productions, on the field of religion and philosophy.

The *Phoinikika* was not only a cosmogony, it would appear, but a history of his and the surrounding nations; and like similar ancient histories, it probably began with the creation of the world, and contained an account of the Jews. All the historical parts, however, are lost, and nothing remains but a fragmentary cosmogony, or, rather, two or three different systems of cosmogony, or, according to Movers, merely an Egyptian and Phœnician patchwork, for a brief account of which we refer the reader to the article PHŒNICIA. One of the chief difficulties for us consists in the Phœnician words of S., which Philo either translated too freely, or merely transcribed so faultily in Greek characters as to render them an everlasting puzzle.

Eusebius further contains a fragment of a treatise

by S., *Peri Judaiôn*, but it is doubtful whether this is the work of Philo of Byblus or of S.; and if it be that of the latter, whether it is a separate work, or merely a separate chapter out of his larger work. A forgery, said to contain the whole nine books of S., and to have been found by a Portuguese, Colonel Pereira, at the convent of St Maria de Merinhâo, and to have been by him intrusted to a German corporal in the Portuguese service, named Christoph Meyer, was published by Wagenfeld (Bremen, 1837), and translated into German (Lübeck, 1837), but was very soon consigned to disgrace and oblivion by Movers, K. O. Müller, and Grotefend, the last of whom had at first not only believed in its genuineness, but even written a preface to the *editio princeps*. There never was such a convent or such a colonel; but the fac-simile taken by 'Pereira' in the convent in Portugal was found to have been written on paper shewing the water-marks of an Osnabrück paper-mill.

SANCROFT, Dr William, an English archbishop, historically notable as the most distinguished dignitary among the *Nonjurors* (q. v.), was born at Fresingfield in Suffolk, January 30, 1616, educated at the grammar-school of Bury St Edmunds, and at Emanuel College, Cambridge. S. was reckoned a first-rate scholar by his contemporaries; and in 1642, S. was elected Fellow of his college, but in the following year he was deprived of his fellowship by the Puritans for refusing the famous 'Engagement,' after which he went abroad. On the restoration of Charles II., in 1660, he was appointed chaplain to Cosin, Bishop of Durham; and after several preferments, was in 1668 made Archdeacon of Canterbury, and in 1677 was raised, against his inclination, to the first dignity in the church—the archbishopric of Canterbury. The manner in which S. discharged his ecclesiastical duties deserves the highest commendation. He attended King Charles II. on his death-bed, and is said to have spoken very freely to the once 'merry monarch' on the nature of his past life. In 1688, along with several of his brother-bishops, he was committed to the Tower by King James VII., for sending him a petition in which they explained why they could not conscientiously order his declaration in favour of liberty of conscience to be read in the churches; but in the events which immediately preceded and accompanied the great Revolution, he played a somewhat ambiguous and perplexing part. At first he refused when James asked him to sign a declaration expressing abhorrence of the Prince of Orange's invasion. Later (December 1683), he even went the length of concurring in an address to William, yet he seems from this point to have drawn back, and to have fallen under the dominion of his theory of the Divine Right of Kings. He was not present at the convention of the lords spiritual and temporal to meet the new monarch, and after the settlement, he refused, along with seven other bishops, to take the oath of allegiance to the government, in consequence of which he was suspended by act of parliament, August 1, 1689, but his actual departure from Lambeth did not take place till June 23, 1691. He then retired to his native village, where he died, November 24, 1693. See Macaulay's *History of England*, vols. ii. iii. and iv.

SANCTIFICA'TION, in distinction from justification, in the nomenclature of Protestant theology, is the process by which the Holy Spirit renews man in the divine image, destroying within him the power of evil, and quickening, educating, and strengthening in him the life of goodness and holiness. Whereas justification is considered as a judicial act on the part of God's free grace, liberating the sinner from condemnation, absolving and pardoning him once for all, sanctification is reckoned a work or process, advancing in various stages of weakness or strength, and only completed in the future life of the believer when removed beyond the influences of sin that now surround him. A large and increasing body of Protestants believe, however, that a high degree of sanctification or perfection is attainable, and consequently obligatory, in this life, and that without a constant advance towards it there is a probable retrogression in spiritual life to a point beyond which the state of justification ceases. The Roman Catholics and others confound the two, not accepting justification short of actual perfection.

SA'NCTUARY, a consecrated place which gives protection to a criminal taking refuge there; or the privilege of taking refuge in such a consecrated place. Among the Jews, there were cities of refuge to which the slayer might flee who killed a man unawares, and something analogous to a right of sanctuary may also be traced in pagan communities. In the ancient Greek states the temples, or at least some of them, afforded protection to criminals, whom it was unlawful to drag from them, although the food which was being supplied might be intercepted. As early as the 7th c., the protection of sanctuary was afforded to persons fleeing to a church or certain boundaries surrounding it. The canon and more ancient ecclesiastical law recognises this protection to criminals as continuing for a limited period, sufficient to admit of a composition for the offence; or, at all events, to give time for the first heat of resentment to pass, before the injured party could seek redress. In several English churches there was a stone seat beside the altar where those fleeing to the peace of the church were held to be guarded by all its sanctity. One of these still remains at Beverley, and another at Hexham. To violate the protection of this seat, or of the shrine of relics, was an offence too grave to be compensated by a pecuniary penalty. Connected, in England, with the privilege of sanctuary was the practice of *abjuration of the realm*. By the ancient common law, if a person guilty of felony took the benefit of sanctuary, he might, within forty days afterwards, go clothed in sackcloth before the coroner, confess his guilt, and take an oath to quit the realm, and not return without the king's licence. On confessing and taking the oath, he became attainted of the felony, but had forty days allowed him to prepare for his departure, and a port assigned him for embarkation, to which he must immediately repair with a cross in his hand, and embark with all convenient speed. If he failed to depart, or afterwards returned without licence, he was condemned to be hanged, unless he happened to be a clerk, in which case he was allowed the *benefit of clergy*.

By the ancient canons of the Scottish councils, excommunication was incurred by the offence of open taking of thieves out of the protection of the church. Some churches, however, by their superior sanctity, were held practically to afford a much surer asylum than others, and it was not uncommon for the Scottish kings, with the view of strengthening the hands of the church, to give a formal sanction to particular ecclesiastical asylums. One of the most celebrated sanctuaries in Scotland was the church of Wedale, now called Stow, where was an image of the Virgin believed to be brought by King Arthur from Jerusalem. David I. granted the 'King's Peace,' in addition to the protection of the church, to all fugitives from peril of life or limb who betook themselves to the church of Lesmahagow. The Scotch law of sanctuary or *gryth* was, however guarded from affording too easy an immunity.

A very remarkable right of sanctuary existed in Scotland under the name of the *privilege of Clan Macduff*, which was alleged to have been granted by Malcolm Canmore on recovering the throne of his ancestors. Any person related within the ninth degree to the chief of Clan Macduff, who should have committed homicide without premeditation, was entitled, on fleeing to Macduff's Cross in Fife, to have his punishment remitted for a fine, or at least to be repledged from any other jurisdiction by the Earl of Fife. There is evidence of this privilege having saved Hugh de Arbuthnot and his accomplices from being proceeded against for the murder of John de Melvil of Glenbervie in 1421.

While the institution of sanctuary often enabled criminals to bid defiance to the civil power, it no doubt was not unfrequently a protection to the innocent, who thus escaped oppression or private enmity pursuing them under the name of law. In rude and unsettled times it seems, on the whole, to have operated beneficially by throwing the control of society into the hands of the clergy, who were less tempted than any other class to misuse that power. But as the civil power and authority of the law were strengthened, the right of sanctuary became useless and mischievous; the civil power endeavoured to narrow the privilege as far as possible, while the church sought hard to preserve it. The English Reformation, though it greatly restricted, did not abolish the right of sanctuary. It was not till 1534 that persons accused of treason were debarred the privilege, and the right of sanctuary for crime was finally abolished by 21 Jac. I. c. 28. Various precincts, however, in and about London, known as sanctuaries, continued to afford shelter to debtors, all which were done away with in 1697, by Act 8 and 9 Will. IV. c. 26.

In Scotland there still exists a sanctuary for debtors in the Abbey and Palace of Holyrood, with its precincts, including the hill of Arthur Seat and the Queen's Park. The sanctuary is placed under the control of a bailie appointed by the Duke of Hamilton as heritable keeper of Holyroodhouse. When a debtor retires to the sanctuary, he has a 24 hours' protection against personal diligence; but in order to extend the privilege longer, he must be enrolled in the books of the abbey. The sanctuary affords no protection to a criminal, a fraudulent debtor, or a crown debtor; nor is it available for protection from personal execution for debts contracted within its precincts, for which the debtor may be imprisoned in the abbey jail.

SAND, Georges. See Dudevant, Madame.

SANDALS, a covering for the feet, consisting of soles so attached as to leave the upper part of the feet bare. See Shoes.

SA'NDAL-WOOD (a name corrupted from *Santal* wood), the wood of several species of the genus *Santalum*, of the natural order *Santalaceæ* (q. v.), natives of the East Indies and tropical islands of the Pacific Ocean. S.-W. is compact and fine grained, very suitable for making work-boxes and small ornamental articles, and is remarkable for its fragrance, which, however, is fatal to insects, so that cabinets of S.-W. are extremely suitable for the preservation of specimens in natural history; but it is much too expensive for general use. The odour is due to an essential oil, heavier than water. White S.-W., the most common kind, is the produce of a small tree (*Santalum album*), a native of mountains in the south of India and the Indian Archipelago, much branched, resembling myrtle in its foliage and privet in its flowers. The trunk is seldom more than a foot in diameter. Yellow S.-W. is probably produced by another species, perhaps *S. Freycinetianum* of the Indian Archipelago and Sandwich Islands, and from these regions the Chinese import it, chiefly for the purpose of burning it both in their temples and in their houses. They reduce it to sawdust, and mix it with paste before burning. Dr Seemann has, however, recently found another and previously-unknown species of *Santalum* (*S. Yasi*) to yield the much-valued S.-W. of the Fiji Islands, where the tree has been almost extirpated in consequence of the demand for its wood in commerce.

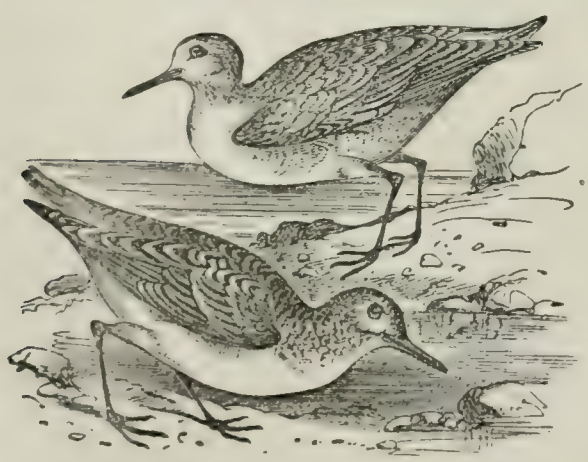
Red S.-W., or Sanders, is the produce of a very different tree, *Pterocarpus santalinus*, of the natural order *Leguminosæ*, suborder *Papilionaceæ*, a native of the tropical parts of Asia, particularly of the mountains of the south of India and of Ceylon. The tree is about sixty feet high, with pinnated leaves, having generally three leaflets, and axillary racemes of flowers. The heart-wood is dark red, with black veins, and so heavy as to sink in water. It is used as a dye-stuff, and also by apothecaries to colour certain preparations. The Arabs use it as an astringent, and it is the basis of some of our tooth-powders.—A deep red dye is also yielded by the chips of *Adenanthera pavonina*, a tree allied to the *Acacias* (q. v.), a native of the East Indies. The wood of this tree is sometimes called Red Sandal-Wood.

SANDALWOOD ISLAND, called by the natives Tjindana, Sumba and Tanah Tjumba, lies in the Indian Ocean, between 9° 18′—10° 20′ S. lat. and 118° 58′—120° 43′ E. long., has an area of 4966 sq. m., and a pop. of 1,000,000. The coast is steep and rocky, so that, except at the west, south, and east corners, ships can approach quite near. The produce consists chiefly in dye-woods, ebony, timber, cotton, rice, pepper, cocoa, maize, coffee, sugar, wild cinnamon, cocoa-nuts, and various fruits. Little sandalwood is exported, though abounding in the forests, the natives refusing to cut the trees, which they believe to be the dwellings of their ancestors' souls. Exports are: horses, timber, cotton, pepper, wax, tortoise-shell, tow made from bark, maize, and edible nests. The cliffs swarm with the *Collocalia esculenta*, and collecting the nests is a leading occupation of the men. The Sandalwood islanders belong to the Malay race, are well made, wiry, and of a brownish complexion. The most trifling causes lead them to commit suicide, a vice of rare occurrence in other parts of the archipelago.

The S. I. is nominally subject to the Netherlands, but the rajahs and regents are almost independent of foreign influence. The principal havens are at Nangamessi on the north, and Tidd about the middle of the south coast, good anchorage being found in many other parts. Notwithstanding the repressive measures taken by the Netherlands government, and the destruction, in 1860, of ten vessels engaged in the slave-trade, it is still extensively carried on by the Sandal-wood islanders.

SA'NDARACH, or SANDARACH RESIN, is a friable, dry, almost transparent, tasteless, yellowish-white resin, which is imported from the north of Africa. It is completely soluble in oil of turpentine, but not completely soluble in alcohol. When heated, or sprinkled on burning coals, it emits an agreeable balsamic smell. It exudes from the bark of the S. tree (*Callitris quadrivalvis*), a native of the north of Africa, of the natural order *Coniferæ*.—The quantity of S. used is not great; it is employed mostly for the same purposes as Mastic (q. v.). The finely-powdered resin is rubbed, as *Pounce*, on the erasures of writing-paper, after which they may be written upon again without the ink spreading.—

The wood of the S. tree is highly balsamic and odoriferous, extremely durable and valuable.



SAND BLAST. When particles of sharp sand are driven forcibly against any unyielding surface, they will quickly penetrate even the hardest substances, and even granite of considerable thickness may be bored through in an incredibly short time. The sand-blast process, by which a jet of steam is employed to drive the sand, has been patented by Mr B. C. Tilghman, of Philadelphia, who is now engaged in applying it to a number of practical uses, among the most elegant of which is the ornamentation of glass, after the effect of etching. A sheet, or other article of glass, is covered in certain parts with a pattern in soft material, or coated with a collodion film and impressed photographically with some ornamental design. It is then placed in front of the sand-blast. The myriad assaults of the little cutting atoms rapidly eat into the glass where it is not shielded by the interposing substance; and the pattern, in its most delicate details, is thus brought into bright relief by the deadening of the adjacent parts. The slightest film of any yielding material will suffice to disarm the sand-blast of its power, the most delicate skin, for instance, feeling no inconvenience from its peltings.

SA'NDCRACK is a splitting or fracture of the horny fibres of the horse's hoof, extending usually from above downwards: when reaching to the quick it causes lameness, and in all cases it constitutes unsoundness. Horses with thin, weak, brittle feet, spoiled by much rasping, and rattled on the hard roads, furnish the majority of cases. The horn must be thinned for an eighth of an inch on either side of the crack; across the upper and lower ends of the crack, to prevent its extension, the firing-iron should be drawn, making a line nearly through the horny crust. The opening may further be held together by winding round the foot several yards of waxed string, or fine iron wire. Except in very bad cases, slow work on soft land may be permitted, but road work is injurious. The growth of healthy horn is promoted by applying round the coronet, at intervals of ten days, some mild blistering liniment.

SAND EEL. See LAUNCE.

SANDEMA'NIANS. See GLASSITES.

SA'NDERLING (*Calidris*), a genus of birds of the plover family (*Charadriadæ*), or which perhaps ought rather to be referred to the snipe family (*Scolopacidæ*). The Common S. (*C. arenaria*) is a very widely diffused bird, breeding in the Arctic regions, and migrating southwards on the approach of winter as far as the coasts of Africa, of India, and

Sanderling, Male and Female (*Calidris arenaria*).

of Brazil. It is pretty common on the American coasts, in small flocks, in winter. It is only about eight inches long; its winter plumage very light ash-gray, under parts white. In spring the plumage acquires a reddish tinge with black markings. The S. feeds on marine worms, small crustaceans, &c. It is esteemed for the table, and appears in the London market.

SAND GROUSE. See GANGA.

SAND-HOPPER (*Talitrus locusta*), a small crustacean, of the section *Edriophthalma* (q. v.) and order *Amphipoda*, which so abounds on the sandy sea-shores of Britain, that the whole surface of the sand often seems to be alive with the multitudes which, leaping up for a few inches into the air, fill it like a swarm of dancing flies. This activity is not, however, displayed at all times; but if a mass of sea-weed left by the retiring tide be turned over, countless sand-hoppers may be seen to leap away, or they may be found by digging in the sand, in which they burrow. The S. leaps by bending the body together, and throwing it open with a sudden jerk. It feeds on almost any vegetable or animal substance, particularly on what is already dead and beginning to decay. It is itself the food of crabs, and of many kinds of birds.

SANDHURST, ROYAL MILITARY COLLEGE. In 1802 it was determined to institute a college for the training of military officers, in which professional education should be grafted on the groundwork of general instruction. The college was opened at Great Marlow; but, in 1812, it was transferred to a handsome stone building at Sandhurst. Up to 1862, this was devoted to the education of boys from the age of 13 upwards; a description of the college as then existing is given under CADETS' COLLEGE. By a new regulation, however, the system has been changed; the course limited to one year immediately before entering the army, and the subjects of instruction confined to the higher mathematics, modern languages, and military science. Entrance is on the nomination of the commander-in-chief; and the payment by the cadets' parent or guardian varies from £100 to *nil*, according to the circumstances and rank of the parent. Those for whom no payment is made must be orphans, and are styled 'Queen's Cadets.' All first commissions in the cavalry and infantry of the line, which are granted without purchase, and not to men from the ranks, are given to cadets from the Royal Military College, who compete for these prizes, and obtain them in order of merit.

While at the college the organisation of the young men is purely military, the whole forming a battalion, divided into cadet companies, each commanded by a captain and lieutenant of the regular army. The boys are allowed to hold the non-commissioned ranks in their several companies. In addition to mental labour, gymnastics, riding, boating, and swimming are taught to the students. The situation, on the sandy heaths which mark the union of Hampshire and Surrey, is particularly healthy, while its proximity to London (about 30 miles) and the camp at Aldershot, render it very suitable to its purpose.

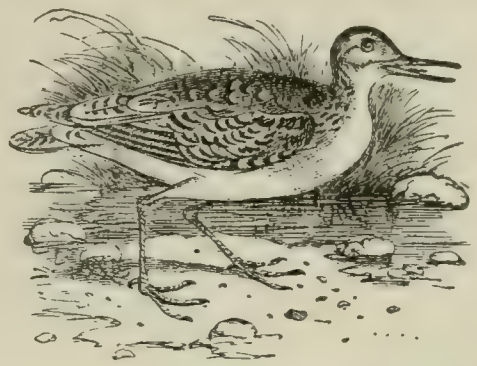
The Staff College (q. v.) is a separate institution, about two miles distant.

The estimated charge for the Royal Military College for 1870—1871 is £23,326. There are 28 professors and masters employed at Sandhurst.

SA'NDIVER, a product of the glass furnaces. When the materials used in the manufacture of glass are melted, a scum arises which has to be removed: this is called sandiver, and is, when powdered, used as a polishing material, and formerly had a considerable reputation as a tooth-powder.

SAND-MARTIN. See SWALLOW.

SAN DOMI'NGO. See DOMINGO, SAN; DOMINICAN REPUBLIC.



SAND PAPER is made in the same way as emery-paper (see EMERY), but with ground glass in place of emery.

SA'NDPIPER, the common English name of a numerous group of birds, generally referred to the family *Scolopacidæ*, all formerly included in the genus *Tringa*, but some now constituting the genera *Totanus*, *Pelidna*, *Actitis*, &c., of ornithologists. In characters and habits they are all very similar. They are not of large size; they are very active and graceful in all their movements; their plumage not gay, but of pleasing and finely-diversified colours; their legs are rather long, the lower part of the tibia naked, the tail very short, the wings moderately long; the bill rather long and slender, grooved throughout the whole or a considerable part of its length, straight in some, and a little arched in others. The feet have three long toes before, and one short toe behind; the toes in the genus *Tringa*, as now restricted, are partially webbed at the base, in *Totanus* they are completely separate. They are good swimmers, but are not, however, often seen swimming; they frequent sandy sea-shores, some of them congregating in numerous flocks in autumn and winter; and seek their food by probing the sand with their bills, and by catching small crustaceans in pools or within the margin of the sea itself. Many are birds of passage, visiting high northern latitudes in summer, and spending the winter on the coasts of more southern regions. The flesh of all the species is good, and some of them are in much request for the table.—The American species are numerous. The DUNLIN (*Tringa variabilis*), noticed in the article DUNLIN, is European.—The KNOT (*Tringa canutus*), also known, in different states of plumage, as the RED S., and the ASH-COLOURED S., is a bird about ten inches in length, appearing in great flocks on the American coasts in winter, and equally common in Britain.—The *T. minutilla* represents the European LITTLE S. (*Tringa minuta*), which occurs in India and in South Africa. The name STINT is given to a number of species of *Tringa*.—The PURPLE S. (*Tringa maritima*), not unfrequent on the American coasts, is reckoned among the birds of Britain, Greenland, Melville Island, Nova Zembla,

Redshank (*Totanus calidris*).

and Spitzbergen.—Of the genus *Totanus*, to all the species of which the popular name GAMBET is sometimes given, one of the best known species is the REDSHANK (*Totanus calidris*), a bird which resides in Britain all the year, but known also as a summer bird of passage in the most northern parts of Europe and Asia, and occurring in winter as far south as Smyrna, and even in India. It is about eleven inches long. It receives its popular name from its red legs.—The GREEN S. (*Totanus ochropus*) is also a pretty common British species, for the most part migrating to the north for the summer.—The COMMON S., or TILT-UP (*Totanus macularius*), is in America a summer resident.—

Common Sandpiper (*Totanus hypoleucos*).

The GREENSHANK (*Totanus glottis*) is chiefly seen in spring and autumn, and has its name from the olive-green colour of its legs.—Sandpipers of various species—some of them the same as the North American, and others different—are numerous in winter in the West Indies, and occur in Europe.

SANDPIPES are cylindrical hollows existing in chalk deposits. They descend perpendicularly into the chalk at right angles to the surface, tapering downwards, and ending in a point; they reach occasionally a depth of 60 feet, and have a diameter varying from 1 to 12 feet. They are most probably produced by the chemical action of water, charged with carbonic acid, which exists more or less in all rain-water, and is especially abundant in water that has been in contact with decaying organic matter. The pipes are filled with sand, clay, or gravel from the overlying deposit.

SANDROCO'TTUS, or SANDROKYPTOS, is the Greek spelling of the name of the Hindu king Chandragupta, of Pât'aliputra or Palibothra, to whom Megasthenes was sent as ambassador from Seleucus Nicator, and who lived about the beginning of the 4th c. B.C.

SANDSTONE is a rock formed of compacted, and more or less indurated sand. The grains generally consist of quartz, though other mineral substances are often mixed with this; they are colourless, or of a dull white, yellow, brown, red, or green colour. The grains vary in size, forming, as the case may be, a fine or coarse grained stone. The loose sand becomes solidified by pressure simply, but more generally from being cemented together by calcareous, silicious, or ferruginous infiltrations, and the dark colour of the mass is produced by the cement. Sandstones that have undergone great or continuous metamorphic action, pass into Quartzite; and between this and friable sand, all intermediate stages are found.

SANDU'SKY, a city and port of Ohio, U.S., on the south shore of Sandusky Bay, an arm of Lake Erie, 110 miles north of Columbus. The bay, 20 miles long and 5 wide, forms an excellent harbour. The city is built upon a bed of limestone, of which its edifices are constructed, among which are a custom-house, 18 churches, 3 banks, large public

halls, hotels, schools, &c. There are several newspapers, manufactures of lumber and bent woodwork for carriages, &c., with extensive fisheries; tonnage 87 vessels, of 10,027 tons. Pop. (1860) 8408; (1870) 13,000.

SANDWICH (i.e., village on the sands), a Cinque Port, market-town, and municipal borough of Kent, on the right bank of the Stour, 98 miles east-south-east of London by the South-Eastern Railway. Within the last 800 years the sea has here considerably receded, for S., which is now two miles from the shore, is described, at the commencement of the 11th c., as the most famous of all the English harbours—*omnium Anglorum portuum famosissimus*. The town is rectangular, and was surrounded by walls, along which a broad path now leads. The streets are confined; and the houses, which seem crushed together, and the architecture of which recals the times of the Plantagenets, are peculiarly and strikingly antique in appearance. The church of St Clement's, with a low Norman tower, is probably the most interesting edifice. Small vessels importing timber, iron, and coal, and exporting corn, flour, malt, seeds, and hops, come up to the town. Tanning, shipbuilding, and seed-crushing are carried on. In conjunction with Deal and Walmer, the town sends two members to parliament. Pop. (1861) of municipal borough, 2944; of the parliamentary borough of S. and Deal, 13,750.

S., the most ancient of the Cinque Ports, probably occupies the site of the Roman *Rutupiæ*, and many interesting antiquities have been found in the vicinity. In the reign of Edward IV. its customs yielded £17,000 yearly, and 95 ships and 1500 sailors belonged to it.

SANDWICH, a favourite viand which is said to have been named after the Earl of Sandwich. It consists of two thin slices of bread, plain or buttered, with some savoury food placed between. Formerly, it was applied exclusively to bread with thin slices of ham, tongue, or beef, but of late a great variety of materials have been used; one celebrated Glasgow confectioner, Mr Lang, has the credit of making one hundred different kinds of sandwiches.

SANDWICH ISLANDS, forming the kingdom of Hawaii, are a rich, beautiful, and interesting chain, eight in number, exclusive of one or two small islets. The chain runs from south-east to north-west, and lies in the middle of the Pacific Ocean, in lat. 19°—22° N., long. 155°—160° W. Area, 6000 sq. m.; pop. (1866) 62,959. The names, with the areas of the respective islands—proceeding from the south-east of the group—are: Hawaii (formerly Owhyhee) 4000 sq. m.; Maui, 620; Oahu, 530; Kaui, 500; Molokai, 167; Lanai, 100; Niihau, about 70; and Kahoolaui, about 60 sq. miles.

Surface, &c.—Situated near the middle of the Pacific Ocean, about half the distance from San Francisco in North America that they are from Melbourne in Australia, and Canton in China, the S. I. form an oasis in the middle of a wide ocean waste, and offer convenient stations for the refreshment and repair of the merchantmen and whalers that traverse the Pacific. They are of volcanic origin, and contain the largest volcanoes, both active and quiescent, in the world. The most prominent physical features of the group are the two lofty mountain peaks of Hawaii, Mauna Kea and Mauna Loa, each of which is 14,060 feet in height, or within 1800 feet of the loftiest of the Alps. Besides these two chief peaks, which stand apart from each other, and one of which is covered with perpetual snow, the island is traversed by other mountains, which give it a rugged and picturesque outline, and in some cases front the sea in bold, perpendicular precipices, from 1000 to 3000 feet in height. In general, the islands are lofty—the small islet of Lehua is 1000 feet high, and the upland regions of Kaui are, on an average, 4000 feet above sea-level. Within the coral reefs, which, in single, and more rarely in double ridges, skirt portions of the coasts, sandy shores, leading up to rich pasture-lands, and occasionally to productive valleys, are frequently seen. Everywhere, however, the configuration of the surface betrays the volcanic origin of the islands. Extinct and partially active volcanoes occur in most of the islands. Kilauea, on the Mauna Loa mountain in Hawaii, the largest active volcano in the world, has an oval-shaped crater 9 miles in circumference, and is 6000 feet above sea-level. In the centre of this immense caldron is a red sea of lava, always in a state of fusion. At intervals, the lava is thrown to a great height, and rolls in rivers down the mountain sides. From 1856 to 1859, this volcano was in an incessant state of eruption, forming at night a sublime spectacle, and occasionally casting forth burning streams, by one of which a small fishing-village was destroyed, a bay on the shore filled up, and a promontory formed in its place. On Maui, the crater of Mauna Haleakala (House of the Sun), by far the largest known, is from 25 to 30 miles in circumference, from 2000 to 3000 feet deep, and stands 10,000 feet above sea-level. Within this huge pit, about 16 basins of old volcanoes, whose ridges formed concentric circles, have been counted. Good harbours are few. The chief is that of Honolulu (q. v.), in Oahu, with 22½ feet of water in its shallowest parts. On the same island is Ewa, an immense basin, with 12 feet water at low-tides. During the prevalence of the trade-wind, which blows south-west for about nine months of the year, the south shores of the islands afford safe anchorage almost everywhere.

Climate, Soil, Rivers, &c.—Though situated within the tropics, the S. I. boast a climate that is temperate rather than tropical. In the native language, there is no word to express the idea of *weather*, and this fact may be considered as evidence that extremes of heat or cold do not occur. At Honolulu, the extremes of temperature in the shade during 12 years were 90° and 53°, and the diurnal range is 12°. Rains brought by the north-east trade-wind are frequent on the mountains; but on the leeward side of the islands, little rain falls, and the sun is rarely obscured by clouds. The soil, the constituent parts of which are mainly scoriæ, decomposed lava and sand, is generally thin and poor. This, however, is not universally the case. At the bases of the mountains and in the valleys, where abrasion, disintegration, and the accumulation of vegetable mould, have gone on for ages, there are extensive tracts as fertile as they are beautiful. The islands produce fine pasturage in abundance, and large herds are bred and fattened, to supply meat to the whalers and merchant-ships. On the Waimea Plains, in Hawaii alone, 30,000 sheep of the merino breed were grazing in 1864. The upland slopes of the mountains are clothed with dense forests; and lower down, are grassy plains and sugar and coffee-plantations. Basalt, compact lava, coral-rock, and sandstone, are used for building purposes. No metals occur. Several of the islands, especially Hawaii and Kaui, are well supplied with rivers, which, from the size and conformation of the group, are necessarily small, but afford great facilities for irrigation. Vast numbers of semi-wild horses roam the islands, and while they consume the pastorage, and break down the fences, are of little use. The indigenous fauna is small, and consists mainly of swine, dogs, rats, a bat that flies by day, birds of beautiful plumage, but for the most part songless. Among

the indigenous trees and plants are the sugar-cane, banana, plantain, cocoa-nut, candle-nut, various palms, the taro, a succulent root which formed the staple of the food of the natives, and is still generally used; the cloth-plant; and the *ti*, the roots of which were baked and eaten, while the leaves were used for thatching huts. Cattle and other useful foreign animals and plants were introduced by Vancouver and other navigators. In 1860, there were 30,000 mules and semi-wild horses in the kingdom.

Commerce, Products, &c.—The commerce of the young kingdom is still in its infancy, but is gradually on the increase. Until recently, the most important branch of it was maintained by vessels engaged in the whale-fisheries of the North Pacific. This branch of commerce has greatly declined within recent years. In 1869, 102 whaling-vessels entered the ports, and 127 vessels, of 76,565 tons, entered and departed. Trusting no longer to the whaling business, the producers and merchants of the S. I. have found out other outlets for their goods, and, without doubt, the trade of the islands will in the future be almost wholly confined to the coasts that bound the Pacific. The islands are within 16 days (by sailing-vessels) of San Francisco, 27 days from Vancouver's Island, 26 days from Kanagawa in Japan, and 67 days from Hong-kong. Sugar, coffee, and rice have been proved to produce well, and all these find ready markets at hand in California, British Columbia, and Vancouver's Island, which together can consume more than the S. I. can supply. Of sugar, 3,000,000 lbs. were produced in 1862, and the exports in 1869 reached 18,302,110 lbs., and from the number of new plantations recently organised, the amount of produce may be expected to continue increasing. The exports, consisting mostly of sugar, coffee, rice, Pulu (q. v.), hides, and corn, amounted in 1869 to 2,366,358 dollars; the imports, mostly manufactured goods, amounted in the same year to 1,898,216 dollars.

History, Constitution, and Finances.—Of the origin and character of the inhabitants of this kingdom, of its interesting internal history, or of the much-canvassed question as to whether the native race will flourish along with or wither before the Saxon race, it is not within our limits to speak. We can only notice a few of the leading events which have occurred in these islands since their shores were first visited by what the natives called the 'floating islands' of the civilised nations. Although one member of the group was seen by Gaetano in 1542, the islands cannot be said to have been discovered till Cook visited them in 1778. The great navigator treated the simple and confiding natives with a cruelty and a hypocrisy which consort ill with his fame, and which were the direct causes of the brawl in which he met the death he had provoked in Kealakeakua Bay, Hawaii, 1779. In early times, each island had a king; but under Kamehameha I., a man of shrewd sense, and of great bravery and resource, the islands were formed into one kingdom. This king, writing to George III., August 6, 1810, desired formally to acknowledge the king of England as his sovereign, and to place the islands under British protection—an offer which was accepted. After inaugurating the era of advancement, this king died in 1819, and was succeeded by Liholiho, who adopted, on his accession, the name of Kamehameha II., and in whose reign idolatry was abolished simultaneously throughout all the islands. The first Christians who visited the S. I. were Cook and his followers, of whom the simple natives retained no favourable impression. Vancouver, who arrived with Cook in 1778 and returned in 1792, and again in 1794, made sincere attempts to enlighten the natives, and the king and his chiefs requested Vancouver to send out religious teachers to them from England; but the first missionaries that visited the islands came from America in 1820. On their arrival, the missionaries witnessed the singular phenomenon of a nation without a religion. The instructions of Vancouver had not been forgotten, and no doubt enabled the idol-worshipping islanders to see more readily the absurdities of their system. But the spontaneous movement of 1819—1820, when the whole nation rose up to destroy idols, temples, and the furniture of idolatry, 'was no triumph of Christianity—for Christianity had not yet claimed or even approached the Hawaian Islands.' The nation had voluntarily cast off the religion of their ancestors, and had not yet adopted—were not even acquainted with—any other system. The American missionaries who arrived in 1820 were well received, and the work of instruction was at once begun. Besides instructing them in Christianity, in less than 40 years they taught the whole Hawaian people to read and write, to cipher and to sew.

Kamehameha II. and his queen visited England, and, after a short residence in that country, both died in London, July, 1824. Prior to the year 1838, the government was a despotism; but in 1840, the king, Kamehameha III., granted a constitution, consisting of king, assembly of nobles, and representative council. This constitution, based on that of Great Britain, has in more recent times been much matured and improved. In 1843, the independence of the Hawaian kingdom was formally declared by the French and English governments. Kamehameha IV. acceded to the throne in 1854, and after a brief but useful reign, died in November, 1863, and was succeeded by his brother, Kamehameha V. A bishop, ordained in London, is now the spiritual overseer of the islands; and wherever there are inhabitants, there are schools and chapels. The revenue for the year 1867 was 831,415 dollars, the public debt, 117,119 dollars.

SANDWORT. See ARENARIA.

SAN FELI'PÉ DE ACONCA'GUA, a town of Chili, capital of the dep. of Aconcagua, 60 miles east-north-east of Valparaiso. It is regularly built, and has a handsome appearance. In the vicinity are copper-mines. Pop. stated at from 12,000 to 13,000.

SAN FELIPE DE JATIVA. See JATIVA.

SAN FRANCI'SCO, the principal seaport on the western coasts of North America, and the chief city of California, U. S., stands on the west shore of San Francisco Bay, 6 miles south of the Golden Gate, the outlet leading west and connecting the bay with the Pacific Ocean. Lat. 37° 47′ 35″ N., long. 122° 27′ 13″ W. It has a fine deep harbour, well-built streets, handsome shops, gas and water works, and elegant public buildings, among which are the custom-house, mint, marine hospital, city hospital, masonic temple, magnificent hotels, and theatres, orphan asylums, for deaf mutes, &c. There are nearly 50 places of public worship, among which are several Buddhist temples; about 20 banking institutions, 25 fire companies, 47 newspapers and journals (9 are daily), published in the French, German, Italian, and Spanish languages. The city is very liberally supplied with excellent private schools, while the public schools are liberally supported. The Chinese have a Roman Catholic church, with a Chinese priest educated at Rome, and a school. Among the manufacturing establishments are flour-mills, saw-mills, woollen factories, and iron foundries. During the year ending June 30, 1870, 69 vessels, of 162,600 tons, cleared for, and 73 vessels, of 172,571 tons, entered from, foreign ports. The total imports from foreign coun-

tries for the same period were valued at $21,834,103, and the exports of produce and manufactures of the United States amounted to $32,186,021. The exports were chiefly treasure, wheat, barley, flour, copper ore, furs, quicksilver, and gunpowder. The imports were rice, coffee, sugar, tea, wines and spirits, coal, iron and manufactures of iron, cotton, wool, silk, linen, hemp, glass, oils, provisions, &c. The interior receipts of coined and uncoined treasure at San Francisco in 1867, 1868, and 1869 amounted to $51,597,504, $51,173,955, and $49,286,474, respectively; the exports of treasure for the same years, to $41,676,292, $35,444,395, and $37,287,117. The coinage at the branch mint for 1867, 1868, and 1869 amounted to $19,370,535, $17,365,000, and $14,363,550. There is a large timber trade with Oregon and British Columbia, and several ocean steamers make regular trips to Panama. The completion of the Union Pacific Railroad in 1870 placed San Francisco on the route of commerce from Asia to the Eastern United States and Europe. In 1776 the mission of St Francis was commenced here by two Spanish monks. In 1825 it had under its care 1800 Indians, and possessed 76,000 cattle and 79,000 sheep. In 1834 the property was secularised, and the mission rapidly decayed. In 1846 it was taken by the United States, and in 1847 had a population of 450. The discovery of gold in 1848 caused it to be at first nearly deserted; but it soon commenced a rapid growth, which, in spite of several destructive fires, continued until its population amounted, in 1860, to 55,626; in 1870 to 149,473, an increase of 165 per cent.

SA'NGERHAUSEN, a town of Prussian Saxony, in the government of Merseburg, and 33 miles west-north-west of the city of that name. It contains two castles; carries on weaving, tanning, shoemaking, and copper-smelting, and manufactures saltpetre. Pop. 8696.

SANGI'R ISLANDS lie to the north of Celebes, in 2°—4° N. lat., are upwards of 50 in number, of various sizes, and nearly all inhabited. Pop. 30,000. The three largest islands, Great S., Sjiauw, and Tagolandang, with those which surround each, form as it were separate groups. In the S. I. are many mountains, which, except the volcanoes, are clothed to their summits with a rich vegetation. Great S. has an area of 273 sq. m., and is divided into four kingdoms. The usual anchorage is on the west side, in 3° 28′ N. lat., and 125° 44′ E. long. Pop. 13,000. In the north-west is a volcano, called Abu, or the 'Ash Mountain,' which has frequently caused great devastation. In March 1856, the streams of lava and boiling water carried away the rich plantations, and 2806 lives were lost.

Sjiauw lies in 2° 43′ N. lat., and 125° 28′ E. long., is also mountainous; a volcano, on the north-east coast, being 6700 feet high. Pop. 3000. The chief town is Uluw

Tagolandang, in 2° 20′ N. lat., and 125° 30′ E. long., is populous, and the centre of the missionary work which has been carried on successfully in the S. Islands. A small ship belongs to the station, in which to visit the scattered converts and schools.

In all the islands, the areng (*Saguerus* or *Borassus gomutus*), the sago, cocoa-nut, and the finest sorts of timber-trees abound. Maize, rice, katjang (a species of bean), tobacco, cocoa, and the sugar-cane are cultivated.

The Sangirese belong to the Malay race, are well made and brave, but cunning, lazy, and dirty in their habits. This, and scarcity of pure drinking-water, make them liable to a loathsome skin disease. There are four rajahs in Great S., one in Tagolandang, and one in Sjiauw. The government is monarchical, somewhat limited by a council.

Towards the end of the 15th c., the Sangirese became Mohammedan; a century later, under the Portuguese, they were brought over to Christianity These islands, forming now a Netherlands dependency, have several Dutch missionaries, and 24 churches, which are also used as schools. Government supports 8 teachers, the villages 16.

SANG-KOI. See TONQUIN.

SANGRAAL. See GRAAL.

SANGUINA'RIA, a genus of plants of the natural order *Papaveraceæ*, having 8—12 petals, 2 stigmas, an oblong swollen capsule with two deciduous valves, and a persistent, many-seeded frame. *S. Canadensis*, the BLOOD-ROOT or PUCCOON of North America, has a fleshy root-stalk abounding in a red juice, which abounds also in the leaf-stalks; and solitary radical leaves, which are roundish, deeply heart-shaped, and with about seven toothed angles. The flowers are solitary and spring from the root, on short stalks. The whole plant is acrid and narcotic, emetic and purgative in large doses; and in small doses stimulant, diaphoretic, and expectorant. It is much used as a medicine in the United States. —It is supposed to owe its properties to a peculiar alkaloid called *Sanguinarine*, which is obtained from it as a white pearly substance. The large white flowers appear early in spring, and are a frequent ornament of flower-borders.

SANGUINE, or MURREY, one of the tinctures of less frequent occurrence in Heraldry, denoting blood colour, and represented in engraving by lines crossing each other saltireways.

SANGUISORBA'CEÆ, or SANGUISO'RBEÆ, according to some botanists a natural order of plants, but more generally regarded as a sub-order of ROSACEÆ (q. v.). As a sub-order, its distinctive characters are apetalous flowers—the tube of the calyx thickened, indurated, and lined with a disc, generally few stamens, and a solitary carpel, which ripens into a nut enclosed in the calycine tube. About 150 species are known, all of which are herbaceous or half shrubby, some of them spiny.—The leaves of *Acaena sanguisorba*, a native of Van Diemen's Land, are said to be an excellent substitute for tea. Of British species, Burnet (q. v.) and Lady's Mantle (q. v.) are among the best known.

SA'NHEDRIM (Gr. *Synedrion*), the supreme national tribunal of the Jews, established at the time of the Maccabees, probably under John Hyrcan. It consisted of 71 members, and was presided over by the Nasi (Prince), at whose side stood the Ab-Beth-Din (Father of the Tribunal). Its members belonged to the different classes of society: there were priests (*Archiereis*); elders, that is, heads of families, men of age and experience (*Presbyteroi*); scribes, or doctors of the law (*Grammateis*); and others, exalted by eminent learning—the sole condition for admission into this assembly. The presidentship was conferred on the high-priest in preference, if he happened to possess the requisite qualities of eminence; otherwise, 'he who excels all others in wisdom,' was appointed, irrespective of his station. The limits of its jurisdiction are not known with certainty; but there is no doubt that the supreme decision over life and death, the ordeal of a suspected wife, and the like criminal matters, were exclusively in its hands. Besides this, however, the regulation of the sacred times and seasons, and many matters connected with the *cultus* in general, except the sacerdotal part, which was regulated by a special court of priests, were vested in it. It fixed the beginnings of the new

moons; intercalated the years, when necessary; watched over the purity of the priestly families, by carefully examining the pedigrees of those priests born out of Palestine, so that none born from a suspicious or ill-famed mother should be admitted to the sacred service; and the like. By degrees, the whole internal administration of the commonwealth was vested in this body, and it became necessary to establish minor courts, similarly composed, all over the country, and Jerusalem itself. Thus, we hear of two inferior tribunals at Jerusalem, each consisting of 23 men, and others consisting of three men only. These courts of 23 men (lesser Synedrion), however, as well as those of the three men, about both of which Josephus is silent, probably represent only smaller or larger committees chosen from the general body. Excluded from the office of judge were those born in adultery; men born of non-Israelitish parents; gamblers; usurers; those who sold fruit grown in the Sabbatical year; and, in single cases, near relatives. All these were also not admitted as witnesses. Two scribes were always present, one registering the condemnatory, the other the exculpatory votes. The mode of procedure was exceedingly complicated; and such was the caution of the court, especially in matters of life and death, that capital punishment was pronounced in the rarest instances only. The Nasi had the supreme direction of the court, and convoked it when necessary. He sat at the head, and to his right hand was the seat of the Ab-Beth-Din; the rest of the 71 took their places according to their dignity, in front of them, in form of a semicircle, so that they could be seen by both the chief officers. The lictors, or 'sheriffs,' were always present at the session. The court met on extraordinary occasions in the house of the high-priest; its general place of assembly, however, was a certain hall (*Lishcat Hagaziz*), probably situated at the south-east corner of one of the courts of the temple. With exception of Sabbath and feast days, it met daily. The political troubles forced the Sanhedrim (70 B.C.) to change its abode, which was first transferred to certain bazaars (*Hannyoth*) at the foot of the temple mount. After the destruction of the temple and Jerusalem, it finally established itself, after many further emigrations, in Babylon.

We cannot here enter into that most difficult question as to the origin and development of the Sanhedrim, and how far it was intended primarily to be a faithful reproduction of the Mosaic assembly of the 70 (Moses himself making 71), supposed to have been re-established by Ezra after the Exile; any more than we can examine in this place into the widely different opinions respecting the jurisdiction and competence of the Sanhedrim at the time of Christ and the apostles; how far, in fact, it may be said to have existed at all—save for a few matters of smallest importance—curtailed and circumscribed as it was by the Romans, who seem to have recognised only the 'high-priest;' and that collateral but most vital question, whether it was the Sanhedrim at all from whom emanated those well-known acts recorded in the New Testament. There can be no question as to its utter incompetence to arraign Christ for a 'crimen læsæ majestatis,' i. e., for high treason against the Roman emperor. No less difficult is the explanation of many of the proceedings against the apostles ascribed to this body. The suggestion, that the word Synedrion, as used in the New Testament, stands only for an arbitrarily convoked 'lynch-tribunal,' deserves more consideration than it has hitherto received.

SANHITÂ is the name of that portion of the Vedas which contains the Mantras or hymns. See VEDA.

SA'NITARY SCIENCE. See SUPPLEMENT.

SA'NJAK, a Turkish word signifying 'a standard,' is employed to denote a subdivision of an *eyalet* (q. v.), because the ruler of such a subdivision, called *sanjak-beg*, is entitled to carry in war a standard of one horse-tail. The sanjak is frequently called a *liva*, and its ruler a *mirmiram*.

SANJAK-SHERIF. See FLAG OF THE PROPHET.

SAN JOAQUI'N, a river of California, U.S., rises in the Sierra Nevada, and runs first south-west to its junction with the outlet of Lake Tulare, thence north-west to its junction with the Sacramento River, 50 miles from the Bay of San Francisco. It receives numerous branches from both the coast range of mountains and the Sierra Nevada. Entire length 350 miles, for only a small portion of which it is navigable for large vessels.

SAN JOSE', or SAN JOSE DEL INTERIOR, the capital of Costa Rica, Central America, on the River Carthago, and 15 miles west-north-west of the remains of the town of that name, which was formerly the capital of the country. It stands on a table-land 4500 feet above sea-level, contains a number of important metropolitan edifices, and carries on an active and important trade. Its port is Punta Arenas, on the Gulf of Nicoyas, 60 miles west. In 1861, 189 vessels of 110,824 tons, and the cargoes of which valued about £386,000, entered and cleared Punta Arenas. Pop. of San José, 16,000.

SAN JUA'N DE PO'RTO RI'CO. See PUERTO RICO.

S'ANKARA, or S'ANKARÂCHÂRYA, i. e., the *âchârya*, or spiritual teacher, S'ankara, is the name of one of the most renowned theologians of India. His date, as is the case with most celebrities of that country, is unknown. Tradition places him about 200 B.C., but H. H. Wilson assigns him, with more probability, to the 8th or 9th c. after Christ. With regard to his place of birth and to his caste, most accounts agree in making him a native of Kerala or Malabar, and a member of the caste of the Nambûri Brahmans. In Malabar, he is said to have divided the four original castes into seventy-two, or eighteen subdivisions each. All accounts represent him as having led an erratic life, and engaged in successful controversies with other sects. In the course of his career, he founded the sects of the *Das'nâmi-Dan'd'ins* (see S'AIVAS). Towards the close of his life, he repaired to Cashmere; and finally to Kedârnâth, in the Himalaya, where he died at the early age of 32. His principal works, which are of considerable merit, and exercised a great influence on the religious history of India, are his commentary on the *Vedânta* (q. v.) Sûtras, and his commentaries on the *Bhagavadgîtâ* and the principal *Upanishads* (q. v.). His learning and personal eminence were so great, that he was looked upon as an incarnation of the god S'iva, and was fabled to have worked several astounding miracles. One of these was his animating the dead body of a King Amaru, in order to become temporarily the husband of the latter's widow, so as to be able to argue with the wife of a Brahman Mandana upon the topic of sensual enjoyments—the only topic on which he had remained ignorant, as he had always led the life of a Brahmachârin, or bachelor student. A number of works are current in the south of India relating to his life; among these, the *S'ankara-dig-vijaya*, or the conquest of the world by S., composed by *Anandagiri*, one of his disciples, is the most important.—See H. H. Wilson, *A Sketch of the Religious Sects of the Hindus;* works, vol. i. (edited by Dr R.

Rost, 1862), pp. 197, ff.; and Cavelly Venkata Ramaswami, *Biographical Sketches of Deccan Poets* (Bombay, 1847).

SÂNKHYA (from the Sanscrit *sankhyâ*, synthetic reasoning) is the name of one of the three great systems of orthodox Hindu philosophy. See SANSCRIT LITERATURE. It consists of two divisions —the Sânkhya, properly so called, and the YOGA (q. v.); and like the other systems (see MIMÂNSÂ and NYÂYA), it professes to teach the means by which eternal beatitude, or the complete and perpetual exemption from every sort of ill, may be attained. This means is the discriminative acquaintance with *tattwa*, or the true principles of all existence, and such principles are, according to the Sânkhya system, the following twenty-five: (1), *Prakr'iti* or *Pradhâna*, substance or nature; it is the universal and material cause; eternal, undiscrete, inferable from its effects; productive, but unproduced. Its first production is (2) *Mahat* (lit. the great), or *Buddhi* (lit. intellect), or the intellectual principle, which appertains to individual beings. From it devolves (3) *Ahankâra* (lit. the assertion of 'I'), the function of which consists in referring the objects of the world to one's-self. It produces (4—8) five *tanmâtrâ*, or subtle elements, which themselves are productive of the five gross elements (see 20—24). Ahankâra further produces (9—13) five instruments of sensation—viz., the eye, the ear, the nose, the tongue, and the skin; (14—18), five instruments of action—viz., the organ of speech, the hands, the feet, the excretory termination of the intestines, and the organ of generation; lastly (19), *manas*, or the organ of volition and imagination. The five subtle elements (see 4—8) produce (20—24) the five gross elements—viz., *âkâs'a*, space or ether, which has the property of audibleness, is the vehicle of sound, and is derived from the *sonorous* tanmâtrâ; air, which has the properties of audibleness and tangibility, is sensible to hearing and touch, and is derived from the *aërial* tanmâtrâ; fire, which has the properties of audibleness, tangibility, and colour, is sensible to hearing, touch, and sight, and is derived from the *igneous* tanmâtrâ; water, which has the properties of audibleness, tangibility, colour, and savour, is sensible to hearing, touch, sight, and taste, and is derived from the *aqueous* tanmâtrâ; lastly, earth, which unites the properties of audibleness, tangibility, colour, savour, and odour, is sensible to hearing, touch, sight, taste, and smell, and is derived from the *terrene* tanmâtrâ. The 25th principle is *Purusha*, or soul. It is neither produced nor productive; it is multitudinous, individual, sensitive, eternal, unalterable, and immaterial. The union of soul and nature takes place for the contemplation of nature, and for abstraction from it, 'as the halt and the blind join for conveyance and for guidance, the one bearing and directed, the other borne and directing.' From their union, creation is effected. The soul's wish is fruition or liberation. In order to become fit for fruition, the soul is in the first place invested with a *linga-s'arira*, or *sûkshma-s'arira*, a subtle body, which is composed of *buddhi* (2), *ahankâra* (3), the five *tanmâtrâs* (4—8), and the eleven instruments of sensation, action, and volition (9—19). This subtle body is affected by sentiments, but being too subtle to be capable of enjoyment, it becomes invested with a grosser body, which is composed of the five gross elements (20—24), or, according to some, of four, excluding *âkâs'a*, or, according to others, of one alone—viz., earth. The grosser body, propagated by generation, perishes; the subtle frame, however, transmigrates through successive bodies, 'as a mimic shifts his disguises to represent various characters.' Some assume, besides, that between these two there is intermediately a corporeal frame, composed of the five elements, but tenuous or refined, the so-called *anusht'hâna s'arira*.

Creation, resulting from the union of Prakr'iti (1) and Purusha (25), is *material*, or consisting of souls invested with gross bodies, and *intellectual*, or consisting of the affections of intellect, its sentiments or faculties. *Material creation* comprises eight orders of superior beings—gods, demi gods, and demons; five of inferior beings—quadrupeds, birds, reptiles, fishes, and insects; besides vegetable and inorganic substances, and man, who forms a class apart. This material creation is again distributed into three classes: that of *sattwa*, or goodness, comprising the higher gods, with virtue prevailing in it, but transient; that of *tamas*, or darkness, where foulness or passion predominates; it comprises demons and inferior beings; and between these, that of *rajas*, or impurity (lit. coloured condition), the human world, where passion together with misery prevails. Throughout these worlds, soul experiences pain, arising from death and transmigration, until it is finally liberated from its union with person. *Intellectual creation* comprises those affections which obstruct, disable, content, or perfect, the understanding; these amount to fifty. *Obstructions* of intellect are error, conceit, passion, hatred, fear, severally subdivided into 62 species. *Disability* of intellect arises from defect or injury of organs, such as deafness, blindness, &c., and from the contraries of the two next classes; making a total of 28 species. *Content* is either internal or external—the one fourfold, the other fivefold. Internal content concerns nature, proximate cause, time, and luck; external content relates to abstinence from enjoyment upon temporal motives—viz., aversion to the trouble of acquisition, or to that of preservation, and reluctance to incur loss consequent on use, or evil attending on fruition, or offence of hurting objects by the enjoyment of them. The *Perfecting* of intellect comprises eight species; it is direct, as preventing the three kinds of pain; or indirect, such as reasoning, oral instruction, amicable intercourse, &c.

Besides the 25 principles, the Sânkhya also teaches that nature has three essential *gun'as*, or qualities—viz., *sattwa*, the quality of goodness or purity; *rajas* (lit. colouredness), the quality of passion; and *tamas*, the quality of sin or darkness; and it classifies accordingly material and intellectual creation. Thus, four properties of intellect partake of goodness or purity —viz., virtue, knowledge, dispassionateness, and power; and four, the reverse of the former, partake of sin or darkness—viz., sin, error, incontinency, and powerlessness. It is worthy of notice that by power the Sânkhya understands eight faculties —viz., that of shrinking into a minute form, to which everything is pervious; of enlarging to a gigantic body; of assuming extreme levity; of possessing unlimited reach of organs; of irresistible will; dominion over all beings, animate or inanimate; the faculty of changing the course of nature; and the ability to accomplish everything desired. The knowledge of the principles, and hence the true doctrine, is, according to the Sânkhya, obtained by three kinds of evidence—viz., perception, inference, and right affirmation, which some understand to mean the revelation of the Veda and authoritative tradition.

It will be seen from the foregoing summary that the Sânkhya proper does not teach the existence of a supreme Being, by whom Nature and Soul were created, and by whom the world is ruled. It was therefore accused by its opponents to be atheistical, or to deny the existence of a creator; and it is the special object of the *Yoga* system

to remove this reproach, by asserting his existence, and defining his essence (see YOGA). The truth however, is, that the Sânkhya proper merely maintains that there is no proof for the existence of a supreme Being; and the passages quoted by the opponents, to shew that the founder of the Sânkhya *denied I's'wara*, or a supreme God, are quite compatible with the view, that he confined his teaching to those *tattwas* or principles which, in his opinion, were capable of demonstration. Nor is it at all probable that the founder of the orthodox Yoga would have propounded his system as supplementary to that of the Sânkhya proper, had there been that incompatible antagonism between them which must separate an atheistical from a theistical philosophy. The Sânkhya system underwent a mythological development in the Purân'as (q. v.), in the most important of which it is followed as the basis of their cosmogony. Thus, *Prakr'iti*, or nature, is identified by them with *Mâyâ*, or the energy of Brahmâ; and the Matsya-Purân'a affirms that *Buddhi*, or *Mahat*, the intellectual principle, through the three qualities, goodness, passion, and sin, 'being one form, becomes the three gods, Brahmâ, Vishn'u, and S'iva.' The most important development, however, of the Sânkhya is that by the Buddhistic doctrine, which is mainly based on it. The Sânkhya system is probably the oldest of the Hindu systems of philosophy; for its chief principles are, with more or less detail, already contained in the chief Upanishads (see VEDA); but whether the form in which it has come down to us, and in which it is now spoken of as *the* Sânkhya, is also older than that in which the other systems are preserved, is a question as yet not solved by Sanscrit philology. That this form, however, is not the oldest one, is borne out, for instance, by the differences which exist between the Sânkhya doctrine of the Upanishads and the doctrine propounded in the first book of the Institutes of Manu on the one side, and the doctrine of the actual Sânkhya on the other.

The reputed founder of the actual Sânkhya is *Kapila* (lit. *tawny*), who is asserted to have been a son of Brahmâ, or, as others prefer, an incarnation of Vishn'u. He taught his system in Sûtras (q. v.), which, distributed in six lectures, bear the name of *Sânkhya-Pravachana*. The oldest commentary on this work is that by *Aniruddha;* another, is that by *Vijnânabhikshu*. The best summary of the Sânkhya doctrine is given by I's'wara Kr'ishn'a, in his *Sânkhya-Kârikâ*, edited by H. H. Wilson, with a translation of the text by H. T. Colebrooke, and a translation of the commentary of Gaud'apâda by himself (Oxford, 1837). For the various theories concerning the word Sânkhya, and the founder of the system, Kapila, and for the literature relating to it, see the elaborate and excellent preface by Fitzedward Hall to his edition of the *Sânkhya-Pravachana*, with the commentary of Vijnânabhikshu, in the *Bibliotheca Indica* (Calcutta, 1856); and see also his valuable *Contribution towards an Index to the Bibliography of the Indian Philosophical Systems* (Calcutta, 1859). Amongst essays on the Sânkhya philosophy, the most reliable still remains that by H. T. Colebrooke, reprinted from the *Transactions* of the Royal Asiatic Society, in his *Miscellaneous Essays* (London, 1837), vol. i. p. 227, ff.

SAN LU'CAR DE BARRAME'DA, a seaport of Andalusia, in the modern province of Cadiz, and 18 miles north of the port of that name, stands on a sandy, undulating tract on the left bank of the Guadalquivir, and at the mouth of that river. It is a dull decaying place, and is notable chiefly as the mart whence inferior and adulterated vintages are exported to England as sherries. Pop. 16,000.

SAN LU'IS POTO'SI, a considerable town of Mexico, capital of the state of the same name, stands near the source of the river Tampico, and 200 miles west of the port of that name on the Mexican Gulf. It stands on a plateau 6350 feet above sea-level, is well built, containing many handsome edifices, chiefly ecclesiastical, and is surrounded by gardens. Its markets are well supplied, and it carries on a considerable trade with the neighbouring states. Shoes, hats, and hardware are the chief manufactures, and woven fabrics and liquors are imported from Tampico. Pop. 33,581.

SAN MARI'NO. See MARINO, SAN.

SAN MIGUE'L, a town of Central America, in San Salvador, and about 80 miles east of the city of that name. It is said to be the chief trading town in Central America. At its annual fair of La Paz, 15,000 strangers assemble, and business to the amount of 2,000,000 dollars is transacted. About five miles west of S. M. is a volcano, 6680 feet high, which was in a state of eruption in 1848, and again in 1855.

SAN MINIA'TO, a city of Central Italy, province of Florence, and 21 miles west-south-west of the city of that name. S. M. is a fine old episcopal city, adorned with many monuments, and is famous in the history of the Florentine Republic. Pop. 2560.

SANNAZARO, JACOPO, a distinguished Italian poet, of Spanish descent, was born at Naples, July 28, 1458. Love for a young lady called Carmosina Bonifacia, whom he has celebrated under the names of Harmosine and Filli, was what developed his poetical faculty. The lady being insensible to his passion, he sought to forget her in travel. It was during his absence that he composed the *Arcadia*, a medley of prose and verse, of which Tiraboschi, the historian of Italian literature, thus speaks: 'The elegance of the style, the propriety and the choiceness of the expressions, the descriptions, the imagery —everything, in fact, is fresh and original.' The work was greatly admired, and in the course of a century went through sixty editions. It has given its author the reputation of being an Italian classic. S., after his return to Italy, was invited to the Neapolitan court, and composed some comedies for the amusement of the royal family, of which only one has been preserved. He died at Naples in 1530 or 1532. His other productions are *Sonetti e Canzoni, Eclogæ VI.* (reckoned by some his most perfect performance); *Elegiarum Libri III.; De Morte Christi ad Mortales Lamentatio;* and *De Partu Virginis, Libri III.*, mostly written in Latin verse. S.'s life has been written by Crispo and J. A. Volpi. See also Tiraboschi's *Storia della Letterat. Ital. VII. Part* iii.

SAN NICA'NDRO GARGANICO, a town of Southern Italy, in the province of Capitanata, 26 miles north of Foggia. Pop. 7898. It is situated on Mount Gargano, and is one of the most populous towns among those mountains. The lands belonging to it are very fertile, and great herds of cattle and sheep are reared there. It trades in grain, wool and wine.

SAN NI'COLAS, or SAN NICOLÂO, one of the Cape Verd Islands (q. v.), and residence of the bishop of the group.

SAN RE'MO, a city of Northern Italy, province of Porto Maurizio, 27 miles east-north-east of Nice. It is built on the slope of a rising ground on the shores of the Mediterranean. Its fine cathedral, the Santuario della Guardia, and the Santuario dell' Assunta are worthy of notice, the last having four handsome pillars of alabaster. The palace of the Marquis Borrea D'Olmo contains a fine picture-gallery

There is a seminary for priests, besides a college and many schools. Its little harbour carries on a brisk trade in oils and lemons. Nine foreign consuls reside in the town. S. R. is an ancient city, and obscure in its origin. In 1170, it was self-governed, and made an alliance with the Genoese against the Pisans. One of its bishops afterwards sold it to Genoa. 'San Remo is perhaps the mildest situation on all the Riviera. Here palms, lemon, and orange-trees grow with the greatest luxuriance, and the fruit of the date palm almost attains maturity.'—Murray's *Handbook*. In recent years, it has begun to be resorted to by English visitors, and several new and excellent hotels have been erected. Pop. 7445.

SAN ROQUE, a town of Spain, in the modern province of Cadiz, on the bay of Gibraltar, and eight miles north-north-west of the town of that name. The salubrity of the climate, and the cheapness of living, have attracted hither many foreign families, especially English. Pop. about 7000.

SAN SALVADO'R, the smallest, though the second in point of population, of the Central American Republics (see AMERICA), consists of a strip of territory stretching along between Honduras and the Pacific, and bounded on the W. by Guatemala, and on the E. by Fonseca Bay, which separates it from Nicaragua. It averages 180 miles in length, by about 40 in breadth, and contains an area of 7230 English sq. m., with a population (according to the most recent estimate) of 750,000, or 103 to the sq. m. The northern frontier is formed by a portion of the great Cordillera chain, and parallel to this range, and between it and the Pacific sea-board, runs another range of mountains along the whole length of the country, breaking it up into an inland valley, and a long low rich belt along the coast. This central range is highly volcanic in character, and has 16 volcanic peaks, ranging in height from 7386 to 4000 feet high. S. S. possesses numerous lakes, the largest of which is Guija, about 90 miles in circumference, and abounding in fish. The greater portion of the interior valley, and the alluvial strip lying along the coast, are of extreme fertility, and agriculture is extensively and successfully practised, to the almost total exclusion of pastoral pursuits. The principal agricultural products are indigo, sugar, and maize, cotton also being successfully cultivated in the districts around La Libertad and the Bay of Jiquilisco. The coast from Acajutla (30 miles from the western frontier) to La Libertad is known as the *Costa del Balsamo*, or Balsam Coast, as in the woods of this district is produced the famous balsam known as 'Balsam of Peru,' in such quantities that from 17,600 to 22,000 lbs. av. are annually exported. The mineral wealth of S. S. is not great, but rich veins of silver are found at Tabanco in the north-east, and mines of iron in the west near Santa Ana. S. S. has considerable export trade in indigo (which is known in trade as 'indigo of Guatemala,' and is reckoned the finest of all) and sugar, as well as turpentine, cocoa, cotton, and spices. In 1868, the value of exports amounted to about $2,420,000, and that of imports to $2,900,000; in the year 1861, 20 steamers and 21 sailing vessels, amounting to 24,554 tons, entered and cleared the ports of the republic.

The climate of S. S. is salubrious, and the temperature is lower than might be expected from the low latitude and general want of elevation of the country.

The population is composed of whites (of Spanish origin), Indians, *Ladinos* (of mixed white and Indian blood), negroes, and mulattoes. The whites form little more than one-fifth, the Indians one-third. The Indians are of the Aztec race, speak the Spanish language, and profess the Roman Catholic religion (the one established by statute), but retain many of their old heathen rites, and live in a certain degree apart from the rest of the population. They have the rights of citizens, but generally exercise them under the advice of the government. The government is carried on by a president, vice-president, and two ministers, one for foreign affairs and finance, and the other for internal business and war. The legislature consists of two chambers, an upper one of 12 senators, and a lower of 24 representatives. Education is well provided for, every village of 50 inhabitants being bound by law to support a school, and there is a university in the capital, San Salvador (q. v.), which is well endowed by the state. The standing army is 1000 men.

S. S. originally called *Cuscatlan*, 'the land of riches,' is said to have been, previous to the immigration of Europeans, the best peopled and most civilised country in America. It was conquered after a long and obstinate contest by Pedro de Alvarado, a lieutenant of Cortes, and under the Spanish rule was one of the most flourishing portions of the Guatemalan kingdom. In 1821, it threw off the yoke, and joined the Mexican Confederation, from which, however, it seceded in 1823. The several trials since made of a union among the Central American States have ended in the dissolution of all political connection; and S. S. is now an independent republic. In 1863, war broke out between S. S. and Guatemala, in which Honduras joined the former, and Nicaragua the latter. The result was the defeat of S. S., and the expulsion of the president from the country. A new president having been appointed February 20, 1864, tranquillity was gradually restored.

SAN SALVADOR, the capital of the republic of San Salvador, was founded in 1589, and supplanted an older town which had been built in 1528 by a brother of Pedro de Alvarado. It was the capital of the Union of Central America from 1823 till 1839. In 1854, it was a fine, well-built city, adorned with numerous splendid buildings, and containing a population of more than 30,000, but on the night of April 16th it was completely destroyed by an earthquake, and about 100 lives lost. In January 1855, it again became the seat of government, and its population is now about 40,000. The trade, which equally suffered, is gradually assuming its former flourishing condition, and is carried on mostly through the port of La Libertad, which is about five miles distant.

SANSANDI'NG, a large town in the north-west of Africa, in Bambarra, about 20 miles north-east of Sego, on the left bank of the Niger, here called the Joliba. A considerable trade in salt, beads, coral, gold-dust, and cotton cloth is here carried on. Pop. from 10,000 to 11,000.

SANSCÂRA, or SANSKÂRA (lit. completing, perfecting), is the name of the ten essential rites or ceremonies of the Hindus of the first three castes. They are the ceremonies to be performed at the conception of a child; on vitality in the fœtus, in the fourth, sixth, or eighth month of pregnancy; and at the time of his birth, before dividing the navel string; the ceremony of naming the child on the tenth, eleventh, or hundred-and-first day; the ceremony of carrying the child out to see the moon on the third lunar day of the third light fortnight, or to see the sun in the third or fourth month; of feeding him in the sixth or eight month (or at other stated periods); the ceremony of tonsure in the second or third year; of investiture with the string in the

fifth, eighth, or sixteenth year—when he is handed to a *guru* to become a religious student; and the ceremony of marriage, after he has completed his studies, and is fit to perform the sacrifices ordained by his sacred writings.

SANSCR'IT, or SANSKR'IT (from the Sanscrit *sam* = Gr. *syn*, 'with, together,' and *kr'ita*, 'done,' with an epenthetic *s*, imparting greater emphasis to the sense of the compound; hence, 'thoroughly done, finished, accomplished') is the name of the ancient language of the Hindus; in which their whole sacred literature, and by far the greatest amount of their numerous ritual, legal, poetical, and scientific works, are written. S. belongs to that stock of languages commonly called the Indo-European, or Indo-Germanic, which includes the Indian, the Medo-Persian, the Græco-Latin, the Germanic, the Lithuanian-Slavonian, and the Gallo-Celtic families. It is therefore intimately allied to the ancient and modern languages comprised in each of these families, itself being the parent of the *Prâkr'it* (q. v.) dialects, the *Pâli* (q. v.), and the languages spoken in the north of India. Compared with the ancient languages kindred with it, S. has come down to us in a state of preservation and development so much superior to theirs, that it must be looked upon as the principal means which enables us to understand the affinity, and in general the linguistic laws which pervade the structure of these languages. The essay of Franz Bopp, *Ueber das Conjugations system der Sanskrit Sprache*, dated 16th May 1816, began a new era in the study of language. See PHILOLOGY, BOPP.

There are two great periods into which the history of the S. language may be conveniently divided: the first embracing the language as contained in the Vedic hymns (see VEDA); and the second, that represented by the so-called classical S., in which the epic works, the law codes, and the later literature are written. Between the two there is a transition period of the language, to which the Brâhman'a and ritual portion of the Vedas, and the Upanishads, may be assigned. In the language of the Vedic hymns, the grammar is less developed and much less settled than in the classical S.; it contains, moreover, many forms which at the second period became obsolete, or altogether disappeared from use; the structure of its sentences, too, is simpler, though it is more elliptical than in classical poetry. Another main difference between the two periods lies in the sense of its words. Though this is the same in many words of the Vedic hymns and the classical literature, still there are numerous words, which, though the same in form at both periods, have a sense which differs according as it belongs to the one or the other class of writings. The difficulty thus presented by the Vedic hymns is in a great measure removed by the commentators who explain the meanings of the Vedic words, and, in doing so, follow tradition, which, considering the peculiarities of Hindu history, and also internal evidence, is in all probability immemorial, and therefore the safest if not the only guide in the understanding of the oldest Vedic works. That their explanations may have become unsafe in some instances, would be but natural; but it is certain that these instances are the rare exceptions; and it is likewise certain that when modern Sanscritists—and several of these only imperfectly acquainted with S. grammar—have attempted to supersede those traditional meanings by interpretations which they suppose better suited to the context, or to some assumed etymology of their own, their rendering may better adapt the Vedic to the classical vocabulary, but is sure to falsify that understanding which the Hindu mind had of its oldest and most sacred works, and on which its further historical development is based. In the transition period of the Brâhman'a and ritual portion of the Vedas and the Upanishads, grammar and vocabulary offer similar difficulties to those of the Vedic hymns; but though for this reason the aid of the commentaries is likewise indispensable, they are much less numerous; and in those works of this extended period, which probably were composed at the classical epoch, the difference between the two is even inconsiderable. In comparing S. with other kindred languages, it is therefore necessary not to lose sight of these periods of the language, and of the peculiarities inherent in them.

SANSCRIT LITERATURE. The most natural, and, at the same time, the most scientific distribution of Sanscrit literature would be that according to the dates at which its writings were composed. The actual condition of Sanscrit philology, however, renders such a course impossible; for, with the exception of very few works, no date whatever is known to which they could be safely assigned. (See INDIA—*Religion:* VEDA.) In spite, therefore, of an apparent plausibility with which some authors have propounded a regular literary chronology of Sanscrit works, even with figures or dates appended to them, the general reader will do well to look upon all such dates as imaginary, and to rest satisfied with the hope, that perhaps future results of Sanscrit philology may afford a more satisfactory settlement of this vexed question of Sanscrit chronology. Under these circumstances, the only possible arrangement of Sanscrit literature is that suggested by their contents, irrespectively of the time at which they were composed, but, under each head, in that order which, within large margins, may be suggestive of consecutiveness.

1. *Religious Literature.*—It comprises, in the first place, the Vedas, and the mystical, philosophical, and ritual works connected with them (see VEDA and UPANISHAD); and secondly, the PURÂN'AS (q. v.) and TANTRAS (q. v.), besides prayer-books and smaller works, and treatises of less importance relating to the modern worship, based on the two latter classes of works.

2. *Law Literature.*—It is comprised under the name of *Dharmas'âstra* (from *dharma*, law—religious and civil—and *s'âstra*, book), and its origin is traceable to the ritual Sûtras relating to the Vedas. A complete Dharmas'âstra consists of three portions: the first treating of *Achâra*, or 'established rules of conduct,' comprising such matters as education, marriage, the funeral rites, the duties of a king, &c.; the second treating of *Vyavahâra*, or judicature, including law, private and criminal, and under the former, for instance, the law of inheritance and adoption; the third, on *Prâyas'chitta*, or penance, treating, besides this subject, also of impurity, the duties of a devotee, transmigration, and final beatitude. The chief extant representatives of this class are the codes of MANU (q. v.) and YÂJNAVALKYA (q. v.). Less complete than the latter—for it does not contain the Vyavahâra portion—is the code of PARÂS'ARA (q. v.); but it deserves special mention, as the modern Hindus consider it to have been especially composed for the requirements of the Kaliyuga, or the present mundane age, and as it is cited, therefore, as *the* authority, for instance, on the question, and in favour, of the remarriage of Hindu widows. For practical purposes, especially those concerning Vyavahâra, the chief actual authorities are the commentaries on Manu, *Yâjnavalkya*, and similar works, and the digests which have grown up from them. Amongst the former, the MITÂKSHARÂ (q. v.), by Vijnânes'wara, occupies the principal rank; and amongst the latter, the *Chintâman'i*,

Viramitrodaya, *Vyavahâra-mayûkha*, *Smr'itichandrikâ*, and *Vyavahâra-Mâdhaviya*, which generally defer to the authority of the *Mitâkshará*; and, besides these, the *Dâyabhâga* of Jîmûtavâhana, which, like the *Dâyatattwa* of Raghunandana, differs from it on several important questions, for instance, on that relating to the hereditary rights of women. (See MITÂKSHARÂ.) As on the Vyavahâra, there are numerous smaller treatises on the Achâra and Prâyas'chitta.

3. *Poetical Literature.*—(*a.*) The two great epic poems. See RÂMÂYAN'A and MAHÂBHÂRATA.

(*b.*) *The Modern Epic Poems.*—Their subject-matter is entirely borrowed from the two great epic poems and other legendary works; and their only merit consists in the art bestowed by their authors on the versification, and all that relates to the æsthetical canon of Hindu poets, which, in some respects, may meet with the approbation of western critics, but, in others, would require in the European reader a total abnegation of his ideas of poetical beauty, in order to make these poems acceptable to him. Minute descriptiveness, elaborateness of diction, and an abundance of figures of speech, are some of the characteristics of these poems, amongst which those of Kâlidâsa approach nearest our standard of poetical worth. One of them, the *Bhattikâvya*, which relates to the history of Râma, was purposely composed for illustrating rules of grammar and formations of words of special interest. In another, the *Râghava-Pândavîya*, the ambiguity of the diction is so studied, that the poem may be interpreted as relating to the history of Râma, or other descendants of Das'aratha (see RÂMÂYAN'A), or to that of the descendants of Pân'd'u (see MAHÂBHÂRATA). The following are the *Mahâ-kâvya* or great poems of this class: the *Raghuvans'a* and *Kumârasambhava*, by Kâlidâsa (q. v.); the *Nalodaya*, also ascribed, though probably wrongly, to the same poet; the *Bhat't'i-kâvya*, or the poem by Bhat't'i; the *S'is'upâlabadha*, by Mâgha, hence also called the *Mâghakâvya*; the *Naishadîyacharita*, by S'rîharsha; the *Kirâtârjunîya*, by Bhâravi; and the *Râghava-Pân'd'avîya*, by Kavirâja (i. e., the prince of poets), as the author calls himself.

(*c.*) *Lyric and Erotic Poetry.*—Several works of this class are more of a descriptive character, and would differ therefore from what in European poetry might be included under this head. The principal works belonging to it are the following: the *R'itusanhâra*, or a description of the seasons, attributed to Kâlidâsa (q. v.); the *Meghadûta*, or the cloud-messenger, also supposed to have been written by Kâlidâsa—a poem in which a demigod, separated by fate from his wife, is imagined to make a cloud the messenger to her of his woes, and incidentally, as it were, describes his course over a large tract of India; the *Amarûs'ataka*, or hundred stanzas of Amaru, on amatory feelings and scenes, the natural sense of which commentators have twisted also into one of a mystical character, so as to make them appear less objectionable, especially as they were supposed by some to have been composed by the celebrated theologian S'ankara, when he had animated the dead body of King Amaru (see S'ANKARA); these stanzas have an epigrammatic character, and share in this respect the style of the first S'ataka, or hundred verses on love, by Bhartr'ihari; the *Bhâminivilâsa*, by Jagannâtha Pan'd'itarâja, in four books, the second of which is connected with amatory subjects, while the third is a beautiful elegy on the death of the poet's wife; the *Gîtagovinda*, by Jayadeva, who probably lived in the 12th c., which, in ten sections, describes the amours of Kr'ishn'a with the cowherdesses, his separation from his wife Râdhâ, and his ultimate reconciliation with her, and which, like the *Amarûs'ataka*, has also been explained in a mystical sense, Kr'ishn'a then being represented as the soul which for a time becomes estranged from the supreme soul, its original source, but finally returns to it. This poem differs from those mentioned before in being intended for singing and for representation at a festival held in honour of Vishn'u; it combines the lyric and the melo-dramatic character.

(*d.*) *Didactic Poetry.*—A portion of this class of poetry may be included under the former head, since even such works as the *Amarûs'ataka*, and the erotic stanzas of *Bhartr'ihari* have much of the sententious character; another is contained in the episodes of the *Mahâbhârata*, and another forms a considerable portion of the books of fables. The chief special representatives of this class are, 'the three *S'atakas*,' or hundred stanzas on love, good and wise conduct, and renunciation of worldly desires, by *Bhartr'ihari*. Similar pieces of poetry are the hundred stanzas of *Chânakya*, and some stanzas in the anthology of *S'arngadhara*, called the *S'ârngadharapaddhati*. Others have been collected in various modern anthologies, such as the *Nîtisankalana* and the *Kavitâmr'itakûpa*. For the poem *Bhagavadgîtâ*, see under YOGA.

(*e.*) *Dramas.*—The plays of the Hindus are not numerous; they were only acted on special occasions, and the subject of the plot is with predilection borrowed from the legendary literature of ancient India. Hindu dramatists have little regard for unity of time, place, and action; and with the exception of Kâlidâsa, they must be considered as inferior in poetical worth to the renowned dramatic writers of ancient Greece and of modern Europe. Besides the reasons to be sought for in the religious, mystical, and metaphysical tendencies of the Hindu mind, a free development of the Hindu drama was probably also impeded by the heavy and artificial canon which weighed upon Hindu dramaturgy, and which, ascribed to sacred sources, and looked upon as a law not to be transgressed by any dramatic poet, did not allow much scope for poetical imagination, and would keep down any free movement upon which it might have ventured. The various kinds of dramatic performances, the number of their acts, the characters of the plays, the conduct of the plot, the sentiments to be represented, and even the modes of diction—all these were strictly regulated; so much so, that in spite of the differences which must exist between different authors and plays, there is still a kind of uniformity which pervades the whole Hindu drama, and must strike any one unacquainted with this elaborate dramatical canon. It must suffice here to mention a few of its peculiarities. All dramatic composition is divided, according to it, into two great classes—the *Rûpaka* or performance, and the *Uparûpaka*, or the minor *Rûpaka*; the former containing ten species, from the *Nât'aka*, or the play, *par excellence*, which represents exalted personages, down to the *Prahasana*, or farcical comedy; and the latter with eighteen species. Neither class contains the species 'tragedy'—which is incompatible with a belief in fate, one of the main features of the Hindu mind. Every drama opens with a prelude in the form of a dialogue between the stage-manager and one of his company, in which the name of the author and of his work, and such prior events as the spectators should know, are brought before the audience. The first part of this prelude is a prayer invoking the benediction of some deity in favour of the assembly. The piece thus being opened, is then carried on in the usual manner; but so long as the same act lasts, the stage is never left empty, but the entrance of a new personage is always announced by a special

person. The piece closes as it began, with a benediction. The principal characters of the play are the hero (*nâyaka*) and the heroine (*nâyikâ*). The former is either *lalita*, gay, thoughtless, and good-humoured; or *s'ânta*, gentle and virtuous; or *dhîrodâtta*, high-spirited, but temperate and firm; or *udâtta*, ardent and ambitious; but as each of these categories is again subdivided, they become multiplied to 144 kinds. Equal minuteness is displayed in specifying the classes of the heroines. The hero has his antagonist in the *pratinâyaka*, or counter-hero; and each of these may have his officers, ministers, and friends. The heroine, on her part, has always a confidential companion, who is often her foster-sister. The subordinate characters are described as being eunuchs, mutes, dwarfs, foresters or barbarians. Two characters, however, deserve special notice, as being peculiar to the Hindu stage—the *Vit'a* and the *Vidûshaka*. The *Vit'a* may be the companion of a man or woman; he is generally on familiar, yet dependent terms, with his associate, and though somewhat like the parasite of the Greek comedy, yet not rendered contemptible; if a female, she is a courtesan. The *Vidûshaka* is the humble companion of a prince or man of rank; he is always lively, sometimes witty, and, according to the definition of his attributes, he is to excite mirth by being ridiculous in person, age, and attire. He is, curiously enough, always a Brâhman. The plays have eight, or, according to some, nine *rasa*, or characteristic flavours: these *rasas* are love, mirth, tenderness, fierceness, heroism, terror, disgust, wonder, and tranquillity; and they again consist of conditions with numerous divisions and subdivisions. The manner according to which the form of speech is regulated, is another peculiarity of the Hindu drama. Only the hero and the principal personages speak Sanscrit, but women—with rare exceptions—and the inferior personages speak Prâkr'it; the various, higher or inferior, idioms of that language being adapted to their higher or inferior character. See PRÂKR'IT. The oldest known Sanscrit drama is the *Mr'ichchhakat'i*, or 'the Clay Cart,' by King S'ûdraka, which, in the opinion of H. H. Wilson—who translated it in his *Select Specimens of the Theatre of the Hindus*—was written in the 1st c. B.C. Of other dramas may here be mentioned *Abhijnâna-s'akuntala* (see S'AKUNTALÂ) and *Vikramorvas'î*, by Kâlidâsa (q. v.), to whom also the drama *Mâlavikâgnimitra* is attributed; *Mâlatîmâdhava*, *Mahâvîracharita*, and *Uttararâmacharita*, by Bhavabhûti; *Ratnâvalî*, by S'rîharsha; *Mudrârâkshasa*, by Vis'âkhadatta; *Hanumannât'aka*, fabled to have been composed by the monkey Hanumat (q. v.); and *Anargharâghava*, by Murâri. A drama of a peculiar nature is the *Prabodhachandrodaya*, by Kr'ishn'amis'ra, who, in the opinion of Goldstücker, expressed in the preface to his translation of this drama, lived at the end of the 12th century. Its leading personages are all of a transcendental kind; such as the supreme spirit, faith in Vishnu, volition, organ of imagination, opinion, devotion, quietude, friendship, &c., on the one side; and error, egotism, hypocrisy, love, voluptuousness, anger, avariciousness, &c., on the other; and its object is to represent the victory of the former over the latter. The general dulness of the play is relieved by a number of sectarian worshippers, who appear on the scene, each eulogising the truth of his own religion, and ridiculing that of his antagonist. That this drama, which would baffle the patience of a European audience, was acted 'before King Kirtivarman, who, with his whole assembly, was very eager to see it,' the poet relates in the prelude to it. An imitation of this drama is the *Chaitanyachandrodaya*, by Kavikarn'apura. For the translation of several of these dramas, and an account of others, see H. H. Wilson's *Select Specimens of the Theatre of the Hindus* (2 vols., London, 1835).

(*f.*) *Fables and Narratives.*—Fables, as such, occur, and are referred to, as early as in the great epic poems; but the oldest *collection* of fables is the *Panchatantra* (q. v.); and after it, the *Hitopades'a* (q. v.). These works are considered by the Hindus to belong to the class called *nîtis'âstra*, or works on conduct and polity, since the morals drawn from the fables, and expressed in sententious verses, with which they are interwoven, are the object for which these collections were made. A different class of writings are the ghost-stories, merely composed for amusement, such as the *Vet'âlapanchavins'ati*, or the 25 tales of the vampire; and the *S'ukasaptati*, or the 70 tales of the parrot; and the *Sinhâsanadwâtrins'ati*, or the 32 tales of the statues on the throne of Vikramâditya. A work of a higher order is the *Br'ihatkathâ*, 'the Grand Tale,' or *Kathâsaritsâgara*, 'the Ocean for the Rivers of Tales,' by Somadeva of Cashmere. Amongst narratives of the romance class, the most celebrated are, the *Das'akumâracharitra*, or the 'Adventures of the Ten Princes,' by Dan'd'in, who lived about the middle of the 11th c., edited, with an elaborate preface, by H. H. Wilson; *Kadambarî*, by Vânabhatta; and the *Vâsavadattâ*, by Subandhu, a critical account of which work is given by Fitzedward Hall, in the preface to his edition of it (Calcutta, 1859).

(*g.*) *Chronicles.*—Historical works, in the European sense of the word, do not exist in Sanscrit literature. The same causes which have clouded all Hindu chronology, and even, at recent periods of Hindu history, have transformed historical facts into myths, seem to have rendered the Hindu mind indifferent to the research and the recording of *historical* truth. The only approach to historical works is found in some chronicles, though these, also, are not devoid of fictitious narratives. The most renowned among them is the *Râjatarangin'î* (q. v.), or the Chronicle of Cashmere, by Kalhana. A modern work of a similar kind, but of much smaller extent, is the *Kshitîs'avans'âvalîcharita*, or the Chronicle of a series of royal families who reigned in Bengal. It was composed in the middle of the last century.

4. *Scientific Literature.*—(*a.*) *Philosophy.* See the articles SÂNKHYA, YOGA, NYÂYA, VAIS'ESHIKA, MÎMÂNSÂ, VEDÂNTA.

(*b.*) *Grammar.*—That a scientific study of grammar was cultivated at a very early period of Hindu literature, is borne out by the testimony of the oldest glossator on the Vedas, YÂSKA (q. v.). The oldest extant work, however, on Sanscrit grammar is posterior to the work of Yâska; it is the grammar of Pân'ini (q. v.), which was criticised by Kâtyâyana (q. v.) in the *Vârttikas*, these, again, being commented on and criticised by Patanjali in the *Mahâbhâshya*. (See PÂN'INI, where some of the principal later works connected with his system are mentioned.) That the *Prâtis'âkhyas* (see VEDA) did not precede the grammar of Pân'ini, has been shewn by Goldstücker in his *Pân'ini, his Position in Sanscrit Literature*, &c. Of authors of grammars, not following the technical system of Pân'ini, the principal are, Hemachandra, a Jaina (q. v.) writer, and Vopadeva, who probably lived about six centuries ago, and is especially esteemed in Bengal.

(*c.*) *Lexicography.*—It consists of glossaries of words and *dhâtus*—a term which may be vaguely rendered by 'roots,' or 'radicals,' though it does not imply, to the Hindu grammarian, the idea of a linguistic *element*—and of commentaries on these glossaries. The oldest known glossary of *Vedic* words—nouns and verbs—is the *Nirukta* (q. v.) of

Yâska. Renowned glossaries of *classical* words are the *Amarakosha*, by Amarasinha, who is probably not later than the 3d c. after Christ; the *Abhidhânaratnamâlâ*, by Halâyudha; the *Haimakosha*, by Hemachandra; and the *Vis'waprakâsa*, by Maheswara. (For other works of this class, see Wilson's *Sanscrit English Dictionary*, preface to 1st ed., 1819; and Colebrooke's *Miscellaneous Essays*, vol. i. p. 50, ff.) The glossaries of *dhâtus* are called *Dhâtupât'has*. The oldest was probably composed by Pân'ini himself, and is the groundwork of the existing works of this name, though the latter contain numerous additions of later forms. The chief commentary on the *Dhâtupât'ha* is that by the celebrated Mâdhavâchârya (q. v.).

(*d.*) *Prosody.*—Sanscrit prosody admits three sorts of metre: one governed by the number of syllables, and which is mostly uniform, or monoschematic, in profane poetry, but not so in various passages of the Vedas; the other regulated by feet equivalent to two long syllables, or to four short; and the third regulated by the proportion of syllabic instants, without noticing the number of feet. Some Sûtras (q. v.) connected with the Vedas contain rules on the Vedic metres; but the principal work on Vedic as well as profane prosody is the *Chhandah's'âstra*, by Pingala, which has been commented on by various writers, the most conspicuous of whom is Halâyudhabhat't'a. A short treatise on prosody, which only exhibits the most common sorts of metre, the *S'rutabodha*, is attributed, but probably wrongly, to Kâlidâsa (q. v.).

(*e.*) *Art of Poetry.*—It is treated in works on dramaturgy, and works on the poetical art in general. The oldest work on the dramatic art is the *Sûtra* of Bharata; a later one is the *Das'arûpa* by Dhananjaya. Some of the principal works of the latter category are the *Kâvyaprakâs'a*, by Mammat'a, the *Kâvyâdars'a*, by Dan'd'in, and the *Sâhityadarpan'a*, by Vis'wanâtha Kavirâja. Several other works of this class are especially concerned in the explanation of figures of speech.

(*f.*) *Works on Music.*—In general, they treat of notes, musical scales, melodies, the art of singing, and musical instruments; and some of them also of the art of dancing and performing. The melodies, or *Râgas*, are represented as deities, who have wives, the *Râyin'îs*. Their number is uniform in the different works, and it is probable that the passages in dramas and other poetical works intended for singing were written to suit these fixed melodies, and not that the melodies were composed after the poet had performed his task. The principal works of this kind are the *Sangîtaratnâkara*, by Sârngadeva, the *Sangîtadarpan'a*, by Dâmodara, and the *Sangîtadâmodara*, by S'ubhankara. Special treatises relate to the melodies alone.

(*g.*) *Amatory Art.*—Works treating of this art purport methodically to explain and to classify all that relates to love, and they refer for many of their statements to the oldest authorities. The chief work on this subject is the *Kâma-Sûtra* of Vâtsyâyana.

(*h.*) *Astronomy and Arithmetic.*—The calendars connected with the Vedas are the earliest evidence of Hindu proficiency in astronomy; they presuppose a knowledge of a solar year of 365 days, and their date is assumed by Colebrooke to belong to the 13th c. B.C., while others would place them a few centuries later. The scientific works of later Hindu astronomers are professedly based on five ancient systems, or Siddhântas, called the Paulis'a-, Romaka-, Vâs'isht'ha-, Saura-, and Paitâmaha-Siddhânta; and the earliest renowned author among these astronomers is Âryabhat't'a, who, according to Colebrooke's calculation, did not live later than the 5th c. after Christ. From the quotations by Brahmagupta, it appears that Âryabhatta 'affirmed a diurnal revolution of the earth on its axis, that he possessed the true theory of the causes of lunar and solar eclipses, and that he noticed the motion of the solstitial and equinoctial points, but restricted it to a regular oscillation, of which he assigned the limit and the period.' See, for further detail, Colebrooke's *Algebra*, &c. (Lond. 1817, p. 38). His principal work, the *Âryâsht'as'ata*, is at present only known from the quotations of Brahmagupta, Bhat't'otpala, and others; but his other works, the *Das'agîtikâ* and *Âryabhat't'îya*, are extant. Varâhamihira, the next important astronomical writer, a native of Ujjayinî, lived about the beginning of the 6th c. after Christ. His compilation of the five Siddhântas, the *Panchasiddhântikâ*, is not yet recovered; but several of his astrological treatises, and the scholia on them by Bhat't'otpala or Utpala are preserved, and his *Br'ihatsanhitâ* has been recently edited by Dr H. Kern (Calc. 1865). Another great astronomical authority is Brahmagupta, who appears to have written towards the close of the sixth, or the beginning of the following century; his work bears the title of *Brahmasiddhânta*, and it was followed up by Bhâskara, who, in the middle of the 12th c., composed a celebrated work, the *Siddhântas'iroman'i*, translated by Lancelot Wilkinson (Calc. 1861). The *Sûryasiddhânta* has been edited by Fitzedward Hall (Calc. 1859); and two translations of it are due, one to E. Burgess, in the *Journal* of the American Oriental Society, accompanied with notes by Whitney (New Haven, 1860); another to Bâpûdeva S'âstri (Calc. 1861); but whether this Siddhânta is the Saura, one of the five original Siddhântas above mentioned, or a later work bearing a similar title, is matter of doubt. That Hindu astronomy is largely indebted for its progress to the kindred sciences of western nations, may be inferred from the occurrence in Sanscrit of terms which are of Arabic and Greek origin. Thus, the terms *horâ*, *dreshkân'a*, *liptâ*, *kendra*, &c., are easily traced to the Greek *hōra*, *dekanos*, *lepta*, *kentron*, &c.—That works on Hindu astronomy contain more or fewer chapters or passages which no longer concern astronomy, but belong to the sphere of astrology, can be no matter of surprise, considering the intimate connection in which, in India, religion and superstition stand to every branch of human knowledge, and much more especially to one concerning the heavenly bodies. There are, moreover, numerous works which are purely astrological, merely treating of nativities and the influence of the planets on certain periods of the day or month, and the occurrences that would take place at them. Among celebrated writers on algebra, it must here suffice to name Varâhamihira and Bhâskara. See Colebrooke's *Algebra*, as quoted above.

(*i.*) *Medicine.*—The origin of Hindu medicine is referred to the god Brahman, from whom the Âyurveda, or 'the science of long life,' was obtained by Daksha, who communicated it in his turn to the As'wins. Some time after this, mankind, in consequence of their wickedness, becoming afflicted with numerous diseases, the Munis, or saints, met in the Himalaya Mountains to search for a remedy. A long list of these saints is given by *Charaka*, one of the greatest medical writers, and it is so far of interest as it contains several names known in Hindu history, and which thus may be probably connected with the early study of Hindu medicine. The two greatest medical authorities the works of whom are still extant are *Charaka* and *Sus'ruta* (q. v.).

both treat of the duties of physicians and their pupils, of anatomy and physiology; hygeology; materia medica, pharmacy, and preparations of medicine; surgery; the diagnosis, prognosis, and treatment of a considerable number of diseases; midwifery, toxicology, &c. Several chapters in them are devoted to omens and portents, as well as to the evil influence of planets and demons on the human body. Charaka, who is older than Sus'ruta, contains more mythological detail than the latter. Of the authorities quoted by Charaka, Âtreya seems still preserved in a work, the *Âtreyasanhitâ*, which is far less scientific and complete than either the work of Charaka or Sus'ruta, and therefore appears to have preceded them.—See also T. A. Wise, *Commentary on the Hindu System of Medicine* (London, 1860).

(*j*). *Architecture.*—Treatises on architecture, sculpture, &c. are collectively called *S'ilpas'âstra.* There appear to have been 32, or, according to some, 64 standard treatises on these arts, but of these only a few are probably still in existence. The most important of them is the *Mânasâra*, which consists of 58 chapters, each of which is devoted to a particular topic—such as measures used in architecture; the different sites to be selected for building temples and houses; the mode of determining the different points of the compass; the several sorts of villages, towns, and cities, with directions for building them; the different parts of an edifice, its ornaments, pedestals, bases, pillars, &c.; the various sorts of temples; the construction of porticoes, gates, palaces, &c.; the construction of images, and cars in which the gods are carried in procession, together with the ceremonies attending the consecration of images; the mode of determining the propitious moment for commencing to lay the foundation of an edifice, &c. See, for further detail, Râm Râz, *Essay on the Architecture of the Hindus* (London, 1834).

For a more copious supply of titles of books on the subjects mentioned, the reader may consult Gildemeister, *Bibliotheca Sanscrita*, Bonn (1847), and the printed catalogues of the Library of the India Office, of the Sanscrit MSS. of the Bodleian Library at Oxford, and of the Sanscrit MSS. of the Royal Library at Berlin.

SANSCULOTTES, i.e., 'without breeches,' was the name given in scorn, at the beginning of the French Revolution, by the court party to the democratic 'proletaires' of Paris. The latter accepted this superfine reproach with sardonic pride, and the term soon became the distinctive appellation of a 'good patriot,' more especially as such a one often made a point of shewing his contempt for the rich by neglecting his apparel, and cultivating rough and cynical manners. As the noblesse prided itself on an illustrious pedigree, so the genuine child of the revolution boasted that he was come of a long line of—noteless sansculottes; that his

'Ancient but ignoble blood
Had crept through scoundrels ever since the flood.'

Towards the close of the Convention, the name, connected as it had been with all the sanguinary excesses of the period, naturally fell into bad odour, and soon after totally disappeared; nor do the French appear to wish that its memory should be preserved, for they have not given it a place in their Encyclopædias.

SAN SEBASTIA'N, a rising seaport city in the north of Spain, capital of the Basque province of Guipuscoa, 381 miles north-north-east of Madrid by the North of Spain Railway. It is built on a peninsula, at the southern base of a conical hill, called Mont Orgullo, 400 feet high, commanding a most striking view, and crowned with a castle strong enough to have obtained for itself the name of the Gibraltar of the north of Spain. Since its almost total destruction during the Peninsular War, the town has been rebuilt on a regular rectangular plan. The streets are narrow, and are bordered by high houses, and having curtained balconies in front. On the east of the town is a confined gulf, formed by the embouchure of the Urumea; and on the west is a magnificent roadstead, protected against enemy and tempest by the isle of Santa-Clara, and a series of rocks, which offer to vessels only a narrow and dangerous pass. The roadstead is bordered by a beautiful shore, which, on account of its suitability as a watering-place, attracts visitors from all parts of the country. The town communicates with the mainland by a narrow tongue of land, and by a bridge leading across the Urumea, and connecting S. S. on the peninsula with the railway station on the mainland. By means of the North of Spain Railway, which was inaugurated by the king of Spain, 15th August 1864, the town is placed in direct communication with Madrid and Paris. S. S. is the seat of an increasing commerce. In 1863, 2112 vessels (including those engaged in the coasting-trade), of 152,474 tons, entered and cleared the port. The exports consist principally of wool, flour, wine, cutlery, firearms, copper-ore, and lead; the imports are salted fish, sugar, silk and cotton and linen goods, cocoa, machinery, coffee, timber, and iron-wares. In 1863, coal, coke, wagons, rails, &c., for the new railway, were imported from Great Britain, France, and Belgium to the value of £538,706. Pop. estimated at 19,000, but probably more.

S. S. has suffered from numerous sieges in the wars between France and Spain. It was captured by the Duke of Wellington in 1813, when the dispossessed French garrison set it on fire.

SAN SEVERI'NO, a city of Central Italy, province of Macerata, 15 miles west-south-west of the city of that name. It is well built, and has handsome palaces, the finest of which are the Palazzo Comunale, and that of the bishop. The neighbourhood produces exquisite wine, oil, and fruit, and cattle are reared on the pasture grounds. Pop. 13,898.

SAN SEVE'RO, a city of Southern Italy, province of Capitanata, with 18,000 inhabitants, stands in a delightful and fertile open country, producing abundance of grain, tobacco, and wine, and affording rich pasturage. It was once remarkable for the industry and activity of its population, but its commerce has been greatly injured, and its lands devastated, by years of brigandage.

SANTA ANNA, Don Antonio Lopez de, ex-president of Mexico, was born in Jalapa, in 1798. While a mere youth, he entered the Spanish army, and became lieutenant-colonel in 1821. When Mexico determined to throw off the Spanish yoke, S. A. greatly distinguished himself at the head of the Mexican troops. The Spanish royalists were expelled from Vera Cruz, and he was elected governor of the city and province. Iturbide had established an imperial rule over Mexico (q. v.), but his tyranny having worked his downfall, S. A. proclaimed, in 1822, a Mexican republic, which was recognised by every foreign state except Spain. He was incessantly engaged in quelling the civil wars kindled by the aristocratic and democratic factions. In 1829, he engaged and put to flight a division of Spanish troops which invaded Mexico by way of Tampico, with the view of again bringing Mexico under Spanish rule. The separation of Texas (q. v.) from the Mexican union was vigorously but

unavailingly opposed by Santa Anna. In 1837, differences arose with France, and a division of French troops landed at Vera Cruz. They were gallantly engaged by S. A., who drove a portion of them into the sea at the point of the bayonet. In this action he received a bullet in the leg, which rendered the amputation of the limb necessary. In 1838, the French took Vera Cruz, and obtained the settlement of their differences. In 1847, war having been declared by Mexico against the United States, S. A. took the command of the Mexican forces. He offered a gallant but ineffectual resistance to the troops of Generals Scott and Taylor. The city of Mexico having been stormed and taken by the Americans under General Scott, the war was at an end, and S. A. retired from Mexico. During 30 years he had disputed the direction of affairs with Bustamente, Herrera, Cevallos, and other chiefs of parties, being at one time dictator, and at another disgraced and an exile. In 1853, Mexico, torn by civil dissensions, and falling into anarchy, again recalled Santa Anna. He declared himself president for life, and a civil war was the immediate result. In 1855, he was driven from the country. During the government of Juarez, 1858—1863, S. A. was looked up to as their chief and future ruler by an influential party in Mexico; but the French occupation, and the establishment of a monarchy under Maximilian of Austria, destroyed his prospects of a return to power. He is regarded by his countrymen as their ablest general, and, although he is chargeable with unjustifiable cruelties in suppressing some insurrections, he has been more successful than any other Mexican ruler in quelling the civil wars that have brought the country to its present miserable situation. He is also accused of being greedy of wealth, and unscrupulous in the means of obtaining it. In February, 1864, he returned to Mexico. Before landing at Vera Cruz, he signed an act of adhesion to the empire. Next day, in violation of the engagement, he addressed a proclamation to the Mexican nation, styling himself the conqueror of Tampico, and describing his administration as the golden age of the Mexican republic. The regency, considering this an appeal to the passions of the people, ordered him to return to Havana, where he remained until May, 1866, when he visited the United States. On the death of Maximilian, June, 1867, he returned to Mexico, made an attempt against the republic, and was taken prisoner by the Juarist party, but was soon after released.

SANTA CRUZ (Teneriffe), the capital of the Canary Islands (q. v.), and the chief seaport of the group, stands on the north-east side of the island of Teneriffe. Its port, the safest in Canaria, has been extended and improved by the construction of two moles, with a united length of about 5400 feet, which enclose a large space of water, affording excellent anchorage in from two to nine fathoms. These works are of inestimable value, in a commercial point of view, to the island. The streets of S. C. are broad, the houses whitewashed and flat-roofed, and several of the public buildings striking in appearance. The town is defended by several forts and redoubts. Formerly, large quantities of wine of excellent quality were grown in Teneriffe, and shipped for export at S. C.; now, however, the principal article of export from this, and also from the other islands, is cochineal. Coals from England, together with manufactured goods, hardware, and furniture, are imported. Of the imports at S. C., more than a third come from England, and the whole imports in 1862 amounted to £159,360. Pop. 14,146.

SANTA CRUZ. See VIRGIN ISLANDS.

SANTA CRUZ DE LA PALMA, the capital of Palma, one of the Canary Islands (q. v.). It stands on the east coast of Palma, on a spacious bay from 7 to 10 fathoms deep. Pop. about 5000, employed partly in manufactures of silks and hosiery.

SANTA FÉ, city and capital of the territory of New Mexico, U.S., built among the Rocky Mountains, on a plain 7047 feet above the sea. It is an old Spanish Mexican town, and contains two Roman Catholic churches and the government buildings. It has an active overland trade with St Louis. Pop. in 1870, 4765.

SANTALA'CEÆ, a natural order of exogenous plants, mostly trees and shrubs. The leaves are undivided, sometimes minute. The perianth is superior, 4—5-cleft. The stamens are 4 or 5, opposite the segments of the perianth, and inserted into their bases. The ovary is 1-celled, with 1—4 ovules. The fruit is 1-seeded, nut-like, or drupaceous.—There are about 110 known species, natives of various parts of the world, the European and most of the North American species being obscure weeds, whilst the trees of the order occur chiefly in the East Indies, New Holland, and the South Sea Islands. SANDAL-WOOD (q. v.) is the produce of plants of this order. The leaves of *Osyris Nepalensis* are used for tea. Some species are used in medicine in their native countries. *Fusanus acuminatus* is the Quandang Nut of New Holland. Its taste and qualities resemble those of Sweet Almonds, as do also those of the seed of the *Cervantesia tomentosa* of Peru. *Pyrularia oleifera*, the Buffalo Tree or Oil Nut, has a large seed, from which, in the Southern States of America, oil is obtained.

SA'NTALIN, or SANTALIC ACID, the colouring matter of *Pterocarpus santalinus*, or red sandal-wood, is readily obtained by digesting the rasped wood in alcohol, and then precipitating the santalin by the free addition of water. It is little used in this country as a dye-stuff, but it is employed in India both in dyeing silk and cotton. It is in consequence of the santalin contained in it that red sandal-wood is retained in the *Pharmacopœia* as a colouring agent for tinctures, &c.

SANTA MARGHERI'TA DI BELI'CÉ, a city of Sicily, in the province of Girgenti, with 7384 inhabitants. From the lands belonging to it, grain, wine, and oil are exported. Woven goods and hats are manufactured for export.

SANTA MARGHERITA DI RAPA'LLO, a commune of the province of Genoa, delegation of Rapallo, situated on the sea-coast. Pop. 6054. It has a garrisoned castle close to the sea. Its seafaring men go to fish for coral on the shores of Sardinia and Africa. Consuls from Turkey, Egypt, and Tripoli reside here.

SANTA MARI'A DI CA'PUA-VETERE, a city of Southern Italy, in the province of Terra di Lavoro, with 9733 inhabitants. It is not handsome, but new, and its population is steadily increasing. The neighbouring soil is very fertile, and produces abundance of grain, fruits, oil, and excellent wines. Its manufactures consist of cloth and other woven materials, and hats.

SANTA MAU'RA, or LEUCA'DIA (anc. also *Leucadia* and *Leucas*) so called from its white cliffs), one of the Ionian Islands, off the west coast of the ancient Greek province of Acarnania, from which it is now separated by a passage about a mile wide, although it was in early times connected with the mainland by an isthmus. The canal across the isthmus, which converted the peninsula into an island, is said to have been cut by the Corinthians. S. M. is about 22 miles long, and has a breadth

ranging from 6 to 9 miles. Area about 180 sq. m.; pop. 20,147. Its surface is very uneven. It is traversed by a range of hills from north to south, which end at the southern extremity in the high white cliffs called by the Italian sailors of the Levant Cape Ducato (a corruption of *Leucates*), but better known under the name of 'Sappho's Leap.'

SANTA'NDER, an important and thriving seaport of Spain, in the modern province of the same name, stands on a magnificent bay, an inlet of the Bay of Biscay, about equally distant from Oviedo on the west, and San Sebastian on the east. The bay on which the town is placed is from two to three miles wide, and about four miles long, and is accessible to the largest vessels at all times of the tide. The situation of the town, on a headland protected by a hill, is picturesque; among its edifices few are either interesting from their appearance, or important from their character. Of its former convents one now serves as a theatre; another as a cigar-factory, giving employment to about 1000 people. Numerous new houses, and handsome warehouses, and commercial establishments of various kinds have been erected recently. The fine harbour of S., with a commodious entrance, is accessible at all tides, and unobstructed by a bar. Several important improvements have taken place here since 1862. The half of the province of S. may be said to be impregnated with iron, copper, zinc, and other ores; though, hitherto, the timidity of native capitalists has rendered the quantity extracted comparatively small. In 1863, 12,625 tons of iron and copper ores, together with a quantity of quicksilver and cobalt, were shipped from the port of S. to Great Britain alone, and mostly to Newport and Swansea. Wheat is an important element in the trade of Santander. The exports, in 1861, amounted to £1,320,363; and in that year, wheat and flour were exported to the value of £1,305,135. The imports—the chief articles of which were sugar from Cuba; textile fabrics from England, France, Belgium, and Germany; and salted cod-fish from Norway—amounted, in 1863, to £1,744,202. A railway runs south from S. to Venta de Banos on the great North of Spain Railway; and in the middle portion of it, from Barcena to Reynosa, a distance of 21 miles, there are 22 tunnels. Pop. (1863) 32,600.

SANTARE'M, an interesting old town and river-port of Portugal, on the right bank of the Tagus, 46 miles north-east of Lisbon by railway. It carries on an active trade in the products of the fertile vicinity with Lisbon, with which there is steam-communication by river as well as by rail. Pop. about 8000.

SANTEE', a river of South Carolina, U.S., which rises in the Blue Ridge, in North Carolina, by two principal branches, the Congaree and Wateree, and flowing south-east, empties into the Atlantic Ocean. Lat. 33° 6'. It is navigable 150 miles to Camden, and is bordered, in its lower course, by rice-swamps and pitch-pine forests.

SANTERRE, Antoine Joseph, a French revolutionist, who for some time exercised an influence quite disproportioned to his feeble abilities, was born at Paris, 16th March 1752. He followed the trade of a brewer in the Faubourg Saint-Antoine, and his wealth, probity, and generosity towards his *employés* gave him an immense influence in the district. On the establishment of the National Guard in 1789, he received the command of a battalion, and took part in the storming of the Bastile. During the year 1792, the Jacobin agitators of the faubourgs often met in the brewery of S., and it was there that the *émeute* of the 20th June was preconcerted, on which occasion S., along with Saint-Huruge, marched at the head of the mob who invaded the Assemblée Nationale, and turned out the Girondists. He also played a conspicuous part on the 10th of August, when he was invested with the dignity of general-commanding of the National Guard. In October he was named Field-marshal (*Maréchal de Camp*), and in April 1793 he got the 'authorities' to let him off scot-free for a debt of some 50,000 livres, which he owed the exchequer in the shape of taxes on the beer manufactured by him—the minister of finance arguing that, inasmuch as S.'s beer was drunk for the most part by 'patriots' (not always careful to pay their score), it ought not to be subjected to 'duty.' But greater things were yet in store for the privileged brewer. On the 30th of July, he was appointed a general of division in the French army, and wishing to do something to justify this strictly military office, he marched at the head of 20,000 men against the Vendéan royalists, but was miserably beaten, and in consequence recalled. Shortly after, he was arrested and imprisoned, and only obtained his liberty after the death of Robespierre. He then withdrew into private life; but his fortunes and his popularity alike declined, and in 1800 we find him begging money and employment from Bonaparte. The latter, who saw clearly enough that S. was intrinsically an incapable fool, declined to employ him, but restored him to his military rank. S. died 6th February 1809. Owing to the calumnies of royalist writers, S. commonly figures as one of the ferocious monsters of the Revolution. There is positively no evidence, however, for such an opinion. Though he was hugely fond of 'brave words,' and menaced his opponents with all the bellicose grandiloquence of a French revolutionist, he was nearly as soft in the heart as in the head. Some witty contemporary made the following epitaph on him:

> Ci-gît le général Santerre,
> Qui n'eut de Mars que la bière.

SANTIAGO, the largest of the Cape Verd Islands (q. v.).

SANTIA'GO DE CHI'LI, capital of the republic of Chili, and of a province of the same name, an archbishop's see, and the seat of the supreme government, stands at the western base of the Andes, 1800 feet above sea-level, and 90 miles east-south-east of Valparaiso. It was founded in 1541 by Pedro de Valdivia, but it has only recently acquired importance. Its climate is delightful; the plain on which it stands is extensive, and fertile in vines, figs, melons, and other fruits, and the scenery, looking towards the range of the Andes, is of the grandest description. The valley or plain of S. is sprinkled with tasteful villas and well-cultivated farms. The city is arranged in squares, and the houses are generally low, and are built around a court or garden, which is intended as a place of refuge during the earthquakes that frequently occur here. But of late years it has become the fashion, in spite of the earthquakes, to build costly houses of two, three, and even four stories, with a façade towards the street. The Alameda, shaded with poplars, and cooled by two streams of running water, is a pleasant promenade. The Mint, a portion of which serves as one of the president's palaces, and as offices for the ministers, is the handsomest of the public buildings, many of which, however, are beautiful structures. The university comprises the five faculties of philosophy, mathematics and physical sciences, medicine, law, and theology. There are important educational institutions (including a normal school), and a library.

and museum. On the west side of the great square, which is adorned with a fine fountain, is the cathedral. On December 8, 1863, one of its churches, that of La Compañia, was destroyed by fire during service, and 2000 out of the 3000 of the congregation—the victims being mostly women—met a dreadful death. Gold, silver, and lead are exported, and the imports are chiefly manufactured goods, wines, and spirits. The chief trade is with Valparaiso by the Valparaiso and Santiago Railway, which was opened in September, 1863. Pop. (1865) 115,377.

SANTIA'GO DE COMPOSTE'LLA, an important and once famous city of Spain, formerly the capital of Galicia, and, from the number of pilgrims by whom it was annually visited, the Mecca of Spain, is extremely picturesque in appearance, from its hill-girt situation on an irregular uneven site, 40 miles south of Coruña. The cathedral, occupying the site of a former edifice of the same nature, was founded in 1082, and its buildings, comprising a cloister, the archbishop's palace, &c., cover more than three and a half acres. The great square is a spacious area, and occasionally used as a bull arena. In front of the town-house is an equestrian statue of Sant Jago (St James the Elder, the patron saint of the city and of Spain), whose body, according to a monkish legend, was discovered near this by a hermit—a star miraculously pointing out the spot, whence the name Compostella (*campus stellæ*, 'field of a star'). It was removed to Santiago in 829. The bones of the saint are believed by the people to be built into the foundations of the cathedral. A desolate appearance is imparted to the town from the number of tenantless and ruined nunneries and convents which it contains. Leather is manufactured, and the making and carving of small silver graven images employ a number of silversmiths. Pop. about 30,000.

SANTIAGO DE CU'BA, formerly the capital of the island of Cuba, and now the chief town of the eastern department of the island, stands on a bay on the south coast at the mouth of a stream of the same name. It is hemmed in by mountains, and is reputed the most unhealthy place in the island. Its harbour is deep, well protected, and fortified. It communicates by railway and telegraph with the other towns of the island. As a seat of commerce, it takes rank after Havana and Matanzas. Pop. 96,000.

SA'NTONIN ($C_{15}H_{18}O_3$) is a vegetable principle possessing slightly acid properties, obtained from the seeds and flower-heads of several species of *Artemisia*. The British Pharmacopœia gives *Santonica*, 'the unexpanded flower-heads of an undetermined species of artemisia,' imported from Russia, as its source. It is one of the most efficacious of the class of medicines known as anthelmintics or vermifuges, the most obstinate cases of ascarides and lumbrici almost always yielding to its prolonged use. Pure santonin may be given in powder combined with scammony or rhubarb, the dose being from half a grain to two grains, according to the age of the child. The French prescribe it in the form of lozenges made with white sugar and mucilage; they are readily obtained in this country, and usually act satisfactorily. Küchenmeister, one of the highest authorities on the subject of intestinal worms, prefers the use of santonate of soda, which he obtains by digesting an alcoholic solution of santonin with carbonate of soda, evaporating and crystallising. The dose is from two to eight grains mixed with sugar. Two very peculiar symptoms occur after the administration of santonin. The urine often acquires a reddish tint, which may give rise to an unfounded suspicion of the presence of blood in that fluid; and under its influence, vision becomes remarkably affected for a few hours, every object appearing either yellow or green to the patient. No satisfactory explanation of the latter phenomenon has yet been given.

SA'NTOS, one of the chief ports of the province of São Paulo (q. v.) in Brazil, 34 miles south-south-east of the city of São Paulo, of which it is the port. It stands on the northern side of the island of Engua Guaçu, and commands a fine bay. Sugar, coffee, and other products of the interior are transported to S. by troops of mules; and salt, flour, and other imported goods find their way back by the same means. It is stated that 200,000 mules arrive here laden during the year. 160,000 sacks of coffee are exported annually. Pop. stated at 8000.

SAN VICE'NTI. See SAN SALVADOR.

SÃO FRANCI'SCO, a large river of Brazil, rises as the Paranpeba, in the province of Minas Geraes, in lat. about 20° 40′ S.; long. 43° 25′ W. It flows north, north-east, and east, and in its lower course it separates the provinces of Bahia and Sergipe from Pernambuco and Alagoas. Its first considerable affluent is the Rio das Velhas, which joins it from the right in lat. 17° 45′ S. Above the junction of the Velhas, at Pirapora, where the river is 1782 feet broad, and 1700 feet above sea-level, there is a fall of 17 feet. From the mouth of the Velhas (1666 feet above sea-level) to the falls of Paulo Affonzo, the river is navigable for 920 miles; and from these falls to the mouth of the river, a distance of about 140 miles, it is navigable for larger vessels and steamers. Its entire length is 1652 miles, and its breadth at its mouth is 3486 feet.

SAÔNE, a river of France, an affluent of the Rhone (q. v.), rises in the department of Vosges, at Vioménil, in the Faucelles Mountains, at the height of 1476 feet above sea-level, and flows south past Gray, Châlons, and Mâcon to its confluence with the Rhone at Lyon. Entire length, 312 miles, of which 170 miles are navigable.

SAÔNE-ET-LOIRE, a dep. of France, bounded on the E. by the dep. of Jura and the river Saône, and on the W. by the dep. of Nièvre and the river Loire. Area, 3303 sq. m.; pop. (1866) 600,006. The country consists for the most part of vast and fertile plains, separated by rich vine-clad hills. The fertility is greatest in the vicinity of the two main streams. Horses of a small but vigorous breed are reared; the excellent and abundant pasturage supports numerous herds. The wines, of which 15,400,000 gallons are made annually, are well known as *vins de Mâcon*. Agriculture, iron-mining, and manufactures of cotton fabrics, leather, pottery, fire-arms, &c., are all actively carried on. The dep. was formed in 1790 out of four districts of the ancient province of Burgundy—Maconnais, Charollais, Chalonnais, and L'Autunois. It now forms five arrondissements, of which Mâcon is the capital.

SAÔNE, HAUTE, a dep. in the north-east of France, bounded on the N. by the dep. of Vosges, and on the E. by a portion of Elsass (Alsace), formerly the dep. of Haut-Rhin. Area, 2061 sq. m.; pop. (1866) 317,706. About one half of the entire area is in cultivable land, and more than a fourth part, comprising the north and north-east districts, is covered with forest-clad mountains. In the south and south-west are fertile plains, bounded by hills, covered with vines or timber. The climate of this rich champaign district, with its bulwark of mountains against the north and north-east winds, is remarkably mild and healthy. Sheep, including some flocks of the merino breed, and cattle are reared in large numbers. Fruits are

largely cultivated; and 6,600,000 gallons of wine and 220,000 gallons of brandy are made annually. The arrondissements are Gray, Lure, and Vesoul, and Vesoul is the capital.

SÃO PAU'LO, a southern maritime province of Brazil, bounded on the N. by the province of Minas Geraes. Area, 169,050 sq. m.; pop. about 975,000. Its coast-line—part of which in the north-east is high and rocky, though the rest is low—is about 400 miles in length. Sugar, coffee, rice, millet, and tobacco are staple crops; horses, cattle, and swine are reared for export; and among the minerals are the precious metals and gems. There are several commodious harbours, and the capital is São Paulo.

SÃO PAULO, a city of Brazil, capital of the province of the same name, stands on an uneven elevation between two small streams, tributaries of the Tiete, 220 miles west-south-west of Rio de Janeiro. There is an Academy of Laws, attended by about 500 legal students. The general appearance of the town is picturesque, and the vicinity and suburbs are beautiful. Pop. stated at 22,032.

SÃO PEDRO DO RIO GRANDE. See RIO GRANDE DO SUL.

SAP, the fluid which circulates in plants, and is as indispensable to vegetable life, as the blood to animal life. Entering by the roots of the plant (see ENDOSMOSE), it ascends through the cells and vessels of the stem, proceeding to the surface of the leaves and utmost extremities of the system, and having been exposed, chiefly in the leaves, to the influences of air and light, returns through the bark, a portion ultimately reaching the root and being excreted there, whilst another portion probably enters again into circulation with the new fluid entering from the soil. See CIRCULATION OF SAP. Sap in its most simple state, the ascending or crude sap, consists chiefly of water, mucilage, and sugar; the elaborated sap varies much more in its properties in different plants, forming the peculiar juices of the plants. The elaborated sap always contains much less water than the ascending sap. Plants seem to derive their supply of sap not only from the soil by their roots, but also from the atmosphere by the Stomata (q.v.) of their bark and leaves; and some, especially succulent plants, are capable of existing and increasing in size although entirely severed from the soil. The ascending sap appears to find its way through the whole wood of the stem in ligneous plants, but chiefly through the alburnum or sap-wood. The elaborated sap has been named LATEX (q. v.).—The ascent of the sap is one of the most wonderful phenomena of spring, and seems to depend not so much on the state of the weather, for it begins in the depth of winter, as on the plant having had its sufficient period of repose, and being therefore constrained by its very nature to renewed activity.

SAP, in Military Engineering, is a narrow ditch or trench, by which approach is made from the foremost parallel towards the glacis or covert-way of a besieged place. The sap is usually made by four sappers, the leading man of whom rolls a large gabion before him, and excavates as he progresses, filling smaller gabions with the earth dug out, and erecting them on one or both sides to form a parapet. The other sappers widen and deepen the sap, throwing more earth on to the parapet. A sap is considered to advance in average ground about eight feet per hour. From the nearness of the enemy's works, running a sap is an extremely dangerous operation. When possible, therefore, it is carried on at night; in any case, the sappers are relieved at least every hour. When a sap is enlarged to the dimensions of a trench, it bears that name.

SA'PAJOU, a name sometimes applied to all that division of American monkeys which have a prehensile tail, and sometimes limited to those of them which are of a slender form, as the genera *Ateles* (q. v.), *Cebus* (q. v.), &c.

SAPINDA'CEÆ, a natural order of exogenous plants, consisting of trees and twining shrubs furnished with tendrils, and a few herbaceous climbers. Their leaves are often marked with lines or pellucid dots. The flowers are in racemes or racemose panicles, hermaphrodite or unisexual. The calyx is 4—5-partite, or consists of 4—5 sepals. The petals are 4—5, occasionally wanting, hypogynous, usually having an appendage in the inside. The stamens are usually 8—10; often inserted into the disc, which is fleshy, and sometimes glandular. The ovary is generally 3-celled, the cells containing one or few ovules. The fruit is fleshy, or *samaroid*, or capsular. The order contains about 380 known species, natives of warm climates, especially of South America and India; none of them natives of Europe, although the HORSE-CHESTNUT (q. v.) is now as well known in many parts of it as most of its native trees.—The timber of some species is valuable, particularly that of *Pterozylon utile* and *Hippobroma alatum*, natives of the Cape of Good Hope, the former known there by the name of *Nieshout*, and the latter of *Pardepis*. Some are used in medicine as astringents. Narcotic and poisonous properties are very generally developed—also a saponaceous principle, especially in the genus *Sapindus* (see SOAP BERRY). Yet GUARANA BREAD (q. v.) is made from the seeds of a species of this order; the leaves of another (*Cardiospermum halicacabum*) are used as a boiled vegetable in the Moluccas; and the fruits of some species are excellent.

SAPODI'LLA PLUM, the name given in the West Indies to the fruit of *Achras Sapota* and other species of *Achras*, a genus of the natural order *Sapotaceæ*. The seeds are aperient and diuretic, but an overdose is dangerous. The pulp of the fruit is subacid and sweet, and it is much esteemed for the dessert in the West Indies. The fruit of *Achras mammosa* is called MARMALADE. The NASEBERRY, also of the West Indies, belongs to this genus.

SAPONIFICA'TION. See OILS AND FATS, and SOAP-MAKING.

SA'PONIN ($C_{12}H_{20}O_7$) is a vegetable principle contained in various plants, including the *Saponaria officinalis*, or Soap-wort, the *Polygala Senega*, several varieties of *Lychnis*, the fruit of the horse-chestnut, &c. It is readily extracted from the root of soap-wort by means of boiling alcohol, which, as it cools, deposits the saponin as an amorphous sediment. It derives its name from its behaviour with water, in which it is soluble in all proportions, yielding an opalescent fluid which froths when shaken, like a solution of soap, if even $\frac{1}{1000}$th part of saponin be present. Its solution, or an infusion of soap-wort, is sometimes employed in place of a solution of an alkaline soap, for cleansing the finer varieties of wool from grease.

SAPOTA'CEÆ, a natural order of exogenous plants, consisting of trees and shrubs, often abounding in milky juice. The leaves are leathery, entire, and without stipules. The flowers are axillary; the calyx regular, persistent, generally with five divisions; the corolla monopetalous, hypogynous, deciduous, regular, its segments usually equal in number to those of the calyx, rarely twice or thrice

as many. The stamens are inserted on the corolla, fertile ones generally as many as the segments of the calyx, and generally with alternate sterile ones. There is no disc. The ovary is superior, with several cells, each cell with one ovule. The fruit is fleshy; the seeds nut-like, sometimes cohering; the *testa* bony and shining, with a very long, opaque, and softer scar on the inner face. — There are considerably more than two hundred known species, chiefly natives of the tropics, and the remainder of subtropical countries. One of the most recently discovered species is also already one of the most important, *Isonandra gutta*, which produces GUTTA PERCHA (q. v.).—The fruits of some are pleasant, as the SAPODILLA (q. v.), and other species of the genus *Achras*, the STAR APPLE, and other species of *Chrysophyllum* (q. v.), different species of *Mimusops; Imbricaria Malabarica* and *I. maxima*, various species of *Lucuma*, &c. The genus BASSIA (q. v.) contains species valuable for the oils which they yield. The seeds of *Mimusops elengi* also yield oil abundantly.

SAPPAN WOOD, SAPAN WOOD, or BUKKUM WOOD, the wood of *Cæsalpinia Sappan* (see CÆSALPINIA), an East Indian tree, about forty feet high, with twice pinnate leaves, and racemes of yellow flowers. The wood is much used as a dye-wood, yielding a good red colour, which, however, is not easily fixed. It is a very considerable article of export from Singapore and other ports of that region both to Calcutta and to Europe.

SAPPER, the name given to a private soldier in the corps of Royal Engineers.—The name of the corps was formerly Royal Sappers and Miners.—The pay of a sapper is £22, 1*s.* a year, with extra pay when at work; the number of such men for 1865 was 3296. Only men of good character, already adepts in a mechanical trade, are eligible for this service, which is very popular, as an intelligent sapper frequently passes into some situation in civil life for which his practical military training specially fits him. Many sappers are excellent surveyors, photographers, and draughtsmen.

SA'PPHIRE, a gem excelled in value by no precious stone except diamond, and regarded as a variety of Corundum (q. v.), highly transparent and brilliant. It is sometimes colourless, and the colourless kind, called *White S.*, is sometimes sold as diamond. It more frequently exhibits exquisite colour, generally a bright red or a beautiful blue; more rarely, gray, white, or green. The red variety is the Oriental Ruby (q. v.) of lapidaries; the blue is that commonly called S., and which has received this name from ancient times. It is found crystallised, usually in six-sided prisms, terminated by six-sided pyramids; and is sometimes found imbedded in gneiss; but it more frequently occurs in alluvial soils. It occurs at Bilin in Bohemia, and Expailly in Auvergne, but more abundantly in some parts of the East. Ceylon is famous both for its rubies and its sapphires, the latter being the more abundant. They occur with garnets and other minerals, in a stratum of water-worn pebbles firmly imbedded in clay, in which there are occasional lumps of granite and gneiss. But nothing has yet been done to seek for them in their original situation in the mountain rocks. A piece of S., which was dug out of the alluvium within a few miles of Ratnapoora in 1853, was valued at upwards of £4000. The S. was one of the stones in the breastplate of the Jewish high-priest. Among the Greeks, it was sacred to Jupiter.—The name *Girasol S.* is given to a beautiful variety with a pinkish or bluish opalescence, and a peculiar play of light. The *Chatoyant S.* has more pearly reflections. The *Asteria S.* has in the midst of it a star of six bright rays, resulting from its crystalline structure.

SA'PPHO, along with Alcæus, the chief representative of the Æolian school of lyric poetry, was born either at Mitylene or at Eresos in Lesbos. She was only six years old when she lost her father Scamandronymus. She was contemporary with Alcæus, Stesichorus, and Pittacus, with the first of whom she lived in friendly intercourse, as is seen in the surviving lyrics of both. All that we know of her is contained in an obscure reference in the Parian Marble, and in one of the epistles of Ovid, to her having fled from Mitylene to some place of refuge in Sicily, between 604 and 592. Her famous plunge into the sea from the Leucadian rock, on finding her love for Phaon unrequited, seems to be an invention of later times. At Mitylene, she is supposed to have been the centre of a literary coterie, all of them females, and most of them pupils of her own in the art of poetry. Her moral character has been the subject of controversy in modern times; the most recent disputants being the late Colonel Mure and the well-known F. G. Welcker of Bonn, who, in the *Rheinisches Museum* (1857—1858), appeared, the former for the prosecution, and the latter for the defence. To whatever opinion on this subject we may incline, there is no doubt of her high lyrical genius, which was the admiration of antiquity from Solon downwards, and which, as still surviving in her matchless ode to Aphrodite, enhances our regret that of the nine books of her poems, we only possess fragments. The best text is that contained in Bergk's *Poetæ Lyrici Græci* (1854); the best separate edition is Neue's (1827).

SAPUCAIA NUT, the seed of *Lecythis ollaria*, a lofty tree, which is plentiful in the forests of the north of Brazil, and belongs to the natural order *Lecythidaceæ*. The fruit is urn-shaped, as large as a child's head, and opens by a lid which falls off. Each fruit contains a number of seeds or nuts, as in the case of the allied Brazil nut. The flavour is finer than that of the Brazil nut, although, hitherto, the S. N. is much less common in our shops. Its form is oval, somewhat pointed at both ends, which are slightly bent in opposite directions. Monkeys are very fond of the S. N., and are sometimes caught in consequence of thrusting the hand into a capsule, and not being able to withdraw it when filled with a nut, whilst they obstinately keep hold of the expected prize.

SA'RABANDE, originally a slow dance, said to be of Saracenic origin; and hence a short piece of music, of deliberate character, and with a peculiar rhythm, in $\frac{3}{4}$ time, the accent being placed on the second crotchet of each measure. The sarabande is of frequent occurrence among the *suites* or series of short pieces written by Handel, Sebastian Bach, and others of the old masters, for the harpsichord or clavichord.

SARACE'NIC ARCHITECTURE. See ARABIAN ARCHITECTURE.

SA'RACENS, a name variously employed by medieval writers to designate the Mohammedans of Syria and Palestine, the Arabs generally, or the Arab-Berber races of Northern Africa, who conquered Spain and Sicily, and invaded France. At a later date, it was employed as a synonym for all infidel nations against which crusades were preached, and was thus applied to the Seljuks of Iconium, the Turks, and even to the pagan Prussians. The true derivation of the word was long a puzzle to philologers; Du Cange deduced it from Sarah, the wife of Abraham, an opinion coincided in by the medieval Christian authors; Hottinger (*Biblio. Orient.*), from

the Arab. *saraca*, to steal; Forster (*Journey*), from *sahra*, a desert; while others strove to see its origin in the Hebrew *sarak*, poor; but the opinion which has been most generally supported, and prevails at the present time, is, that the word was originally *Sharkeyn* * (Arab. 'eastern people'), corrupted by the Greeks into *Sarakenoi*, from which the Romans derived their word *Saraceni*. The epithet Sarakenoi was applied by the Greek writers (from the 1st c. of the Christian era) to some tribes of Bedouin Arabs in Eastern Arabia, though they do not agree among themselves as to the particular tribe so denominated. Pliny and Ammianus place the S. in Arabia Petræa and Mesopotamia, on the common frontier of the Roman and Persian empires; and the description of them by the latter, a most painstaking and accurate historian, coincides, in every important particular, with what is known at the present day of the Bedouin tribes of those regions.

SARACEN'S HEAD, a not unfrequent bearing in Heraldry. It is represented as the head of an old man, with a savage countenance.

SARAGO'SSA. See ZARAGOZA.

SARASWATÎ is, in Hindu Mythology, the name of the wife, or the female energy, of the god Brahman, the first of the Hindu Trimûrti or triad. She is also the goddess of speech and eloquence, the patroness of music and the arts, and the inventress of the Sanscrit language and the Devanâgarî letters. She was induced to bestow these benefits on the human race by the sage *Bharata*, who, through his penance, caused her to descend from heaven, and to divulge her inventions. Hence she is also called *Bhâratî*. She was very white, hence another of her names, *Mahâs'wetâ*, or *Mahâs'uklâ* (from *mahat*, great, and *s'weta* or *s'ukla*, white).—S. is also the classical name of the river now called *Sarsooty*, which rises in the mountains bounding the north-east part of Delhi, whence it runs in a south-westerly direction, and is lost in the sands of the great desert in the country of the Bhatti. According to the Hindus, the river only disappears in this place, and continuing its course underground, joins the Ganges and Jumna at Allahabad.

SARATO'GA SPRINGS, one of the chief watering-places in the U.S., is in New York, 38 miles north of Albany. It contains 23 mineral springs, some chalybeate; some containing iodine, with salts of soda and magnesia; and all highly charged with carbonic acid. They are prescribed in diseases of the liver, chronic dyspepsia, &c. In the village are 25 hotels, some of immense magnitude; and during each season, there are from 25,000 to 35,000 visitors. Pop. in 1860, 7496; in 1870, 8539.

SARATO'V, a government in the south-east of Russia, is bounded on the E. by the river Volga, and on the N. by the governments of Penza and Simbirsk. Area, 31,213 sq. m.; pop. 1,688,561. Its dimensions were much larger prior to the year 1850, when a considerable portion of it—the portion to the *east* of the Volga—was taken to form a part of the government of Samara (q. v.), erected in that year. One-third of the area is pasture-land, $\frac{1}{7}$th is under crop, $\frac{1}{14}$th in wood, and $\frac{1}{25}$ths waste land. The chief rivers are the Volga and the Medwieditza. A number of German colonists settled here in 1765—1775, and distinguished themselves by their persevering industry and by diligent cultivation of the soil. Their descendants have become an important section of the population. Cattle-breeding is carried on extensively; fishing is of considerable importance.

SARATOV, a city of Russia, capital of the government of the same name, on the right bank of the Volga, 460 miles south-east of Moscow. Though its houses are generally built of timber, the town has a rich and picturesque appearance. Its 16 churches are ornamented with numerous towers and cupolas; and its broad streets, from the character of the houses and of the elegant equipages that roll through them, have quite a European appearance. It manufactures pottery, bricks, tobacco, silk, hosiery, &c. Pop. (1866) 85,670.

SARAWA'K, a kingdom on the north-west coast of Borneo, is bounded S. and W. by Sambas, E. by Brunai, and N. by the Bight of Datu. The coast stretches from the west of Cape Datu, in lat. 2° N., and long. 109° 55′ E., to the east of the river Samerahan, in long. 111° 3′ E., a distance of nearly 70 miles. Area, 3000 sq. m. Pop. 50,000. The Sarawak is the most important river; it has two navigable mouths, the one entering the Bight of Datu in lat. 1° 42′ 30″ N., and long. 110° 20′ 30″ E.; the other, a few miles further to the east. Other considerable rivers are the Rejang (navigable for 120 miles for vessels of more than 1000 tons), the Lūndu, Samerahan, and Sadang. A chain of mountains, 3000 feet in height, rises in S., and, with increasing elevation, tends towards the north; while others are detached, as the Samerahans, and the steep, densely-wooded Lūndu. Sandstone and granite are the prevailing rocks; porphyries, basalt, and quartzose schists also occurring. In some parts, the soil is clayey; in others, it is a rich mould. With the exception of some cultivated spots, the surface is covered with forests, which abound with wild swine, harts, and a variety of monkeys. There is excellent coal near the river Sadang. Antimony ore, which can be both easily worked and shipped, is obtainable in any quantity; copper and gold have been found, and iron ore is plentiful at Lūndu. Fine timber trees, as ironwood, ebony, sandal-wood, teak, and other sorts peculiarly adapted for shipbuilding, grow on the lands near the mouths of the rivers. Overtopping them all is the tall Camphor Tree (*Dryobalanops aromatica*), from which, by incision, the valuable camphor-oil is obtained; or by felling and splitting the wood, the crystallised camphor, which is prized above that produced in any other part of Asia.

The climate is not considered unhealthy. Much rain falls from September to March, and the thermometer usually indicates about 83° F. Edible nests, wax, and aromatic woods are collected by the Dyaks for the Singapore market, and the plains are well adapted for the growth of rice and sago. In 1862, two cargoes of choice timber for shipbuilding were sent to the royal dockyards of Great Britain, and more attention is now being paid to that natural source of wealth. In 1863, the exports, the chief articles of which were gutta percha, sago flour, antimony ore, and edible birds' nests, amounted to £96,609; and the imports, chiefly gray and coloured shirtings, tobacco, brass-ware, opium, rice, and cocoa-nut oil, amounted to £103,689. The exportation of antimony and sale of opium are monopolised by the government, and with a small head-tax, form the chief revenue.

The original inhabitants are Dyaks, divided into some 20 tribes, and speaking different dialects; they are, for savages, mild, industrious, and honest. Malays live on the coast, and the mines are worked by Chinese. From 1841 to 1868 S. was governed by

* *Sharkeyn*, or *Sharakyoun*, 'eastern people,' is thus opposed to *Magharibé*, or *Maghribé*, 'western people,' the self-styled appellation of the inhabitants of *Maghrib* ('the west') or *Morocco*.

Sir James Brooke (q. v.), as an independent rajah appointed by the sultan of Borneo, in return for distinguished services in putting down rebellion and restoring order; and even on the testimony of the Dutch, who view with extreme jealousy the increased influence of the British on that coast, his rule did much to promote the civilisation and prosperity of his people.

The seat of government is the town of Sarawak, formerly called Kūtjing, near the mouth of the river which is navigable for large ships. Mission-stations and schools have been erected, and the population has increased to 25,000. Trade, which has multiplied ten-fold since Sir J. Brooke was appointed rajah, is principally carried on with Singapore.

SA'RCINA (Lat. a package), or SARCI'NULA, a genus of minute plants of very low organisation, sometimes reckoned among *Algæ*, and sometimes among *Fungi*. A number of forms or species are known. The first discovered, called *S. ventriculi*, was originally observed by Goodsir in matters vomited from the human stomach. It is of a roundish quadrangular form, about $\frac{1}{100}$th to $\frac{1}{120}$th of a line in diameter; the individuals generally grouped in cubes of four, sixteen, or sixty-four in the cube, separated by rectangular striæ. Although the most common seat of sarcinæ is the human stomach, they have likewise been detected in the stomach of the tortoise, the rabbit, the dog, the ape, and in the cæcum of the fowl; in the urine, in a considerable number of cases; in the lungs; in the fæces and intestinal canal; in the fluid of the ventricles of the brain; in cholera stools; in the fluid of hydrocele; in the bones; and Dr Lowe has noticed their existence in stagnant water. It appears from the measurements of Welcher that the sarcinæ occurring in urine are about half the size of those occurring in the stomach, and the aggregations of sarcina cells are also smaller.

Sarcina Ventriculi, magnified 1000 diameters.

(Copied from the *Micrographic Dictionary*. Lond., Van Voorst.)

The occurrence of the sarcina in the urine, the fluid of the ventricles of the brain, &c., is probably a *post-mortem* phenomenon of little diagnostic or pathological importance. Its appearance in vomited fluids is, however, characteristic of a peculiar and important form of dyspepsia. The vomited matter in these cases has a faint acid smell, like that of fermenting wort, and is obviously in a state of fermentation. After standing a few hours, it becomes covered with a thick, brownish, yeast-like froth, and deposits a brown flaky sediment. On examining the froth and the deposit under the microscope, sarcinæ are found in great abundance, together with the torulæ characteristic of Yeast (q. v.). The fluid is always acid, if sarcinæ are present. The amount of vomited matter is always large, and sometimes enormous. It is usually ejected in the morning, after a night spent awake from a sense of heat, gurgling, and distention in the epigastric region; and its discharge gives almost immediate relief. Dr Budd, one of the highest authorities in diseases of the stomach, believes that the disease consists, primarily and essentially, in some organic change, which prevents that organ from completely emptying itself, and which causes a secretion from its coats, capable, when mixed with food, of undergoing or exciting a process of fermentation; and that the development of the sarcinæ bears to this process, or to some stage of it, the same relation which the development of torulæ bears to simple alcoholic fermentation. The well-known power of sulphurous acid in checking the fermentative process, induced Professor Jenner to try the effect of sulphite of soda—a salt which readily yields its sulphurous acid—in this disease; and experience has fully confirmed the accuracy of Jenner's induction; for this salt, administered soon after a meal, or when the fermenting process is commencing, in doses varying from 10 grains to a drachm, dissolved in water, is the most effectual remedy at present known for relieving this disorder. The hyposulphite of soda, in somewhat larger doses, has a similar action.

SA'RCINE (Gr. *sarx*, gen. *sarcos*, flesh) is the name now given to a nitrogenous substance ($C_5H_4N_4O$) which has been obtained from the muscular tissue of the horse, ox, and hare; and from various glandular organs, as the liver and the spleen of the ox, the thymus gland of the calf, and the human liver, in cases of acute atrophy of that organ, in which case it is associated with zanthine ($C_5H_4N_4O_2$), a substance differing from it only by two atoms of oxygen. It is identical with the substance formerly known as Hypoxanthine.

SARCOLE'MMA is the term applied to the delicate sheath which invests each primary muscular fibre. See MUSCLE.

SARCO'MA is a somewhat vague term used by Abernethy and many subsequent surgical writers to designate a fleshy or firm morbid tumour. The term sarcoma is comparatively rarely met with in recent works on surgery.

SARCO'PHAGI. See CANNIBALISM.

SARCO'PHAGUS (Gr. flesh-eater), any stone receptacle for a dead body. The name originated in the property assigned to a species of stone, found at Assos in Troas and used in early times, of consuming the whole body, with the exception of the teeth, within the space of forty days. The oldest known sarcophagi are those of Egypt, some of which are contemporary with the pyramids. The earliest of these are of a square or oblong form, and either plain, or ornamented with lotus leaves; the later are of the form of swathed mummies, and bear inscriptions. The Phœnician and Persian kings were also buried in sarcophagi. The Roman sarcophagi of the earlier republican period were plain. Sarcophagi were occasionally used in the later republic, although burning had become the more general mode of disposing of the dead. The use of stone chests for the interment of distinguished persons has not been altogether discontinued in modern times.

SARDANAPA'LUS. See ASSYRIA.

SARDE, or SARDA, a variety of quartz, differing from carnelian only in its very deep red colour, blood-red by transmitted light. It is rare, and brings a much higher price than common carnelian. The name is probably from Sardis. The S. was one of the stones of the breastplate of the Jewish high-priest. There were also two in the ephod. The SARDONYX is an Onyx (q. v.) containing layers of sarde.

SA'RDÉS, or SARDIS, anciently a city of Asia Minor, the capital of Lydia, was situated in a fertile plain between the northern base of Mount Tmolus and the river Hermus, about 60 miles east-north-east of Smyrna. Through its *agora*, or market-place, flowed the Pactolus, a tributary of the Hermus. The city is first mentioned by Æschylus. It was taken by the Cimmerians, in the reign of

King Ardys (680—631 B.C.). In the reign of Crœsus, the last Lydian king, S. attained its highest prosperity. It became the residence of the Persian satraps after the overthrow of the Lydian monarchy. The Athenians burned it 503 B.C., and it afterwards passed under the Romans, and was the seat of a separate provincial government. It is one of the Seven Churches mentioned in the Book of Revelation.—*Sart*, the modern Sardis, is a poor village, worthy of mention only for the ruins of the ancient city to be seen in the vicinity. Of these, the chief are those of a stadium, of a theatre, and of the Acropolis.

SARDINE (*Clupea Sardina*), a fish of the same genus with the herring and pilchard, smaller than the pilchard; abundant in the Mediterranean, and found also in the Atlantic Ocean, although not so far north as the British shores. It is much esteemed for its flavour, and sardines preserved in oil are exported in large quantities from some of the Mediterranean ports. But the 'sardines' of the west coast of France, which are largely imported into Britain, are generally not true sardines, but young sprats—the *garvies* of the Firth of Forth—and sometimes young herring.

Sardines appear in shoals on the coasts of the Mediterranean at particular seasons, as herrings and pilchards on those of Britain. The S. fishery on the coast of Provence is chiefly in the months of May, June, and July; but the fishery for sprats, which are cured as sardines, and sold under that name on the coast of Bretagne and elsewhere in the west of France, takes place in the winter months. The quantity of both kinds cured is so great as to amount in value to 3,000,000 or 4,000,000 francs annually, about £120,000 to £160,000 sterling. They are exported to the most distant parts of the world; cured with oil in tin boxes, forming a much esteemed delicacy, and, at the same time, a most wholesome article of food. To cure them in this way, they are first carefully washed in the sea, then sprinkled with fine salt; and after a few hours, the head, gills, &c. are removed; they are then washed again, and spread out on willow branches or wire-work, exposed to the sun and wind, if the weather is dry, but in damp and rainy weather, to a current of air under cover. They are next put into boiling oil, in which they remain for a short time, and when they are taken out, the oil is drained away from them as much as possible, and they are put into the tin boxes, of which the shape and appearance are so familiar to everyone. The boxes being filled with sardines, are filled up with oil, the lid is soldered on, and they are placed for a short time in boiling-water, or exposed to hot steam. The boxes which have leaked or have burst in boiling are rejected, and those which remain sound are now ready for the market.

In the south of France, sardines are sometimes cured in red wine, and those so cured are called *Sardines Anchoisées*, or Anchovied Sardines.

There seems to be no good reason why the sprats of the British coast should not be cured in oil, like those of the west coast of France, and so prove a new source of wealth, besides probably being brought at a lower price to the market, to the advantage of those for whom sardines are at present too expensive.

Several species of small *Clupeidæ*, much resembling the S., are found in different parts of the world, and are used in the same way as the S. of the Mediterranean. One species frequents the southern and eastern coast of Ceylon in such vast shoals, that 400,000 have been taken at a single haul of the nets in a little bay; and when the shoal approached the shore, the broken water became as smooth as if a sheet of ice had been floating below the surface.

SARDI'NIA, KINGDOM OF, a former kingdom of Italy, and the nucleus of the present *Kingdom of Italy*, included the duchies of Savoy and Genoa, and parts of those of Montferrat and Milan, the principality of Piedmont, the county of Nice, and the islands of Sardinia and Caprera, amounting in all to 19,564 English sq. m. of continental territory, with a pop. of (1857) 4,590,260, and 9205 of insular territory, with a pop. of 577,282; total area 28,769 English sq. m., pop. 5,167,542. In 1859 it was increased by the addition of the Austrian portion of the Milanese, and diminished by the cession in 1860 of Savoy and Nice to France, the change in the continental territory being shewn by the following figures: area, 21,099 English sq. m.; pop. (1858) 6,530,232; the insular territory remaining unaltered. The various districts above mentioned differ greatly from each other in physical configuration and climate, and the more important of these are treated in separate articles. See also ITALY. The Roman Catholic religion was established by law in March 1848; but monastic orders, with the exception of those which are also benevolent institutions, were suppressed May 28, 1855. In 1859, the army amounted to 76,172 men, and the fleet to 29 ships (none of them men-of-war), with 436 guns; the revenue (1858), which was mostly derived from customs, duties, and direct taxation, to £5,799,301; and the expenditure to £5,949,902—a want of equilibrium in the finances which had long existed, and which caused the establishment, since 1819, of a gradually increasing national debt, that amounted (1858) to £27,080,810. The annual import trade amounted (1857) to a declared value of £19,123,054, and the exports to £14,605,043.

The kingdom of S. was originated by a treaty (24th August 1720) between Austria and the Duke of Savoy (q. v.), by which the latter agreed to surrender Sicily to the former on condition of receiving in exchange the island of Sardinia, and the erection of his states into a kingdom. In 1730, *Victor-Amadeus I.*, the last Duke of Savoy and first king of S., resigned the throne to his son, *Charles-Emmanuel I.* (1730—1773); but repenting his resolution, and attempting to resume the government, he was put in prison, where he died in 1732. His son, by joining with France and Spain against Austria, obtained (1735) the territories of Tortona and Novara, to which were further added (1743), during the war of the Austrian Succession, the county of Anghiera, and the territories of Vigevano and Pavia. He was the author of the code known as the *Corpus Carolinum*. His successor, *Victor-Amadeus II.* (1773—1796), acceded to the European coalition against France, and was deprived in consequence of Savoy and Nice in 1792; but sustained by England and the pope, he raised an army, and maintained himself in his kingdom till 1796, when Bonaparte forced him formally to relinquish the territories he had lost. His son, *Charles-Emmanuel II.* (1796—1802), was at first an ally of France; but the Directory, in 1798, compelled him to surrender all his continental possessions, which were then incorporated with France; and it was not till the first peace of Paris (May 30, 1814) that the House of Savoy regained its territories. The Congress of Vienna (December 1814) annexed to S. the ancient republic of Genoa, and the second peace of Paris (1815) restored a small portion of Savoy, which France still possessed, and gave the king a protectorate over the small principality of Monaco. Long before this time, Charles-Emmanuel had abdicated, and his brother, *Victor-Emmanuel I.* (1802—1821), succeeded to his rights, and made his entry into

Turin, 20th May, 1814. His return restored the ancient misgovernment; and similar political changes in the other Italian states revived the societies of the 'Carbonari' (q. v.) and other similar secret associations, whose aims were supported by a portion of the nobility and army, and by the heir-presumptive to the throne, Charles-Albert, Prince of Savoy-Carignan. The insurrection of the army on the 9th and 10th of March 1821, brought on a general revolution. But the king having abdicated in favour of his brother, *Charles-Felix* (1821—1831), and the Austrians having come to the rescue, the insurrection was put down. Under the protection of an Austrian army of occupation till 1823, Charles-Felix re-established absolute power, recalled the Jesuits, persecuted the Protestants, and took various other measures for rooting out all opposition. On his death, the elder line of Savoy became extinct, and the succession fell to the cadet branch of Savoy-Carignan (see SAVOY, HOUSE OF), whose rights had been recognised by the Congress of Vienna, and *Charles-Albert* (q. v.) (1831—1849) ascended the throne. The liberals were gratified with some slight reforms, but the power of the clergy was untouched, and the conspiracy of 30th November 1833 at Turin, and the mad inroad of Mazzini, at the head of a small band of German, Polish, and Italian refugees, in February 1834, only disturbed the country, and confirmed the government in its despotic policy. The interior administration was, however, carried on with more energy than under the two previous reigns, through the conclusion of treaties with France, Britain, Turkey, the Low Countries, Denmark, Austria, and the Hanse Towns, &c.; the construction of roads, bridges, and railways was vigorously prosecuted, and agriculture and other industries were encouraged. In 1842, the king commenced a gradual but progressive liberal policy, promulgated a limited act of amnesty to political offenders, relaxed the severity of censorship, reformed judicial administration and prison discipline, and abolished the feudal system in Sardinia. The kingdom participated in the agitations of 1846 and 1847, which affected the whole peninsula, but was wholly exempt from insurrections and conspiracies, the people contenting themselves with expressing their views and wishes in petitions and demonstrations displaying entire confidence in the government. On February 8, 1848, the king announced a new and extremely liberal constitution, which was proclaimed some weeks afterwards; a liberal law of election was decreed, the first Sardinian parliament convoked for the 17th April, and the act of amnesty declared general. In the midst of these changes, the revolution broke out, and Charles-Albert put himself at the head of the movement, and declared war against Austria. (See ITALY, RADETSKY, &c.) After the rout of Novara (13th March, 1849), he resigned the throne to his son, *Victor-Emmanuel II.* (q. v.), who has succeeded in uniting Italy into one kingdom. By the treaty of Villafranca, July 11, 1859, and peace of Zurich, November 10, 1859, Victor Emmanuel obtained Western Lombardy, part of the Papal States, Parma, and Modena, and by the treaty of Prague, August 23, 1866, the remainder of Lombardy with Venetia, and on October 9, 1870, the remaining portion of the Papal States was annexed to the kingdom by royal decree.

SARDINIA, ISLAND OF, the largest, after Sicily, of the islands of the Mediterranean, lies directly south of Corsica, from which it is separated by the Strait of Bonifacio, a channel only 7 miles wide in its narrowest part. S. is situated about halfway between Central Italy and Africa, and between Southern Italy and Spain. Its length is 166 miles; greatest breadth 90 miles; and area 9205 sq. miles. The country is mostly mountainous, some of the peaks of the central chain having an elevation of 6300 feet. The Limbara range, in the north-west, is granite, the diagonal chain palæozoic, and the central range of the tertiary calcareous formation; many of the peaks, especially within the semicircle formed by the Limbara range, are extinct volcanoes. The coasts are generally steep and rugged. A few islands lie off the coast, and all, of any considerable size and importance, are situated at the corners; off the north-east corner are the Maddalena group, consisting of Maddalena, Caprera and five or six minute islets; off the north-west corner is Asinara; and off the south-west corner are San Pietro and San Antioco. The island is well supplied with streams, but none of them have a long course, and only one is partially navigable.

Soil and Climate.—Between the mountain ranges are several wide valleys of remarkable beauty and fertility. There are also several large sandy or stony districts (*macchie*), of almost irremediable sterility. The mountain sides are partly rocky and barren, partly clad with woods, and partly fitted for pasture. The climate is mild, the temperature ranging from 34° to 90°; but in the low lands, which are largely of a marshy character, and in the neighbourhood of the littoral lakes, a deadly malaria (*intemperie*) prevails, especially in autumn. The inhabitants of those districts, who can afford to do so, migrate annually during the unhealthy season; and those who are compelled to remain never leave their houses till an hour after sunrise, and carefully return before sunset, taking all precautions to prevent the entrance of the poisonous gas by door or window. The inhaling of the miasma by a stranger is considered among the inhabitants to be as deadly as a dose of strong poison.

Products.—Wheat, barley, maize, oranges, and other fruits are produced in abundance, and are esteemed for their excellent quality. The vine is extensively cultivated, but, from carelessness in the process, the wine is not so good as might naturally be expected. The olive-grounds are extensive, and the produce excellent. Tobacco (of inferior quality), cotton, linseed, flax, hemp, saffron, and madder are also produced. The woods which clothe the mountain sides are chiefly composed of cork, chestnut, oak, pine, and other timber trees, which form a considerable item in the export trade. Many mountain-slopes have, however, been much deteriorated in fertility by the excessive cutting down of timber.

The bullock is the favourite animal for draught, but horses are also used; and a small species of pony, which in ancient times was much esteemed by the Roman matrons, is still found. The sheep are of ordinary quality, and the swine are said to be among the best in Europe. Few cows are kept, and cheese is obtained almost wholly from sheep's and goat's milk. Wild boars and deer are not uncommon, and the Moufflon (q. v.) is found in the Alpine woods. Foxes, rabbits, hares, and martens are so abundant that a large export trade in their skins is carried on. The fisheries are important.

Manufactures are insignificant, being mostly the result of home industry; but the royal manufactories of gunpowder, salt, and tobacco are of considerable importance. S. is rich in minerals, but these, like its other resources, are as yet little developed; silver, mercury, granite, gypsum, marble, alabaster, amethyst, and other precious stones, are found; and lead, iron, and copper are in considerable abundance. Gold, bismuth, and antimony are said to exist.

Inhabitants.—The inhabitants bear a considerable resemblance to the Greeks, and speak a barbarous dialect, composed chiefly of Spanish, Arabic, and Italian; they are ignorant and bigoted, having

been subjected to misgovernment and oppression from their emancipation from Roman rule till 1836, when feudal tenure was abolished, and the enormous power of the clergy somewhat reduced. They are generally stupid and indolent, clothe themselves in sheep-skins, and invariably profess the Catholic religion. The custom of the *Vendetta* is frequently practised, though not to the same extent as in Corsica.

History.—S., at first called by the Greeks *Ichnusa* and *Sandaliotis* (from its resemblance to a human foot-print), and afterwards *Sardo* by the Romans, was colonised at a very early period. The first really historical event is its conquest, about 480 B. C., by the Carthaginians, who, during their occupation, rendered the island a celebrated corn-producing country. They were forced to abandon it to the Romans (238 B.C.), who gradually subdued the rebellious natives, and made it a province of the republic; but on three several occasions, formidable outbreaks required the presence of a consul with a large army to restore the authority of Rome. From this time it was held as a subject province, and on account of its value as the 'granary of Rome,' was carefully protected from invasion. It fell into the hands of the Vandals and other barbarians, and was recovered by the Eastern Empire in 534 A. D., but was finally separated from the Roman Empire by the Saracens. They were driven out in their turn by the Pisans, one of whose deputy-governors, being supported by the Genoese, obtained the erection of S. into a kingdom (1154) by Frederick I. The popes, who had long claimed a right of suzerainty over the island, gave it, in 1296, to James II. of Aragon; and it continued in the possession of Spain till 1708, when it was taken possession of by the British, and by the peace of Utrecht (1713) it was yielded to Austria. In 1730, Austria gave it to the Duke of Savoy in exchange for Sicily, and it has since that time formed a part of the dominions of the House of Savoy. When S. came to the House of Savoy, two-thirds of it belonged to barons of Spanish descent, and the most of the remainder to the clergy, who also levied a tithe on the whole produce, and for a century afterwards, it was shamefully neglected by the government. However, in 1836 and 1837, patrimonial rights and compulsory labour were abolished; and in 1838 and 1847, the peasants were freed from the rest of the vexatious imposts with which they were burdened. In 1847, the vice-royalty was abolished, and S. incorporated with the Sardinian kingdom (q. v.). It is at present divided into two provinces or *capos*—Cagliari in the south, containing 5166 English sq. m., with a population of 372,097; and Sassari in the north, containing 4093 English sq. m., with a pop. of 215,967. Cagliari is the capital.

SARDO'NIC SMILE is a term applied by the older medical writers to a convulsive affection of the muscles of the face, somewhat resembling laughter. It may occur in tetanus or lock-jaw, and other convulsive affections, or may result from the action of certain vegetable poisons, such as the *Ranunculus sceleratus*, or Celery-leaved Crowfoot. The name is derived from a species of ranunculus that grows in Sardinia, termed *Herba Sardonica* or *Sardoa*.

SARGA'SSUM. See GULF-WEED.

SARI', the capital of the province of Mazanderan, Persia, is situated on the banks of a small stream, the Tejend, 18 miles south of the Caspian Sea. It is surrounded by a dilapidated wall and ditch. S. is distinguished by its remarkable tower, and by its gardens, which are adorned with rows of beautiful cypresses, forming, when seen from a distance, a conspicuous feature of the landscape. S. is a modern town, built near the ruins of a very ancient town of the same name, and at present contains a pop. of about 35,000, who carry on a small trade in the produce of the province with Russia, through the Caspian ports, and with the interior of Persia. The great causeway of Shah Abbas runs through the town.

SARK, one of the Channel Islands. See JERSEY —THE CHANNEL ISLANDS.

SARMA'TIANS. The root *s-rm* in this word is in all probability the same as *s-rb*, so that it has been conjectured the name S. has the same ethnological meaning as *Serbi* and *Servi*. The oldest Greek form of the word (and the only one found in Herodotus) is *Sauromatæ*. The region occupied by the S. embraced (according to Ptolemy, our chief authority) a portion both of Europe and Asia.—1. The *European S.* are found as far west as the Vistula; as far north as the Venedicus Sinus (Gulf of Riga?), or even further; as far east as the Crimea and the Don; and as far south as Dacia. Roughly speaking, their territory corresponded to modern Esthonia, Lithuania, Western Russia, and parts of Poland and Galicia. The principal, or at least the best-known nations among the European S., were the Peucini and Bastarnæ, about the mouths of the Danube, and in Moldavia and Bessarabia; the Jazyges and Roxolani, probably in Kherson, Tauris, and Ekaterinoslav; the Venedi and Gythones, about Riga, Memel, and Elbing; and the Avareni, at the sources of the Vistula.—2. *The Asiatic S.* are found as far west as the Tanais (Don), as far east as the Caspian, as far south as the Euxine and Caucasus, and as far north as the water-shed between the rivers that fall into the White Sea and the Black, but we have no distinct knowledge of their territorial possessions. North of the Don, in the region now occupied by the Don Cossacks, dwelt the *Perierbidi;* south-east of it, about Astrakhan, the Jaxamatæ. Beyond the Perierbidi lay the Asæi, the 'horse-eating' (*Hippophagi*) Sarmatæ, the 'Royal' and Hyperborean Sarmatæ, and many others, besides a multitude of nations in the region of the Northern Caucasus. The question naturally arises: What were these Sarmatians? The vast extent of territory over which they spread, and the manifest inclusion under the name S. of different races, as, for example, Goths, Finns, Lithuanians, Circassians, Scythians, and Slaves, prove that the term was loosely used by Ptolemy and his contemporaries, just like the older Herodotean term Scythia, and is not strictly ethnological; yet Dr Latham's view (see Smith's *Dictionary of Greek and Roman Geography*, arts. Sarmatia and Scythia), that it designated on the whole Slavic races, and in particular the north-eastern portion of the great Slavic family, may be regarded as tolerably certain. The S. figure prominently among the barbarians who vexed the north-eastern frontiers of the Roman Empire.

SA'RNO, a city of Southern Italy, in the province of Principato Citra, on the river of the same name, 13 miles north-west of Salerno. It is a well-built town, with a very handsome cathedral containing some good paintings, and has a seminary for priests, a hospital, several paper-manufactories, and foundries. Its environs are famous for the produce of very fine silk. In the centre of the town, there are springs of sulphureous and chalybeate waters. Among the buildings worthy of notice is the ancient castle of the Barberini family. Pop. 15,341.

In the plain near S., Teias, king of the Goths, in a desperate battle with the Greeks, commanded by Narses, in 553, was vanquished and slain, and the reign of the Goths in Italy brought to a close.

SARPI, PIETRO, better known by his monastic appellation, FRA PAOLO, or Brother Paul, was born at Venice, in the year 1552; became an early proficient in mathematics, as well as in general literature, resolved to embrace the monastic life, and in his 20th year took the vows in the religious order of the SERVITES (q. v.). Soon afterwards, he was appointed by the Duke of Mantua to a professorship of theology in that city; but he held it only for a short time; and returning to his order, of which he was elected provincial in his 27th year, he continued to pursue in private his studies in languages, in mathematics, in astronomy, and in all the other branches of natural philosophy, including the medical and physiological sciences, in which he attained to great proficiency, being by some writers regarded (although, as it would seem, without sufficient grounds) as entitled to at least a share in the glory of the discovery of the circulation of the blood. The freedom of some of his opinions led to his being charged at Rome with heterodox views, and although held free from actual heresy, his opinions became an object of suspicion; and in the dispute between the republic of Venice and Paul V. (q. v.) on the subject of clerical immunities, S. justified these suspicions by the energy with which he threw himself into the anti-papal party. On being summoned to Rome to account for his conduct, he refused to obey, and was accordingly excommunicated as being contumacious. The zeal of S.'s opposition to Rome drew upon him the hostility of the partisans of the Roman claim; and an attempt was even made upon his life by a band of assassins, whom the ardour of party-spirit at the time did not hesitate, although upon mere presumption, to represent as emissaries of the Jesuits. Fra Paolo himself openly professed to share this suspicion, and believing his life in danger, confined himself thenceforward within the enclosure of his monastery. It was in this retirement that he composed his celebrated *History of the Council of Trent*, which has long been the subject of controversy and criticism. It was published in London by Antonio de Dominis, the ex-bishop of Spalatro, who had recently conformed to Protestantism, at first under the pseudonym of *Pietro Soave Polano*, an anagram of the real name of the author, *Paolo Sarpi Veneto;* and it almost immediately rose into popularity with the adversaries of Rome as well in England as throughout the continent. It is by no means a simple history of the proceedings of the Council, but rather a controversial narrative of the discussions, in which the writer freely enters into the merits of the doctrines under discussion, and in many cases displays a strong anti-Catholic bias. His judgment of the motives and of the conduct of the members of the Council, especially of the representatives of the pope and his partisans in the assembly, is uniformly hostile, and has been accepted by Protestants as a strong testimony against Rome from a member of the Roman Church. It must be confessed, however, that whatever judgment we may form of S.'s credibility on his own merits, it is idle to look upon him in the light of a member of the church of Rome. It is plain, from numberless declarations in his work, and from remains of his correspondence published after his death, that his opinions were strongly biassed, not merely with an anti-Roman, but even with rationalistic leanings; and Ranke does not hesitate to declare that his unsupported statements cannot be accepted with security, when there is question of a damaging narrative of some intrigue of the legates in the Council, or some cabal of the Italian bishops in the interest of Roman views. A voluminous counter-history of the Council of Trent was written by the Roman Jesuit (afterwards Cardinal) Pallavicino, which follows him into the details as well of the history as of the controversy. It would be out of place here to enter into any comparison of these rival histories of the Council. The History of S. has been translated into most of the European languages. The French translation is by the celebrated Courrayer, and is enriched with copious vindicatory and critical annotations. S. lived in the full vigour of intellect to the age of 71, and died of a neglected cold, which led to a protracted illness, in the year 1623. His life, as an ecclesiastic, was without reproach; and his long-tried zeal in the cause of the republic had made him the idol of his fellow-citizens. He was honoured accordingly by the republic with a public funeral. His *History of the Council of Trent* has been reprinted in numberless editions; and his collected works were published at Verona in 8 vols. 4to, 1761—1768, and again at Naples, in 24 vols. 8vo, in 1790.

SARRACE'NIA, or SIDE-SADDLE FLOWER, a genus of very singular marsh plants, natives of North America. *S. purpurea* is common from Hudson's Bay to Carolina; the other species are confined to the Southern States. They are herbaceous perennial plants, with radical leaves and scapes, which bear one or more large flowers. The

Sarracenia Purpurea:

1, a flower, from which the corolla has fallen off, shewing the very large 5-angled stigma; *a*, a fully expanded flower; *b*, germen; *c*, section of the fruit.

leaves are of very remarkable structure, the stalk being hollow and urn-shaped, and the blade of the leaf articulated at its apex, and fitting like a lid. It is from the form of the leaves that the name Side-saddle Flower is derived.—The genus is the type of the small natural order *Sarraceniaceæ*, the only other genus of which has recently been discovered in Guyana. The order is regarded as closely allied to *Papaveraceæ*.

SARREGUEMINES, a town of Elsass (Alsace), in what was formerly the French department of Moselle, 41 miles east of Metz. It is famous for its manufactures of pottery; hempen fabrics and velvets are also made. Pop. 6802.

SARSAPARI'LLA, or SARSA. This much-employed medicine is the produce of several species of *Smilax* (q. v.), although the species yielding the different kinds brought to the market have not yet been fully ascertained. Among them, the three principal are believed to be *S. officinalis*, *S. medica*, and *S. papyracea;* twining shrubs, with prickly angular stems; the first with large ovate-oblong, acute, heart-shaped, leathery leaves; the second

with shortly acuminate smooth leaves; the lower ones heart-shaped, the upper ones approaching to ovate; the third with membranous, oval-oblong,

Sarsaparilla.

obtuse leaves. These shrubs are natives of warm parts of America; *S. officinalis* and *S. papyracea* being found in South America, and *S. medica* on the Mexican Andes. Some botanists regard them as mere varieties of one species.

The part of the plant used in medicine is the dried root, of which the following are the characters, as given in the British Pharmacopœia: 'Roots not thicker than a goose-quill, generally many feet in length, reddish-brown, covered with rootlets, and folded in bundles about eighteen inches long, scentless; taste mucilaginous, feebly bitterish, faintly acrid.' S. has been analysed by various chemists, and appears to consist of volatile oil, most of which is expelled during the process of drying, of a white crystallisable neutral substance named *Smilacin*, whose composition is represented by the formula $C_{16}H_{13}O_5$, an acrid bitter resin, lignin, starch, and mucilage. S. is one of the class of medicines called Diaphoretics. The British Pharmacopœia contains three preparations of this drug —viz., the Decoction, the Compound Decoction (containing S., sassafras chips, guaiac wood-turnings, liquorice root, and mezereon), and the Liquid Extract. The cases in which they are serviceable are those of chronic rheumatism, secondary syphilitic affections, chronic skin diseases, &c. To be of any service, S. must be taken in considerable doses. The compound decoction, formerly known as the *Decoction of Sweet Woods*, is the best preparation, and should be taken in doses of four or six ounces three times a day.

The root of *S. aspera*, a native of the south of Europe, is used as a substitute for S., although of inferior quality, and is called Italian sarsaparilla.

The root of *Hemidesmus Indicus*, a climbing shrub of the natural order *Asclepiaceæ*, is used in India as a substitute for S., and is therefore called Indian sarsaparilla. The plant is common in all parts of India. The root has a peculiar aromatic odour and bitter taste In consequence of the high price charged for genuine S., the root of *Hemidesmus Indicus*, or *Indian Sarsaparilla*, has been introduced into the British Pharmacopœia. The following are its characters: 'Yellowish-brown, cylindrical, tortuous, furrowed, and with annular cracks, having a fragrant odour, and a very agreeable flavour.' The only official preparation is the Syrup; but in India, where this root is highly esteemed as a diaphoretic and tonic, and is extensively used as a substitute for S., an Infusion, prepared by infusing two ounces of the root in a pint of boiling water, is generally employed, the dose being from two to four ounces three times a day. The syrup is chiefly used, in consequence of its pleasant flavour, as a vehicle for more active medicines.

In Germany, the roots of *Carex arenaria*, *C. disticha*, and *C. hirta* (see CAREX) are occasionally used as a substitute for S., under the name of German sarsaparilla.

SARTHE, an inland dep. of France, north of the Loire. Area 2395 sq. m.; pop. (1866) 463,619 It is a country of plains, traversed by low hills and by undulations clothed with vines, of large picturesque forests, and of pleasant valleys. The soil is fertile, productive in grain and in clover; hemp is cultivated, and hempen fabrics largely manufactured. The wine produced is of a mediocre quality. The climate is healthy and temperate. Clover-seeds are exported to England and Holland, and swine and cattle are reared in large numbers for the Paris and other markets. S. is divided into the four departments of Mans, La Flèche, Mamers, and St Calais. The capital is Le Mans. See MANS, LE.

SARTI, GIUSEPPE, one of the most skilful and learned musical composers of the 18th c., was born at Faenza in the Papal States in 1729. He studied under Padre Martini at Bologna; and in 1752 produced his first opera, *Il Re Pastore*, which was performed at Faenza with great success. He held for a time the office of *Hof Kapellmeister* at Copenhagen, but returned to Italy in 1765. In 1770, and the following years, he composed his principal operas, including *Le gelosie villane* and *Giulio Sabino*, the latter of which was enthusiastically received throughout Italy, and is highly praised by Dr Burney. In 1779, he became *maestro di capella* of the Duomo at Milan, and gave himself to the composition of church music. In 1784, he went to St Petersburg as music director of the court of the Empress Catharine, by whom he was treated with great liberality, and raised to the highest rank of nobility. He died at Berlin in 1802, on his way to Italy. His operas are thirty in number; but the composition by which he is now most known is his beautiful sacred terzett, *Amplius Lava Me*. S. was the musical instructor of Cherubini (q. v.).

SARTO, ANDREA DEL, one of the most famous painters of the Florentine school, was born at Florence in 1488. According to later writers, the family name was Vannucchi, and Andrea only received the name of *del Sarto* (the Tailor) from the occupation of his father; but this statement is probably erroneous. S. was a pupil of Piero di Cosimo, but formed his style mainly through study of the works of Masaccio, Domenico Ghirlandajo, and Buonarotti. These artists inspired him with a love of fresco-painting, in which he achieved great distinction. During 1509—1514, he executed a series of representations from the life of St Filippo Benizzi, in the porch of the Annunziata at Florence; and in these the characteristics of his genius—dignity of composition, purity of form, freshness of colour, and grace of expression—are seen at their best. In 1514 he commenced a series of frescoes from the life of John the Baptist, which were not finished, however, till 12 years afterwards. The finest works, of what may be called his middle period, are the 'Madonna di San Francesco' and the 'Contending Theologians,' both in the Florentine galleries. In 1518, Francis I. invited S. to Paris, where he painted, among other things, the picture of 'Charity' in the Louvre; but at the solicitations of his wife he

returned to Florence, where he died in 1530. To the later years of his life, which were neither happy nor honourable, belong his 'Piety,' his most celebrated fresco, the 'Madonna del Sacco' (in the Annunziata at Florence), the 'Madonna with Saints' (in the Berlin Museum), and the 'Sacrifice of Abraham' (in the Dresden Gallery). His largest fresco is the 'Lord's Supper,' in what was formerly the Abbey of San Salvi, near Florence.—See Reumont's *Andrea del Sarto* (Leip. 1835).

SA'RUM, OLD, an extinct city and borough of England, was situated on a hill two miles to the north of Salisbury, in Wiltshire. It dated from the time of the Romans, by whom it was known as *Sorbiodunum*, and remained an important town under the Saxons. A Witenagemôte was held at O. S. in 960; and here William the Conqueror assembled all the barons of his kingdom in 1086. It was the seat of a bishop from the reign of William the Conqueror till 1220, when the cathedral was removed to New Sarum, now Salisbury (q. v.), and was followed by most of the inhabitants. In Henry VII.'s time it was almost wholly deserted, and has so continued till the present time. Some traces of walls and ramparts, and of its cathedral and castle, are still seen. Though without a single house or inhabitant, two members represented it in parliament, till, like many other rotten boroughs, it was disfranchised by the Reform bill of 1832. William Pitt, Earl of Chatham, first sat in parliament for O. S. in 1735.

SARVÂSTIVÂDAS, or SARVÂSTIVÂDINS (lit., those who maintain the reality of all existence), is the name of one of the four divisions of the *Vaibhâshika* system of Buddhism; its reputed founder was *Râhula*, the son of *the* Buddha S'âkyamuni.—See C. F. Koeppen, *Die Religion des Buddha* (Berlin, 1857); and W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St Petersburg, 1860).

SARZA'NA, a city of Northern Italy, in the province of Genoa, 8 miles east of Spezia. Its cathedral, built in 1200, is very rich in paintings and marbles. There is also an ancient fortress built by the Pisans in 1262. It is the birthplace of Pope Nicholas V. Pop. about 3000.

S. is a very ancient city, founded 176 B.C. The adjacent city of Luni having been sacked and destroyed by the Vandals and by the Normans, its inhabitants abandoned it, and took refuge in S., to which place they removed the episcopal see in 1204. There are still remains of the amphitheatre of Luni.

SASH, in the British Army, is a military distinction worn on duty or parade by officers and non-commissioned officers. For the former, it is of crimson silk; for the latter, of crimson cotton. It is tied on the right side by the cavalry, and on the left side by the infantry. In Highland regiments, the sash is worn over the left shoulder and across the body.

SASH. The frames in which the glass of windows is inserted are called window-sashes. Common windows are usually made with an upper and lower sash, contrived so that, by means of cords or chains, pulleys, and balance-weights, they slide up and down in a wooden case.

SASIN. See ANTELOPE.

SA'SINE. (See INFEFTMENT.) The ceremony was as follows: the attorney of the party giving the right produced his warrant of title, and gave it to the bailie or representative of the other party, who gave it to the notary to be explained by the latter to witnesses, and then the first party delivered earth and ground, that is, part of the very soil, to the other in presence of the witnesses. The notary then drew up an instrument reciting what had been thus done, and which was signed by the notary and two witnesses. In England, *seisin* never had so narrow and technical a meaning as it had in Scotland.

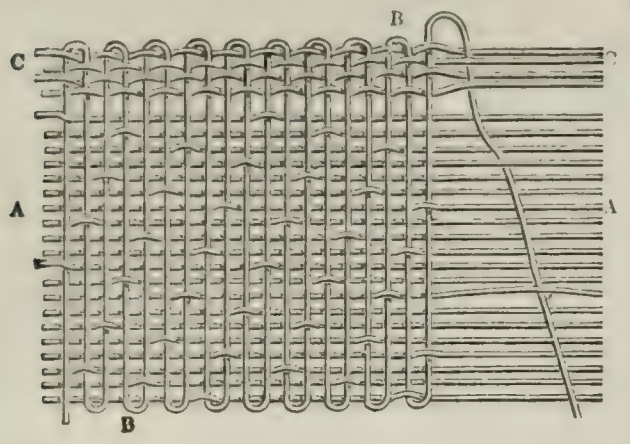
SASKA'TCHEWAN, a large, important, and only recently-explored river of British North America, draws its waters from the Rocky Mountains, and is formed by two head-waters called the South Branch or Bow River, and the North Branch. The South Branch issues from a lake about four miles long, fed by a glacier descending from a magnificent *mer de glace*, and by a group of springs in the vicinity. A few yards north of this group of springs is another group, from which the North Branch takes its rise. The height above the sea is 6347 feet; the lat., 51° 40′ N.; the long., 117° 30′ W. The South Branch flows south-east to its junction with the Belly River in long. 111° 40′ W., then north-east to its junction with the North Branch in long. 105° W. Fed mainly from the same glacier that feeds the South Branch, the North Branch flows north past Mount Murchison, 15,789 feet above sea-level, and one of the highest peaks of the Rocky Mountains, north through Kutanie Plain, a fine prairie abounding in game, and then flows in a general eastern direction to its confluence with the South Branch. From long. 105 W., the river flows east, and falls into Lake Winnipeg. Entire length stated at 1600 miles. From its mouth it is navigable (on the North Branch) to Rocky Mountain House, a distance of 1000 miles. It flows through a country rich in coal and iron, with a healthy climate, and comprising almost boundless plains suited to the cultivation of grain. At the sources of the S., there are several easily practicable routes across the Rocky Mountains, especially the mountain-road called Vermilion Pass, which is practicable for carts.—*Journal of the Geographical Society for* 1860.

SA'SSAFRAS (*Sassafras*), a genus of trees or shrubs of the natural order *Lauraceæ*, having diœcious flowers, a 6-parted membranous perianth, 9 stamens, a succulent fruit placed on the thick fleshy apex of the fruit-stalk, and surrounded by the unchanged perianth. The S.-tree (*S. officinale*) of North America, found from Canada to Florida, a mere bush in the north, but a tree of 50 feet in the south, has deciduous leaves, yellow flowers which appear before the leaves, and small dark-blue fruit. The wood is soft, light, coarse in fibre, dirty-white and reddish-brown, with a strong but agreeable smell, resembling that of fennel, and an aromatic, rather pungent and sweetish taste. The wood of the root possesses these properties in a higher degree than that of the stem, and the thick spongy bark of the root most of all. The wood is brought to market in the form of chips, but the bark of the root is preferred for medicinal use, is a powerful stimulant, sudorific, and diuretic, and is employed in cutaneous diseases, gout, rheumatism, and syphilis, generally in combination with other medicines. It contains a volatile oil, *Oil of S.*, which is often used instead. An agreeable beverage is made in North America by infusion of S. bark or S. wood; and a similar beverage was once very commonly sold at daybreak in the streets of London under the name of *Saloop*. A few saloop-venders are still to be seen plying their vocation. The leaves of S. contain so much mucilage that they may be used for thickening soup.—Another species of S. (*S. parthenoxylon*), possessing similar properties, is found in Sumatra.

SASSAFRAS NUTS. See PITCHURIM BEANS.

SASSA'NIDÆ, the dynasty which succeeded that of the Arsacidæ on the throne of Persia (q. v.), derived its name from Sassan, the grandfather of the newly-elected monarch ARDISHIR. The reign of the Sassanidæ is remarkable in the history of Persia, not for the extent of their sway, or the luxury and magnificence of their court, though in these respects they could vie with the Achæmenidæ at the epoch of their greatest power and splendour, but for the intense energy which they succeeded in infusing into the people at large. A comparatively small army of Greeks might and did successfully strive against the immense hordes of a Xerxes and a Darius; but the veterans of Rome could gain no permanent laurels in a conflict with an equal force of Persians under the Sassanidæ. Ardishir made the desert of Khiva and the Tigris his boundaries, and resigned the throne to his son, SHAHPUR I. (SAPOR) (240—273 A. D.), who subdued Armenia, took Algezira (258) and Nisibis, totally routed the Romans at Edessa, taking prisoner the Emperor Valerian and the relics of his army, and overrunning Syria, Cappadocia, and other portions of Western Asia. This monarch paid as much attention to the prosperity of his subjects and the encouragement of the fine arts as he did to the extension of his power; but his enlightened plans were not carried out by his immediate successors.—NARSI (NARSES) (294—303) retook Armenia, and signally defeated the Romans under Galerius; but fortune deserted him in the following year (297).—His grandson, SHAHPUR II. (310—381), surnamed POSTHUMUS, an infant, succeeded, and Persia, during his minority, was much harassed by the Arabs, Romans, and Tartars; but Shahpur had no sooner taken in his hands the reins of government, than in return, he ravaged Yemen, punished the Tartars, and took the sole revenge at that time in his power against the Romans, by commencing a dreadful persecution of the Christians in his dominions. A regular war speedily followed; the army of Constantius was routed at Singarah, and he was compelled to sue for peace. But the war continued; Constantius's successor, Julian, was defeated, and lost his life (363) near Ctesiphon, and the Romans were glad to conclude the humiliating peace of Dura. Armenia, Iberia, and the other Caucasian principalities were then reduced by Shahpur. The wholesome terror thus infused into the Romans effectually restrained them from aggressions for many years.—Among his successors were BAHARAM V. (420—448), surnamed GOUR, who recommenced hostilities with the Romans, the result being a partition of Armenia and a truce for 100 years; and KOBAD (COBADES or CABADES) (488—498, 502—531), a wise and able monarch, who, on the Romans refusing any longer to pay the stipulated tribute, declared war against them, and defeated them in every engagement, concluding peace (505) on receiving 11,000 lbs. of gold. A second war, which commenced in 521, was from beginning to end in favour of the Persians, though the Romans at that time possessed a staff of generals unsurpassed at any previous epoch of their history. The war continued for some time after the accession of KHUSRU I. (q. v.) (531—579), and was continued at intervals till nearly the conclusion of the century, when another great Persian conqueror, KHUSRU II. (q. v.) (591—628), ascended the throne; but the details of his annihilation of the Roman power in Asia, and the resistless march of Heraclius (q. v.), who again cooped up the Persians within the Tigris, and inflicted upon the S. a blow from which they never recovered, will be found under these names.—After four years of petty civil war, which wore out the remaining strength of the nation, YESDIGERD III. (632—651) was raised to the throne. The Arabs, who had already twice attacked Persia without success, made a third attempt in 639, and routed Yesdigerd's army at Kudseah (Cadesia) with immense loss. Yesdigerd made another energetic attempt to rescue his kingdom; but the great battle of Nahavend, in which more than 100,000 Persians are said to have been slain, extinguished all hope of success; and the unfortunate monarch became a fugitive and a wanderer in Northern Khorassan till 651, when he was treacherously murdered.—Thus perished the dynasty which had pulled down the Romans from their proud pre-eminence among nations by the hands of a horde of robber-fanatics, under whose barbarous rule the extensive commercial prosperity and refined civilisation which had been so carefully fostered for four centuries, were utterly swept away, leaving only such traces as ruined aqueducts, choked-up canals, and the still magnificent remains of almost forgotten cities.

SA'SSARI, a city in the north-west of the island of Sardinia, the chief town of the province of the same name, 8 miles from the shore of the Gulf of Asinara. It is a handsome and important archiepiscopal city, and has a vast cathedral, with many sculptures, one of which is by Canova; a university, founded in 1776; a college; and a rich library, with the MSS. of the Azuni. S. is a very busy town, and trades especially in grain, wine, fruits, wool, olive oil, and tobacco. Its harbour, Torres, is 10 miles north-west of S.; it is narrow and shallow, and does not admit large vessels. Pop. 22,945.



SATAN. See DEVIL.

SÁTÁRÁ, generally spelled *Sattara*, a collectorate in the Poona division of the Bombay presidency, British India, is bounded on the N. by the state of Poona, and on the W. by the lofty ridge of the Western Ghauts. Area, 11,000 sq. m.; pop. 1,220,000. SÁTÁRÁ, the capital, from which the state derives its name, one of the most salubrious and pleasant stations in the Deccan, is 133 miles south-east of Bombay. Pop. inconsiderable.

SA'TELLITES (Lat. *satelles*, an attendant) are certain celestial bodies which attend upon and revolve round some of the planets, as these latter revolve round the sun; and hence scientific men frequently apply to them the generic term, 'secondary planets.' The Earth, Jupiter, Saturn, Uranus, and Neptune, each possesses one or more of these attendants. The eclipses, inequalities, inclinations, and reciprocal attractions of the satellites, have been carefully noted from time to time, and the theory of their motions, at least of the most prominent of them, has been found to coincide with that of the moon. The satellites of Jupiter are invested with additional interest, from their eclipses having been the means of directing Römer to his great discovery of the successive propagation and velocity of light. On careful investigation, he found that the eclipses regularly happened 16′ 26″ earlier when the planet was in opposition (i. e., nearest the earth), than when it was in conjunction (i. e., furthest from the earth), a phenomenon which could only be accounted for by the supposition, that light requires 16′ 26″ to pass over a distance equal to the diameter of the Earth's orbit.

SATIN, a fabric in which so much of the weft is brought uppermost in the weaving as to give a more lustrous and unbroken surface to the cloth than is seen when the warp and weft cross each other more frequently; this will be better understood by reference to the figure than by any verbal description. A are the warp threads, of which only every tenth

one is raised to allow the shuttle to pass, but they are all raised in regular succession, so that the weaving is quite uniform throughout; B are the weft threads; and C is the selvedge, which is formed on each side of the piece of stuff by the

regular method of plain-weaving, that is, by raising every other warp thread for the passage of the weft. The term satin is very rarely applied to any other than silk fabrics, woven as described; but there are woollen, linen, and cotton satins known in the markets.

SATIN-BIRD. See BOWER-BIRD.

SA'TINET, an inferior satin, woven much thinner than the ordinary kind. The term is also occasionally applied to a variety of cloth woven with cotton warp and woollen weft.

SATIN-WOOD, a beautiful ornamental wood obtained from both the West and East Indies. The former is the better kind, and is supposed to be the produce of a moderate-sized tree, *Ferolia Guianensis*, and probably other species, as there are several varieties of the wood. That from the East Indies is less white in colour, and is produced by *Chloroxylon Sweitenia*. Both are much used by cabinet-makers, and for marquetry, &c. The logs are usually only 6 or 7 inches square.

Chloroxylon Sweitenia is a tree of the natural order *Cedrelaceæ*, growing on the mountains of the Circars in India, and in Ceylon. Sir James E. Tennent says that 'in point of size and durability, it is by far the first of the timber-trees of Ceylon. The richly-coloured and feathery logs are used for cabinet-work, and the more ordinary for building purposes, every house in the eastern province being floored and timbered with satin-wood.'—Tennent's *Ceylon*.

SA'TIRE (Lat. *sătĭra;* older form, *sătŭra*), the name given by the Romans to a species of poetry of which they may be considered the inventors. The word *satura* (from the root *sat*, enough) is strictly and originally an adjective, meaning 'full' or 'filled;' but afterwards it came to possess also a substantive signification, and denoted a dish filled with a medley of ingredients, like the *Pot-pourri* (q. v.) of the French, or the *Olla Podrida* (q. v.) of the Spaniards. Hence, in its figurative application to a branch of literature, it throws a light on the primary character of that literature. The oldest Roman satire was a medley of scenic or dramatic improvisations expressed in varying metres (Livy, lib. 7, cap. 2), like the Fescennine Verses (q. v.); but the sharp banter and rude jocularity of these unwritten effusions bore little resemblance, either in form or spirit, to the earnest and acrimonious criticism that formed the essential characteristic of the later satire. The earliest—so far as we know—who wrote *saturæ*, were Ennius (q. v.) and Pacuvius; but the metrical miscellanies of these authors were little more than serious and prosaic descriptions, or didactic homilies and dialogues. Lucilius (b. 148, d. 103 B.C.) is universally admitted to be the first who handled men and manners in that peculiar style which has ever since been recognised as the satirical; and the particular glory of Lucilius, in a literary point of view, consists in this, that he was the creator of a special kind of poetry, which in all subsequent ages has been the terror and aversion of fools and knaves. The serious and even saturnine gravity of the Roman mind must have readily disposed it to a censorious view of public and private vices. After the death of Lucilius, satire, as well as other forms of literature, languished, nor do we meet with any satirist of note till the age of Horace (q. v.), whose writings are as a glass in which we behold mirrored the tastes and habits of the Augustan age. His satire, though sharp enough at times, is in the main humorous and playful. It is different when we come to Juvenal (q. v.)—a century later, when satire became a *sæva indignatio*, a savage onslaught on the tremendous vices of the capital. Persius (q. v.), who lived in the generation before Juvenal, is every way inferior, in force of genius, to the latter. After Juvenal, we have no professed satirist, but several writers, prose and poetic, in whom the satiric element is found, of whom Martial, the epigrammatist, is perhaps the most notable.

During the middle ages, the satirical element shewed itself abundantly in the general literature of France, Italy, Germany, England, and Scotland. Men who have a claim to the character of satirists, *par excellence*, are Ulrich von Hutten, one of the authors of the *Epistolæ Obscurorum Virorum* (q. v.), Erasmus (q. v.), Rabelais (q. v.), Sir David Lindsay (q. v.), George Buchanan (q. v.). In all of these writers, priests are the special objects of attack; their vices, their greed, their folly, their ignorance, are lashed with a fierce rage. But it was in France that satire as a formal literary imitation of antiquity first appeared in modern times. Vauquelin (q. v.) may be considered the true founder of modern French satire. The satirical verses of Mottin, of Sigogne, and of Berthelot, of Mathurin Regnier, *L'Espadon Satirique* of Fourqueraux, and *Le Parnasse Satirique*, attributed to Théophile Viaud, are very impure in expression, and remind us that at this time a satire was understood to be an obscene work—the 17th c. scholars supposing that the name had something to do with Satyr, and that the style ought to be conformed to what might be thought appropriate to the lascivious deities of ancient Greece! During the 17th and 18th centuries, both England and France produced professed satirists of the first order of merit, who have not been surpassed by the best either of their predecessors or successors. The names of Dryden (q. v.), Butler (q. v.), Pope (q. v.), and Churchill (q. v.) on this side of the Channel, of Boileau (q. v.) and Voltaire (q. v.) on the other, are too well known to require more than mention. Dr Edward Young (q. v.) and Dr Johnson (q. v.) have also made a name for themselves in this branch of literature. It may be noticed, however, as a distinguishing characteristic of Dryden, Boileau, Young, Pope, Churchill, and Johnson, and as a mark of the difference of the times in which they lived from those of the satirists of the Reformation, that it is no longer the church that is assailed, but society, political opponents, literary rivals, &c.; the war is carried on, not so much against bad morals in the clergy, as against the common vices of men in general, or is even the expression of partisan hatreds. Swift (q. v.) and Arbuthnot (q. v.) are perhaps as great satirists as any of those we have mentioned.

Satire in the shape of political squibs, lampoons, &c., is very abundant in the 17th and 18th centuries. Butler's *Hudibras* is simply one long lampoon against the Puritans; most of the playwrights of the Restoration were royalist satirists—unscrupulous and indecent partisans. Dryden himself was but *facile princeps* of the herd. Andrew Marvell (q. v.) is the most famous name on the side of liberty. The *Beggars' Opera* of the poet Gay is a piece of very fine political satire. Gifford (q. v.) and Wolcott (q. v.), better known as Peter Pindar, also deserve mention in a historical point of view, though their intrinsic merits are small. Incomparably superior to all their contemporaries, and among the first order of satirists, are Robert Burns (q. v.) and Cowper (q. v.).—Meanwhile, in France, since Voltaire, no great name has appeared, except, perhaps, that of Béranger (q. v.), though the spirit of satire has pervaded most of the current literature, more particularly political literature, of which one of the most pungent expressions is the pamphlet published in 1865 by M. Rogeard against the system of government pursued by Napoleon III., and entitled *Les Propos de Labienus.* In Germany, the most conspicuous modern names are those of Hagedorn, Rabener, Sturz, Stolberg (q. v.), Kästner, Wieland (q. v.), Tieck (q. v.), and Goethe (q. v.), but none of these have adhered very strictly to the classic models of satire. Of 19th c. satirists in England, the best names are Byron (q. v.), the brothers Smith (q. v.), and Hood (q. v.) in poetry; and Hook (q. v.), Jerrold (q. v.), Thackeray (q. v.), and Carlyle (q. v.) in prose. To these may be added the name of the author of the *Biglow Papers*, James Russell Lowell.—See Sellar's *Roman Poets of the Republic* (Edinb. 1863); Browne's *History of Roman Classical Literature* (Lond. 1853); Thomson's *History of Roman Literature* (forming a volume of the *Encyclopædia Metropolitana*); Mommsen's *History of Rome;* Niebuhr's *Lectures on Roman History;* M. Viollet le Duc, article 'Satire' in the *Dictionnaire de la Conversation;* and James Hannay's *Satire and Satirists.*

SA'TRAP, in the ancient Persian monarchy, was the governor of a province, whose power—so long as he enjoyed the favour of the king—was almost absolute. He levied taxes at his pleasure, and could ape the tyranny of his great master without let or hindrance. When the monarchy of Cyrus began to decline, some of the satraps threw off their slight allegiance, and founded independent kingdoms or sultanates of their own, the most famous of which in ancient times was the Mithridatic kingdom of Pontus. See PONTUS and MITHRIDATES.

SA'TURN, an ancient Italian divinity, who presided over agriculture. His name, from the same root as *satum* (*sero*, to sow), indicates what was probably one of the earliest personifications in the Italian religion, S. being the god who blessed the labours of the sower. His identification with the Greek KRONOS by the later Græcising myth-mongers is a peculiarly infelicitous blunder, and has led to more than ordinary confusion. The two have absolutely nothing in common except their antiquity. The Greek *Demeter* (Ceres), it has been observed, approaches far more closely to the Italian conception of the character of Saturn. The process of amalgamation in the case of Kronos and S. is visible enough. First, there is the Greek myth. Kronos, son of Uranos (Heaven) and Gæa (Earth), is there the youngest of the Titans. He married Rhea, by whom he had several children, all of whom he devoured at birth except the last, Zeus (Jupiter), whom his mother saved by a stratagem. The motive of Kronos for this horrible conduct was his hope of frustrating a prophecy which declared that his children would one day deprive him of his sovereignty, as he had done in the case of his father Uranos; but fate is stronger even than the gods, and when Zeus had grown up, he began a great war against Kronos and the Titans, which lasted for ten years, and ended in the complete discomfiture of the latter, who were hurled down to Tartarus, and there imprisoned. So ran the common myth. But other myths added, that after his banishment from heaven, Kronos fled to Italy, where he was received hospitably by Janus, who shared his sovereignty with him. At this point the Greek myth coalesced with the Italian. S., the old homely deity of the Latin husbandmen, was transformed into a divine king, who ruled the happy aborigines of the Italian peninsula with paternal mildness and beneficence, taught them agriculture and the usages of a simple and innocent civilisation, and softened the primitive roughness of their manners. Hence the whole land received from him the name of *Saturnia*, or 'land of plenty.' His reign was that 'golden age,' of which later poets sang as the ideal of earthly happiness, and in memory of which the famous *Saturnalia* (q. v.) were thought to have been instituted. At the foot of the Capitoline, where the fugitive god had formed his first settlement, there stood in historical times a temple dedicated to his worship. Ancient artists represented him as an old man, with long straight hair hanging down, the back part of his head covered, his feet swathed in woollen ribbons, and a pruning-knife or sickle-shaped harp in his hand. Other attributes, as the scythe, serpent, wings, &c., are of later invention.

SATURNA'LIA, an ancient Italian festival, instituted, according to the common belief of the ancients, in memory of the happy reign of Saturn (q. v.). Discarding all mythical explanations of the institution of the S. as simply incredible, and not worth the trouble of refutation, we may rationally conjecture that the S. was a rural festival of the old Italian husbandmen, commemorative of the ingathering of the harvest, and therefore of immemorial antiquity. It is not, we conceive, to be doubted for a moment that the untrammelled jollities of the S. were familiar to the farmers of Latium long before their homely national god, who blessed the labours of seedtime with abundant fruit, had been decorated with incongruous Hellenic honours, and transformed into a skyey Titan. Later ages may have introduced novel elements into the S. befitting the hybrid myth of king Saturn, but originally, no thoughtful investigator can doubt that the cessation from toil, and the wild self-abandoning mirth that marked the feast, were expressive of the labouring man's delight that the work of the year was over, and not of an artificial enthusiasm for a 'golden age' that never had been. The great feature of the S., as we know the festival in historical times, was the temporary dissolution of the ordinary conditions of ancient society. The distinctions of rank disappeared or were reversed. Slaves were permitted to wear the *pileus*, or badge of freedom, and sat down to banquets in their master's clothes, while the latter waited on them at table. Crowds of people filled the streets, and roamed about the city in a peculiar dress, shouting *Io Saturnalia;* sacrifices were offered with uncovered head; friends sent presents to each other; all business was suspended; the law-courts were closed; school-boys got a holiday; and no war could be begun. During the Republic, the S. proper occupied only one day—the 19th of December (xiv. Kal. Jan.). The reformation of the calendar by Julius Cæsar caused the festival to fall on the 17th (xvi. Kal. Jan.), a change which produced much

confusion, in consequence of which the Emperor Augustus ordained that the S. should embrace the whole three days 17th, 18th, and 19th of December. Subsequently, the number was extended to five, and even seven, though even in the times before the Empire, it would appear that the amusements often lasted for several days. But while the whole week was regarded in a general sense as devoted to the S., three distinct festivals were really celebrated—the S. proper; the *Opalia*, in honour of *Ops*, the wife of Saturn, and the goddess of field-labour (from *opus*, a work); and the *Sigillaria*, in which *sigilla*, or little earthenware figures, were exposed for sale, and purchased as children's toys. The modern Italian Carnival (q. v.) would seem to be only the old pagan S. baptised into Christianity.

SATU'RNIAN VERSE, the name given by the Romans to that species of verse in which their oldest poetical compositions, and more particularly the oldest national poetry, were composed. In the usage of the later poets and grammarians, the phrase has two different significations. It is applied in a general way to denote the rude and unfixed measures of the ancient Latin ballad and song, and perhaps derived its name from being originally employed by the Latin husbandmen in their harvest-songs in honour of the god Saturn (q. v.). In this sense, it simply means *old-fashioned*, and is not intended to determine the character of the metre. It is also applied to the measure used by Nævius, and a common opinion, sanctioned by the great name of Bentley, is, that it was a Greek metre introduced by him into Italy. But though the Saturnian verse is found among the measures employed by Archilochus, scholars generally incline to the opinion that this is an accidental coincidence, that the measure of Nævius is of Italian (Hermann even thinks of Etruscan) origin, and that it merely improved on the older ballad-metre—the primitive Saturnian verse. It continued in use down to the time of Ennius (q. v.), who introduced the Hexameter (q. v.). According to Hermann, the basis of the verse is contained in the following *schema:*

⏑ ´ ⏑ – ⏑ ´ ⏑ | – ⏑ – ⏑ – ⏑,

which, as Macaulay happily points out, corresponds exactly to the nursery rhyme,

The queén was in her párlour | éating bréad and hóney,

and is frequently found in the Spanish poem of the *Cid*, the *Nibelungen Lied*, and almost all specimens of early poetry; but in the treatment of it a wide and arbitrary freedom was taken by the old Roman poets, as is proved by the still extant fragments of Nævius, Livius Andronicus, Ennius, and of the old inscriptionary tables which the *triumphatores* set up in the Capitol, in remembrance of their glorious achievements.—See *History of Roman Literature*, by Thompson, Arnold, Newman, &c. (*Encyclopædia Metropolitana*, 1852); Browne's *History of Classical Roman Literature* (1853); Niebuhr's *History of Rome;* Preface to Macaulay's *Lays of Ancient Rome;* and Sellar's *Roman Poets of the Republic* (1863).

SATYRI'ASIS (see SATYRS) is the insanity, or the ungovernable sway of the lowest instincts and propensities, by which man becomes an animal in its savage and excited state. The ancients were acquainted with this loathsome form of alienation, in which man is the sport of foul and dangerous instincts, and recognises no law or hindrance to the promptings of hunger, thirst, or lust. It still appears at puberty and in dotage, but is more rarely met with; and its disappearance may be hailed as significant of the predominance of the higher sentiments, or of the subjection of propensities to law, decency, and decorum.—Mason Good, *Study of Medicine*, vol. v. p. 124; Sauvages, vol. ii. p. 214.

SA'TYRS, in Greek Mythology, were a race of woodland deities, first mentioned by Hesiod, who designates them—'the race of worthless Satyrs unfit for work.' Subsequently, they figure in great numbers in the train of Dionysus (Bacchus)—their leader being that model of tipsy revellers, the never-sober Silenus! In appearance, they were at once grotesque and repulsive, like all old woodland demons. They are described as robust in frame, with broad snub noses, large pointed ears like those of animals (whence they are sometimes called *theres*, 'wild beasts'), bristly and shaggy hair, rough skin, little horny knobs on their foreheads, and small tails. The S. are of course sensual in their inclinations, and ravishers of the woodland nymphs, fond of music, dancing, wine, and of the deep slumbers that follow a debauch. The Roman poets identified them with the *Fauni* of their own mythology, and gave them larger horns and those goats' feet with which they are so often represented. Ancient sculpture was fond of the Satyr as a 'subject'—one of the most famous specimens of ancient art being the Satyr of Praxiteles (q. v.).

SAUCES are preparations of various condiments, used for the purpose of giving piquancy and flavour to various kinds of food, chiefly animal. Sauces have been in use from the earliest times of culinary art. The ancients prided themselves much upon them, and used them almost wholly with fish. Sauces were used by the Greeks, but seem to have arrived at the summit of their reputation in the time of the Roman Empire, when that called *garum*, made from a fish called *garon* by the Greeks, probably the anchovy, was considered one of the greatest luxuries of the table. Besides the garum, many other sauces were made of the tunny and other fishes. In modern times, we have sauces in great variety: there are those ready prepared, as Harvey's, the Worcestershire, the Holyrood, &c., the basis of which is Ketchup (q. v.), which of itself is one of the most extensively known sauces; and there are a large number prepared, when wanted, by the cook, to suit every kind of dish sent to the table. These usually consist of rich gravies, thickened with flour or other materials, and flavoured with some suitable condiment. One of the reproaches of British cookery is the extensive use of a sauce called melted butter, which is usually little better than billstickers' paste, and which at the best is a little flour, water, and butter warmed together, and well mixed; and it is the habit to serve this to almost every kind of dish needing a sauce, whether animal or vegetable.

SAU'CISSON, or SAUSAGE, is a fascine of more than the usual length; but the principal application of the term is to the apparatus for firing a military mine. This consists of a long bag or pipe of linen, cloth, or leather, from one inch to one and a half inch in diameter, and charged with gunpowder. One end is laid in the mine to be exploded; the other is conducted through the galleries to a place where the engineers can fire it in safety. The electric spark is now preferred to the saucisson. See BLASTING.

SAUER-KRAU'T, a preparation of the common white cabbage, well known and in extensive use in Germany and the north of Europe, where it supplies during the winter the place of fresh vegetables. The cabbages are gathered when they have formed firm white hearts; and these, sliced into thin shreds, are placed in a succession of thin layers in a cask, each layer being sprinkled with fine salt,

to which some add juniper berries, cumin seed, caraway seeds, or other condiment. A board is then placed on the top, with a heavy weight, so as to press the whole down firmly, but gently. After a time, fermentation begins; and when a sour smell arises from the cask, it must be removed into a cool place, and kept for use. It is generally eaten boiled, in the same way as fresh cabbage.

SAUL, the first king of Israel, was the son of Kish, a wealthy chief of the tribe of Benjamin. The circumstances that marked his election to the royal dignity are familiar to all the readers of Scripture, and need not be repeated here (see JEWS, SAMUEL) Gigantic in stature, noble in mien, and imperious in character, he appeared admirably fitted to accomplish the task of consolidating the dislocated tribes of Israel. His earlier achievements augured hopefully for his future. The deliverance of the men of Jabesh Gilead, above all, his victories over the Philistines, the Moabites, Ammonites, Edomites, and Amalekites, were unmistakable proofs of his vigorous military capacity, but gradually there shewed itself in the nature of the man a wild perversity—'an evil spirit of God,' as it is called—culminating in paroxysms of insane rage, which led him to commit such frightful deeds as the massacre of the priests of Nob. Samuel, who had retired from the 'court' of S., and had secretly anointed David as king, did not cease to 'mourn' for the wayward monarch; but nothing availed to stay his downward career, not even the noble virtues of his son Jonathan; and at last he fell in a disastrous and bloody battle with the Philistines on Mount Gilboa.

SAUMAREZ, JAMES, BARON DE, a celebrated naval hero, was descended from an old French family, which had long been settled in Guernsey, and was born there, 11th March 1757. He entered the navy as midshipman at the age of thirteen, and served in the American war (1774—1782), receiving for his gallantry at the attack of Charleston (1775) the grade of lieutenant; but he was recalled before the end of this war, and placed under Sir Hyde Parker. He did good service in the action off the Dogger Bank (August 1781), and was rewarded with promotion to the rank of commander, being soon afterwards placed under the orders of Admiral Kempenfeldt on the Jamaica station. At the great fight between Rodney and De Grasse (12th April 1782), S. commanded the *Russell*, a line-of-battle ship, and gained much distinction by his coolness and intrepidity throughout. For his gallant capture of the French frigate *La Réunion*, with one inferior in size and equipment, he received the honour of knighthood; and in command of the *Orion*, a seventy-four, he served under Lord Bridport at the battle of L'Orient, June 23, 1795. He also took a prominent part in the battle off Cape St Vincent (February 14, 1797), and was second in command at the battle of the Nile, in which he was severely wounded. In 1801, he became a baronet, and vice-admiral of the blue, and in the same year he fought his greatest action off Cadiz (July 12), defeating a French-Spanish fleet of 10 line-of-battle and 4 frigates, with a squadron less than half their strength, and causing to the enemy a loss of 3000 men and three ships. This contest, than which, according to Admiral Nelson, 'a greater was never fought,' gained for S. the Order of the Bath, the freedom of the city of London, and the thanks of parliament. In the Russian war, he commanded the Baltic fleet, and took or destroyed two large Russian flotillas (July 1809). In 1814, he became admiral, vice-admiral of Great Britain in 1821, was created a peer in 1831, and died at Guernsey, 9th October 1836. His life has been written by Sir John Ross (*Memoirs of Admiral Lord de Saumarez*, 2 vols., 1838).

SAUMUR, a town of France, on the left bank of the Loire, in the dep. of Maine-et-Loire, 28 miles south-east of Angers by railway. Bridges connect the town with a suburb on the right bank of the river. The river-side is lined with handsome quays, and there are good bridges and agreeable promenades. There is an imperial riding-school, in which riding-masters for the army are trained. Upwards of 600 workmen are employed in the manufacture of rosaries of cocoa-nut shell and beautiful articles in enamel. Its trade is in spirits, wines, hemp, and linen. Pop. 14,079.

S., formerly the capital of the province of Saumurois, was a stronghold of the Protestants during the reign of Henry IV., at which time it contained 25,000 inhabitants. Its prosperity was annihilated by the revocation of the Edict of Nantes, and its population reduced to a fourth. Perhaps the most striking event in the history of the town was its brilliant capture by Larochejaquelein and the Vendeans, June 10, 1793. In this action, the victors, with but a slight loss, captured 60 cannon, 10,000 muskets, and 11,000 republicans.

SAUNDERSON, NICHOLAS, LL.D., a distinguished English scholar, was born at Thurleston in Yorkshire in 1682. He became blind from smallpox at the age of twelve months, but received a good education, including instruction in the classics, which was orally communicated. His strong predilection for mathematics becoming known to his friends, attempts were made with success to instruct him in arithmetic, geometry, and algebra, by means of ingenious mechanical contrivances which it is not necessary to describe. In 1707, he came to Christ's College, Oxford, as a teacher, and there delivered a series of lectures on the Newtonian philosophy, including (strange to say) a discussion of Newton's theory of optics. Four years afterwards, he succeeded Whiston as Lucasian professor, and died 19th April 1739. A valuable and elaborate treatise on Algebra, from his pen, was published in 1740 (2 vols., 8vo), and another on Fluxions, including a commentary on some parts of Newton's *Principia*, in 1756. The mental process by which he was enabled to understand the rules of perspective, the projections of the sphere, and some of the more recondite propositions of solid geometry, seems to have been peculiar to himself, and was almost wholly unintelligible to others.

His sense of feeling was extremely acute; and he is said even to have been able to distinguish, by this sense alone, true Roman medals from counterfeits. He could judge fairly of the size of a room and of his position in it by the sound of his own footsteps, and could tell, in some inexplicable manner, when light clouds were passing across the sun's disc.

SAU'RIA, in the systems of Cuvier and other recent naturalists, an order of Reptiles (q. v.), having an elongated body, covered with scales or with bony plates; a more or less elongated tail; four limbs, or sometimes only two apparent, the rudimentary hind-limbs being concealed beneath the skin; the mouth always furnished with teeth; the ribs movable, rising and falling in respiration; the young issuing from the egg in a form similar to that of the mature animal.—To this order belong Chameleons, Geckos, Iguanas, Agamas, Varans, Teguixins, Lizards, Skinks, &c., numerous families, some of which contain many genera and species. Crocodiles and their allies, having a quadripartite heart, cere-

bellum with lateral lobes, articulate quadrate bone, &c., are removed from amongst the Saurians, and a place nearer to the Chelonians is assigned to them. In their external form and structure, however, they correspond to Saurians, and have no resemblance to Chelonians. The recent S. are far excelled in size and in variety of strange forms by the saurian-like fossils, as the *Ichthyosaurus*, *Lælaps*, &c.

SAURIN, JACQUES, a celebrated French Protestant preacher, was born at Nimes, 6th January, 1677, studied at Geneva, and was chosen minister of a Walloon church in London in 1701. But the climate of England did not agree with his delicate health; and in 1705 he settled at The Hague, where his extraordinary gift of pulpit oratory was prodigiously admired, but not by his clerical brethren, who enviously assailed him with the accusation of heresy. The ground of their charge was that S. had attributed falsehood to God. Commenting in a thesis on the conduct of Samuel (1 Sam. chap. xvi.) when about to proceed to Bethlehem to anoint David, S. had pointed out that God certainly induced the prophet to adopt such measures and such language as could not but lead King Saul to believe what was not true. He argued, however, that the 'will of God' can never command what is criminal or wrong, and that this deception—this falsehood, as men would call it—was quite innocent and permissible. S.'s logic is not perhaps quite faultless, but he at least deserves credit for not denying the existence of a moral difficulty. The dispute was carried to the synod of Hague, and S. was subjected to a series of petty persecutions that shortened his days. He died at the Hague in 1730. As a preacher, S. has often been compared with Bossuet, whom he rivals in force, if not in grace and subtlety of religious sentiment. His chief productions are: *Sermons sur divers Textes de l'Ecriture Sainte* (La Haye, 1708—1725); *Nouveaux Sermons sur la Passion* (Rotterdam, 1732); *Discours sur les Evénements les plus mémorables du V. et du N. T.* (Amst. 1720—1728); *Abrégé de la Théologie et de la Morale Chrétiennes en Forme de Catéchisme* (Amst. 1722); and *Etat du Christianisme en France* (La Haye, 1725).

SAURODO'NTIDÆ, a family of fossil fishes related to the Herring and Salmon families, whose remains occur in the Cretaceous formations of America and Europe. There are three genera, *Saurocephalus*, Harl, *Saurodon*, Hays, and *Ichthyodectes*, Cope. They were all predaceous, the teeth of the first being lancet-shaped; in the last two, cylindric. The rays of the tail were long and strong, and beautifully and minutely segmented. Many of the species were of large size, the *Saurocephalus thaumas*, from Kansas, having been ten feet in length.

SAUROPLEU'RA, a species of Stegocephalous Batrachians, of snake-like form, from the coal-measures of Linton, Ohio. There are three species, *S. digitata*, *S. remex*, and *S. pectinata*, Cope. The last two had exceedingly weak limbs and compressed tails, which were used as oars in swimming. This form is caused by the presence of fan-like spines extending in a vertical plane above and below the vertebræ, which are variously sculptured.

SAUROPTERY'GIA, an order of extinct Reptilia, which first appear in the Trias and disappear in the Cretaceous. They are distinguished by their immovable quadrate bone, single attachments for ribs, and fin-like feet. They have been found in New Zealand, Europe, and North America. The older are the more varied, there being several genera in the German Trias, as *Pistosaurus*, *Nothosaurus*, and *Simosaurus*. In the Jura it is represented by many species of *Plesiosaurus* and *Pliosaurus*, some of the latter of huge size. The genera *Elasmosaurus* and *Cimoliosaurus* belong to the Cretaceous, especially in North America. The *E. platyurus*, from Kansas, was 50 feet long, with a neck of 22 feet.

SAU'RY PIKE (*Scomberesox*), a genus of fishes of the order *Synentognathi*, family *Scomberesocidæ*, having the body greatly elongated, and covered with

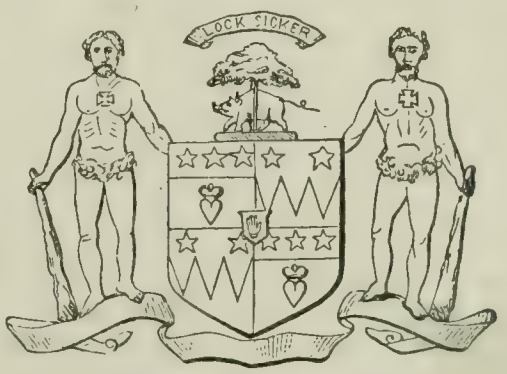
Saury Pike (*Scomberesox saurus*).

minute scales; the head also much elongated, and the jaws produced into a sharp long beak, as in the Garfish (q. v.); from which, however, the present genus differs in the division of the dorsal and anal fins into finlets, as in mackerels. One species (*S. storeri*) is common on the American coasts. It is about fifteen inches long, the back dark-blue, the under parts white; the fins dusky-brown. It approaches the coast, and enters bays in shoals, which are pursued by larger fishes, porpoises, &c.; and in order to escape from these, the S. P. often leaps out of the water, or rushes along the surface, for a distance of one hundred feet, scarcely dipping or seeming to touch the water.

SAU'SAGE, a preparation of flesh, made by chopping the raw meat very fine, adding salt and other flavouring materials, and often bread-crumbs also, the whole forming a pasty mass. The sausages of Lucania were very celebrated amongst the Romans. They were made of fresh pork, and bacon chopped fine, with nuts of the stone-pine, and flavoured with cumin-seed, pepper, bay-leaves, various pot-herbs, and the sauce called garum.

SAUSAGE-POISON. It is well known that sausages made or kept under certain unknown conditions are occasionally highly poisonous; and in Germany, where sausages form a staple article of diet, fatal cases of sausage-poisoning are by no means rare. The symptoms are slow in appearing, three or four days sometimes elapsing before they manifest themselves. The poison may be described as of the narcotico-irritant character, and is very dangerous. An English case recorded by Dr Taylor, in his *Medical Jurisprudence*, differed from those commonly occurring in Germany in this respect, that the sausages were fresh, while the sausages which have proved poisonous in Germany had always been made a long time. Dr Kerner, a German physician, who has specially studied this subject, believes that the poison is an acid formed in consequence of a modified process of putrefaction; others regard it as an empyreumatic oil.

SAUSSURE, HORACE BENEDICT DE, a celebrated Swiss physicist and geologist, was born at Conches, near Geneva, 17th February, 1740. His education was directed with such success that, in 1762, young S. obtained the chair of Physics and Philosophy in the university of Geneva. In 1768, he commenced the famous series of journeys which were fraught with such important consequences to science and to his own reputation; and during the course of which he visited the Jura and Vosges Mountains, those of Germany, England, Italy, Switzerland, Sicily, and the adjacent isles; the extinct craters of Auvergne, &c.; and traversed



the Alps no less than 14 times, crossing them by 8 different routes. He was the first 'traveller' who ever ascended to the summit of Mont Blanc; he camped for 17 days on the Col du Géant, and finished his Alpine achievements by the ascent of Monte Rosa in 1789. During this extensive course of travel, he made numerous observations on the minerals, physical features, botany, and meteorology of the mountain ranges he visited; and these observations were found, after having undergone a searching examination, to be as correct and valuable as they were numerous. In short, they put the science of geology for the first time on a basis of fact. The work in which they are found is entitled *Voyages dans les Alpes*, &c. (Neufchatel, Geneva, Paris, 1779—1796, 4 vols.), and is much admired for its accurate and splendid descriptions of Alpine scenery. His observations were not made without considerable preliminary labour, for he found it necessary to improve his thermometer, hygrometer, eudiometer, electrometer, anemometer, and to invent other two instruments—viz., the cyanometer and diaphanometer, before his investigations, which were conducted with much care and candour, produced satisfactory results. In 1786, S. resigned his chair; and in 1798 was appointed Professor of Natural History in the Central School of the *department of Leman* (formed on the annexation of Geneva to France); but four years afterwards, he was struck with paralysis, and after a long period of suffering, died at Geneva, 22d January 1799. Besides the great work above mentioned, he wrote numerous others, the chief of which are: *Observations sur l'écorce des Feuilles et des Pétales* (1762); *De Præcipuis Errorum nostrorum Causis, ex Mentis Facultatibus Oriundis* (1762); *De Electricitate* (1766); *De Aqua* (1771); *Sur l'hygrométrie* (1783), which, according to Cuvier, is one of the most important contributions to science in the 18th c.; and in which S. set forth his discovery of the dilatation in bulk, and diminution in specific gravity, of air charged with moisture. His 'Description of the Alps,' a portion of his great work, was published separately in 1834, at Geneva and Paris.

SAUTRÂNTIKA is the name of the second of the four great schools or systems of Buddhism, the three others being called *Vaibhâshika*, *Madhyamika*, and *Yogâchâra*. They recognise the authority of the *Sûtras* (q. v.), but reject that of the Abhidharma. —See C. F. Koeppen, *Die Religion des Buddha* (Berlin, 1857); and W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St Petersburg, 1860).

SAVAGE, Richard, an English poet, was born in London on 16th January 1696—1697. He was the fruit of an illicit intercourse between Lord Rivers and the Countess of Macclesfield, which resulted in the divorce of the lady, and the declared illegitimacy of her offspring. Lord Rivers, though permitting his name to be given to the child, seems not to have concerned himself further with him at all; and at the hands of his mother he met with only the grossest neglect. To the interference of *her* mother, Lady Mason, he was indebted for his education, received at the grammar-school of St Albans. Afterwards, he was apprenticed to a shoemaker in Holborn, but an accident revealing to him the secret of his birth, he quitted this obscure handicraft. Repeatedly and in vain he appealed to the tender sympathies of his mother, who declined even to see him, and withheld all acknowledgment and assistance. Failing other means of subsistence, he turned his attention to literature, and at an early age produced several comedies, which met with but little success. Somewhat more fortunate was his tragedy of *Sir Thomas Overbury*, which, though indifferently received on the stage, with the author himself as actor of the leading part, obtained in print some approval, and put a little money in his purse. In 1727, he killed a man in a drunken tavern brawl—an offence for which he was tried, and sentenced to death. A pardon was, however, obtained for him on the intercession of the Countess of Hertford with the queen, and the details of his story becoming widely known, a strong feeling arose in his favour. Though his mother continued inexorable, and would, it was thought, have been well pleased to be rid of him by the hands of the hangman, certain of her relations interested themselves in him, and he was received into the household of Lord Tyrconnel, who allowed him £200 a year, and otherwise treated him with considerate generosity. His poem, *The Wanderer*, was now published; its success was great, and for a time the career of Savage was prosperous, and even brilliant. But it did not very long remain so. The inveterate irregularity of his habits involved him in difficulties with Lord Tyrconnel, and they parted with mutual recriminations. After this, he sunk irretrievably. Though he failed in an attempt to obtain the post of poet-laureate, a poem which he wrote to commemorate her birthday so pleased the queen, that along with 'a permission to write annually on the same subject,' she conferred on him a pension of £50 a year. This sum, which might have been to him the basis of a modest subsistence, it was his regular habit to dissipate in a week's debauchery, passing the rest of his year in what disreputable fashion he could. On the failure of his pension by the death of the queen, a subscription was set on foot, mainly through the influence of Pope, with the view of sending him to live quietly at Swansea in Wales. Thither, accordingly, he retired; but happening to visit Bristol, where he lived in the reckless manner habitual to him, he was arrested for a debt of £8, and died in prison there, on the 31st July 1743.

The poetry of S., though a few vigorous lines of it continue to be remembered, is scarcely such as of itself would have sufficed for a permanent reputation. His most powerful and finished piece is *The Bastard*, in which, when he had finally broken with the relations of his mother, he held her up to public execration. Such celebrity as still attends his name he owes, however, almost entirely to the masterly life of him by Dr Johnson, who, in the time of his own early struggles, was thrown much into his society.

SAVAGES, or **WILD MEN**, in Heraldry, are of frequent occurrence as supporters. They are represented naked, and also, particularly in the later

Savage (the Douglas Arms).

heraldry, are usually wreathed about the head and middle with laurel, and often furnished with a club in the exterior hand. Savages are especially

prevalent in the heraldry of Scotland. In more than one of the Douglas seals of the first half of the 15th c., the shield is borne in one hand by a single savage, who acts as sole supporter.

SAVA'NNAH, a city and port of Georgia, U. S., on the right bank of the Savannah River, 18 miles from its mouth, 90 miles south-west of Charleston, lat. 32° 5′ N., long. 81° 5′ W. It is built on a sandy plain, 40 feet above the river, with broad streets shaded by beautiful trees. Its chief edifices are the custom-house, city exchange, court-house, state arsenal, theatre, St Andrew's Hall, Oglethorpe Hall, market, hospitals, and asylums. In 1870, the exports were $58,000,000, consisting of cotton, rice, lumber, naval stores, &c. The harbour admits vessels of 14 feet draught to the wharfs; larger ships discharge and load 3 miles below. The city is surrounded by marshes and islands, and was defended by Fort Pulaski and Fort Jackson. S. was founded in 1733 by the English general, Oglethorpe. In 1776, a British fleet, attempting to take the town, was repulsed after a severe action; but it was taken in 1778, and held in 1789 against the combined French and American forces. In the war of Secession, after many unsuccessful attacks by sea, it was taken by General Sherman in February, 1865. The population in 1870 was 28,235.

SAVANNAH, a river which forms the boundary between Georgia and South Carolina, U.S., rises in the Alleghanies, on the south-western border of North Carolina, and flows south-east to the Atlantic. Its length is 300 miles, navigable to Augusta.

SAVANNAHS (Span. *savana* or *sabana*), the name given by the early Spanish settlers to the great plains or prairies (q.v.) of the North American continent.

SAVARY, Anne Jean Marie René, Duc de Rovigo, a French general and diplomatist, was born at Marcq, in Ardennes, 26th April 1774, entered the army as a volunteer in 1790, and served with distinction in the army of the Rhine. In 1797, he accompanied Desaix to Egypt as *chef d'escadron*, and remained under his command as long as that general lived. After the battle of Marengo (1800), Napoleon made him his aide-de-camp, and for several years employed him only in political affairs, for which he shewed an admirable capacity. In 1803, he was made general of brigade; in 1804, as commandant of the troops stationed at Vincennes, he presided at the execution of the Duc d'Enghien, an event which he is believed to have unduly hastened; and in the Prusso-Russian Austrian wars of 1806—1808, he acquired high military reputation, his victory at Ostrolenka (February 16, 1807) being really a brilliant achievement. Created Duke of Rovigo in the beginning of the following year, he was sent to Spain by the emperor, and negotiated the perfidious arrangement by which the Spanish king and his son were kidnapped. In 1810, he replaced Fouché as Minister of Police. After the fall of Napoleon, to whom he had always been passionately, and, we may add, unscrupulously devoted, he wished to accompany him to St Helena; but he was confined by the British government at Malta for seven months, when he succeeded in making his escape, and getting on board a ship, was landed at Smyrna. After experiencing several vicissitudes, he returned to Paris in 1818, and was reinstated in his titles and honours. In 1823, he removed to Rome; but at the close of 1831, he was appointed commander-in-chief of the army of Africa, and during his brief administration of affairs in Algeria, exhibited a splendid energy and generalship. But ill-health forced him to withdraw to France in March, 1833, and on the 2d of June following, he died at Paris. S.'s *Mémoires* (Par. 8 vols. 1828) are among the most curious and instructive documents relating to the period of the Empire.

SAVE, a river of the south of Austria, and an important affluent of the Danube, is formed by two upper waters, which rise in the extreme north-west of Carniola, and unite at Radmannsdorf 1560 feet above sea-level. The river then flows south-east through Carniola, passing Laibach (at which point it becomes navigable), and forming in part the boundary between Carniola and Styria, after which it enters and traverses Croatia; and at its confluence with the Unna, first touches the Turkish dominions, the northern boundary of which it continues to form throughout the remainder of its course to its junction with the Danube at Belgrade. Entire length, 644 miles. Its principal affluents are the Laibach (200 miles long), Kulpa, Unna, Bosna, and Drina.

SA'VELOY, a kind of sausage common in the London shops; it only differs from pork sausages in being made of young *salted* pork, and is highly seasoned, a little saltpetre being added to give the contents a red colour.

SAVIGLIA'NO, a city of Northern Italy, province of Cuneo, 9 miles east of Saluzzo. It is situated on the Maira and the Grana, and is a handsome and clean town. Cloth and silk are extensively manufactured, and the country in the vicinity is productive in wines and grain. Cattle are reared in great numbers, and silk-worms are bred largely. Pop. 17,634.

SAVIGNY, Friedr. Karl von, an illustrious writer on Roman jurisprudence, was descended from a French Calvinistic family, that had emigrated to Germany in 1622, to avoid religious persecution, and was born at Frankfurt, 21st February 1779. He studied at Marburg, and took his degree in 1800, after which he commenced a series of lectures on juridical subjects, which were attended by a numerous auditory. Struck, in his exposition of the Digest, with the divergence existing between the text and the commentaries on the theory of possession, he composed in 1803 his masterly treatise, *Das Recht des Besitzes*, in which the Roman law is disengaged from the extraneous elements introduced into it by Germanic law, common usage, and the misapprehensions of commentators. Its merit was quickly recognised, and S. received the most advantageous offers from different universities, which, however, he declined, in order to prosecute researches in the libraries of France and Germany, with a view to a historical development of the glosses of commentators. He was assisted in this laborious undertaking by his pupil, Jakob Grimm, and his young wife, a daughter of the poet Clem. Brentano, and Bettina von Arnim. Appointed Professor of Law at Landshut in 1808, he was called, two years afterwards, to Berlin, on the reorganisation of the university, and there he continued to lecture with unbroken success for a period of 32 years, in the course of which he filled various important offices in the university and the state, and died 25th October 1861, at the age of 82. S. is the virtual founder of the new historical school of writers upon jurisprudence, although it is but fair to admit that Hugo and Schlosser had preceded him in the same direction. The essential idea of this school is, that 'law' or 'right' is not an abstract and absolute rule, manifesting itself under the same forms in all countries, but that it is one

of the forces of society, with which it changes, according to fixed laws of development that are beyond the caprices of the day. This idea, when worked out historically, has produced the most important and original results, and may even be said without exaggeration to have regenerated the science of jurisprudence. S.'s principal writings are: *Vom Berufe unserer Zeit für Gesetzgebung und Rechtswissenschaft* (Heidelb. 1815); *Geschichte des Römischen Rechts im Mittelalter* (6 vols. Heidelb. 1826–1831); *System des heutigen Römischen Rechts* (8 vols. Berl. 1840—1848); *Das Obligationenrecht* (1851—1853), and *Vermischte Schriften* (5 vols. Berl. 1850), a collection of essays which had originally appeared in the *Zeitschrift für Historische Rechtswissenschaft*, and elsewhere.

SA'VINE (*Juniperus Sabina*, see JUNIPER), a low, much-branched, and very widely-spreading shrub, with very small, imbricated, evergreen leaves, which grows on mountains in the south of Europe and the East. It bears small black berries, covered with a pale blue bloom. Its foliage has a strong, fetid, aromatic, penetrating odour, particularly when rubbed. Its exhalations cause headache. The part of the plant used in medicine is the tops of the branches, collected in spring, and dried. Their odour is strong, peculiar, and unpleasant, and their taste acrid, bitter, resinous, and disagreeable. The therapeutic properties of S. are due to the volatile oil which it contains. Two pounds of the tops yield about five ounces of this oil, which is limpid and nearly colourless, having the odour of the plant, and a hot acrid taste. Its composition is $C_{10}H_{16}$, being isomeric with oil of turpentine.

S. exerts a stimulating effect on the uterine organs, and is employed with much benefit in cases of amenorrhœa and chlorosis, depending upon want of tone in those parts. It is best given in the form of the oil, one or two minims of which may be prescribed in a pill, to be taken twice a day. This drug is often employed by the lower classes for the purpose of procuring abortion; but it ought to be generally known that if it is given in a sufficiently large dose to produce the desired effect, the life of the mother is placed in the greatest possible peril. If a poisonous dose has been given for this or any other object, emetics should first be employed to remove any of the drug that may remain in the stomach, after which opiates and demulcents should be prescribed, and a general cooling and lowering treatment adopted. S. in the form of ointment is much used as an external application, with the view of keeping up the discharge from a blistered surface. The ointment cannot, however, be kept long without losing its properties.

SAVINGS-BANKS. The application of the banking-system to the middle and humbler classes of society was commenced by individual exertions long before the legislature took cognizance of the matter. In 1799, the Rev. J. Smith, rector of Wendover in Bucks, as a means of inducing habits of prudence and frugality among his parishioners, offered, with two other inhabitants, to receive weekly any sum not less than twopence; and if the amount were not touched before the next following Christmas, to add one-third to it as a bonus or encouragement. Of course, such a plan could only be applicable for a limited time and for small sums. Other attempts followed, more or less involving the principle of charity; until, in 1810, the Rev. H. Duncan established a Parish Bank Friendly Society at Ruthwell (Scotland), more resembling a modern savings-bank than anything which had preceded it. A minute account of its organisation and mode of operation drew so much attention to it, that, by the year 1817, there were 78 establishments somewhat resembling it in the United Kingdom.

The first savings-banks' acts were passed in 1817, one for England and Wales, and one for Ireland. A fund, called the Fund for the Banks for Savings, was opened with the National Debt Commissioners; and into this fund were to be placed all savings-banks' deposits as soon as they reached £50. On these sums the National Debt Commissioners gave £4, 11*s.* 3*d.* per cent. interest (3*d.* per cent. per diem). The trustees and managers of the savings-banks in most cases allowed the depositors 4 per cent., the difference being applied to the working expenses. As it was considered that all such institutions were established for a benevolent rather than a commercial purpose, the trustees and managers were not allowed to make any profit out of the transactions. In England, each depositor's amount in one year was limited to £50 after the first year, which might be £100; but in Ireland, the first and all other years' deposits were to have a limit of £50.

This, the fundamental statute on the subject, has been modified and extended in many ways since. In 1824, as it was found that the benefits of the savings-banks' system were reaped by persons for whom it was not intended, an act was passed declaring that the deposits in the first year should not exceed £50; that those in subsequent years should not exceed £30; that no interest would be allowed on any excess beyond £200; and that no person would be allowed to make deposits at more than one savings-bank. In 1828, an act was passed to give greater security to the depositors. The rules drawn up by the trustees and managers of all savings-banks were to be submitted to a barrister appointed by the National Debt Commissioners, and without his approval, no savings-bank could commence or continue operations. The justices of the peace had also a veto in the matter; and the clerk of the peace was to keep a certified copy of the approved rules and regulations. The money deposited in savings-banks was to be invested in the Bank of England or of Ireland, in the name of the National Debt Commissioners. The trustees were to receive £3, 16*s.* $0\frac{1}{4}d.$ per cent. interest ($2\frac{1}{2}d.$ per cent. per diem), and were to pay the depositors not exceeding £3, 8*s.* $5\frac{1}{4}d.$ interest ($2\frac{1}{4}d.$ per cent. per diem). No depositor was to deposit more than £150; but compound interest might accumulate until the total reached £200. Friendly societies and charitable institutions were, however, permitted to invest to the amount of £300.

In 1833, an act was passed to enable savings-banks to manage the granting of small deferred annuities, to be paid for by weekly, monthly, quarterly, or yearly instalments. In 1835, another act extended the operation of the statutes of 1828 and 1833 to Scotland, and enabled existing savings-banks to conform to the stipulations without a necessity for reorganisation.

In 1844, a new act made extensive changes in the savings-banks' system, the chief items of which may thus be summarised: Interest allowed by the commissioners to trustees to be reduced to £3, 5*s.* 0*d.* per cent., and by trustees to depositors to £3, 0*s.* 10*d.* per cent.; every depositor's book to be sent once a year to his savings-bank for examination; the extent of the liability of trustees, managers, actuaries, and cashiers exactly defined; arrangements for making deposits in trust for other persons; annuities under the act of 1833 not to exceed £30 for any one person, but separate annuities to that amount may be granted to a husband and wife; deposits made by a married woman may be returned to her, unless the husband give notice to the contrary;

rules laid down concerning the inheritance of the deposits of intestate and illegitimate persons; payments to the relations of intestate depositors to be made to the next of kin according to the law of Scotland, if in that country. An act passed in 1848 placed a limit on the liability of trustees of savings-banks in Ireland. In 1853, an act placed the maximum and minimum of savings-banks' annuities at £30 and £4 respectively; and allowed a husband and wife to purchase a joint-annuity, although one of them may have already had an annuity of the full amount. Another act in 1860 authorised the National Debt Commissioners to invest the moneys received by them from savings-banks in any kind of stock, debenture, or other security that has received parliamentary sanction; and required them to make an annual return to parliament of all such transactions. The act of 1861, establishing Post-office Savings-banks, contained provisions for the transfer of deposits from the one kind of savings-banks to the other. By another statute passed in 1863, the arrangements for deposits in the name of a minor are defined; the order of proceedings is settled whereby any savings-bank may be wound up and closed, and the claims of the depositors transferred to the Post-office Savings-banks; and slight changes are made in the mode of managing savings-banks' annuities and transfers of deposits.

From time to time, as the above-named statutes came into operation, the National Debt Commissioners have laid down rules for giving them practical effect, and the registrar of savings-banks has exercised the necessary supervision. The rules on the important subject of savings-banks' annuities may be thus briefly noticed: The nominee's age must not be under 15; no annuity below £4, and the aggregate of annuities to any one person not to exceed £30; by purchasing two half annuities instead of a whole one, the annuitant may receive his money in four quarterly sums; on the death of the annuitant, a sum equal to one-fourth part of the annuity will be paid to his or her next representative, if claimed within two years; if the purchaser of an annuity is unable to continue his instalment of payments, he may either receive back the whole of his money without interest, or may have an immediate or deferred annuity equivalent in amount to the moneys which he has paid; if the purchaser of a deferred life-annuity die before the annuity becomes due, the whole amount of his payments, but without interest, is paid to his family; an annuity is not transferable, except by a bankrupt to his creditors, from whom it will be purchased by the National Debt Commissioners at its proper value; if an annuitant becomes insane, the trustees of savings-banks are empowered to make weekly payments for his benefit, under certain conditions.

These institutions have wrought vast benefit, by inducing habits of economy among the working-classes. It will suffice to take three years equidistant apart—viz., 1833, 1848, and 1863—to shew the rate at which the operations have extended. On November 20, 1833, there were 484 savings-banks, holding balances belonging to 475,155 depositors; the sum in hand was £15,715,111, giving an average of more than £33 due and belonging to each depositor; these totals applied to England, Wales, and Ireland, but did not include Scotland. On November 20, 1848, there were 582 savings-banks in the United Kingdom, holding balances belonging to 1,044,927 depositors; the sum in hand was £27,809,429, giving an average of about £27 due and belonging to each depositor; the deposits in England were nearly ten times as large in amount as those of the other three sections of the United Kingdom combined. On November 20, 1863, there were savings-banks in the United Kingdom holding balances belonging to 1,555,089 individual depositors, charitable institutions, and friendly societies; the sum in hand (including interest) was £43,278,656, giving an average of about £28 due and belonging to each depositor. The charitable institutions and friendly societies which had accounts open with savings-banks were so large in number as 28,334, having deposits of about £100 each on an average. About 300,000 depositors had accounts open of less than £5 each. There were 6627 savings-banks' annuities then in force, for an aggregate sum of £135,748 per annum; in other words, the annuities were more than £20 each on an average.

SAVINGS-BANKS IN THE UNITED STATES.—There are no available statistics of savings-banks in the United States. It is certain, however, that they are more numerous in the northern than in the southern states, and in the eastern than in the western. These institutions occupy a large space in Massachusetts, and the returns of their business are among the most complete in the country. The savings deposited in these banks have hitherto been mainly the fruit of labour and economy substantially belonging to the labouring classes, but within a few years the high rate of interest (6 per cent. per annum) and other causes have attracted deposits from capitalists, and the aggregate has reached an extraordinary amount. In October, 1869, the deposits and surplus earnings amounted to $114,801,608, a sum equal to the corporate capital invested in cotton, woollen, iron, and leather manufactures in the state, and exceeding the capital of the banks of discount by $35,000,000. There were, in 1869, 131 savings-banks and 431,769 depositors in Massachusetts. In 1868, New Hampshire had 31 banks, and $13,541,534 on deposit; Connecticut, 54 banks, with $36,283,460; Rhode Island, 25 banks, with $21,413,647.

POST-OFFICE SAVINGS-BANKS have been instituted in connection with the money-order department of the General Post-office of Great Britain. An act of parliament was obtained in 1861 to enable the Postmaster-general to act in connection with the Treasury and the National Debt Commissioners. Deposits not less than one shilling in amount may be made at any of the money-order offices, or at such offices as the Postmaster-general may appoint. Each depositor is provided with a deposit-book; each deposit is entered in this book, and is attested by the receiving-officer and by the dated stamp of his office. The amount received is reported on the same day to the Postmaster-general. An acknowledgment of each deposit is transmitted to the depositor, and this is to be conclusive evidence of his claim to repayment with interest. The depositor is entitled to repayment of the whole or any part of the deposit, on making a demand in a prescribed form at *any* of the offices (not necessarily the one at which he made his deposits) within ten days at furthest after sending in the demand. The names of the depositors, and the amounts paid in and returned, are not to be disclosed except to the officials immediately concerned. All the moneys are paid into and received back from the National Debt Office, on the authority of the Postmaster-general. Interest at 2½ per cent. is allowed on all deposits as soon as they amount to £1, but none on fractional parts of £1. Facilities are supplied by means of certificates for transferring deposit accounts from ordinary savings-banks to Post-office savings-banks, or *vice versâ*. All expenses are refunded to the Post-office out of the deposit fund; and if there should be any deficiency, the Consolidated Fund is to bear it. A detailed account of the proceedings is to be presented annually to

parliament. The maximum sum deposited by any one person in one year is limited to £30. The deposit-book, in which the name, address, and occupation of the depositor are written, contains minute printed directions for his guidance. The book contains a pocket, in which the receipts from the Postmaster-general are recommended to be kept. The depositor pays nothing for the book, and nothing for postage for letters to and from the Postmaster-general.

This new system has proved remarkably convenient and successful. Operations commenced on September 16, 1861; and by the 31st of March 1864, the numbers stood thus: 372,955 accounts then open; £4,097,492 accumulated deposits and interest. Tabulated as to sections of the United Kingdom, they were as follow:

	P. O. S. Banks.	Depositors.	Due to Depositors.
England and Wales,	2160	339,633	£3,828 804
Scotland,	354	18.683	107,932
Ireland,	510	14 639	160 756
	3024	372,955	4,097,492

It will be seen, from these figures, that Scotland and Ireland have not yet embraced this new system except to a very small extent. Nearly 2000 Friendly, Provident, and Charitable Societies, and several Penny Banks, now deposit their funds in the Post-office savings-banks. It is gratifying to know that this new system is not a mere transfer of deposits from the old savings-banks; it is almost wholly an addition to them.

MILITARY AND NAVAL SAVINGS-BANKS.—The ameliorating influence of savings-banks has been brought to bear upon soldiers and sailors by special enactments. In 1842, an act was passed for establishing military savings-banks, to be managed in connection with the regimental pay departments. Reports are annually presented to parliament in relation to these banks. Another act was passed in 1859, affording greater facilities to the frugal soldier, and leading to a large increase in the deposits. The proceedings of these banks in recent years present the following figures:

	Deposits in Year.	Withdrawals in Year.
1859,	£70 736	£64,197
1860,	163,191	116,393
1861,	167,136	149.090
1862,	152,203	164 775

These accounts are made up to the end of the military year, March 31, and therefore consist principally of transactions in the preceding *civil* year. In March 1863, the accumulated sum, consisting of deposits and interest, due to individual depositors and to army charitable funds, amounted to £279,091.

Concerning seamen's savings-banks, they mainly depend for their provisions on an act passed in 1856, which recognised the shipping-offices for seamen as branch savings-banks; and authorised the Board of Trade to lay down rules with respect to the persons entitled to become depositors, the making and withdrawal of deposits, &c. The operations of the seamen's saving-banks are far less extensive in amount than those of the military savings-banks. Recent years have exhibited the following figures, made up to the end of what may be called the savings-bank year, November 20. (This termination of the year on different dates throws great confusion into official returns):

	Deposits in Year.	Withdrawals in Year.
1859,	£13,539	£8,417
1860,	14,959	9.653
1861,	17 112	12,681
1862,	17,089	15 343
1863,	17,098	14,090

The fund in hand, by the excess of deposits over withdrawals, accumulated to £36,068 by November 20, 1863.

SAVOIE. See SAVOY.

SAVO'NA, a maritime city of Northern Italy, in the province of Genoa, and 25 miles south-west of the city of that name. It is situated on a plain near the sea, and has numerous manufactures. The soil produces olives, fruits, grain, wood, and wines. It carries on a brisk trade with Marseille. The port of S., begun in 1197, is one of the safest harbours in the Mediterranean. At first it had from 25 to 30 feet depth of water, but the envious Genoese, in the 16th c., contrived to fill it with stones, and now it is only about 5 feet deep. A fortress defends the harbour; and, as many vessels touch there, S. has many European consulates. Pop. 11,441. S. is a very ancient city, and in the time of the Romans was called Sava, founded, according to tradition, by Janus, flourished under the Roman empire, was destroyed by Rotharis (639), was rebuilt by Ludovic the Pious (981), and was afterwards laid waste by the Saracens.

SAVONAROLA, JEROME, the celebrated preacher, and political as well as religious reformer of Florence, was born of a noble family at Ferrara, September 21, 1452. He was educated at home, and, at a very early age, became deeply versed both in the philosophy of the schools and in the old Greek philosophy, which at that time had become popular in Italy; but his disposition from the first was strongly tinged with religious asceticism, and, in 1474, he formally withdrew from secular affairs, and entered the Dominican order at Bologna. Having completed his novitiate, and the studies of the order, his first public appearance as a preacher seems to have been in 1482, at Florence, where he had entered the celebrated convent of his order, San Marco, and where he preached the Lent in that year. His first trial, however, was a signal failure. His voice was harsh and unmusical, and he so utterly failed to interest his hearers, that, after a time, the course of lectures was entirely deserted. Some time afterwards, S. was sent to a convent of his order at Brescia, where, by degrees, his earnestness and zeal began to attract notice, and eventually, the disadvantages of manner and address, which had told against the effect of his early efforts, either were overcome through practice, or ceased to be felt under the influence of his sterling genius and irresistible enthusiasm. In 1489, he was once more recalled to the convent of San Marco at Florence. His second appearance in the pulpit of San Marco was a complete success. The great subject of his declamation was the sinfulness and apostacy of the time; and in his denunciation of the vices and crimes of his age, he took as his theme what has been the topic of enthusiasts in almost every age, the mystical visions of the Apocalypse, which he applied with terrible directness to the actual evils with which, as with a moral deluge, the age was inundated; and in these half-expositions, half-prophetical outpourings, his followers claimed for him the character of an inspired prophet. Under the rule of the great founder of the family of the Medici, Lorenzo the Magnificent, art, literature, and philosophy had all followed the common direction of that elegant but semi-pagan revival, which the scholars of the 15th c. had inaugurated; and the whole spirit of the social as well as intellectual movement of which Florence, under the Medici, was the centre, was utterly at variance with the lofty Christian spirituality and severe asceticism in which S. placed the very first conditions of the restoration of true religion and morality. His preaching, therefore, in its spirit, as well as in its

direct allusions, was no less antagonistic to the established system of the government, than to the worldly and irreligious manners of the age; the visions and predictions ascribed to him had quite as much of political applicability as of religious significance; and thus, to the aristocratic adherents of the Medici, S. early became an object of suspicion, if not of antipathy and dread. It is said by Pico de Mirandola, that he refused to grant absolution to Lorenzo, when the latter lay dying in 1492; but the statement does not accord with Poliziano's account of his patron's death. Through all this time, however, S.'s relations with the church were, if not of harmony, at least not of antagonism; and when, in the year 1493, a reform of the Dominican order in Tuscany was proposed under his auspices, it was approved by the pope, and S. was named the first general vicar. About this time, however, his preaching had assumed a directly political character, and the predictions and denunciations which formed the staple of many of his discourses, pointed plainly to a political revolution in Florence and in Italy, as the divinely ordained means for the regeneration of religion and morality. In one of his discourses, he pointed plainly to the advent of the French under Charles VIII.; and when this prediction was fulfilled by the triumphant appearance of the French expedition, S. was one of a deputation of Florentines to welcome Charles VIII. as the saviour of Italy, and to invite him to Florence. Very soon, however, the French were compelled to leave Florence, and a republic was established, of which S. became, although without political functions, the guiding and animating spirit, his party, who were popularly called *Piagnoni*, or 'Weepers,' from the penitential character which they professed, being completely in the ascendant. It was during this brief tenure of influence that S. displayed to the fullest extent, both the extraordinary powers of his genius, and the full extravagance of the theories to which his enthusiastic asceticism impelled him. The republic of Florence was to be the model of a Christian commonwealth, of which God Himself was the chief ruler, and His Gospel the sovereign law; and thus the most stringent enactments were made for the repression of vice, and of all the sinful follies by which it is fomented and maintained. All the haunts of debauchery were suppressed; gambling in all its forms was prohibited; the vanities of dress were restrained by sumptuary enactments; and, under the impulse of the popular enthusiasm which the enthusiasm of the prophet engendered, women flocked in troops to the public square to fling down their costliest ornaments; and gay gallants and grave scholars destroyed, in one common *auto da fé* before the gates of the cathedral, whole hecatombs of the amatory poetry or licentious fiction of the day, in conjunction with the elegant paganism or unconcealed immorality of the classic period. Meanwhile, the extremes of his rigorism; the violence of his denunciations, which did not spare even the pope himself; the assumption by him, or attribution to him, of a supernatural gift of prophecy; and the extravagant interpretation of the Scripture, and especially of the Apocalypse, by which he sought to maintain his views, drew upon him the displeasure of Rome. He was cited, in the year 1495, to answer a charge of heresy at Rome; and on his failing to appear, he was forbidden to preach; the brief by which the Florentine branch of his order had been made independent, was revoked; and he was again summoned to Rome. Once again S. disregarded this order. But his domestic difficulties now began to deepen. The measures of the new republic proved impracticable. The party of the Medici, called 'Arrabbiati' (Enraged), began to recover ground. A conspiracy for the recall of the exiled House was formed; and although, for the time, it failed of success, and six of the conspirators were condemned and executed, yet this very rigour served to hasten the reaction. The execution of these conspirators was a direct violation of one of S.'s own laws, and it tended to direct the popular sympathy in their favour. At the critical point of the struggle of parties came, in 1497, a sentence of excommunication from Rome against Savonarola. S. openly declared the censure invalid, because unjust, and refused to hold himself bound by it. In the following year, however, 1498, when the new elections took place, the party opposed to S., the Arrabbiati, came into power. He was ordered to desist from preaching; and the struggle was brought to a crisis by the counter-denunciations of a preacher of the Franciscan order, long an antagonist of S., Francesco da Puglia. In the excited state of the popular mind thus produced, an appeal was made by both of the contending parties to the interposition of divine providence by the ordeal of fire. But at the moment when the trial was to have come off, difficulties were originated by the party of S., and nothing was actually done. The result of this was to destroy, with the populace, the prestige of S.'s reputation, and to produce a complete revulsion of public feeling. In the midst of this reaction, he was cited before the council, and brought to trial for misleading the people by false prophecies. He denied the charge; but being threatened with torture, he is said to have made a confession, which, however, his friends say was garbled, if not utterly falsified. He was declared guilty of heresy and of seditious teaching. The acts of the trial were sent to Rome, where the sentence was confirmed; and he, with two others of his order, were given up to the secular power. An effort was made to procure a remission of the capital sentence which was passed upon them, but in vain; and on May 23, 1498, this extraordinary man, with his two companions, F. Domenico da Pescia and Silvestro Maruffi, were executed, and their bodies burned by the executioner. They died professing their adherence to the Catholic Church, and humbly accepting the last absolution from the papal commissary; and it is still a question among Catholics, whether S. is to be regarded in the light of a confessor of the truth, or of a fanatical forerunner of the movement which so soon reached its full development in the Reformation. The works of S. are very numerous. They were all written either in Latin or in Italian, but have for the most part been translated into French, German, Spanish, and other languages. His works in Latin are: (1.) *On the Simplicity of the Human Soul;* (2.) *The Triumph of the Cross;* (3.) *A Dialogue of the Spirit and the Soul;* (4.) *A Fourfold Exposition of the Lord's Prayer;* (5.) *On the Perfection of the Spiritual Life.* Most of them were translated contemporaneously into Italian, and some even by S. himself. His principal Italian works are: *A Treatise on Humility, On the Love of Jesus Christ, On the State of Widowhood, Two Treatises on Prayer, Rules of Christian Living* (together with a work of a title almost the same which he wrote while in prison, and at the desire of his jailer), *On the Mysteries of the Mass*, and several other doctrinal and ascetical treatises. No collected edition of his sermons has been published, and his correspondence also has, for the most part, disappeared; but the works which survive sufficiently illustrate the peculiarities of his genius, and the stern and almost fierce enthusiasm which was the secret of his influence on that corrupted but yet cultivated age.—See Madden's *Life of Savonarola* (2 vols. 8vo, 1854): Abbé Carle's

Histoire de Fra Hieron Savonarola (Paris, 1842); Revere's *I Piagnoni e gli Arrabbiati al Tempo de Savonarola* (2 vols., Milan, 1843).

SAVONE'TTES, soap of fine quality, perfumed and made into balls or other shapes, for use at the toilet.

SA'VORY (*Satureja*), a genus of plants of the natural order *Labiatæ*, nearly allied to Thyme (*Thymus*), and differing from it in the regularly 5-toothed or 5-cleft calyx, and the stamens bent together into an arch under the upper lip of the corolla. The species are herbaceous and half-shrubby plants, all natives of the south of Europe and the East. They have narrow, linear-lanceolate, entire leaves, with resinous dots, and short, axillary, little corymbs. The COMMON S., or SUMMER S. (*S. hortensis*), is commonly cultivated in kitchen-gardens for flavouring dishes. It is an annual plant, ½—1 foot high, with leaves not prickly pointed, and lilac or white flowers; has a strong and agreeable aromatic smell, and an aromatic pungent taste, and is in common use both fresh and dried for flavouring dishes, and especially for flavouring beans. It is stomachic and tonic.—WINTER S. (*S. montana*) is used exactly in the same way. It is a half-shrubby plant, with prickly-pointed leaves and larger flowers. Its taste is pungently aromatic.—Summer S. is propagated by seed; winter S. by slips and cuttings.

SAVOY, a cultivated variety of CABBAGE (q. v.), forming a large close head like the true cabbages, but having wrinkled leaves. A number of sub-varieties are in cultivation. The mode of cultivation and the uses are the same as those of cabbage. Savoys are much cultivated for winter use; they require a light rich soil.

SAVOY, formerly a duchy belonging to the kingdom of Sardinia (q. v.), now incorporated with France, is bounded on the N. and E. by Switzerland, E. and S. by Piedmont, and W. by the French departments of Isère and Ain. While an Italian duchy, it was politically divided into seven provinces, a division which exhibited the successive steps of its acquisition by the House of Savoy; but since its annexation to France this division has been modified, though the change has been little more than nominal. It is now separated into two departments: first, SAVOIE, or CHAMBERY, the southern part of S., with an area of 2282 sq. m., and a pop. of 271,663, which is divided into four arrondissements—Chambery (old province of *Chambery*), Albertville (*Alta-Savoia*), Moutiers (*Tarantasia*), and Saint Jean de Maurienne (*Maurienne*)—and has Chambery for its capital; secondly, HAUTE-SAVOIE, or CONFLANS, the northern part of S., which has an area of 1319 sq. m., with a pop. of 273,768, and is divided into four arrondissements—Bonneville (*Fossigni* or *Faucigny*), Thonon (*Ciablese* or *Chablais*), Annecy and St Julien (*Genevese*)—Annecy being the capital. The two departments resemble each other so much in all respects, that they may be described together.

S. is the most elevated tract in Europe, and is mostly covered with mountains, which break up the country into a number of valleys, each watered by its own snow-fed torrent or stream. The highest elevation of S. is the summit of Mont Blanc (q. v.), and the lowest is the bank of the Rhone at Saint-Genix d'Aosta, 670 feet above sea-level. The Graian Alps run along the eastern boundary of S., and form a natural barrier between it and Piedmont, several breaks or gorges affording means of communication between the two countries; from this range, the mountains gradually decrease in height towards the valley of the Rhone, which is on the western boundary.

S. (especially Haute-Savoie) is extremely picturesque, and within a comparatively limited space, exhibits at once the curious, the beautiful, the grand, and the wild and forbidding phases of natural scenery. There we have the lakes of Geneva, Annecy (9 miles by 1½), Aiguebellette, each perfect in its own style of beauty; the subterranean lakes of Bauge, the cascades of Sallanches and Bout-du-monde, the intermittent springs of Pigros and Haute-Combe, the grottoes of Balme, Bauge, and Sallanches, the hot springs of Aix-le-bains (near Chambery), of Saint Gervais, Bride, Echaillon, and others; the smiling valleys of Chambery, Faverge, Maglan, and Albertville; the glaciers of Chamounix, Buet, and Upper Tarantasia; the wooded mountain-sides of Ciablese, the bare rugged peaks which surround Mont Blanc, the frowning gorge of Challes, and the wild and savage glens and dells of Maurienne. Tourists consequently flock in great numbers to S., the robust to gratify their love of sight-seeing, and the invalids to benefit by the thermal springs, which are much esteemed.

The whole of the country is drained by streams which flow either into Lake Leman (the northern boundary) or the Rhone. Chief of the former is the Drance, which traverses Chablais; among the latter are the Arve, which drains the Chamounix valley, the Usses, the Fier, the Laisse, the Guier, and the Isère. The geology of S. is marked by the presence of three distinct ranges, exhibiting respectively the primary, transition, and secondary series of rocks with great completeness; and the depth of the crevasses, the height of the mountains, inversions of strata, débris on the mountain-sides, afford excellent opportunities for a thorough study of the constitution and elements of the earth's crust.

The whole of S. is broken up into a multitude of small estates, and the country is, as a consequence, most carefully cultivated, some of the fertile valleys resembling a continuous garden abounding in flowers and fruits. The ground suitable for cultivation being very limited, the enterprising natives have made extraordinary efforts to increase it by constructing line above line of parapets along the steep mountain-sides, and by filling in earth behind, forming long and narrow terraces, on which, if they can succeed in growing two rows of vines, they consider themselves well rewarded for their labour. These terraces are most common in the hilly districts of Tarantasia and Maurienne.

The climate of S. is in general cold, the winters are long and severe, and the summers frequently follow without an intermediate spring. Yet S. can boast of the vegetation of warm countries, as well as of that of higher latitudes; the vine is found growing almost to the edges of the glaciers, and cereals and fruits of various sorts are produced in great perfection. The pasturage is rich and abundant, and mulberry trees are largely planted. Although it is essentially an agricultural country, the industrial arts are not unrepresented; fabrics of cotton, printed calico and gauze, stockings, felt-hats, woollen cloth, are manufactured in various localities; and tanneries, breweries, distilleries, glass-works, potteries, &c., are occasionally met with. The chief occupation, however, is the breeding of cattle, horses, and mules, all of which are much esteemed, and fetch good prices; and bees and silkworms are tended as a source both of amusement and profit.

S. is rich in minerals—silver, iron, copper, antimony, manganese, lead, zinc, asphalt, marble, granite, gypsum, sulphur, and salt. The principal mines are the spathic iron-mine of Saint Georges d'Hurtières, and the lead-mine of Macot. Coal is found in Maurienne.

The exports consist of the surplusage of these

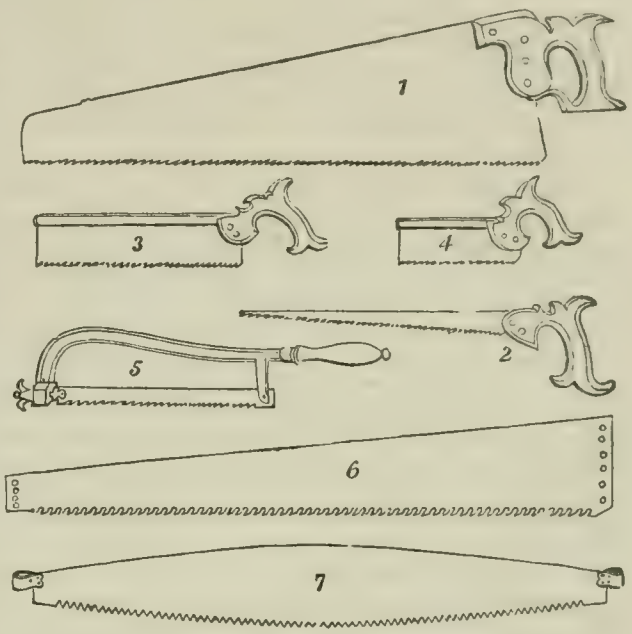
products, and also of cheese, hemp, silk both raw and spun, and wood of various sorts. S. is, with the exception of Bavaria, the only country of Europe in which advanced education is given gratuitously, there being within the country 14 colleges for this purpose. Ordinary education is also well provided for, as more than 1200 schools exist, nearly the whole of which are supported on old foundations.

The Savoyards are honest, intelligent, religious, hospitable, and enthusiastically patriotic, even to a greater extent than the Swiss. More than 20,000 of them expatriate themselves annually for the purpose of pursuing various callings, but the greater portion return early in summer, while others wait till they have amassed wealth sufficient for the rest of their lives.

SAVOY, House of. The small territory of Savoy, formed a part of ancient Gaul, and after the decline of the Roman power, was seized by the Burgundians (407 A. D.), and along with Burgundy, passed under the Franks (534). On the breaking up of the Frankish empire, Savoy was joined to *Transjurane Burgundy*, and along with that kingdom was united to *Cisjurane Burgundy*, or Arles. On the accession of the last king of Arles to the imperial throne as Conrad II., the great lords of North-western Italy, such as the lords of Suza, Chablais, Maurienne, and Turin, became vassals direct of the empire. The counts of Maurienne, the ancestors of the House of S., are generally believed by most historians who have investigated their genealogy to have descended directly in the male line from a son of Wittekind the Great, the last independent king of the Saxons; and Count Humbert, *the White-handed*, was the first of the family who, by the addition of Chablais and Valais (grants from the Emperor Conrad the Salic) to his hereditary lordship of Maurienne, rose to high position among the princes of Northern Italy. One of his descendants, Humbert II. (1078—1103), succeeded to the marquisate of Suza (which included the greater part of Piedmont), and further increased his little territory by the conquest of Tarantasia. The family now commenced to form alliances with the royal Houses of France, Portugal, England, Naples, Spain, and Germany, which added greatly to its political importance. Amadeus III. (1103—1149) received from the Emperor Henry V. the title of Count of Savoy (1111), and his grandson, Thomas I. (1188—1233), obtained important accessions in Chambery, Turin, the country of Vaud, and many other lordships. Count Thomas was the initiator of the policy so long and successfully adopted by his successors, 'of preserving armed neutrality in all contests between France and the Empire, and of vigorously supporting the Empire against the papacy.' From this time, the counts of Savoy became the arbiters of all quarrels in North, and occasionally in South Italy, and their bravery in the field, and keen political sagacity,* increased at once their political influence and their territorial jurisdiction. After the death of Count Boniface in 1263, without heirs, his uncle, Pietro, the Earl of Richmond and lord of Essex, usurped the crown; but in 1285, the rightful heir, Amadeus V. (1285—1323), the grandson of Pietro's elder brother, obtained the succession; and his grant to his brother Thomas of the principality of Piedmont as a hereditary fief, founded the two lines of Savoy and Piedmont, which continued to rule over their respective territories till, on the latter becoming extinct in 1418, Piedmont reverted to the elder line. (See Amadeus V., VI., and VIII.) Amadeus VIII. was the first Duke of Savoy, being so created by the Emperor Sigismond in 1416. Charles I. (1482—1489) obtained from Charlotte of Lusignan, queen of Cyprus, the transference of her rights, and from this date (1485) the dukes of Savoy also claimed to be kings of Cyprus and Jerusalem. The elder male line becoming extinct in 1496, the next collateral heirs were Philibert II. (1496—1504) and Charles III. (1504—1553); but the latter, having sided with Charles V. against Francis I. of France, was deprived of the duchy of Savoy in 1533, the countries of Valais and Geneva placed themselves under the protection of Switzerland, and in 1536 the country of Vaud was seized by the people of Bern. But his son, Philibert Emmanuel, who was the Spanish governor in the Netherlands, succeeded, at the peace of Cateau-Cambresis (1559), in obtaining repossession of Savoy. It was this duke who attempted to convert the Vaudois (q. v.), and who founded the now important silk-production in Piedmont, besides, to the utmost of his power, encouraging the prosecution and development of other branches of industry. He re-annexed (1576) the principality of Oneille, and conquered the county of Tende. His successor, Charles Emmanuel I. (1580—1630), was celebrated as a scholar, statesman, and warrior, but he was cursed with an inordinate ambition, which involved him in unfortunate contests with Geneva (a former town of Savoy, of which he wished to regain possession), with the French, who in revenge took possession of his dominions, and with the Spaniards. His two sons, Victor Amadeus I. (q. v.) (1630—1637) and Thomas, were the respective founders of the two lines of Savoy and Savoy-Carignan. Victor Amadeus speedily regained the dominions which his father had lost; and with the consent of France, added to them Montferrat, Alba, and some other places, relinquishing Pignerol, La Perouse, Angrone, and Lucerne to the French. As generalissimo of the French army in Italy, he gained two victories over the Spaniards, but died soon after. His grandson, Victor Amadeus II. (1675—1730), was one of the claimants for the Spanish throne on the extinction of the Spanish-Hapsburg dynasty (see Succession, War of the Spanish); and by his adroit policy in the contest between the Hapsburgs and Bourbons for the possession of this crown, he succeeded in obtaining extensive additions to his little territory, the chief of these being Alessandria, Val-di-Sesia, and other portions of the Milanese, the island of Sicily in 1713, and along with this latter the title of king. He and his descendants were also recognised as the legitimate heirs of the Spanish throne, should the Bourbon dynasty ever become extinct. But in 1720 he was compelled to surrender Sicily to Austria, in exchange for the island of Sardinia, which, along with Savoy, Piedmont, and his other continental possessions, was then erected into the Kingdom of Sardinia (q. v.).

SAVOY CONFERENCE, the name given to an ecclesiastical conference held in 1661 at the Savoy Palace (so called because built in 1245 by Peter, Earl of Savoy and Richmond [see Amadeus]; burned by Wat Tyler in 1381, it was rebuilt and endowed in 1505 as an hospital for poor persons) between the Episcopalian and Presbyterian divines, with the view of ascertaining what concessions would satisfy the latter, and thereby lead to 'a perfect and entire unity and uniformity throughout the nation.' During the rule of the Protector Cromwell, the Church of England had been in a very anomalous condition. Most of the clergy who held office during the early period of the Civil Wars were strong royalists, and either were ejected or fled, when the cause of the parliament

* It is a remarkable fact, in connection with the history of this family, that they have numbered among them more great warriors and politicians than any other royal House of Europe.



triumphed. Their places had been supplied in many cases by zealous Presbyterians—a rather numerous body in England at that time, and thus it happened at the restoration of Charles II. that a considerable section of the ministers *within the church* were hostile to the re-introduction of Episcopalian order and practice. Aware of this feeling, yet desirous of not adopting severe measures, if such could possibly be avoided, the king issued letters-patent dated 25th March appointing twelve bishops, with nine clergymen as assistants on the side of the Episcopal Church, with an equal number of Presbyterian divines, 'to advise upon and review the *Book of Common Prayer*.' Among the Episcopalian commissioners were Frewen, Archbishop of York, Sheldon, Bishop of London, Gauden of Exeter, Reynolds of Norwich, &c.: among their assistants, Dr Peter Heylin, Dr John Pearson, and Dr Thomas Pierce. The most notable representatives of the Presbyterian party were Richard Baxter, Dr John Wallis (then Savilian Professor of Geometry at Oxford), Edmund Calamy, William Spurstow, and Matthew Newcomen. The Conference (which lasted four months) was opened on the 13th of April. The Presbyterians (according to Burnett) demanded that Archbishop Usher's scheme of a 'reduced Episcopacy,' in which the elements of the Scotch system of presbyteries, synods, and general assemblies were combined with distinctions of ecclesiastical ranks, should be made the basis to begin with; that responses should be given up; that the prayers in the Litany should be combined into one; that no lessons should be taken out of the Apocrypha; that the psalms read in the daily service should be according to the new translation; that the term regeneration (among others) should be struck out of the baptismal service; and that the use of the surplice, of the cross in baptism, of godfathers as sponsors, and of the holy days, should be abolished. They were told in reply that the commission had no authority to discuss questions affecting the government of the church, such as were contained in Archbishop Usher's scheme; whereupon they proceeded to consider the minor points, such as the alterations of the Liturgy. Baxter, with the consent of his party, drew up a 'Reformed Liturgy' which the Episcopalian commissioners would not look at, considering the wholesale rejection of the older one *ultra vires* on their part. Finally, the parties separated without arriving at any conclusion; and this fruitless attempt at 'comprehension' was followed in 1662 by the famous 'Act of Uniformity,' the result of which was that 2000 clergymen were forced to abandon their livings in the Church of England.

SAVU' ISLANDS lie in the Indian Ocean, to the south-east of the Sandalwood Island. Pop. 35,000. The islands of the group are small, except Savu, in 121° 45′—122° 7′ E. long., and 10° 25′—10° 36′ S. lat., with an area of 237 sq. miles. It is very fertile and healthy, the thermometer ranging from 76° to 88° F., by day, and 68° to 70° by night. The products are those usual in the Indian Archipelago. Horses and excellent tobacco are exported to Timor.

There are several rajahs who are under the Netherlands Resident at Timor, a postholder being stationed at Seba, where there is good anchorage.

The Savunese belong to the Malay race. Their religion is a traditionary heathenism, in which the offering of sacrifices of dogs is frequently practised.

SAW, one of the most important tools used in working timber. It usually consists of a long strip of thin steel, with one edge cut into a continuous series of sharp teeth. Notwithstanding the great simplicity of the principle upon which the saw is made, it admits of great variation, and modern carpentry has brought into use a great many kinds of saws adapted to different purposes. The most common is the *Hand-saw* (fig. 1), in general use. For this the blade is broader at one end than the other, and a wooden handle is fixed to the broader end, without which it could not be used. This kind of saw is varied by the manner in which the teeth are cut and set, and in the shape and width of the blade, as in *Compass* or *Key Saws* for cutting small holes (fig. 2). Other kinds of hand-saws, such as the *Back-saw* (fig. 3) and the *Tenon-saw* (fig. 4), have straight blades, and the back is guarded and

strengthened by a piece of brass or iron bent over it. The *Bow-saw* (fig. 5) is used for a variety of purposes; the blade, which is always thin, is stretched like a bowstring to an iron frame. The *Frame-saw* (fig. 6), chiefly used in sawpits and mills for cutting timber longitudinally, is similar in shape to the ordinary hand-saw, but much larger, with holes at each end, for fixing it in the frame by which it is moved up and down. For cutting timber transversely, the *Cross-cut-saw* (fig. 7) is used; this differs not only in shape, but in the set of the teeth

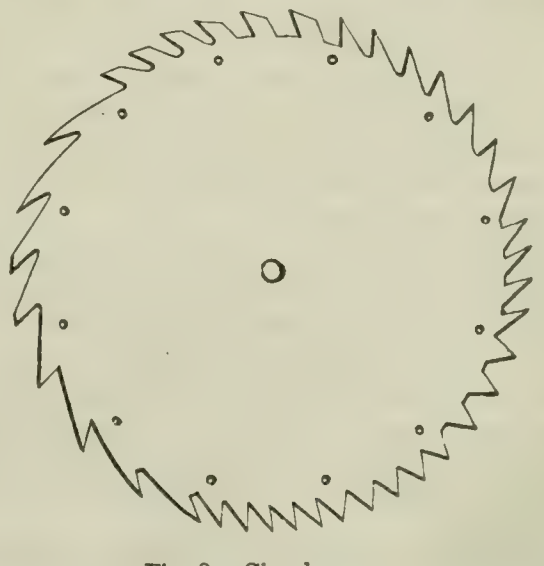


Fig. 8.—Circular-saw.

from other saws. Within the present century, the *Circular-saw* (fig. 8) has come into universal use wherever machinery can be had for working it. It

is generally so fitted as to be worked under a flat bench, a part only of the blade projecting through a narrow slit cut in the top of the bench. It is made to revolve with great rapidity, and the wood resting on the bench is pushed against the saw in the direction it is intended to be cut. The rapidity with which wood is cut by the circular-saw is truly marvellous. To save space, several forms of teeth are shewn in the figure, but each saw has but one kind. The *Ribbon-saw* is comparatively a new invention. It consists of a very long band—or web, as it is called—of steel, usually very narrow, and with finely-cut teeth. The two ends are joined together so as to form an endless band, which is passed over two revolving drums, one above, and the other below the working-bench, through holes in which the saw passes. With this work, the finest patterns in open work may be cut out with great ease and rapidity. Numerous other kinds of saws are in use, but these are the chief.

SAWDUST. The waste made by sawing timber, formerly of little or no use, has now become a material of some value in localities where it can be applied. Its most interesting application is one very recently patented by Messrs Dale & Co. of Manchester, whereby it is converted into oxalic acid, and with so much success as to have nearly or altogether displaced every other method of making that chemical. The process is very simple. The sawdust is first saturated with a concentrated solution of soda and potash in the proportion of two of the former to one of the latter; it is then placed in shallow iron pans, under which flues run from a furnace, whereby the iron pans are made hot, and the saturated sawdust runs into a semi-fluid, pasty state. It is stirred about actively with rakes, so as to bring it all in contact with the heated surface of the iron, and to granulate it for the succeeding operations. It is next placed in similar pans, only slightly heated, by which it is dried. In this state it is oxalate of soda mixed with potash. It is then placed on the bed of a filter, and a solution of soda is allowed to percolate through it, which carries with it all the potash, leaving it tolerably pure oxalate of soda. It is then transferred to a tank, in which it is mingled with a thin milk of lime, by which it is decomposed, the lime combining with the acid to form oxalate of lime, and the soda being set free. Lastly, the oxalate of lime is put into a leaden cistern, and sulphuric acid is poured in; this takes up the lime, and sets free the oxalic acid, which readily crystallises on the sides of the leaden cistern, or on pieces of wood placed on purpose. So rapid and cheap is this method, compared with that formerly in use, that several extensive old manufactories have been shut up since the article on Oxalic Acid was written, being unable to compete with the patent process.

Another interesting use of the sawdust of hard woods, such as rosewood, ebony, &c., is that recently made known in France under the name of *Bois-durci*. The various kinds of sawdust used are reduced to fine powder, and mixed with blood into a paste; other materials are doubtless added, for when pressed into moulds it is jet black, and receives the most beautiful impressions. Messrs Latry, Senior, & Co. of Paris produce some very beautiful medallions and other small articles in this material.

SAWFISH (*Pristis*), a genus of cartilaginous fishes, constituting the family *Pristidæ*, which is ranked with the Rays (q. v.), although the elongated form of the body agrees rather with that of the sharks. In a number of anatomical characters, however, the sawfishes differ from sharks, and agree with rays, and conspicuously in the position of the gill-openings, which are not on the sides, as in sharks, but on the under-surface, as in rays. The mouth is on the under surface of the head, and is furnished with pavement-like teeth, adapted for crushing. But the S. is particularly remarkable for the elongation of the snout into a flat bony sword, armed on each edge with about twenty large bony spines or teeth; a most formidable weapon, of

Sawfish (*Pristis antiquorum*).

which it seems to make use for killing prey, rushing amongst shoals of fishes, and slaying them right and left. Whales are said to be sometimes killed by sawfishes, and the saw has been sometimes driven into the hull of a ship. There are six or seven known species of S., and they are distributed over the whole world. The Common S. (*P. antiquorum*) was known to the ancients, being found in the Mediterranean. It is a very widely distributed fish, being found both in polar and tropical seas. It sometimes attains the length of eighteen feet, including the saw. Sawfishes are seldom seen near the shore, and no species is reckoned among British fishes.

SAWFLY (*Tenthredo*), a Linnæan genus of insects of the order *Hymenoptera*, now divided into many genera, and constituting a family of which the species are very numerous. They derive the name S. from the ovipositor of the females, which is scaly, serrated, pointed, and enclosed in a sheath of two concave plates. By means of this instrument, the female S. perforates the stalks or other parts of plants, laying an egg in each hole. The hole soon becomes filled with a frothy liquid, and sometimes a gall-like swelling is formed, within which the larva resides. The larvæ of many sawflies, however, live

Turnip Sawfly (*Athalia spinarum*), in its various stages of Transformation.

in no such nests, but feed on foliage, like caterpillars, which they very much resemble. One of the most common species of gooseberry 'caterpillar' is the larva of a S. (*Nematus ribesii*). Sawflies have the abdomen cylindrical, and so united to the thorax that the distinction is not easily perceived. They

vary much in the antennæ. Both pairs of wings are divided by nervures into numerous cells. Among the more notable species is the CORN S. (*Cephus pygmæus*), which, in its perfect state, abounds on umbelliferous flowers, a shining black insect, marked with yellow, the abdomen elongated. The larva consumes the inside of the straw of corn, and descending to the base of the straw, cuts it down level with the ground.—Another important species is the TURNIP S. (*Athalia spinarum*), reddish, spotted with black; the larva nearly black, and known by the names of *Black Jack* and *Nigger*. The Turnip S. is sometimes very troublesome and destructive for a year or two, and then almost completely disappears for a number of years. It has sometimes been very destructive to the turnip-crops of Britain.—The S. of the Pine (*Lophyrus pini*) is a common British species, and sometimes, although not very often, strips pine and fir trees of their leaves.

SAW-MILL. Within the present century, the art of working saws by machinery has been invented, and large mills for cutting up timber by means of large saws worked by machinery, are to be found in most civilised countries. They are worked both by steam and water-power, and in Holland, wind-mills are made to work sawing machinery. The arrangements of a saw-mill are very simple: they consist of a fixed horizontal frame, with rollers at short intervals, upon which the tree or log of timber is laid; at the end of this, another frame is placed in a vertical position; it contains as many saws placed side by side as it is proposed to cut planks out of the log, and they are set as far apart as the desired thickness of the planks or boards. A rapid up-and-down motion is given to these saws by the machinery, and at the same time the log is pulled forward on the rollers by the same power, so as to be kept constantly up to the saws. In this way, a large tree or log of wood may be cut into twenty planks in much less time than was formerly required by laborious hand-labour to cut one single thickness.

The circular-saw is also much used in mills for cutting planks and boards into pieces of almost any form.

SAXE, HERMANN MAURICE, COUNT OF, one of the greatest warriors of the 18th c., was the natural son of Augustus II. (q. v.), Elector of Saxony and king of Poland, and the Countess Aurora von Königsmark, and was born at Goslar, 28th October 1696. When only twelve years of age, he ran off from home, made his way to Flanders, joined the army of Marlborough, and took part in the capture of Lille and the siege of Tournay. With a boyish love of change, he joined the Russo-Polish army before Stralsund (1711), and after the taking of Riga, returned to Dresden, where his mother induced him, in 1714, to espouse a young and amiable German heiress. In the two following years, he took part in the civil war then raging in Poland; but having quarrelled with his father's favourite minister, he returned to Dresden, where the well-grounded jealousy of his wife made his life sufficiently disagreeable. Obtaining the annulment of his marriage, and a pension from his father, he came to Paris in 1720, where he devoted himself for some years to the study of military tactics, and originated and developed an entirely novel system of manœuvres, which was highly spoken of by the Chevalier Folard, the celebrated military engineer. In 1726, he was elected Duke of Courland, and for a time maintained himself in his new possession against both Russians and Poles, but was compelled to retire to France in the following year. Joining the army on the Rhine, under the Duke of Berwick, he signalised himself at the siege of Philipsburg (1734), and decided the battle of Ettingen by a desperate charge at the head of a division of grenadiers. For these services, he was made a lieutenant-general in 1736; and on the breaking out of the war of the Austrian Succession, he obtained the command of the left wing of the army which was appointed to invade Bohemia, and took the strongly-fortified town of Prague by storm with marvellous celerity. The capture of Egra was similarly effected a few days afterwards, and the rest of the campaign shewed that his abilities in the field were not inferior to his skill against fortifications. In 1744, he was made a marshal of France, and appointed to command the French army in Flanders, and on this occasion he gave decisive proofs of the soundness and superiority of his new system of tactics, by reducing to inaction an enemy much superior in number, and taking from him, almost before his face, various important fortresses. The following year was for him more glorious still; his army was reinforced, and though so ill with dropsy that he had to submit to tapping (15th April), he laid siege to Tournay on the 22d, and on the advance of the Duke of Cumberland to its relief, took up a position at Fontenoy, and awaited attack. He was assailed on the 11th May, and the desperate valour of the English for a time bore down everything before them; but S. sped about in his litter, encouraging his troops, and when the critical moment came, the fire of his artillery disorganised the English, and a charge of the French completed the victory. Four months afterwards, every one of the numerous strong fortresses of Belgium was in his hands. In 1746, S., by a series of able manœuvres, threw back the allies on the right bank of the Maese, and gained (11th October) the brilliant victory of Raucoux, for which he was rewarded with the title of marshal-general, an honour which only Turenne had previously obtained. For the third time, at Laufeldt (2d July 1747), the victor of Culloden suffered complete defeat at the hands of S., whose favourite system of tactics was again brought into full play; and the brilliant capture of Bergen-op-zoom brought the allies to think of peace. The Dutch, however, were still disposed to hold out, till the capture of Maestricht (1748) destroyed their hopes, and the peace of Aix-la-Chapelle followed. S. had previously carried on a correspondence with the great Frederick of Prussia, and he now took occasion to visit him at Berlin, experiencing the most brilliant reception. In the following year, Frederick wrote to Voltaire: 'I have seen the hero of France, the Turenne of Louis XV.'s time. I have received much instruction from his discourse on the art of war. This general could teach all the generals in Europe.' S. lived at his estate of Chambord for some time afterwards, and died there of dropsy, 30th November 1750. His work on the art of war, entitled *Mes Rêveries*, was published at Paris in 1757.

S. was probably the greatest captain of his time, and a gallant and enterprising leader, but he was a mere soldier, and the offer of membership made to him by the Académie Française is sufficiently ridiculous. S. had, however, the good sense to decline the proffered honour, and he did so in a sentence, the extraordinary orthography of which accidentally rebuked, more than the most cutting sarcasm could have done, the mean sycophancy of the Académie. He wrote: 'Ils *veule* me *fere* de *la cademie; sela* m'*iret come* une *baye* a un *chas*.'

Many biographies of S. have been written, but few of them are to be much depended upon.—See *Moritz von Sachsen* (Dresden, 1863), by Karl von

Weber; and the *Nouvelle Biographie Générale* (art. 'Saxe'). His character and genius are also well, though not flatteringly, portrayed in Carlyle's *Life of Frederick the Great*.

SAXE-A'LTENBURG, a small Saxon duchy and state of the new German empire, bounded by Saxe-Weimar, Prussian Saxony, the kingdom of Saxony, Saxe-Meiningen, and Schwarzburg-Rudolstadt, and separated into two nearly equal parts by the interposed principality of Reuss-Gera. The eastern portion, or *circle of Altenburg*, from its being watered by the Pleisse, was formerly called *Pleissengau*. It contains 241 English sq. m., with a pop. (1868) of 93,383. The western part, or *circle of Saal-Eisenberg*, is watered by the Saale, with the Orla and Rode, and contains 262 English sq. m., with a pop. (1868) of only 48,043. Total area, 509 sq. m., pop. (1868) 141,426, one-third of whom are inhabitants of towns. The vast bulk of the population are Protestants, there being in 1858 only 800 Catholics and 1400 Jews, almost none of the latter settled in the country. The eastern portion is open, undulating, and very fertile, and agriculture has here attained considerable perfection, and is diligently pursued by a large proportion of the population, so that much more corn is produced than is necessary for home-consumption. The peasants in this circle, though speaking the Thuringian dialect, exhibit in their dress, manners, and customs a family resemblance to the Wendish-speaking Serbs of Lusatia; and numerous names of places, especially those ending in *itz*, indicate their Slavic origin. They are celebrated throughout Germany for their skill as agriculturists, and their superior intelligence, knowledge, and comparative wealth. The revenue amounted in 1865—1868 to $659,178; and the expenditure, including the duke's civil list, to the same sum. The military force consists of 1473 men, who form two battalions of the imperial army. S. is a limited monarchy, in accordance with the constitution of 29th April, 1831, modified somewhat by the events of 1848—1849. The assembly of deputies consists of 24 members, 8 representing the landed proprietors, 8 from the towns, and 8 from the country. The government is in the hands of a ministry of three. Altenburg (q. v.) is the seat of government.

SAXE-CO'BURG-GO'THA, one of the minor Saxon duchies and a state of the new German empire, comprising the *duchy of Gotha*, lying between Prussia, Schwarzburg, Saxe-Meiningen, and Saxe Weimar, and containing 542 English sq. m. (inclusive of *Nazza*, an isolated portion on the north-west, 14 English sq. m., and *Volkenrode*, on the north-east, within Prussia, 25 English sq. m.), with a pop. (1867) of 119,245; and the principality of *Coburg*, 18 miles south of Gotha, lying between Meiningen and Bavaria, and containing 230 English sq. m. (inclusive of *Königsberg*, in Bavaria, 19 English sq. m.), with a pop. (1867) of 49,490. Total area, 816 English sq. m.; pop. 168,735. Gotha lies on the north side of the Thuringerwald, which extends along and within its southern frontier; but the rest of this duchy consists of low, undulating, and very fertile land, and is watered by the Werra, an affluent of the Weser, the Unstrut, a tributary of the Saale, and several smaller streams. Coburg lies on the southern slope of the same range, is watered by the Itz and Rodach, affluents of the Main, and has extensive forests, and many beautiful valleys between the spurs of the Thuringerwald. Of the surface of the whole duchy, $\frac{5}{9}$ths is arable, $\frac{2}{7}$ths is wood, $\frac{1}{14}$th waste land, and the rest pasture and gardens. In the plains and valleys, the climate is mild and salubrious, but in the mountainous parts of Gotha it assumes a more inclement character. Agriculture is the principal occupation of the people, and is pursued with energy and skill; corn and flax being produced in abundance, as also potatoes and various leguminous plants. The breeding of horses, cattle, and sheep is also successfully conducted. The mineral wealth includes coal (chiefly in Gotha), iron, cobalt, manganese; also marble, porcelain-earth, millstones, and salt. The manufactures are not of much importance, and are chiefly confined to Gotha. There is a large beet-sugar factory at Gotha. The extensive forests of the duchy employ a large proportion of the population in the production of pitch, tar, and potash. The duchy is a limited monarchy, in accordance with the fundamental law of 3d May, 1852. Coburg and Gotha have each a *landtag*, or diet; that of the former consisting of 11, that of the latter of 19 deputies; besides which there is a common landtag for the whole state, composed of 7 of the Coburg and 14 of the Gotha representatives, who are elected by their several diets. The mode of election to the separate diets is peculiar, being effected by electors equal in number to the members to be chosen, each elector being appointed for that purpose by a separate district. The diet endures for 4 years, and must never be prorogued for more than 6 months. There are two ministers for carrying on the government, one for Coburg, and another for Gotha. The duke had a vote in the plenum, and shares the 12th vote in the little council of the German diet. The military contingent consists of 1302 men, a reserve of 372, and the same number of substitutes, making in all 2046 men, who form one regiment of two battalions in the imperial army, and are, by the convention of July 1, 1861, under the authority of, and maintained by, Prussia. Education is well attended to.

The finances of the two portions of the duchy are separately administered, that of Coburg being as follows: estimated receipts by the budget of 1869—1873, $170,587; expenditures, $166,547; public debt, comprising $140,000 of paper-money, $1,142,392; and of Gotha, receipts, $443,475, equal to the expenditure; debt, including $300,000 of paper-money, $1,512,432. The estimated revenue (1867—1873) of the ducal domains is $584,118, and the expenditures, $336,323. The present duke, Ernest II., was born 1818, and succeeded to the throne on the death of his father, Ernest I., in 1844. The family is distinguished among the German princely families for the spirited and liberal character of its members, as well as for physical and mental gifts. It is allied with several of the royal families of Europe, the present duke's elder brother having been the late Prince Albert of Great Britain; one of his cousins, the husband of Queen Maria II. of Portugal; and his uncle, Leopold, king of the Belgians. The heir-apparent to the duchy is Alfred, the second son of Queen Victoria of Great Britain.

SAXE-MEI'NINGEN, a small Saxon duchy, now forming a state of the new German empire, consisting of one large crescent-shaped territory, which lies immediately north of Bavaria and Coburg, with the horns of the crescent pointing northwards, and contains 862 English sq. m., with a population (1861) of 159,868, and two small isolated territories, Kranichfeld (28 English sq. m., pop. 3144) — consisting of four detached portions, on the north, between Weimar and Schwarzburg-Rudolstadt—and Kamburg (53 English sq. m., pop. 9329), on the north-east between Weimar and Prussia; total, 933 English sq. m.; pop. (1867) 180,335, of whom 177,319 are Protestants, 1125 Catholics, 44 Mennonites, and 1629 Jews. The crescent is composed of the old duchy of Meiningen, the old duchy of Hildburghausen, and the principality of Saalfeld (both of which, along with Kamburg, were annexed to Meiningen in 1826). S.

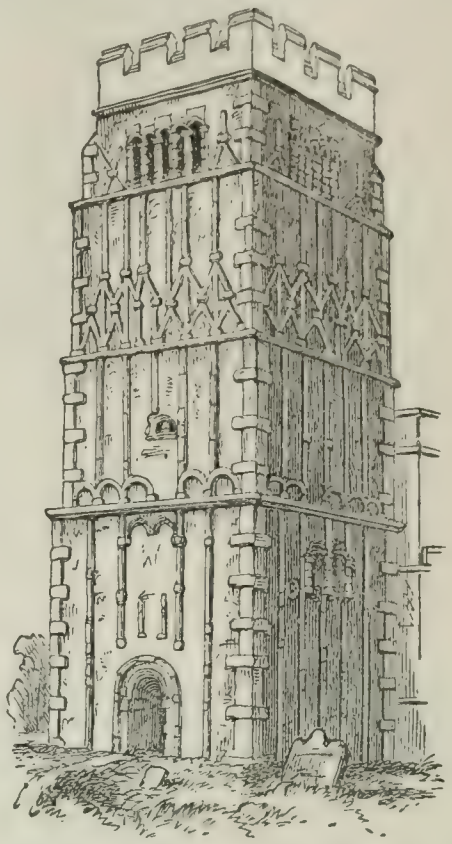
forms the south-west of Thuringia (q. v.), and is traversed in the east and north by the Thuringer-wald, offshoots from which also cover the west, while the Rhön-gebirge enters the country at the south-west. Its surface is thus necessarily hilly, in some places even mountainous, Kieferle in the Thuringer-wald being 2700 feet, and Geha-berg in the Rhön-gebirge, 2308 feet above sea-level; but between the mountain ridges are numerous fruitful valleys, and that of the Werra in particular is one of the most fertile and picturesque in Germany. The Werra, Saale, Milz, Steinach, Itz, &c., water the country. Two-fifths of the country is arable land; a nearly equal extent is under wood; and the rest is meadow, garden and vineyard, and waste. In the lower lands, agriculture is in an advanced condition, and is prosecuted with such vigour, that corn enough is produced for home-consumption; potatoes, hemp, flax, and tobacco are the other chief crops.

The mining industry of the east and north is important, employing in 1852 no less than 3820 men; and the important mineral products are iron, copper, cobalt, coal, porcelain-clay, sulphur, and salt from the works of Salzungen, Neusulza, and Friedrichshall. S. is also an active manufacturing district, chiefly in woollen, cotton, and linen fabrics, and paper; and brewing, distilling, the making of glass and porcelain, and various other branches of industry, are prosecuted. The fabrication of wooden toys in the district around Sonneburg employs 8000 men, and the produce is bought up by the Sonneburg dealers for export. A rape-sugar factory is maintained. S. is a limited monarchy in accordance with the fundamental law of 1829, and the election act of 25th June, 1853. The diet consists of 24 representatives — 2 from the nobles, 6 from the landowners, 8 from the towns, and 8 from the country. The government is carried on by four ministers, each of whom heads a separate department. The duke had a voice in the plenum, and shared the twelfth vote in the small council of the old Germanic Confederation. The army consisted of 2110 men, and 384 substitutes, and formed a regiment of two battalions in the federal army. The annual budget (1869—1871) is as follows: Revenue of domains, $353,800; and from taxes, &c., $387,240; total revenue, $741,041; expenditure, $715,840; public debt, Jan. 1, 1870, $1,720,719. The present duke is George II., son of Bernard Eric-Freund, who abdicated in 1866, after a reign of 63 years, and who spontaneously gave his subjects a liberal representative constitution in 1824. S. is distinguished as the best governed state in Germany.

SAXE-WEI'MAR-EI'SENACH, a large Saxon duchy, and now a state of the new German empire, consisting of *Weimar*, which lies between Prussia, Altenburg, and Schwarzburg-Rudolstadt, and contains (inclusive of Allstädt, on the Unstrut, within Prussia, 45 English sq. m., and Ilmenau, in the south-east of Gotha, 32 English sq. m.) 685 English sq. m., with a pop. (1867) of 147,681; *Eisenach*, the western portion, which lies to the north of Meiningen and Bavaria, and contains (inclusive of Ostheim, in the Rhön-gebirge, in Bavaria, 23 English sq. m.) 461 English sq. m., with a pop. (1867) of 84,267; and *Neustadt*, which lies on the western boundary of the kingdom of Saxony, and contains 239 English sq. m., with a pop. (1867) of 50,980; total area, 1421 English sq. m.; pop. (1867) 282,928, of whom 271,767 are Protestants, 9906 Roman Catholics, 49 Greek Catholics, 1182 Jews; the Jews and Catholics being chiefly in Eisenach. The Eisenach portion is traversed in the north by the Thuringer-wald, and in the south by the Rhön-gebirge, the intermediate districts being also hilly and undulating, and watered by the Werra and its feeders, the Fulda, Ulster, Suhl, and Orsel. The Neustadt division is traversed from south-east to north-west by several offshoots of the Erz-gebirge, but most of the surface belongs to the plain of the Saale, and is watered by the Elster and Orla, affluents of that river. The Weimar portion is also partly hilly and uneven, and partly belongs to the plain of the Saale, which, with its tributary, the Ilm, traverses it. The highest peak in the grand duchy is Hinkelhahn (2694 feet), in the detached territory of Ilmenau. The climate is somewhat inclement in the high lands, more temperate in the plains, and particularly pleasant along the valley of the Saale. Of the whole surface, about $\frac{2}{5}$ths is arable, $\frac{3}{11}$ths is forest, and the rest is meadow-land, gardens, and vineyards. Agriculture is in an advanced condition, and is diligently prosecuted, there being frequently a surplus of grain over and above that required for home-consumption, in spite of the occasional infertility of the soil; and potatoes, pulse, hemp, flax, hops, and (on the banks of the Saale) vines are also cultivated. Horse and cattle breeding is a common pursuit in Neustadt and Eisenach, and sheep-breeding in Weimar, the sheep having the usual good reputation of the Saxon breed. The mineral wealth comprises coal, iron, copper, cobalt, and marble. Eisenach is the chief seat of the manufacturing industry, with the exception of the woollen manufactures, which are principally carried on in Neustadt. The form of government is, according to the revised fundamental law of 15th October, 1849, a limited monarchy; the diet, or landtag, is composed of 31 deputies, 1 representing the landtag nobility, 4 chosen by landed proprietors, with incomes under 1000 thalers, 5 by those who possess the same income from other sources, and 21 by universal suffrage. The government is administered by three heads of departments. The grand duke had one vote in the plenum, and shared the twelfth vote in the little council of the old German diet with the rulers of Saxe-Meiningen, Saxe-Coburg-Gotha, and Saxe-Altenburg. The military contingent was 2345 men, which, with 670 of reserve, amounted to 3015 men, who formed 3 battalions of the federal army. The annual revenue is estimated (for 1869—1871) as follows: Receipts, $1,394,625; expenditure, $1,352,742; public debt, $3,372,000. The Grand Duke of Weimar is the chief of the Ernestine branch of the House of Saxony. The most celebrated of the Weimar family was Duke Karl-August, the Mæcenas of the art, literature, and science of Germany, who took the reins of government in 1775, and displayed extreme anxiety to favour the development of public prosperity and the progress of education. Under his fostering care, the university of Jena became a focus of intellect and knowledge to Germany; and the presence of Herder, Goethe, Schiller, and others at his court, well entitled it to be denominated the abode of the Muses. He also elevated the theatre of Weimar to its present position as the chief German school of dramatic art. In 1806, he joined the Confederation of the Rhine with the title of duke, and received from the Congress of Vienna an accession of territory, and the title of grand duke. In 1816, he granted a liberal representative constitution to his subjects, expressly guaranteeing the liberty of the press, and died 14th June, 1828. His successors have followed in his footsteps.

SA'XIFRAGE (*Saxifraga*), a genus of plants of the natural order *Saxifrageæ*, or *Saxifragaceæ*. This order has a calyx, usually of five sepals more or less cohering at the base; a corolla usually of five perigynous petals, alternate with the sepals, rarely wanting; perigynous stamens; a hypogynous or

perigynous disc; an ovary, usually of two carpels, cohering more or less by their face, but diverging at the apex; fruit generally a 1—2-celled capsule, the



Saxifrage (*S. stellaris*).

cells opening at the ventral suture, and often divaricating when ripe; the seeds usually minute and numerous. The order *Saxifrageæ* is sometimes regarded as including above 900 species, divided into several suborders, which are elevated by some botanists into distinct orders—leaving, however, more than 300 species to the reduced order SAXIFRAGEÆ, which contains herbaceous plants, often growing in patches, with entire or divided alternate exstipulate leaves, natives chiefly of mountainous tracts in the northern hemisphere, and often found up to the limits of perpetual snow, some of them forming there a rich and beautiful turf, and adorning it with their very pleasing flowers. A considerable number are natives of Britain. Some of the genus *Saxifraga* are well known in gardens, and are employed to cover rock-works, &c. *S. umbrosa*, London Pride, or None-so-pretty, is familiar in all cottage gardens. It is a native of the hills of Spain, and of the south and west of Ireland.

SAXO-GRAMMATICUS (i. e., Saxo the 'Grammarian' or 'Scholar'), the most celebrated of the early Danish chroniclers, flourished in the 12th c., and was secretary to Archbishop Absalom. He is said to have died at Koeskilde in 1204. S. undoubtedly formed his style on that of the later Roman historians, particularly Valerius Maximus, yet in his whole mode of representation, he belongs to the school of medieval chroniclers, although ranking first in that school. Erasmus half wondered at his elegance. Moreover, it adds mightily to our respect for S., that although a cleric, he did not in the very least degree allow himself to be swayed in his historical conceptions by the prejudices incident to his profession. His work is entitled *Historia Danica*, and consists of 16 books. The earlier portions are of course not very critical, but in regard to times near his own, S. is a most invaluable authority. According to his own statement, he derived his knowledge of the remoter period of Danish history—the 'Heroic Age' of the North—from old songs, Runic inscriptions, and the historical notices and traditions of the Icelanders; but he is not sharply critical in his treatment of the Danish sagas, although a rudimentary critical tendency is occasionally visible. The best edition of the *Historia Danica* is that undertaken by P. E. Müller, and finished by J. M. Velschov (Copen. 1839). It is furnished with a complete critical apparatus. There are good translations from the original Latin into Danish.

SAXON ARCHITECTURE, the style of building used in England before the introduction of the Norman architecture at the Conquest. There are few specimens remaining which can be depended upon as genuine. The Saxons built chiefly in wood, and all their wooden edifices are now lost. It seems probable that a rude and simple style, not unlike Early Norman, was that used by the Saxons. There

Tower of Earl's Barton, Northamptonshire.
(From Parker's *Glossary of Architecture*.)

are several buildings in England which Mr Rickman considers entitled to rank as Saxon. Amongst these, the Tower of Earl's Barton, Northamptonshire, is one of the best examples. The peculiar 'long and short' work of the quoins, the projecting fillets running up the face of the walls, and interlacing like wood-work, and the baluster-like shafts between the openings of the upper windows, are all characteristic of the style.

SA'XON LAND. See TRANSYLVANIA.

SAXON STATES, MINOR. The capitulation of Wittenberg, which followed the rout of Muhlberg (see SAXONY), and deprived John Frederick the Magnanimous of the electorate of Saxony, at the same time despoiled him of a large portion of the hereditary possessions of the Ernestine branch. The remainder, amounting—after the acquisition of Coburg, Altenburg, Eisenberg, &c., in 1554—to little more than one-fifth of the whole Saxon territory, was divided into two portions, *Saxe-Gotha* and *Saxe-Weimar*, the former falling to John Frederick II., and the latter to John William, the two sons of the deposed elector. Each of these portions was afterwards subdivided, the former into *Saxe-Coburg* and *Saxe-Eisenach*, and the latter (1573) into *Saxe-Weimar* and *Saxe-Altenburg*. It would only bewilder the reader to attempt to follow the endless subdivisions and reunions that followed. Suffice it

to say, that the gradual adoption of the law of primogeniture during the 18th c., and the extinction of various cadet branches, has left the four states of Saxe-Altenburg, Saxe-Coburg-Gotha, Saxe-Meiningen, and Saxe-Weimar-Eisenach, as described under their several names. Should the Albertine or Saxon-royal line become extinct, the Duke of Weimar succeeds to the throne; and failing his family, the lines of Saxe-Meiningen, Saxe-Altenburg, and Saxe-Coburg-Gotha obtain in this order the right of succession.

SAXON SWITZERLAND. See SAXONY.

SAXONS (Lat. *Saxŏnes*, Ger. *Sachsen*), a German people, whose name is usually derived from an old German word *sahs*, meaning a 'knife,' are first mentioned by Ptolemy, who makes them inhabit a district south of the Cimbrian Peninsula. Towards the end of the 3d c., a 'Saxon League' or 'Confederation' makes its appearance in North-western Germany, to which belonged, besides S. proper, the Cherusci, the Angrivarii, and the largest part of the Chauci. In the times of the emperors Julian and Valentinian, S. and Franks invaded the Roman territory; but their piratical descents on the coasts of Britain and Gaul are far more famous. At what period these commenced, it is impossible to tell, but it is believed to have been much earlier than is commonly supposed. Recent investigations seem to prove that S. had established themselves in England long before the time of the mythical Hengist and Horsa (see ANGLO-SAXONS); and we know that as early as 287 A. D., Carausius, a Belgic admiral in the Roman service, made himself 'Augustus' in Britain by their help. They had firmly rooted themselves, at the beginning of the 5th c., in the present Normandy, where a tract of land was named after them, the *Limes Saxonicus*. They fought against Attila (q. v.) in the Catalaunian Plain, 451 A. D. They also obtained a footing at the mouth of the Loire; but all the S. who settled in France 'disappeared' before the Franks, i. e., were probably incorporated with their more powerful kinsmen of Southern Germany. At home, the S. (called *Alt Sachsen*, or 'Old Saxons,' to distinguish them from the emigrant hordes who found their way to England and France) enlarged, by conquest, their territory north and north-west as far as the North Sea, the Yssel, and the Rhine; south, as far as the Sieg, and nearly to the Eder; eastward, to the Weser and Werra, the Southern Harz, the Elbe, and the Lower Saale. Along with the Franks, they destroyed the kingdom of the Thuringians in 531, and obtained possession of the land between the Harz and the Unstrut; but this district was in turn forced to acknowledge the Frankish sovereignty. From 719, wars between the S. and the Franks became constant; but the latter, after 772, were generally successful, in spite of the vigorous resistance offered by Wittekind; and in 804, the S. were finally subjugated by the arms of Charlemagne. Wittekind was the last Saxon king, and the first Saxon duke of the German empire. A collection of the old national laws and usages of the S., under the title of *Lex Saxonum*, was made during the reign of Charlemagne.

During 1830—1840, A. Schmeller published (from two manuscripts, one preserved at Munich, and the other in the British Museum) an 'Old Saxon' poem of the 9th c., called *Hêliand*, i. e., the 'Healer,' or 'Saviour,' which narrates in alliterative verse the 'History of Christ' according to the Gospels, whence it is also called the 'Old Saxon Gospel Harmony.' It is probably a part of a more comprehensive work, embracing a poetical treatment of the history of the Old and New Testament, which Ludvig the Pious intrusted to some celebrated Saxon singer. This unknown poet lived, as his language leads us to conjecture, somewhere between Münster, Essen, and Kleve. His work is not only the almost sole monument of the old Saxon tongue left us, but is also of high poetical value, through its warmth of feeling, and the strength and splendour of its diction—worthy, indeed, to take its place alongside the contemporary Anglo-Saxon and old Norse poetry. —See Vilmar's *Deutsche Alterthümer im Hêliand* (Marb. 1845).

SA'XONY (Ger. *Sachsen*), KINGDOM OF, the second in importance and population of the minor German states, and a state of the new German empire, is bounded on the N. and N. E. by Prussia, S. E. and S. by Austria, and W. by Bavaria, Thuringia (q. v.), and Prussia. It is divided for administrative purposes into the following circles:

	English Sq. Miles.	Pop. in 1867.
Dresden,	1674	638,916
Zwickau,	1790	908,525
Leipzig,	1342	553,583
Bautzen or Budissin,	971	322,562
Total,	6777	2,423,586

The kingdom is somewhat of the form of a right-angled triangle, with the right angle in the north-west, and the longer side lying along the foot of the Erz-gebirge range, which sends its spurs northward over the southern half of the country, giving to that portion a somewhat mountainous character, while the northern half remains a flat or undulating plain. The whole country, with the exception of a small portion in the extreme east, which belongs to the Oder basin, and is watered by the Neisse, is drained by the Elbe (which is wholly navigable in S.) and its tributaries the Muglitz, Wilde-Weisseritz, Trubsch, Mulde, and White Elster, on the west; and the Wessnitz, Black Elster, and Spree on the east. From the point where the Elbe bursts through the Erz-gebirge chain to within about 8 miles of Dresden, it traverses a district rich in picturesque scenery, to which the somewhat inappropriate name of *Saxon Switzerland* has been given. This district, which averages about 24 miles long by 23 broad, is an elevated plateau of coarse crumbling sandstone (much resembling the English green-sand); and though destitute of the perpetually snow-clad mountains, glaciers, serrated ridges, and escarped peaks which give a character of lofty grandeur to its namesake, it can boast of features equally peculiar and strikingly romantic. From the soft nature of the rock, it has yielded freely to the action of the mountain rills, which rise from the hills on its east and west borders, and converge to the Elbe, and is cut up in all directions by deep narrow gorges (so symmetrical in their formation as to resemble artificial lanes), the constantly deepening beds of these mountain torrents, which here form cascades, there sullenly glide through deep vales bordered by rocks of the most fantastic forms, or by steep rugged slopes thickly clad with trees. High above the level of the plateau rise towering rocks, some of them pyramidal or conical, others pillar-like, while a few taper almost to a point, and then bulge out at the top; all clearly testifying to the agency by which they have been produced. The medieval knights took advantage of these curious results of nature's so-called freaks, to erect castles upon the summits of some of them; several of these castles still exist, and one of them, Königstein, is almost the only virgin fortress in Europe. The most remarkable of these peaks are Königstein (864 feet), Lilienstein (1254 feet), the Bastei (600 feet), Nonnenstein, Jungfernsprung, and seven others, each of which possesses its group of traditionary gnomes and

kobolds. The lakes of S. are unimportant, and the only canals are those constructed between the mines and ore-mills.

Climate, Soil, Products, &c.—The climate is healthy, and on the whole temperate, though occasionally severe in the south-western districts. Of the whole surface, more than one-half is arable, nearly one-third is in forest, about one-ninth in meadow, while the rest is occupied by gardens and vineyards, coarse pasture and waste land, or quarries and mines. The arable land has long been in a high state of cultivation, as is the case with the whole of Upper S. (see *History*), yet notwithstanding this, and its extreme fertility, the produce is hardly sufficient to supply the wants of the dense population (390 to the English sq. mile). The agricultural products consist of the usual cereals and leguminous plants, with rape, buck-wheat, hops, flax, and potatoes, and all kinds of fruits suited to the climate. The forests, the largest of which are in the Voigt-land (the south-west corner of Zwickau), and along the northern slopes of the Erz-gebirge, supply timber of excellent quality, and in such abundance as to render them one of the great sources of wealth and industry. The rearing of cattle is an important employment in the mountainous districts of the south-west. Sheep, for which S. was formerly so famous, have been less generally attended to of late years, though, from the introduction of merinos, and increased care in breeding and rearing, the quality of the wool has much improved, and at the present day it occupies a high position in the markets of the world. Minerals are another great source of national wealth, the ore being both rich and abundant, and the processes of excavation and smelting in a high state of perfection. Most of the mines belong to the crown; they are situated in Zwickau and Dresden, and mostly on or near the northern slope of the Erz-gebirge. The mineral wealth includes silver, tin, iron, cobalt, bismuth, zinc, lead, nickel, arsenic, antimony, and other metals, besides coal, marble, porcelain-earth, vitriol, and various gems. In 1857, there were in operation 469 mines, employing 11,599 hands; and the products amounted in value to more than £278,000, five-sixths of the amount being the value of the silver obtained. Salt is not found.

Manufactures, Commerce, &c.—Manufacturing industry has also been greatly developed, and several branches have been carried to a high degree of perfection. This species of labour employs nearly three-fifths of the whole population. The oldest manufacture is that of linen, which at present employs more than 16,000 looms; but it is now eclipsed by the cotton-spinning and weaving, which is the most important branch of Saxon industry, has its chief seats at Chemnitz, Frankenberg, Zschoppau, Folkland, and Lausitz, and uses up annually about 30,000,000 lbs. of raw cotton in 135 spinning-mills, which have 554,646 spindles. Broadcloth, thread, merinos, silks, mixed silk and woollen wares, &c., are also produced in considerable quantity, and of excellent quality; the muslin de laines being still preferred by many to those of England and France, while the laces and embroideries preserve their ancient well-won reputation. Saxon pottery and porcelain have long been famous. The chief centres of manufacturing industry are in Bautzen and in the mountainous country to the north of the Erz-gebirge. Owing to this extension of manufacturing industry, combined with a deficiency in the supply of home-grown articles of consumption, an extensive foreign commerce is rendered necessary, and this is chiefly carried on through the medium of the great fairs of Leipzig (q. v.). The chief imports are corn, wine, salt (not found in S., though common enough in Prussian Saxony), cotton, silk, flax, hemp, wool, coffee, tea, &c. The kingdom forms a part of the Zollverein (q. v.), and, consequently, statistics of the state of its commerce cannot be readily obtained. The country is well provided with roads, railways, and lines of telegraph.

Government, Religion, Education, Revenue, &c.—The government is a limited monarchy, hereditary in the Albertine line, and is carried on according to the constitution of Sept. 4, 1831, modified by several changes in 1849, 1851, 1860, 1861, and 1868. The legislature consists of two chambers, which meet at the same time, and possess equal powers; the first chamber consisting of the nobles, superintendents and deputies of 5 colleges, a representative of the university of Leipzig, one of the Evangelical and one of the Catholic clergy, and the superior magistrates of the chief towns; the second, of deputies from the landowners, from towns, from the communes, and from manufacturing and commercial districts. There is also a council of state, to advise regarding the propriety of legislating in any given direction. The king possesses the whole executive power, which is administered through a cabinet of five departments. The established religion is the Lutheran, though the reigning family, since the time of Fr. Augustus I., have been Roman Catholic. Of the population, 2,367,434 are Protestants, 51,476 Roman Catholics, 413 of the Greek Church, 2103 Jews, and 2160 of other religions. Education is as much attended to in S. as in Prussia. The budget for finance for the years 1870—1871 estimated the revenue at $9,486,444, and the annual expenditure, together with a reserve fund of $73,295, at the same sum. The public debt on the 1st of January, 1870, amounted to $78,060,732—incurred mainly for the establishment and promotion of railways and telegraphs. In 1870—1871 the contribution of S. to the expenditure of the North German Confederation was $1,481,031. The army is raised by conscription, each conscript having the power of sending a substitute in time of peace; the term of service is 12 years, 3 of which are in the active army. The Saxon troops composed the twelfth corps of the army of the North German Confederation, and were composed of the following when on the peace footing: Infantry, including chasseurs, &c., 15,683; cavalry, 4212; artillery, 2 regiments, with 16 batteries and 96 cannons, and 2215 men, pioneers, and train, 2 battalions of 724; a total of 22,834 men. In time of war the effective force is raised to 41,000 men, exclusive of the troops in the dépôts and the landwehr or militia. S. occupied the 4th place in the old Confederation, and possessed 4 votes in the plenum and one in the minor council.

History of the Great Duchy of Lower Saxony, and of the Ascanian Electorate of Upper Saxony.—After the final conquest of the Saxons by Charlemagne, they became one of the components of the German empire; but their country by no means corresponded to what is now known as Saxony. It included the most of the country between the Elbe, the Harz Mountains, the Rhine, and Friesland, and, in 850, was erected into a dukedom, with Lübeck for its capital, and ruled by hereditary princes. Ludolf, the first duke, is said to have been the great-grandson of Wittekind, but nothing is certainly known of his ancestry. His second son, Otho the Illustrious (880—912), was the most distinguished of the German princes; he fought valiantly against the Normans, and, on the extinction of the Carlovingian dynasty (911), refused the crown of Germany which was unanimously offered him by the electors. His son Duke Henry (912—936), surnamed 'the Fowler,' obtained the throne (919), and commenced the Saxon line of German sovereigns, which was continued by Otho I. (q. v.), Otho II. (q. v.), Otho III. (q. v.), and Henry II., and ended in 1024. Otho I. handed over the great duchy of S. to Hermann

Billung in 960, on condition of military service; and this family held it till 1106. Under the Billung dynasty, the prosperity of the country greatly increased, and Meissen, Thuringia, East S., in Lusatia, S. in the Northern Mark, Anhalt, Saltzwedel, and Slesvig, were all dependent on the Saxon duke. A portion of S. had, however, been reserved by the emperor, Otho I., for his nephew Bruno, who founded a lordship of Saxony-Brunswick; and, in the middle of the 11th c., a duchy of 'Saxony on the Weser' was also founded; but both of these (united by marriage in 1090 or 1096) came (1113) by marriage to Count Lothar of Supplinburg, who was also invested (1106) with the great duchy of S., which was now more extensive than ever, stretching from the Unstrut, in Gotha, to the Eider, and from the Rhine to Pomerania. After Lothar's accession to the imperial throne in 1125, he handed over (1127) the duchy to his son-in-law, Henry the Proud, the Guelphic Duke of Bavaria, who was thus the ruler of more than half of Germany; but this overgrown dominion did not long exist, for under his son, Henry the Lion (q. v.), it was wrested (1180) from the House of Guelph, Bavaria being given to the House of Wittelsbach; East Saxony created an electorate, and given to Bernhard of Ascania; Brunswick and Lüneburg mostly restored to Henry's son; while the numerous and powerful bishops of Northern Germany divided among themselves Westphalia, Oldenburg, and many portions of Lüneburg and Brunswick; Mecklenburg and Holstein became independent; and the Saxon palatinate in Thuringia went to the Landgraf Ludwig. S., now shorn of its former greatness, consisted chiefly of what is now Prussian S., a few districts separated from Brandenburg, and Saxe-Lauenburg, the last being the only portion of the great duchy of S., or *Lower Saxony*, as it is called, which retained the name. Wittenberg was the capital of the new duchy. S. was diminished in 1211 by the separation of Anhalt as a separate principality; and in 1260, it was permanently divided into two portions, *Saxe-Lauenburg* and *Saxe-Wittenberg*, to the latter of which the electoral dignity remained, and to which, on subsequent dispute between the two branches, it was confirmed by the celebrated Golden Bull (1356). The Ascanian line became extinct in 1422 with Duke Albert III., and the duchy then passed to Frederick the Warlike, Markgraf of Misnia, and Landgraf of Thuringia, who was invested with it by the Emperor Sigismund in 1423. His possessions consisted of Thuringia, the present kingdom of S., Prussian S., in fact, the whole of *Upper Saxony*, with the exception of Anhalt.

History of the Country now known as Saxony.—The earliest inhabitants of Upper S., since the Christian era, were the Hermunduri (see THURINGIA); and on the destruction of the great Thuringian kingdom in the beginning of the 6th c., their settlements were taken possession of by the Sorbs, a Slavic race, who practised agriculture and cattle-breeding. The Carlovingian rulers, dissatisfied with the ingress of those non-German tribes, erected 'marks' to bar their progress; and Duke Otho the Illustrious of S., and his celebrated son, Henry the Fowler, warred against them, the latter—subduing the Heveller, the Daleminzer, and the Miltzer—founded in their country the marks of Brandenburg (q. v.), Misnia (Meissen), and Lusatia (Lausitz), and planted colonies of Germans among the Sorbs. In 1090, the mark was bestowed on the House of Wettin (a supposed off-shoot of the race of Wittekind), and was confirmed as a hereditary possession to that family in 1127; and the markgraf, Henry the Illustrious (1221—1288), whose mother was heiress to the landgrafdom of Thuringia, with its appendages, combined the whole into a powerful state. Business, commerce, and mining industry now flourished; great roads for commercial purposes were constructed throughout the country, and the Leipzig fairs were established; and, in spite of much internal discord, and frequent partitions of S., its prosperity increased. At last, FREDERICK THE WARLIKE (1381—1428) succeeded in uniting the severed portions of S., to which were added, by purchase and marriage, various districts in Franconia; and in 1423, the electorate of S. (see above). The Saxon elector was now one of the most powerful princes of Germany; but unfortunately the fatal practice of subdividing the father's territories among his sons still continued, and during the reign of the Elector FREDERICK THE MILD (1428—1464), whose brother William had obtained Thuringia, a civil war broke out, and was carried on for years. ERNEST (1464—1486) and ALBERT (1464—1500), the sons of Frederick, in accordance with the will of their father, reigned conjointly over the hereditary domains of the family (the duchy of S., with the electoral dignity, being reserved always to the eldest) till the death of their uncle (14 5), when Ernest obtained Thuringia, and Albert, Meissen, while Osterland was equally divided between them. Ernest, the founder of the *Ernestine*, which was also the *elder* or *electoral line*, was succeeded by his son, FREDERICK THE WISE (1486—1525), who favoured the reformation, and firmly supported and protected Luther against the overwhelming power of the Catholic party, which he was enabled to do, from his personal influence with the Emperors Maximilian and Charles V. His brother and successor, JOHN THE CONSTANT (1525—1532), was still more a partisan of the new doctrines, as was also his son and successor, JOHN FREDERICK THE MAGNANIMOUS (1532—1547); but the latter, by the defeat of Muhlberg (q. v.) (see SCHMALKALD), was forced to resign both his electoral dignity and his states. Albert, the founder of the *younger*, *ducal*, or *Albertine line*, was succeeded by his sons, GEORGE THE BEARDED (q. v.) (1500—1539), a rabid Catholic, and HENRY THE PIOUS (1539—1541), a no less zealous Protestant; after whom came the celebrated MAURICE (1541—1547), who was a professed Protestant, but joined the Catholic party against the league of Schmalkald, obliged the Protestant army to retreat from the Danube, and took possession of the estates of the Elector John Frederick, who, however, speedily drove him out, and took possession of ducal S. in his turn. After the rout of the Protestants at Muhlberg, Maurice received the electoral title (1547—1553), and the greater portion of the estates of his vanquished cousin. But the arbitrary political measures and religious severities which were either instituted or promoted by the emperor, induced Maurice to join the Protestants, and by a sudden march on Innspruck, he forced the emperor to agree to the peace of Passau. New tyrannical measures of the emperor caused him to look to an alliance with France, but the scheme was frustrated by his death, July 11, 1553, near Sievershausen, where two days before he had totally defeated the Markgraf Albert of Kulmbach, a secret agent of the emperor's. His brother, AUGUST I. (q. v.) (1553—1586), the first economist of the age, has left a memory dear to S., from the numerous excellent institutions which he established; he considerably increased his territories by purchase and otherwise, and restored Altenburg to the Ernestine line. CHRISTIAN I. (1586—1591), a weak prince, surrendered the reins of government to his chancellor, Crell, who was sacrificed, in the succeeding reign of CHRISTIAN II. (1591—1611), to the revenge of the offended nobility. Christian II. weakly

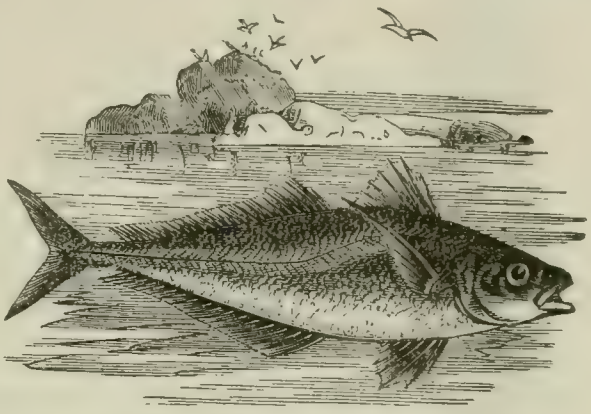
neglected to assert his claims to Juliers, on the death of its last duke, and allowed it to become a prey to Brandenburg and the palatine House of Neuburg; but his brother, JOHN GEORGE I. (1611—1656), in revenge for this spoliation, allied himself to Austria, and conquered Upper and Lower Lusatia and Silesia. Subsequently, the good understanding between these powers was destroyed, and the elector allied himself with Gustavus Adolphus (1631), and took part in the Thirty Years' War. But on the death of Gustavus, the elector separated from the Swedes, and made a separate peace (1635) with Austria, by which he obtained Upper and Lower Lusatia, acquisitions confirmed by the general treaty of Westphalia (1648). This was the period of the electorate's greatest power. His sons, JOHN GEORGE II. (1656—1680), August, Christian, and Maurice, divided the estates, the three latter founding cadet lines, all of which became extinct before 1750. The reigns of his successors, JOHN GEORGE III. (1680—1691) and JOHN GEORGE IV. (1691—1694), are unimportant, but that of FREDERICK AUGUST I. (q. v.) (1694—1733) well-nigh ruined the hitherto prosperous electorate. Frederick August had been chosen king of Poland; and his attempt, in company with the czar and the king of Denmark, to dismember Sweden, brought down upon him and his two states the vengeance of the northern 'fire-king.' Poland was utterly devastated, and S. exhausted of money and troops. Besides, the king's habits were most extravagant, and to maintain his lavish magnificence, he was forced to sell many important portions of territory. FREDERICK AUGUSTUS II. (q. v.) (1733—1763), also king of Poland, took part in the war of the Austrian Succession (q. v.) against Maria Theresa, but finding the treaty of Berlin (1742) not so satisfactory for himself as he expected, he joined the empress in 1745. The country was atrociously ravaged during the Seven Years' War (q. v.), and a long time elapsed before it recovered its previous peaceful and prosperous state. FREDERICK CHRISTIAN (1763—1763) and FREDERICK AUGUST I. (1763—1827)), laboured zealously for the good of their subjects; and under the reign of the latter, agricultural, manufacturing, and industrial enterprise progressed with rapid strides. In spite of his love for peace, the elector was led into the quarrel respecting the Bavarian Succession (q. v.); but he refused the crown of Poland in 1791, and declined to take part in the convention of Pilnitz, though he joined the Prussian confederation of German princes, and had an army of 22,000 Saxons at the battle of Jena. But the pressure of the French compelled him to join the Confederation of the Rhine in 1806, and from this time his army fought side by side with the French. He obtained the union to S. of the duchy of Warsaw (see POLAND); but fearing that the disasters of the French, in 1812, would be fatal to their supremacy, and to the interests of S., he withdrew to Bavaria, and thence to Prague, renounced the duchy of Warsaw, and made every attempt to come to amicable terms with the allies. But he was again compelled to join the French, between the battle of Lutzen (May 2, 1813) and that of Leipzig (October 16—19, 1813), after which he became the prisoner of the allies, and his army was joined to theirs. For his support of Napoleon, he was deprived of the greater portion of S., which was handed over to Prussia, but he retained the title of king, which had been conferred upon him in 1806. The rest of his reign was occupied with internal reforms. ANTONY (1827—1836) reformed the entire legislation of the country, and granted a liberal constitution, being urged thereto by a popular outbreak in the autumn of 1831. The constitution was proclaimed September 4, 1831, and the state's representatives first assembled, January 27, 1833. FREDERICK AUGUST II. (1836—1854), his nephew, who had been regent for several years, now succeeded, and though favourable to constitutionalism, he was unable to obtain the smooth and harmonious working of the new system. In 1843, violent contests commenced, accompanied by occasional riots in the principal towns, on the subject of the liberty of the press, and the publicity of legal proceedings. Sometimes the constitutionalists, and sometimes their opponents, gained the supremacy, and for a long time, the efforts of the two parties counteracted each other. Towards the close of the king's reign, he was a mere tool in the hands of the reactionary party, headed by his brother JOHN, who succeeded in 1854. King John has, however, supported constitutionalism and religious toleration, and in spite of the resistance of his nobles, who wished to preserve their feudal rights, has established royal courts of justice throughout the kingdom.

SAXONY, PRUSSIAN, a province of Prussia, bounded on the E. and N.E. by the province of Brandenburg, and on the N.W. by that of Hanover. Area, 9729 sq. m.; pop. (1867) 2,077,572. The west districts are occupied by the Harz Mountains, and the peak of the Brocken (3738 feet high) is the chief elevation. The greater portion of the surface, however, is level, and slopes toward the north, in which direction flow the principal rivers—the Elbe, with its tributaries, the Saale and Mulde. The climate is mild and healthy, and the soil is exceedingly fertile and well cultivated. More than the half of the area is under crop, and nearly $\frac{2}{5}$ths are uncultivated, and in water and wood. The *Goldene Aue*, in the south-west, is especially famous for its abundant fertility. Manufacturing industry is most actively carried on, and there are spinning, weaving, and oil-mills in great numbers. The capital is Magdeburg (q. v.). The larger portion of Prussian S. (7911 sq. m.) was detached from the kingdom of Saxony, and ceded to Prussia, by decree of the Congress of Vienna, 1815. See SAXONY.

SAY, JEAN BAPTISTE, an eminent French economist, was born at Lyon, 5th January 1767. Being destined by his father for a commercial career, he passed a part of his youth in England; and on his return to France, obtained a situation in a Life Insurance Company, about which time he made his first acquaintance with the works of Adam Smith. During the Revolution, he was for some time secretary to Clavière, the Minister of Finance; and from 1794 to 1800 edited a journal called *La Décade*, in which he expounded with great effect the views of Smith. Already S. had acquired a distinguished reputation as a thinker by his *Traité d'Economie Politique, ou Simple Exposé de la Manière dont se forment, se distribuent et se consomment les Richesses* (Paris, 1803), and other works. Called to the tribunate in November 1799, he was not slow to express his disapprobation of the arbitrary tendencies of the new consular government, and in 1804 he ceased to be a member of a body that had become a mere tool in the hands of Bonaparte. Under the despotism of the Empire, S. was forced into private life, and betook himself to industrial pursuits, establishing (along with his son) at Auchy a large spinning-mill, which soon employed not less than 500 workmen; and when Bonaparte fell, S. found himself at the head of the economical and commercial movement that marked the epoch. In 1814, the second edition of his now celebrated *Traité* appeared, dedicated to the Emperor Alexander, who had long called himself his 'pupil;' and in the same year the French government sent him to England to study the economical condition of that country. In 1819,

a new chair, that of *Economie Industrielle*, was created for him at the *Conservatoire des Arts et Métiers;* and S. added both to his influence and his popularity by the lucidity, grace, and intensity of conviction displayed in his lectures. In 1831, he was appointed Professor of Political Economy at the *Collége de France*, but died 15th November 1832. Although strictly a follower of Adam Smith, S. is an independent, sagacious, and penetrative thinker. Ricardo speaks of his works as containing 'several accurate, original, and profound discussions.' He was the first to teach Frenchmen to consider rationally such questions as customs-duties, the currency, public credit, the colonies, and taxation; and though the brilliant socialistic theorisers say that he is not an *économiste spiritualiste*, many will consider that defect a merit. Besides his *chef-d'œuvre* already mentioned, S. wrote (among other works) *De l'Angleterre et des Anglais* (Par. 1812), *Catéchisme d'Economie Politique* (Par. 1815), *Lettres à Malthus* (Par. 1820), *Cours Complet d'Economie Politique* (Par. 1828—1830), and *Mélanges et Correspondance* (Par. 1833). His principal writings form vols. 9—12 in Guillaumin's *Collection des Economistes.*

SCAB, in Sheep, like itch in man, or mange in horses or dogs, depends upon the irritation of a minute acarus, which burrows in the skin, especially if dirty and scurfy, causing much itching, roughness, and baldness. The parasite readily adheres to hurdles, trees, or other objects against which the affected sheep happen to rub themselves, and hence is apt to be transferred to the skins of sound sheep. Chief amongst the approved remedies are diluted mercurial ointments, tobacco-water, turpentine and oil, and arsenical solutions, such as are used for sheep-dipping. One of the best and simplest applications consists of a pound each of common salt and coarse tobacco, boiled for half an hour, in about a gallon of water; to this are added two drachms of corrosive sublimate; and the mixture diluted until it measures three gallons. For each sheep, a pint of this mixture should be carefully applied, from a narrow-necked bottle, along the back, and to any other scurfy itchy parts. A second dressing, after an interval of a week, will generally effect a perfect cure.



SCA'BBARD is the sheath for a sword or bayonet, at once to render the weapon harmless and to protect it from damp. It is usually made of black leather, tipped, mouthed, and ringed with metal; but the British cavalry wear scabbards of steel. These better sustain the friction against the horse's accoutrements, but are objectionable from their noisiness, and the consequent impossibility of surprising an enemy. The sword-scabbard is suspended to the belt by two rings; the bayonet-scabbard hooks into a frog in connection with the waist-belt.

SCABE'LLUM, a kind of pedestal to support busts.

SCA'BIES. See ITCH.

SCA'BIOUS (*Scabiosa*), an extensive genus of herbaceous plants, exclusively natives of the eastern hemisphere, of the natural order *Dipsacaceæ*. See TEASEL. The flowers are collected in terminal heads, surrounded by a many-leaved involucre, so as to resemble those of the order *Compositæ*. The DEVIL'S-BIT S. (*S. succisa*) is a very common autumnal flower in British pastures. The plant possesses great astringency, but no important medicinal virtues, although it was formerly supposed to be of great efficacy in all scaly eruptions, and hence the name S., from Lat. *scabies*, leprosy. The end of the root appears as if abruptly bitten off, and the superstition of the middle ages regarded it as bitten off by the devil, out of envy, because of its usefulness to mankind! The SWEET S. (*S. atropurpurea*) is a well-known fragrant garden-flower. It is supposed to be a native of India.

SCAD (*Caranx trachurus*, or *Trachurus vulgaris*), a fish of the family *Scomberidæ*, sometimes called the *Horse Mackerel*, because of its resemblance to the mackerel, and its comparative coarseness. It is from 12 to 16 inches long, of a dusky olive colour, changing to a resplendent green, waved with a bluish gloss, the head and lower parts silvery, the throat black. There are two small free spines in front of the anal fin. The species of *Caranx* are very numerous, and it is sometimes divided into several genera;

Scad (*Caranx trachurus*).

but the S. is the only one found on the British coasts. It is common on the south-western coasts of England, but comparatively rare to the north. It sometimes appears in immense shoals, pursuing the fry of herring or similar prey, and the multitudes have sometimes been so great and so crowded together, that they could be lifted out of the sea by buckets, and overloaded nets have been torn to pieces. The S. has something of the mackerel flavour. Although not much cared for when fresh, it is often salted, and in that state is esteemed as an article of food.

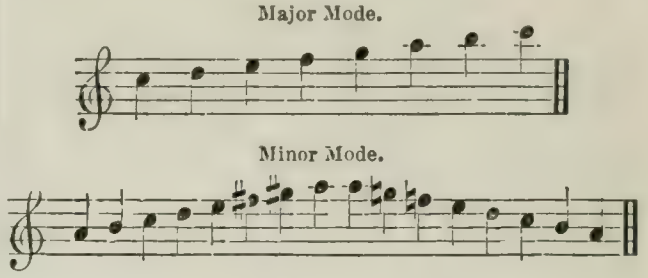
SCA'FELL, a double-peaked mountain in Cumberland, on the Westmoreland border, 13 miles south-south-west of Keswick, is a chief feature in the scenery of the Lake Country, in the heart and centre of which it stands. Of its two peaks, the higher is 3229 feet, the other 3092 feet in height.

SCAGLIO'LA, a composition made to imitate the more costly kinds of marble, and other ornamental stones; and so successfully is it done that it is often difficult to distinguish between the artificial and the real stone. It consists of finely ground plaster of Paris mixed with a thin solution of fine glue, and coloured with any of the earthy colours, such as ochres, umber, Sienna earth, Armenian bole, and sometimes chemical colours, such as the chrome yellows, &c. This is spread over the surface intended to represent marble; and whilst still soft, pieces of fibrous gypsum, marble, alabaster, and other soft but ornamental stones, are pressed into it, and made level with the surface. When the composition is set hard, it is rubbed down, and polished with the ordinary stone-polishing materials, which give it a very fine gloss. This kind of work is only adapted for interiors, because scagliola will not bear exposure to damp for any length of time; but its lightness, and the extreme ease with which it may be applied to walls, pillars, pilasters, and even cornices, render it very useful for the decoration of the better class of dwellings and public buildings.

SCA'LA NO'VA, a seaport of Asiatic Turkey, stands on an eminence at the head of a gulf of the same name, 40 miles south of Smyrna. The ruins of the ancient city of Ephesus (q. v.) are in the vicinity. An important export trade is carried on. Pop. stated at 20,000. The Gulf of S. N., confined on the south by the island of Samos, is 40 miles long, and about 20 miles broad.

SCALD-HEAD (a corruption probably of *Scaled Head*) is the popular name of a fungous parasitic disease of the scalp (and occasionally of the face and other parts), known in medical phraseology as *Favus*, *Tinea favosa*, and *Porrigo scutulata*. The primary seat of the parasite is in the lowest portion of the hair-follicles, outside the layer of epithelium which covers the root of the hair. The plant is, however, often found in cup-shaped depressions on the surface of the scalp, forming the yellow honeycomb-like masses which suggested the specific name *Favus* (honeycomb) for the disease. The honeycomb crust continues to increase, preserving its circular form and depressed centre, till it occasionally reaches a diameter of nearly half an inch. These crusts commonly appear in crops, and may be either distinct or confluent. 'At a more advanced stage,' says Dr Aitken, 'the epidermis disappears, and a viscid fluid is secreted in such abundance as to form one entire incrustation over the entire head; hence the *Porrigo larvalis*—mask or vizor-like scald-head. The smell of the scab is peculiar, and has been compared to that of the urine of a cat, or of a cage in which mice have been kept. It is probably due to a species of alcoholic fermentation in connection with the vegetable growth.' The scab sometimes resembles a lupine, or a minute shield, rather than the cell of the honeycomb, and hence the varieties of scald-head which have been described under the name of *Porrigo lupinosa* and *Porrigo scutulata*.

Scald-head:
A, A, chains of sporules projecting beyond the edges of the hair; B, sporules between the fibres of the hair; C, D, broken-up root end of the hair, with masses of sporules between the laminæ.



The great point to be aimed at in the treatment of this affection is to destroy the cryptogamic parasite, and to eradicate its germ. For this purpose, the head should be shaved, and poultices then applied till the scabs are removed. Tar-ointment should then be applied, night and morning, the old ointment being washed off with soft soap and water before the fresh dose is laid on. Dr Aitken states, that in the early stage of the disease, in place of the preceding treatment, it is sometimes sufficient to cut the hair close, and to wash the affected parts, night and morning, with oil of turpentine. If the disease does not yield to these applications, the same treatment as that recommended for RINGWORM must be tried.

SCALDS. See BURNS.

SCALE-ARMOUR consisted of small plates of steel riveted together in a manner resembling the scales of a fish. From the small size of the plates, it possessed considerable pliability, and was therefore a favourite protection for the neck, in the form of a curtain hanging from the helmet. Scale-armour is now obsolete, except, perhaps, among some eastern potentates.

SCALE INSECT. See COCCUS.

SCALE, MUSICAL, a succession of notes arranged in the order of pitch, and comprising those sounds which may occur in a piece of music written in a given key. The ultimate criterion of what should constitute a musical scale, is doubtless what gives most pleasure to a cultivated ear; but the sounds that please the ear are also found to be those that stand in certain simple mathematical relations to each other. Among the ancient Greeks, various different scales or *modes* were in use, of which six were generally enumerated—the Dorian, Phrygian, Lydian, Mixo-Lydian, Ionic, and Æolian. Excepting in the music of the Greek Church and of the Ambrosian Chant, modern musical feeling has rejected all of these but two, the Ionic and Æolian, the former of which is now known as the Major, and the latter the Minor Mode. In both modes, the scale consists of a series of seven steps leading from a given note fixed on as the tonic or key-note to its octave, which may be extended indefinitely up or down, so long as the sounds continue to be musical.

For an explanation of the principles on which these scales are founded, and of their derivation from the harmonic triad, see MUSIC. The major scale is derived from much simpler proportions than the minor. The minor scale requires to be modified by occasionally sharpening its sixth and seventh.

SCALES OF FISHES. They are divided by Agassiz, whose classification is generally adopted, into the *placoid*, *ganoid*, *ctenoid*, and *cycloid* forms. *Placoid* scales (from the Gr. *plax*, a broad plate) lie side by side without overlapping or imbricating. They are often elevated at the centre so as to form a strong projecting point. All the cartilaginous fishes, except the sturgeon, have placoid scales. *Ganoid* scales (from the Gr. *ganos*, splendour) are covered with a fine enamel, and generally of a rhomboidal form and imbricated. The

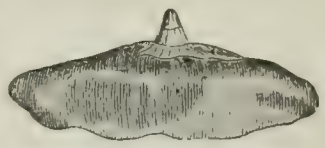


Fig. 1.—Placoid Scale.

Fig. 2.—Cycloid Scale.

sturgeon and the bony pike (*Lepidosteus*) have scales of this nature, but the finest examples of these scales are found in fossil fishes. *Ctenoid* scales (from *kteis*, a comb) are generally of a rounded or oval form, with teeth or projections on their posterior margin. They are devoid of enamel, and present an imbricated arrangement. The perch and many osseous fishes possess these scales. *Cycloid* scales (from the Gr. *kyklos*, a circle) consist of concentric layers of horn or bone, without spinous margins, and not covered by enamel. They are soft and flexible, present a variety of linear markings on their upper surface, and usually exhibit an imbricated arrangement. The carp, herring, salmon, &c., possess these scales. In many cases, two kinds of scales occur in the same fish, while in other cases the different species of a single genus exhibit different kinds of scales.

For anatomical details regarding the structure and mode of development of scales, the reader is referred to Professor Huxley's article 'Tegumentary Organs' in the *Cyclopædia of Anatomy and Physiology*, and to Professor Williamson's Memoirs in the *Philosophical Transactions*, 1849—1852. In their chemical composition, the scales of fishes approximate to the bones, except that they contain more organic matter. The brilliancy of tint exhibited by many fishes is due apparently to the phenomena of optical interference, rather than to the presence of colouring matter. Figures of Ctenoid and Ganoid Scales are given in the articles CTENOID FISHES and GANOID FISHES.

SCALES OF NOTATION are the various 'radices' which determine, as explained under NOTATION (q. v.), the form and digits of the number expressing any numerical quantity. Thus, the number 289, in the decimal or common system whose radix is 10, signifies 9 units, 8 tens, and 2 hundreds, or $2 \times 10^2 + 8 \times 10 + 9$. To express the same number in the quinary scale, for instance, we must group the 289 units into multiples and powers of 5; an operation which may be performed in either of two ways, as follows:

5)289 5 57-4 5)11-2-4 2-1-2-4	289 10 103 (taking in 8. and 10 carrying by 5) 2124	2124 (quinary) 5 11 (carrying by 10) 5 57 5 289

or 2124 (i.e., $2 \times 5^3 + 1 \times 5^2 + 2 \times 5 + 4$) in the quinary scale represents the same numerical quantity as 289 in the decimal scale. The following list shews the same numerical quantity according to the scales having for their radices the first 11 numbers after unity, and will partly indicate the advantages and disadvantages of each scale:

In the *binary*	(*radix* 2)	scale,	. .	100,100 001
" ternary	(" 3)	"	. . .	101,201
" quaternary	(" 4)	"	. .	10,201
" quinary	(" 5)	"	. . .	2,124
" senary	(" 6)	"	. .	1,201
" septenary	(" 7)	"	. . .	562
" octary	(" 8)	"	. .	441
" nonary	(" 9)	"	. . .	351
" decimal	(" 10)	"	. .	289
" undenary	(" 11)	"	. . .	243
" duodecimal	(" 12)	"	. .	201

It will be observed that the binary scale possesses only two symbols, 0 and 1, the ternary has 3, while the undenary would require a symbol in addition to the 9 digits and zero to express 10, which is a digit in that scale, and the duodecimal scale two additional symbols for 10 and 11. A glance at the above table shews at once that if the binary scale had been in ordinary use, great facility in the 'performance' of arithmetical operations would have been obtained at the cost of largely increasing their 'extent,' and that both the advantage and disadvantage diminish as we raise the scale. The selection of 'ten' as the ordinary scale is very prevalent, and was evidently suggested by the number of fingers; but the scales of two, three, four, five, six, and twenty have at various times been made use of by a few nations or tribes. The scale of 12 has long been generally employed in business among northern European nations, as is instanced by such terms as 'gross,' signifying 12 times 12, and 'double gross,' denoting 12 times 12 times 12; and it has also been largely introduced into the standard measurements of quantity, as inches, pence, ounces troy, &c., causing a considerable amount of complexity in calculation, as all abstract numerical calculation follows the decimal system. To remedy this acknowledged evil, it has been proposed to introduce the decimal system *in toto*, as has been done in France, Italy, Russia, &c., or else to do the same with the duodecimal system. Those who hold to the first proposal have the argument of conformity in their favour; those who support the latter do so on the ground, that 12 has in proportion far more aliquot parts than 10 has, and that on this account the number of fractions, and the size of each numerator and denominator, would be diminished; while both parties can bring overpowering arguments against the continuance of the present method, or rather want of method. See DECIMAL SYSTEM.

SCALIGER, JULIUS CÆSAR, one of the most famous men of letters that have appeared since their revival, was born in 1484. In after-life, he created for himself a noble pedigree, and made out that he was descended from the princely family of the Scalas of Verona, and that his birthplace was the castle of Riva, on the banks of the Lago di Guarda. According to his own account, he was educated first under the famous Fra Giocondo; was afterwards attached as a page to the Emperor Maximilian, whom he attended for 17 years in peace and war; was next made a pensioner of the Duke of Ferrara; thereafter studied at Bologna; commanded a troop of cavalry at Turin under the French viceroy; prosecuted his studies there in philology, philosophy, and medicine; and in 1525 went to Agen, in France, with the bishop of that diocese, a member of the Rovere family, to whose household he became physician. Tiraboschi's account, however, which is the more probable, represents him as having been born at Padua, the son of Benedict Bordoni, who was a geographer and miniature-painter of that city, and who, either from the sign of his shop or the name of the street he lived in, assumed the surname Della Scala. Up to his 42d year, young Giulio Bordoni resided chiefly in Venice or Padua, engaging in the study and practice of medicine, and appearing under his true name as an author. In 1525, he withdrew to Agen, either from some advantageous offer, or with a view to promote his fortune, and there fixed his abode. He became physician to the bishop of the diocese, and in that capacity sought in marriage Andietta de Roques-Lobejac, a young lady only 16 years of age, and of noble and rich parentage. An obstacle was thrown in the way of this alliance; and probably with the purpose of improving his position, and lessening the disparity in station between himself and the object of his affections, he procured, in 1528, letters of naturalisation as a French subject, under the name of Jules-César de Lescalle de Bordonis. This was probably the occasion when he added Cæsar to his baptismal name of Julius. The marriage took place in 1529, and was both happy and fruitful. He died in 1558, leaving behind him a mass of publications on various subjects, and a reputation for extent and depth of learning, which,

considering the ripe age at which he made the majority of his acquirements, redounds to the credit of his vigorous understanding and extraordinary memory. As a thinker, he was more independent than sound; and as a man, was of violently irritable temper and excessive vanity. His best known publications are—*Commentarii in Hippocratis Librum de Insomniis* (Commentaries on the Hippocratic Treatise on Dreams); *De Causis Linguæ Latinæ Libri XVIII.*, celebrated as the first considerable work written in the Latin language in modern times, and not without value even yet; his Latin translation of Aristotle's *History of Animals;* his *Exercitationum Exotericarum liber quintus decimus de Subtilitate ad Hieronym. Cardanum;* his seven books of *Poetics* (also in Latin, and on the whole his best work); his *Commentaries on Aristotle and Theophrastus;* his two orations against Erasmus; his Latin poems, &c.

SCALIGER, Joseph Justus, the tenth son of J. C. Scaliger and Andietta de Roques-Lobejac, and much his father's superior in learning, was born in 1540 at Agen, whence, at the age of 11, he was sent, along with two of his brothers, to the college of Bordeaux, where for three years he studied Latin. A pestilence breaking out in the town, he was recalled by his father, who supplemented the scanty knowledge which his son brought home with him by making him write a Latin declamation every day upon any subject he chose. Under this training, he soon attained great proficiency as a Latinist; and in his 19th year, on the death of his father, he went to Paris, where he studied Greek under the famous Turnebus. He was less indebted, however, to any master than to himself; and finding that his progress was slow under his great preceptor, he closeted himself alone with Homer, and in 21 days read him through, with the aid of a Latin translation, and committed him to memory. In less than four months, he had mastered all the Greek poets. Next, Hebrew, Syriac, Persian, and the most of the modern European languages succumbed in rapid succession to his industry, while at the same time he was assiduous in his composition of verses both in Latin and Greek. About this time, he boasted that he could speak 13 languages, ancient and modern; and such was his ardour in study, that he allowed himself only a few hours' sleep at night, and would frequently pass whole days without rising from his books even for meals. His proficiency in literature, especially in the history, chronology, and antiquities of Greece and Rome, secured him, in 1583, an honourable engagement from Louis de la Roche Pozay, at that time French ambassador at the pontifical court. The year before, however, he had become a Protestant, which rendered it difficult for him to retain an appointment in France. Except that he travelled a good deal, at the generous instance of his patron, and visited the chief universities of France and Germany, and even found his way to Scotland, we know little of his life between 1565 and 1593. He is conjectured to have travelled in Italy, and to have gone as far as Naples. Certain it is, however, that in the year last named he complied with an invitation of the Dutch government, and went to fill the chair of Literature, vacated by Lipsius in Leyden University, where he spent the residue of his days. His labour now consisted chiefly in interpreting and illustrating the classical authors. He died of dropsy on the 21st January 1609, and was never married. We have said that he far excelled his father in learning; but it should be added that he was not a whit less irritable, arrogant, or vain; that he fully shared the paternal pride of pedigree, spurious as he probably knew his own to be; and that he endeavoured to support his father's genealogical fictions in his well-known letter to Dousa on the splendour of the Scaliger family. His writings abound with expressions of hatred and contempt towards his opponents, and he has enriched the vocabulary of learned abuse to an extent well nigh proverbial. He was, however, a man of immense vigour of understanding, and must be credited with having been the first to lay down, in his treatise *De Emendatione Temporum* (Paris, 1583), a complete system of chronology formed upon fixed principles. It was this most learned achievement, and his invention of the Julian period, that secured for him the title of the Father of Chronological Science. It was subjected to much emendatory criticism by censors like Petavius, and also by himself, its errors having been partly corrected by him in his later work, the *Thesaurus Temporum, complectens Eusebii Pamphili Chronicon cum Isagogicis Chronologiæ Canonibus* (Amst. 1658, 2 vols. fol.). Among the classical authors whom he criticised and annotated are Theocritus, Seneca (the tragedies), Varro, Ausonius, Catullus, Tibullus, Propertius, Manilius, and Festus. His other works are *De Tribus Sectis Judæorum; Dissertations on Subjects of Antiquity; Poemata; Epistolæ;* a translation into Latin of two centuries of Arabian proverbs, &c. He numbered among his friends the most illustrious scholars of the time, such as Lipsius, Casaubon, Grotius, Heinsius, the Dupuys, Saumaise, Vossius, Velser, P. Pithou; and interesting notices of him are preserved in such works as the *Huetiana*, and above all, in the two vols. of *Scaligerana*, which embody his conversations, and which were collected and published after his death.

SCA'LLOP, more commonly Escallop (q. v.), in Heraldry, a species of shell. It has been considered the badge of a pilgrim, and a symbol of the apostle St James the Greater, who is usually represented in the garb of a pilgrim.

SCALLOP-SHELL. See Pecten.

SCALP, The, is the term employed to designate the outer covering of the skull or brain-case. Except in the fact, that hair in both sexes grows more luxuriantly on the scalp than elsewhere, the skin of the scalp differs so slightly from ordinary skin that it is unnecessary to enter into any details on this point. But besides the skin, the scalp is composed of the expanded tendon of the occipito-frontal muscle, and of intermediate cellular tissue and blood-vessels. Injuries of the scalp, however slight, must be watched with great caution, 'for they may be followed by erysipelas, or by inflammation and suppuration under the occipito-frontal muscle, or within the cranium, or by suppuration of the veins of the cranial bones, and general pyæmia that may easily prove fatal.'—Druitt's *Surgeon's Vade Mecum*, 8th edition, p. 332. In the treatment of a wound of this region, no part of the scalp, however injured it may be, should be cut or torn away; and, if possible, the use of stitches should be avoided, as plasters and bandages will generally suffice to keep the separated parts in apposition. The chance of suppuration may be prevented by coagulating the blood externally, by dressing the wound with lint, saturated with *Friars' Balsam* (*Tinctura Benzoin. Comp.*), so as to seal up the injured part from the access of air. The patient should be confined to the house (and in severe cases to bed), should be moderately purged, and fed upon non-stimulating, but not too low diet.

Burns of the scalp are very liable to be followed by erysipelas and diffuse inflammation, but the brain is comparatively seldom affected in these cases.

Tumours of the scalp are not uncommon, the most

frequent being the cutaneous cysts popularly known as *Wens* (q. v.), and vascular tumours.

SCAMA'NDER, the ancient name of a river in the Troad (see TROY), which, according to Homer, was also called Xanthus (Gr. yellow) by the gods, and as a divinity took an important part in the Trojan war, its destructive floods doing serious injury to one party, and thus materially assisting the other. The S. rose in Mount Ida (q. v.), and, flowing west and north-west, discharged itself into the Hellespont, after being joined by the Simois, about two miles from its mouth: the two rivers, however, since the 1st c. A.D., have had separate courses. There has been much controversy as to what modern river corresponds to the ancient S.; Mr C. Maclaren, however, in his *Plains of Troy*, has clearly identified it with the Mendere.

SCAMI'LLUS, a small plinth below the bases of Ionic, Corinthian, and other columns.

SCA'MMONY is a gum-resin of an ashy-gray colour, and rough externally, and having a resinous, splintering fracture. Few drugs are so uniformly adulterated as scammony, which, when pure, contains from 81 to 83 per cent. of resin (which is the active purgative ingredient), 6 or 8 of gum, with a little starch, sand, fibre, and water. The ordinary adulterations are chalk, flour, guaiacum, resin, and gum tragacanth.

Scammony, when pure, is an excellent and trustworthy cathartic of the drastic kind, well adapted for cases of habitual constipation, and as an active purgative for children. The resin of scammony, which is extracted from the crude drug by rectified spirit, possesses the advantage of being always of a nearly uniform strength, and of being almost tasteless. The *Scammon Mixture*, composed of four grains of resin of scammony, triturated with two ounces of milk, until a uniform emulsion is obtained, forms an admirable purgative for young children in doses of half an ounce or more. According to Christison, 'between 7 and 14 grains of resin, in the form of this emulsion, constitute a safe and effectual purgative' for adults. Another popular form for the administration of scammony is the *Compound Powder of Scammony*, composed of scammony, jalap, and ginger, the dose for a child being from 2 to 5 grains, and for an adult from 6 to 12 grains. Scammony is frequently given surreptitiously in the form of biscuit to children troubled with threadworms.

The plant which produces this valuable drug is *Convolvulus Scammonia* (see CONVOLVULUS), a native of the Levant. It is a perennial, with a thick fleshy tapering root, 3—4 feet long, and 3—4 inches in diameter, which sends up several smooth slender twining stems, with arrow-head-shaped leaves on long stalks. The root is full of an acrid milky juice, which indeed pervades the whole plant. The scammony plant is not cultivated, but the drug is collected from it where it grows wild. The ordinary mode of collecting scammony is by laying bare the upper part of the root, making incisions, and placing shells or small vessels to receive the juice as it flows, which soon dries and hardens in the air.

The name *French* or *Monpelier Scammony* is given to a substance which is prepared in the south of France, chiefly from the juice of *Cynanchum Monspeliacum*, a plant of the natural order *Asclepiaceæ*. It is a violent purgative.

SCA'NDALUM MAGNA'TUM. This offence was committed in speaking words in derogation of a peer, judge, or great officer of the realm, and a special action was brought for such words, the punishment being damages and imprisonment. But now this proceeding, though not expressly abolished, is superseded by the ample remedies of Criminal Information (q. v.), indictment, or action. A somewhat similar offence in Scotland is called Leasing-making (q. v.).

SCANDERBEG (properly, *Iskander-beg*, 'the Prince Alexander,' the name given him by the Turks), the famous patriot chief of Epirus, was born in that country in 1414. His real name was George Castriota, and his father, John Castriota, was one of the great lords of Epirus, his mother, Voisava, being a Servian princess. In 1423, he was given as one of the hostages for the obedience of the Albanian chiefs, and his physical beauty and intelligence so pleased Amurath II., that he was lodged in the royal palace, and subsequently circumcised and brought up in Islamism, being also put under the tuition of skilful masters in the Turkish, Arabic, Slav, and Italian languages. In 1433, he greatly distinguished himself in Asia as a Turkish pasha (of one tail); but being offended at the confiscation of his paternal domains, and being solicited by some Epirote friends to return to his native country to aid in the restoration of its independence, he watched an opportunity of withdrawing from the Turkish army. He had not long to wait, for the generous and unsuspicious sultan, who had caused him to be brought up as if he had been his own son, gave him the command of a large division of the army which was destined to act against the Hungarian invaders. S., having concerted his plans with 300 of his fellow-countrymen in the Turkish army, deserted during the confusion of the first battle (1443), and having previously compelled Amurath's secretary (whom he afterwards murdered to avoid detection) to prepare an order investing him with the government of Croia (now *Ak-hissar*), the capital of Epirus, he and his companions fled thither with all possible speed. The unsuspecting governor at once resigned the town into his hands, and was massacred along with the garrison. At the news of S.'s success, the whole country rose in insurrection, and in 30 days he had driven every Turk, except the garrison of Sfetigrad, out of the country. In order to strengthen himself in his new position, he invited a number of the neighbouring princes and Albanian chiefs to a conference, at which it was unanimously agreed to make no terms with the Turks, and to obey S. implicitly as their leader. S. then raised an army of 15,000 men, with which he completely scattered (1444) the 40,000 Turks whom the indignant sultan had sent against him, killing an immense number of them, and taking a few prisoners. Three other Turkish armies shared the same fate, and the 'animus' with which the contest was carried on may be imagined, when we consider that the number of prisoners taken in the last (1448) of these three battles amounted to *seventy-two*. Amurath himself in 1449 took the field, and stormed many of the principal fortresses, but being then ill of his fatal malady, he retired from before Croia, to die at Adrianople (1450). S.'s splendid successes brought in congratulations from the pope and the sovereigns of Italy and Aragon, but many of the Epirote chiefs were becoming wearied of the continual strife, and fell off from him, some of them even joining the Turks. S.'s career was now, in consequence, of a more chequered character, but in spite of occasional defeats, he stoutly refused all the liberal and fair proposals of the sultan, Mohammed II., who had a profound admiration for him, and sheltered by the mountainous nature of the country, carried on an unceasing warfare. At last an armed convention was agreed to in 1461, and S. profited by this leisure to pay off his debt to the pope and the king of Aragon (both of whom had supplied him with material assistance during his greatest need)

and crossing over to Italy, he routed the partisans of Anjou, and restored the kingdom of Naples to the latter of his benefactors, returning home laden with honours and benedictions. At the instigation of the pope, who had tried in vain to raise the other Christian princes of Europe against the Turks, S. broke the armed truce in 1464, and repeatedly defeated the Turks; but Mohammed becoming furious at these unprovoked aggressions, equipped two mighty armies, the first of which invested Croia, and the second, under his own leadership, advanced more leisurely. The first army was, after a desperate contest, defeated by S. in 1466; but the restless and indomitable chief, worn out with the incessant toil of 24 years, died at Alessio, 17th January 1467. The war continued to rage some time longer, but the great mainstay of the country was now wanting, and before the end of 1468, the Turkish standard floated undisturbed over Epirus. Barlesio, a fellow-countryman of S., who has written his biography (*De Vita et Moribus ac rebus gestis Geo. Castrioti*, Rome, 1537), remarks his sobriety, the purity of his manners, and the strictness of his religious belief. He had vanquished the Turks in 22 pitched battles.

SCANDINAVIA, a large peninsula in the north of Europe, bounded on the N. by the Arctic Ocean; on the W. by the Atlantic, North Sea, Skager Rack, Cattegat, and Sound; and on the S. and E. by the Baltic Sea, Gulf of Bothnia and Finland, with which it is connected on the north-east by an isthmus 325 miles wide. This peninsula comprises the two kingdoms, Norway (q. v.) and Sweden (q. v.); is 1240 miles long, from 230 to 460 miles broad, area 300,000 sq. miles. The ridge of mountains which traverses the peninsula in the direction of its length gives character to the whole conformation. The western division of the Scandinavian peninsula is covered with mountains; the eastern half, Sweden, consists principally of low-lying country. The mountains of S. extend from Waranger Fiord, in the extreme north-east, to the promontory of the Naze, in the extreme south-west, with an average breadth of 180 miles. They consist principally of gneiss and micaceous schist, sometimes, but rarely, of porphyry, syenite, granite, and chalk; salt is not found; silver, copper, and iron abound. The Scandinavian Mountains, though forming in reality one great range, are considered as forming four sections—the Lapland Mountains, in the north, from 1000 to 2060 feet high; the Kjolen Mountains, from 1500 to 2575 feet high; the Dovre Fjelde, from 2500 to 3600 feet high; and lastly, the Southern Fjelde, 4000 to 5150 feet high. Though of inconsiderable height, yet the numerous glaciers and snow-fields of the mountains of S. impart to this range almost an Alpine character. The climate of S. is much milder on the west than on the east side, a fact to be ascribed probably to the influence of the Gulf Stream. The character of the country, its physical features, industries, &c., are given under the articles NORWAY and SWEDEN.

The ancient *Scandia*, or S., included Northern Denmark, as well as the peninsula that still retains the name. It is first mentioned by Pliny, who, unaware that the peninsula was attached to Finland on the north, considered S. as an island.

SCANDINAVIAN LANGUAGE AND LITERATURE. The language which was spoken during the heathen ages in all the northern or Scandinavian lands, and which, in accordance with traditionary belief, had been introduced by Odin and his companions, when the Gothic tribes supplanted the more ancient races of the Finns and Lapps, is always referred to by the oldest authorities either as the *Dönsk túnga*, 'Danish tongue,' or as the *Norræna*, 'Norse.' We never hear of the 'Swedish' or 'Gothic tongue,' and although different dialects no doubt existed, from a very early period, among the Scandinavian people, it is certain that substantially the same language was spoken by the Northmen generally till the 11th century. According to recent inquirers, the race of the Northmen, before their settlement in Sweden and Norway, was divided into an eastern and western branch, the former of which is supposed to have used the old language of Norway and Iceland, and the latter the Swedish and Danish dialects. These two divisions of the race had entered Scandinavia by different routes, the eastern having passed along the Gulf of Bothnia, through the country of the Finns and Lapps, while the western branch had crossed from Russia to the Aland Islands, and spread from thence southward and westward; and it seems natural to infer that in their respective lines of migration they may have incorporated into their own speech some of the special characteristics that belonged to the language of the peoples with whom they came in contact. But the differences thus introduced could not have been important, for we find the same language employed in the several most ancient laws of the different people of Scandinavia, while the two Eddas (q. v.)—the oldest monuments of Scandinavian speech—which were compiled in Iceland, whither the Northmen had carried their language on their settlement in the island in the 9th c., give evidence of an almost complete identity of local and personal names. This unity of language is further proved by the agreement which is found to exist in all runic inscriptions, from Slesvig to the northern parts of Sweden, and from Zealand to the western shores of Iceland. All monuments of this old Northern tongue would, however, have been lost to us, had not the Norræna or Norwegian form of it been carefully preserved and cultivated in Iceland through the short songs (*lj'od* or *quida*) relating to the deeds of the gods and heroes of the north, which had existed as early probably as the 7th c., and had passed with the religion and usages of Norway to the new colony. After the introduction of Christianity into Iceland in the year 1000, schools were founded there, classic literature was cultivated, and Roman characters were adopted for the writing of the national tongue, but this did not interfere with the zeal with which the national laws and poems were collected and studied by native scholars. This literary activity continued unabated till the 13th c., when the republic of Iceland, after having long been distracted by the dissensions of the rival aristocratic families of the island, was conquered by Hakon VI., king of Norway. Since 1380, Iceland has formed part of the Danish dominions, and although since that period the colonists have partly succumbed to the cramping influences of the subordinate and dependent conditions in which they have been placed; the distance from the mother-country, and the tenacity with which the people cling to all memorials of their former history, have enabled them to preserve their language so unchanged, that the Icelander of the present day can read the sagas of a thousand years since, and still writes in the same phraseology that his forefathers used ages ago. But while the old Scandinavian tongue was thus preserved in the far distant colony, it had undergone great changes in Norway; and when, by the union of Calmar in 1380, the latter country was united to Denmark, the Danish form of speech, that had in the meanwhile been changing under the modifying influences due to the introduction of Latin and to contact with other nations,

supplanted the Norwegian language, which thenceforth being banished from the pulpit, the law courts, and from literature, split up into numerous dialects peculiar to special valleys and fijords, but unknown in the larger towns.

When we come to examine the Icelandic or ancient Scandinavian, which is closely allied to its sister Teutonic languages, and like them betrays its eastern origin, we find that it differs from the latter in several important points. It has this striking peculiarity, that the definite article, instead of coming before the noun, is appended as a termination to the end of the word. The adjective, moreover, which in its indefinite form is subject to inflections, for all genders and cases, undergoes, when in its definite form, fewer and slighter changes. Again, while in the German tongues the verb in the infinitive ends in a consonant, in the old Scandinavian it invariably terminates in a vowel. The old Scandinavian language has a passive form of the verb unknown to its Gothic sister tongues; and while in German the third person of the present tense differs from the second person, such is not the case in Old Northern. In the latter, the vowel sounds are greatly modified by a very perfect system of combinations, indicated by dots or accents; and in addition to the consonants of the Gothic languages, it has an aspirated *d* and *t*. It possesses, moreover, a flexibility and richness of construction, which admit of favourable comparison with those of the ancient classical languages, while in regard to the number and comprehensiveness of its words, and its consequent independence of foreign derivates, it presents a character of regularity and unity which is wanting to the other Germanic languages. Its mode of construction is simple in prose, and in the earlier forms of poetry, although in the later periods of the Skalds (q. v.) it degenerated into a state of artificial complexity. The chief feature of the metrical system employed in Old Northern poetry was alliteration (q. v.). The alliterative method was continued after the introduction of terminal rhyme, but the simplicity of the ancient lay gave way in the 10th c. to the most artificial complexity of versification in the metres invented by the skalds. Besides these skaldic measures, of which 106 are enumerated in the *Hattalykli*, or Key of Metres, drawn up in the 13th c. by the Icelander, Snorri Sturlesson (q. v.), the skalds were required to know the *Kenningar*, or poetic synonyms, of which there were an enormous number; some words, as Odin, island, &c., having upwards of 100. The main feature of the system was that nothing must be called by its right name: thus a ship was a beast of the sea, a serpent of the waters, a dragon of the ocean, &c.; a woman was a graceful tree, a fair pearl, &c.; a wife was her husband's *Rune* (q. v.), or his confidential and intimate friend, &c.

The fragments of Old Northern poetry that have come down to us in the *Eddas*, belong for the most part to the 8th c., or even perhaps to the 7th c.; and consist of short songs (*liljod* or *quida*), which are either mystic, didactic, mythic, or mytho-historic in their character. See EDDA. It is supposed that some of these compositions, and several of the poems which celebrate the adventures of the gods, giants, and elves, were composed prior to the immigration into Scandinavia of Odin and his followers; while, on the other hand, the local colouring of others sufficiently proves their northern origin. In addition to the subjects belonging to the Odinic mythology, we have in the mytho-historic lays, known as the songs of the famous Smith Völundr, or the *Völundar-quida*, a cyclus of heroic poems similar to the Old German epic the *Nibelungenlied*, (q. v.); but much more ancient in form than that in which the latter has reached us. In the 9th and 10th centuries the ancient epic and the simple songs of the older poets gave place to the artificial poetry of the skalds, which, from its earliest development, manifested a realistic tendency, and made the real adventures of living men the subject of their compositions. Many of these compositions, as the *Eiriksmál*, or the Death and Apotheosis of King Eric Bloodaxe, who died in 952; the *Hakonar-mal*, or Fall of Hakon the Good; and several poems by the famous Icelandic skald Egill Skalagrimson, while they afford valuable materials for the early history of the north, are among the latest of the skaldic productions that preceded the more degenerate periods of the art. To the 11th and 12th centuries belong the poems known as *Grongaldr* and *Solar-ljod*, which were composed in imitation of the ancient compositions, and consist of moral and didactic maxims, the former conceived from an assumed heathen, and the latter from a Christian point of view. In the 13th c., the skaldic art thoroughly declined, and gave place, in Iceland, to a puerile literature, based upon Biblical stories and saints' legends. In Scandinavia Proper, a more modern form of national literature was in the meanwhile being gradually developed by means of oral transmission, whence arose the folk-lore and popular songs of Norway and Sweden, and the noble Danish ballads known as the *Kæmpe viser*, whose composition in the Old Northern or Icelandic tongue may probably be referred to the 14th century. The earliest Icelandic prose belongs to the beginning of the 12th c., when Ari 'hinns Frode,' or the Wise, composed a history of his native island and its population in the *Islendinga-bok* and *Landnâma-bok*, the latter of which was continued by others. He was the first northern writer who attempted to assign fixed dates to events by reference to a definite chronology, and his work is remarkable as the earliest historical composition written in the old Danish or Norse, as it still remains in the living language of Iceland. These works, which have since perished, entered largely into the composition of the annals of the early kings of Norway, compiled a century later by Snorri Sturlesson under the title of the *Heimskringla*. Throughout the middle ages the literature of Iceland was enriched with numerous national and other sagas, the materials of which were drawn from skaldic songs, folk-lore, local traditions and family histories; and in its later stages of development included among its subjects the mythic cycle of Arthur and his knights, Merlin, Alexander, Charlemagne, &c. The compilation of the laws of the island attracted the attention of the Icelanders at an early period; and in 1118 a complete code, known as the Gragas, which had been derived from the ancient Norse law, was submitted to the Allthing or popular assembly, and a few years later the canons of the church, or the *Kristinrettr*, were settled and reduced to writing. A collection of those enactments in the ancient and subsequent codes, which are still in force in Iceland, has been made by Stephensen and Sigurdsson (Copen. 1853), under the title of *Lagasafn handa Islandi*; while the ancient Norse laws, beginning with the *Gulathings-lôg* and the *Hirdskra* of Hakon the Good, which date from the 10th c., have been ably and critically edited in Norway under the title of *Norges gamle Love* (Christ. 1846—1849). The study of the Old Northern language and literature, which was successfully inaugurated by the native scholars of Iceland in the 17th c., was soon prosecuted with equally happy results in Denmark and Sweden, and within the last 25 years in Norway, where the subject forms a necessary introduction to the investigation of the language and history of the

country. Copenhagen has, however, in recent times, been the principal seat of these inquiries, the successful prosecution of which has been materially facilitated by the large number of important Icelandic MSS. contained in its libraries, and by the foundation of the Arne-Magnussen collection in 1772; and the different societies especially designed to promote the study of Icelandic and of northern antiquarian monuments. Among the Icelandic and Danish scholars who have gained pre-eminent distinction in these departments of research, we may instance Arne-Magnussen, Torfæus, Olavsen, Finn Magnussen, Worm, Resenius, Bartholin, Thorlacius, Müller, Rask, Rafn, Keyser, Munch, Unger, Lange, &c. In the study of the grammar and comparative structure of the language, which excited an interest as early as the 13th c., as is proved by the grammatical treatises and rules of prosody incorporated in the younger *Edda*, no one has evinced a higher order of scientific acumen and critical learning than Rask (q. v.), who in his erudite work *Om det gamle Nordiske Sprogs Oprindelse* (Kjopenh. 1818) threw a flood of new and important light on the subject; while the labours of Jakob Grimm, Munch, and others, have tended materially to exhibit the affinities between the Old Northern and the Teutonic languages, and to assign to it its right position among the kindred Indo-Germanic tongues.

SCANDINAVIAN MYTHOLOGY. Our knowledge of Scandinavian mythology is mainly derived from the collections of ancient Northern sagas known as the Eddas (q. v.), which constitute the Odinic Bible, as it were, of heathen Scandinavia. The value and interest attaching to these records of the ancient faith of the Northmen are enhanced by the fact that there are strong grounds for assuming that the closest affinity, if not identity, of character existed between their religious doctrines and practices and those of the Germanic nations generally. Hence, in the absence of anything beyond the incidental notices of the Pagan religion of Germany, which are contained in the classic writers, the Eddaic exposition of northern mythology is of the highest importance to the student of the history of every nation of Teutonic origin. Owing to the remote situation of the Scandinavian lands, and the hold which the Odin religion had taken of the minds of the Northmen—whose natural tendencies inclined more to the Pagan merits of valour, courageous endurance of hardships, indomitable resolution, and unflinching fidelity in hate and love, than to the Christian virtues of submission, meekness, and forgiveness of injuries—Christianity took root slowly and insecurely in those lands, and only long after a national literature, based upon the superstitions and memorials of the ancient faith, had been firmly established among the people. But although there is every reason to believe that all branches of the great Indo-Germanic family of nations had essentially the same system of belief and worship, and venerated the same deities, minor differences were numerous. Thus, for instance, while Danes, Saxons, and Gothlanders worshipped Odin as their chief god, the Swedes generally paid supreme honours to Frey, the god of the year; some tribes of Northern Germany regarded Hlodyn, or the Earth, as their principal deity; and the Norwegians directed their worship to Odin's son, Thor; while in some parts of Norway even, as in Halgoland, the people worshipped deities not honoured elsewhere in Scandinavia. Thus the chief objects of worship in the latter district were Thorgerd, Horgabrud, and Irpa, the daughters of Halogi, or high flame, from whom the name of the country was derived, and who was probably identical with Loki (Fire), who, after having, according to the myth, been beneficent in the beginning of time and united with the All-father, fell from his high estate, and, like some fallen angel, became crafty, evil, and destructive as a desolating flame. Halgoland appears from remains discovered there to have been a special seat of fire or sun worship, which seems to have been nearly universal at one period of the world's history.

Leaving for the present the discussion of the sources from whence the northern mythology derived some of the numerous complex elements which entered into its composition, we proceed to give a short summary of its cosmogony:—In the beginning of time a world existed in the north called Niflheim, in the middle of which was a well, Hvergelmeer, from which sprang twelve rivers. In the south was another world, Muspelheim, a light, warm, radiant world, the boundary of which was guarded by Surt with a flaming sword. Cold and heat contended together. From Niflheim flowed venomous, cold streams called Elivaager, which, hardening into ice, formed one icy layer upon the other within the abyss of abysses that faced the north, and was known as the Ginnunga-gap. From the south streamed forth the sparkling heat of Muspelheim; and as heat met cold, the melting ice-drops became instinct with life, and produced, through the power of him who had sent forth heat, a human being, Ymir, the progenitor of the frost-giants, by whom he was called Œrgebner, or Chaos. He was not a god, but evil, both he and all his race. As yet there was neither heaven nor earth, neither land nor sea, but only the abyss Ginnunga-gap. Ymir drew his nourishment from the four milky streams which flowed from the udders of the cow Aedhumla, a creature formed from the melting frost. From Ymir there came forth offspring while he slept—a man and woman growing from under his left arm, and sons from his feet; and thus was generated the race of the frost-giants, or Hrimthursar, among whom the All-father dwelt in the beginning of time before the heavens and the earth were created.

In the meanwhile, as the cow Aedhumla licked the frost-covered stones, there came forth the first day a man's hair, the second day a head, and the third day an entire man. This man, *Buri*, or the Producing, had a son *Bör* (the Produced), who married Beltsa, one of the giant race, by whom he had three sons, Odin, Vili, and Ve.

These three brothers, who were gods, slew Ymir, and carrying his body into the middle of Ginnunga-gap, formed from it the earth and the heavens. Of his blood they made all seas and waters, taking the gore that flowed from his body to form the impassable ocean which encircles the earth; of his bones they made the mountains, using the broken splinters and his teeth for the stones and pebbles; of his skull they formed the heavens, at each of the four corners of which stood a dwarf, viz., Austri at the east, Vestri at the west, Northri at the north, and Suthri at the south. Of his brains they formed the heavy clouds, of his hair plants and herbs of every kind, and of his eyebrows they made a wall of defence against the giants round Midgard, the central garden or dwelling-place for the sons of men. Then the three brothers took the glowing sparks that were thrown out of the world Muspelheim, and casting them over the face of heaven, raised up the sun, moon, stars, and fiery meteors, and appointed to each its place and allotted course; and thus arose days, months, and years.

Night was of the race of the giants, and in turn married three husbands, by one of whom she had a daughter, Earth, and by another a son, Day, who was bright and beautiful like the gods, or Œsir, to whose race his father Delling belonged. To this

mother and son, who were akin to the opposite races of the frost-giants and the gods. Allfader committed chariots and horses, and placed them in heaven, where Night rides first through her twenty-four hours' course round the earth with her horse Hrimfaxi, from whose bit fall the rime-drops that each morning bedew the face of the earth. Close after her comes her fair son Day, with his horse Skinfaxi, from whose shining mane light beams over heaven and earth. All the maidens of giant race were not dark like Night, for to Mundilfori were born a son and daughter of such beauty that their father gave to them the names of Mani or Moon, and Sol or Sun. The gods, incensed at this presumption, took them up to heaven, and ordained that they should direct the course of the sun and moon, which had been made to give light to the world, and thenceforth Sol drove the chariot of the Sun, which was drawn by two horses, Arvakur (the Watchful) and Alsvith (the Rapid), under whose shoulders the gods in pity placed an ice-cool breeze. A shield named Svalin (the Cooling) was also by their care attached to the front of the car, to save sea and land from being set on fire. Mani directs the course of the moon, and he, like his sister, is followed by a wolf that seems about to devour him; and in the end of time this animal, which is of giant race, will with his kindred swallow up the moon, darken the brightness of the sun, let loose the howling winds, and sate himself with the blood of all dying men.

When heaven and earth were thus formed, and all things arranged in their due order, the chief gods or Œsir, of whom there were twelve, met in the middle of their city Asgard, which lay on the plain of Ida. These gods were Odin, or All-father, who has twelve names in Asgard besides many others on earth; Thor, Baldur, Tyr, Bragi, Heimdal, Hod, Vidar and Vali his sons, and Niord, Frey, Ull, and Forsetti. Here they raised for themselves a court with a high seat for All-fader; a lofty hall for the goddesses; and a smithy, in which they worked in metal, stone, and wood, but chiefly in gold, of which precious substance all the implements which they used were made, and hence this period of their existence was known as the Golden Age.

This age of peaceful labour lasted till three beautiful, but evil maidens made their way from the giants' world, Jötunheim, to Asgard, when confusion and ill-will arose in the world. Then the gods, taking counsel, determined to create new beings to people the universe, and first they gave human bodies and understanding to the dwarfs, who had been generated like maggots within the dead body of Ymir, but who now took up their abodes in the bowels of the earth, in rocks and stones, and in trees and flowers. Then Odin, with two companions, Hænir and Lodur, went forth on an excursion to the earth, where finding two trees, Ask and Embla, created a man and a woman of them, Odin giving them spirit or the breath of life, Hænir sense and motion, and Lodur blood and a fair colour, with sight, speech, and hearing; and from this pair, whose dwelling was in Midgard, the human race has sprung. A bridge of three colours, Bifrost, known to men as the rainbow, connects Midgard with Asgard, and over this the gods ride daily on their horses to the sacred fountain of Urd, where they sit in judgment. This fountain lies at one of the three roots of the ash, Yggdrasil, whose branches spread over the whole world and tower above the heavens. Under one of these roots is the abode of Hel (q. v.), the goddess of the dead, under another, that of the frost-giants, while under the third is the dwelling of human beings. Below the tree lies the serpent Nidhogg, who is constantly gnawing the roots, and striving with his numerous brood of lesser serpents to undermine Yggdrasil, whose branches are as constantly refreshed by water from the well of Urd, which is poured over them by the Norns. These are three maidens known as Urd, Verdandi, and Skulld (or Past, Present, and Future), who dwell in a fair hall below the ash-tree, where they grave on a shield the destiny which they determine for the children of men.

Besides gods, frost-giants, dwarfs, and men, there were other beings, as the Vanir, who dwelt in the world Vanaheim, lying between the abodes of the gods and of men, and the Light Elves and Dark Elves, the former of whom were friendly to mankind, and of great beauty, while the latter were of evil demoniacal natures, and blacker than pitch.

Now, after the three giant maidens came to Asaborg, dissensions soon broke out among these different races, and Odin, by casting a spear among mankind, created war and discord in the world. Then his maidens, the Valkyriur (or choosers of the doomed), surrounded by lightnings, rode forth with bloody corselets and radiant spears, to choose on every battle-field those who should fall, and to lead them into Valhal, where the chosen heroes, known as Einheriar, daily go forth to fight and slay one another, but returning at early morn sound and fresh, recruit themselves for the next night's combats by drinking beer with the gods and eating the flesh of the sacred hog. It is, however, only men of rank, as jarls (or earls), who enter Odin's hall after death, for the base-born, or thralls, belong to Odin's powerful son, Thor (q. v.), who rules over Thrudheim, and drives through the world in a chariot drawn by he-goats, bearing with him his magic hammer Miolnir, the iron gloves which he requires to grasp the haft, and his belt of power.

Among the gods there reigned good-will and happiness even after the rest of the world had been disturbed by war, until Loki, or the impersonation of evil, who in infancy had been Odin's foster-brother, was admitted into Asaborg as their equal. By his treachery Baldur (q. v.), the purest, most beautiful, and best loved of Odin's sons, was slain. The gods, indeed, had power to inflict temporary punishment on Loki, and to chain him under a hot sulphur spring, where he lay for ages, but at length a time will come when Loki's evil progeny will prevail over the gods and the world. This terrible age of destruction, the Ragnarök, or twilight of the gods, will be marked by a three years' winter of hard frost, cutting winds, and sunless air uncheered by summer or spring-tide, when there will be bloodshed throughout the world, brothers will slay one another, parents and children will be at war. The wolf Fenrir will break loose, the sea will burst its bounds as the serpent Jormundgard, encircling Midgard, writhes in fierce rage, and struggles to reach the land. The wolf Sköll will swallow up the sun, and when the world is plunged in almost total darkness, his brother Hati will devour the moon, while the stars will vanish from heaven. As Midgard's serpent and the wolf Fenrir go forth, scattering venom through air and water, the heavens will be rent asunder; the ship Naglfar, which is made of dead men's nails, will be floated on the waters; the Œsir will ride forth across the bridge Bifrost, which will break away behind them; and all the friends of Hel, led on by Loki, will offer battle to the gods on Vigrid's plain. Then Odin, having taken counsel at Mimir's well, will advance armed with his spear Gungnir against the wolf Fenrir, while Thor encounters Midgard's serpent, and is killed by the venom which it exhales from its mouth. Although Fenrir, the wolf, will swallow Odin, and thus cause his death, he will

himself be slain by the god Vidar, while Loki will fall beneath the hand of Heimdal, the watchman of the gods, and Surt, hurling fire from his hand, will burn up the whole world. After the conflagration of heaven and earth and the whole universe, there will still be dwellings for the evil and the good, the worst of which is Nastrond, a horrible habitation for perjurers and murderers, where serpent-heads pouring forth venom line the walls, while in Gimli, Odin's best heaven, the good and virtuous will find a happy resting-place.

But from the great destruction of the universe another earth, verdant and fresh, will arise from the deep waters of the ocean, the unsown fields will bear fruits, and all evil will cease; Baldur and other gods will then return to Ida's plain, where Asgard once stood, and taking counsel together, will find the golden tablets which their race had possessed at the beginning of time, and remembering their deeds of old, will await the coming of the mighty All-father, the ruler of all things, who will pronounce judgments, and establish peace that shall endure to the end of time.

The above brief epitome of the Odin cosmogony serves as a framework for the numerous beautiful prose and poetic myths which make up the substance of northern mythology; and are contained in a rich mass of sagas, not all complete in themselves, but each capable of throwing some light on the others.

Many theories have been advanced to explain the origin and the fundamental ideas on which the northern myths have been based; and while some expositors have seen in them a mere re-clothing of Bible narratives, and a perversion of Christian truths, and have referred their composition to monks living in the middle ages, others, feeling that their title to antiquity could not be set aside, have gone to the other extreme, and tried to prove that they reflected the truths of Christianity, and represented under active and tangible forms the mysteries of Revelation; and that thus, for instance, in the narrative of Thor crushing the serpent we have a figurative delineation of Christ. Other interpreters, again, have attached very different meanings to these myths, regarding them as historic, psychical, physical, or even chemical; but against each of these assumed modes of explanation, taken in their full integrity, conclusive arguments might be adduced; and all that can be safely accepted is, that they are partly historical and partly an impersonation of the active forces of nature. Like the northern languages, their original seat was in the south and east, where kindred mythologies existed among the ancient tribes of India and Persia; and it is probable that the more practical and energetic spirit of the northern myths, and the more warlike character of the gods of the north, when compared with the reflective and contemplative nature of their oriental prototypes, may be due to the gradual effect on the minds of a people who had passed from the soft enervating influences of a southern climate to the stern rigours of the north, where man lived in constant warfare with the elements and with his fellow-men. According to Snorri Sturlesson (q. v.), whose opinion seems to a certain extent to have been a mere re-echo of the traditional belief of his forefathers, Odin and his sons and companions were earthly kings and priests of a sacerdotal caste, who had migrated from Asia —perhaps, as some conjectured, from Troy—and who conquered and ruled over various parts of Scandinavia and Northern Germany, where after their death they were regarded by the people as deities. In conjunction with this mode of representation, the mythic tales of the warfare of the gods with giants, their intercourse with dwarfs, and spirits of the air and water, and their wanderings on earth, are interpreted as memorials of real war with pre-existing races, and of the spread of Odin's religion from its chief seat in Sweden over the neighbouring countries. This theory explains only a few of the myths; while some, as we have already observed, may be referred to traces of an older faith, which lingered amongst the Finns and Lapps after the advance of the more civilised conquering races had driven those tribes from the southern districts of Scandinavia, which they originally occupied, to the barren recesses of the north.

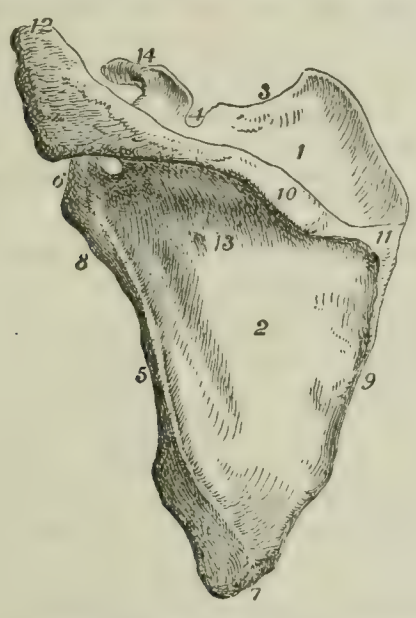
The worship of the gods was celebrated either in spacious temples, of which there were many in different parts of Scandinavia, or on stone heaps or altars, known as *horg*. These altars were always near some well, and close to a sacred grove, or a solitary tree, on which the votive offerings were suspended, after they had been washed at the neighbouring spring by the attendant priestesses, known as *horga'rudar*. Human sacrifices, although never resorted to on ordinary occasions, were not uncommon in times of public calamity, arising from war, failure of crops, disease, &c.; and the horse, whose flesh was highly esteemed, was a frequent victim, while the fruits of the earth and spoils of war were the usual offerings. Three great festivals were held every year, the first of which was celebrated at the new year in the Yule month, when Thorablot, or the sacrifice of Thorri, an ancient god of the Finns and Lapps, was offered. On these occasions, offerings were made to Odin for success in war, and to Frey for a fruitful year, the chief victim being a hog, which was sacred to the latter god, on the assumption that swine first taught mankind to plough the earth. Feastings and Yule games occupied the whole of the month, whence it was also called the Merry Month. The second festival was in mid-winter, and the third in spring, when Odin was chiefly invoked for prosperity and victory on the Vikings, or sea-roving expeditions which were then entered upon. On the introduction of Christianity, the people were the more ready to conform to the great church festivals of Christmas and Easter, from the fact of their corresponding with the ancient national sacrificial feasts; and so deep-rooted was the adhesion to the faith of Odin in the north, that the early Christian teachers, unable to eradicate the old ideas, were driven to the expedient of trying to give them a colouring of Christianity. Thus the black elves, giants, evil subterranean sprites, and dwarfs, with which the Northmen peopled earth, air, and water, were declared by them to be fallen angels, or devils, and under the latter character suffered to retain their old denominations. Belief in these imaginary beings survived the spread of the Reformation, and can scarcely be said to have died out in Scandinavian lands among the superstitious and ignorant, while among the more enlightened the myths connected with them are still related, and serve to give a poetic interest to special localities.

Our own association with the Scandinavian mythology is perpetuated in numerous superstitions and usages still lingering amongst us, and in the name of the days of the week. See WEEK.

The best northern authorities on Scandinavian mythology are N. M. Petersen, *Danmarks Historie i Hedenold* (1837); Rask, in his edition of *Sæmund's Edda*; Jakob Grimm, *Deutsche Mythologie*; Faye, *Norske- Folke- Sang*; Thorpe, *Northern Mythology* (Lond. 1851).

SCANSO'RÉS. See CLIMBERS.

SCA'NTLING, the sectional breadth and thickness of timbers for roofs, floors, &c. The term is



also applied to quarterings or pieces of timber of about five inches in thickness and under.

SCA'PHOID BONE (Gr. *skaphe*, a boat), a term applied to two somewhat boat-like bones, of which one occurs in the carpus or wrist (see HAND), and the other in the tarsus of the Foot (q. v.).

SCAPPLE, a kind of work applied to masonry. To scapple a stone, is to work the surface even without making it smooth.

SCA'PULA, THE, or SHOULDER BLADE, is a flat triangular bone, which, when the arm hangs loosely down, extends posteriorly and laterally from the first to about the seventh rib. It presents for examination an outer convex and an inner, smooth, and concave surface, three borders (a superior, an inferior or axillary, and a posterior), three angles, and certain outstanding processes.

The figure represents an outer or posterior view of the scapula. It is divided into two unequal

A Posterior View of the Left Scapula:

The parts designated by the figures 1, 2, 4, 6, 8, 10, 11, 12, are sufficiently described in the text; 3 is the superior border; 5, the anterior or axillary border; 7, the inferior angle; 9, the posterior border or base; 13, one of the nutritious foramina; 14, the coracoid process. (From Wilson's *Anatomist's Vade Mecum.*)

parts, the supra-spinous fossa (1), and the infra-spinous fossa (2), by the spine (10), a crest of bone commencing at a smooth triangular surface (11) on the posterior border, and running across towards the upper part of the neck of the scapula (8), after which it alters its direction, and projects forwards so as to form a lofty arch, known as the acromion process (12), which overhangs the glenoid cavity (6), or receptacle for the head of the humerus, or main bone of the arm. This acromion (so called from the Greek words *acros ōmos*, the summit of the shoulder) obviously serves to protect the shoulder joint, as well as to give great leverage to the deltoid muscle which raises the arm. It is this process which gives to the shoulder its natural roundness. From the upper part of the neck (8) there proceeds a remarkable curved projection termed the coracoid process, from its supposed resemblance to the beak of a raven (Gr. *kŏrax*). It is about two inches long, and gives attachments to several muscles. The upper border of the scapula presents a very remarkable notch (4), which in the recent state is bridged over with a ligament, and gives passage to the supra-scapular nerve. This bone articulates with the clavicle and humerus, and gives attachment to no less than 16 muscles, many of which, as the biceps, triceps, deltoid, serratus magnus, are very powerful and important.

The uses of this bone may be stated as follows: 1. It connects the upper extremity to the trunk, and participates in, and is subservient to many of the movements enjoyed by the arm; 2. By its extended flat surface it furnishes a lateral protection to the chest; and 3. It affords attachments to various muscles which modify the size of the thoracic cavity, and is thus concerned in the process of respiration.

SCA'PULAR, or SCAPULARY (Lat. *scapula*, the shoulder), a portion of the monastic habit, so called from its being worn upon the shoulders. It consists of a long stripe of serge or stuff, the centre of which passes over the head, one flap hanging down in front, the other upon the back. The scapular of the professed monks in most orders reaches to the feet, that of the lay brothers only to the knees. The colour differs for different religious orders or congregations. Besides the scapular worn by the members of religious orders strictly so called, there exists also in the Roman Catholic Church a religious association or confraternity, the members of which, while living in the world and mixing in ordinary life, wear, although not conspicuously, a small religious emblem called a scapular. The chief duties of this confraternity consist in the recitation of certain prayers, or the observance of certain religious or ascetical exercises through devotion to the Blessed Virgin. The members may or may not bind themselves by a vow of chastity. This pious association was founded in the middle of the 13th c. by an English Carmelite friar named Simon Stock, and is said to have originated in a vision, which has been the subject of much controversy, as well with Protestants as among Catholics themselves.

SCARABÆ'IDÆ, a very numerous tribe of lamellicorn coleopterous insects (see LAMELLICORNES), of which more than 3000 species are known, the greater number inhabitants of tropical countries, although species are found in almost all parts of the world. Some of the tropical species are amongst the largest of beetles; those found in colder regions, as in Britain, are of comparatively small size. The tribe is divided into six sections: *Coprophagi* (dung-eaters), *Arenicoli* (dwellers in sand), *Xylophili* (delighting in wood), *Phyllophagi* (leaf-eaters), *Anthobii* (living on flowers), and *Melitophili* (delighting in honey), named according to prevalent and characteristic habits of the species belonging to them, although the names do not accurately denote the habits of all the species of each section. The sections are distinguished by differences in the organs of the mouth and the antennæ. To the section *Crotophagi* belong the greater number of the Dung Beetles (q. v.), or Scavenger Beetles, so useful in warm countries in removing offensive matter; amongst which is the Sacred *Scarabæus* of the ancient Egyptians (*Scarabæus*, or *Ateuchus sacer*). Some of the *Xylophili*, as the great Hercules Beetle (q. v.), have remarkable projections from the head or the thorax of the males. The Cockchafer (q. v.) is an example of the *Phyllophagi;* the Goliath Beetle (q. v.) is one of the *Melitophili*, to which section the Rose Beetle, common in Britain, also belongs. None of the *Anthobii* are British.

SCARABÆ'US, the name of a beetle held sacred by the Egyptians, commonly known in entomology as the *Scarabæus* or *Ateuchus sacer*. It was called *Heliocantharus* or *Cantharus*, by the Greeks, and

S. by the Latins. Scarabæi were employed for rings, necklaces, and other purposes by the Egyptians, Phœnicians, and Etruscans (see GEMS). These are principally distinguished by the absence or presence of striated elytra and other marks. Entomologists have recognised four distinct species of the *Ateuchus* on the Egyptian monuments, viz., *A. semipunctatus*, *A. laticollis*, *A. morbillosus*, *A. punctícollis*. Several mystical ideas were attributed to the S.: the number of its toes, 30, symbolised the days of the month; the time it deposited its ball in which its eggs were deposited, was supposed to refer to the lunar month; the movement of the clay-ball referred to the action of the sun on the earth, and personified that luminary. The S. was supposed to be only of the male sex, hence it signified the self-existent, self-begotten, generation or metamorphosis, and the male or paternal principle of nature. In this sense it appears on the head of the pygmæan diety, Ptah-Socharis Osiris, the demiurgos, and in astronomical scenes and sepulchral formulas. In the hieroglyphs it is used for the syllable *khepru*, and expresses the verb 'to be, exist.' In connection with Egyptian notions, the Gnostics and some of the Fathers called Christ the scarabæus. The insect, during its life, was worshipped, and after death, embalmed.—*Horapollo*, i. c. 10; Ælian, *De Nat. Anim.* x. 15; Pettigrew, *History of Mummies*, p. 221; Wilkinson, *Man. and Cust.* v. p. 255.

Scarabæus.

SCARAMOUCH (Ital. *scaramuccia*, skirmish), a character in the old Italian comedy, originally derived from Spain, representing a military poltroon and braggadocio. He was dressed in a sort of Hispano-Neapolitan costume, including a black *toque* and mantle, and a mask open on the forehead, cheeks, and chin, and always received an inglorious drubbing at the hands of harlequin.

SCARBOROUGH (i. e., fortified rock), a seaport and municipal and parliamentary borough in Yorkshire, in the East Riding, 42 miles north-east of York, and about 20 miles north-west of Flamborough Head. It is built around a charming bay open to the south and south-west, and protected on the north-east by a promontory ending in a castle-crowned height, which looks out on the North Sea. From the sands the town has gradually climbed the rising ground behind in successive terraces and crescents. The chief buildings are churches, chapels, and benevolent and other institutions, with which the town is well furnished. A fine cast-iron bridge, 75 feet high, and stretching over a chasm 400 feet wide, connects the old and new towns, and leads to the spa, and a bridge has recently been erected over a picturesque ravine to connect the western part of the town with its large and fashionable southern suburb. The springs, which are saline and chalybeate, are on the margin of the sea, and are surrounded by walks and ornamental grounds. The harbour, composed of three piers, and furnished with a light-house, is the most important in this part of the east coast. Every accommodation is offered to visitors for sea-bathing, and S. is reputed the most fashionable watering-place on the north-east coast. The season lasts from June to the middle of October. In 1863, 407 vessels, of 22,349 tons, entered and cleared the port. Pop. (1871) 24,244. The castle was erected about the year 1136. It was held against the barons by Piers Gaveston, who, however, surrendered, and was afterwards beheaded. It was twice besieged by the parliamentary forces. At present, it serves as a barrack, and is fortified by batteries.

SCA'RCEMENT, a plain set-off or projection in a wall; foundations have generally one or more scarcements.

SCARF, in Heraldry, a small ecclesiastical banner suspended from the top of a crosier.

SCARFING, the junction of two pieces of timber made to overlap, and united so as to appear as one piece.

SCARLATI'NA, or SCARLET FEVER, is one of the group of diseases called Exanthemata (q. v.). In addition to the characters common to the group, scarlatina is almost always attended by sore throat, and the rash or eruption, which is of bright scarlet colour, commonly appears as early as the second day after the manifestation of the febrile symptoms, and ends in desquamation of the cuticle on the sixth or seventh day. Most writers on medicine make three varieties of this disease—viz., *S. simplex*, in which there are the fever and the rash, but scarcely any throat-affection; *S. anginosa*, in which, in addition to the fever and the rash, the throat-affection is the most prominent symptom; and *S. maligna*, a name which is applied to certain cases of extreme violence, in which the system is at once overwhelmed by the force of the disease, or in which the symptoms evince an extraordinary degree of weakness and want of vital power.

The disease begins with shivering, lassitude, headache, a frequent pulse, a hot dry skin, a flushed face, thirst, loss of appetite, and a furred tongue. Shortly after the appearance of the febrile symptoms, the throat begins to feel irritable, and, on examination, is found to be red, and often more or less swollen. This redness becomes diffused over the interior of the mouth, and the tongue. The rash begins in the form of minute red points, which soon become so numerous that the surface appears of an almost uniform red. It first appears on the neck, face, and breast, whence it gradually spreads over the trunk and extremities. The reddened surface is smooth to the touch, and the colour temporarily disappears on pressure of the finger. Along with the true rash, minute vesicles, known as *Sudamina* (q. v.), sometimes occur. The eruption, in ordinary cases, is persistent for three or four days, after which it gradually disappears, and is usually gone by the end of the seventh day. The cuticle then begins to scale off in small bran-like scurf, or in flakes of various sizes. Specimens of an almost entire epidermic covering of the hand or foot, forming a natural glove or slipper, are of common occurrence in our pathological museums; but it is comparatively seldom that such perfect moulting takes place. The desquamative process is usually completed in a fortnight, or rather more, from the commencement of the disease. The fever does not abate on the appearance of the rash, but continues in a more or less decided degree through the progress of the case; it often presents exacerbations towards the evening, and is occasionally attended with delirium, or even with comatose symptoms. If the urine be examined, both chemically and microscopically, a few days after desquamation has set in, it will be found to contain albumen, and to exhibit a large amount of epithelium from the uriniferous ducts of the Kidneys (q. v.).

Malignant Scarlatina is so terrible a disease that its characteristic symptoms require a brief special notice. The rash comes out late and imperfectly, and sometimes is hardly perceptible; or, having appeared, it may suddenly recede; and sometimes it is intermixed with livid spots. The

pulse is feeble, the skin is cold, and there is extreme prostration of strength. In such a case as this, death may occur (apparently from blood-poisoning) in a few hours. Other cases rapidly assume a typhus-like character. 'The pulse (says Dr Watson) becomes frequent and feeble; the tongue dry, brown, and tremulous; the debility extreme; the breath offensive; the throat is livid, swollen, ulcerated, and gangrenous; and the respiration is impeded by viscid mucus, which collects about the fauces. Over this variety of the disease, medicine has comparatively little control.'

Even in *S. anginosa*, there is very considerable danger. The disease may prove fatal (1) from inflammation or effusion within the head, or (2) from the throat-affection, which too often proceeds to disorganisation and sloughing of the adjacent parts. Moreover, in parturient women, even the mildest form of the disease is fraught with the greatest peril. Further, when the disease is apparently cured, the patient is exposed to great hazard from its consequences or *sequelæ*. Children who have suffered a severe attack of scarlet fever are liable (in the words of the eminent physician to whom we have already referred) 'to fall into a state of permanent bad health, and to become a prey to some of the many chronic forms of scrofula—boils, strumous ulcers, diseases of the scalp, sores behind the ear, scrofulous swellings of the cervical glands and of the upper lip, chronic inflammation of the eyes and eyelids. The above-named consequences not unfrequently follow small-pox and measles, but, in addition to these, scarlatina is often followed by the form of dropsy known as *anasarca*, or serous infiltration of the subcutaneous cellular tissue, frequently accompanied with dropsy of the larger serous cavities. Strange as it may at first sight appear, this dropsy is much more common after a mild than after a severe form of the disease; but this apparent anomaly is probably due to the fact, that less caution is observed in the former than in the latter cases during the dangerous period of desquamation. If the patient (for example) is allowed to go out while new cuticle is still forming, the perspiratory power of the skin is checked by the cold, and the escape of the fever poison through the great cutaneous outlet is thus prevented. An excess of the poison is therefore driven to the kidneys, where it gives rise to the form of renal disease known as 'acute desquamative nephritis.'

Scarlatina is a disease that—like all the exanthemata—occurs in the epidemic form; and each epidemic presents its peculiar type, the disease being sometimes uniformly mild, and in others almost as uniformly severe. The treatment of this disease varies according to the preponderating symptoms. In *S. simplex*, nothing is required except confinement to the house, a non-stimulating diet, and the due regulation of the bowels, which are apt to be costive. In *S. anginosa*, cold or tepid sponging gives much relief if the skin is hot. If there is much fever, and especially if delirium supervene, a few leeches should be applied behind the ears, or if the patient were previously in robust health, blood might be cautiously taken from the arm. If, however, no bad head-symptoms are present, all that is necessary is to prescribe saline draughts, of which citrate of ammonia, with a slight excess of carbonate of ammonia, forms the best ingredient, and to keep the bowels open once or twice a day by gentle laxatives. In *S. maligna*, there are two main sources of danger, which were first recognised as distinct by Dr Watson, who describes them as follows: 'The one arises from the primary impression of the contagious poison upon the body, and particularly upon the nervous system, which is overwhelmed by its influence. The patients sink often at a very early period, with but little affection either of the throat or skin. If we can save such patients at all, it must be by the liberal administration of wine and bark, to sustain the flagging powers until the deadly agency of the poison has in some measure passed away. But another source of danger arises from the gangrenous ulceration which is apt to ensue in the fauces, when the patient is not killed by the first violence of the contagion The system is *re*-inoculated, I believe, with the poisonous matter from the throat. Now, under these circumstances also, quinia, or wine, and upon the whole, I should give the preference to wine, is to be diligently though watchfully given.' In addition to these remedies, a weak solution of chloride of soda, of nitrate of silver, or of Condy's disinfectant fluid, should be used as a gargle; or if, as is too often the case, the patient is incapable of gargling, the solution may be injected into the nostrils and against the fauces by means of a syringe or elastic bottle.

Three medicines have been so highly commended in scarlet fever generally, by trustworthy observers, that it is expedient to notice them. The first is chlorate of potassium ($KClO_3$) dissolved in water in the proportion of a drachm to a pint. A pint, or a pint and a half, may be taken daily. It was originally prescribed under the idea that it gave off its oxygen to the blood, and was eliminated from the system as chloride of potassium (KCl). Although this view is now known to be incorrect, there is no doubt that the salt is often prescribed with great benefit in this and some other diseases, as, for example, diphtheria and typhus fever. The second medicine is a very weak, watery solution of chlorine, of which a pint may be taken in the day; and the third is carbonate of ammonia in five-grain doses three times a day, given in beef-tea, wine, &c.

In the early stage, before the appearance of the rash, scarlatina may be readily mistaken for several other febrile diseases; after the appearance of the rash, the only disease for which it can be mistaken is measles, and we must refer to the article on that disease for a notice of the distinctive characters of the two affections.

There is no complaint in which the final result is more uncertain than this, and the physician should give a very guarded opinion as to how any special case may terminate.

Whether the disease is contagious throughout its course, or only at one particular period, is unknown; and if the physician is asked at what period the danger of imparting the disease on the one hand, or catching it on the other, is over, he should candidly declare that he does not know. That the contagion remains attached to furniture, clothing, &c., for a long period is undoubted. Dr Watson gives a remarkable instance of a small piece of infected flannel communicating the disease after the interval of a year.

The popular delusion that *scarlatina* is a mild and diminutive form of *scarlet fever* should always be corrected, as the error, if uncorrected, may do much harm by leading to a disregard of those precautions which are always necessary in this disease.

SCARLATTI, Alessandro, a musician of great eminence, born at Trapani in Sicily in 1659. He is said to have studied under Carissimi; if so, it must have been when very young. In 1680, S. visited Rome, and composed his first opera, *L'onestà nell' amore*, first performed at the court of Queen Christina of Sweden. His opera, *Pompeo*, was performed at Naples in 1684. In 1693, he composed the oratorio, *I Dolori di Maria sempre Vergine*, and

the opera *Teodora*, in which orchestral accompaniments were first introduced to the recitatives, and a separate design given to the accompaniments to the airs. In the following eight years, during part of which time he held the office of *maestro di capella* at Naples, he produced various operas, the most remarkable being *Laodicea e Berenice*, composed in 1701. Between 1703—1709 he held the situation of *maestro di capella* at St Maria Maggiore at Rome; he then returned to Naples; and in 1715, produced *Il Tigrane*. Alessandro S. died in 1721. His musical works comprise 117 operas, several oratorios, and a great deal of church music, besides various madrigals and other chamber music. He was the founder of the Neapolitan school, in which were trained most of the great musicians of last century, and whose influence can be traced in the works of almost every composer who has flourished since. His invention was rich and bold, his learning great, and his style pure. His modulations, often unexpected, are never harsh, and never difficult for the voice.—His son, Domenico (born 1685, died 1757), was the first harpsichord player of his day. Among his compositions are a number of sonatas, remarkable for invention, graceful melody, and skilful construction.—Domenico S. had a son, Giuseppe (born 1718, died 1796), who was also known as an eminent musician.

SCARLET COLOURS. Cochineal furnished the scarlet colour employed in dyeing before the application of aniline, and was extensively used; a solution of tin and cream of tartar being employed as the mordant to fix it. Scheffer, who produced the best formula for dyeing this colour, also added starch, the proportions being as follow: Starch, 9 lbs.; cream of tartar, 9 lbs. 6 oz.; solution of tin, 9 lbs. 6 oz.; and cochineal, 12 lbs. 4 oz. These are the quantities required for 100 lbs. of wool or cloth.

SCARLET RUNNER. See Kidney Bean.

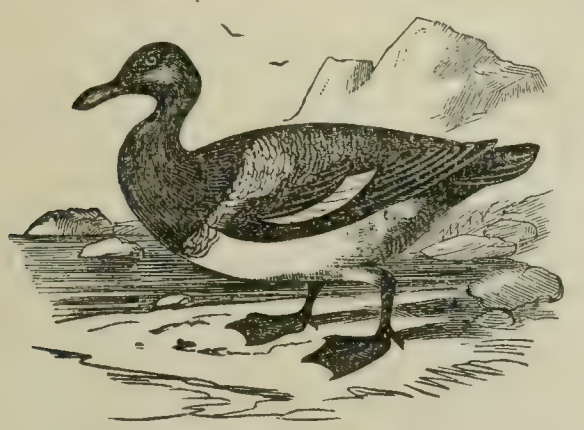
SCARP. See Escarp.

SCARPA, Antonio, a celebrated anatomist, was born on 13th June, 1747, at Castello-Motta, a village in the Friuli. He was educated at Padua, where his ardour attracted the attention of the octogenarian Morgagni, who, having lost his sight shortly after the arrival of S. at the university, engaged the young enthusiast as his secretary, and dictated to him in Latin the answers which he made to letters soliciting his advice. The intervals between their medical studies were employed by Morgagni and S. in the perusal of the Latin authors, and it is to this practice that we must ascribe the elegance that distinguished the scientific style of S. in his subsequent publications. In 1772, he was appointed Professor of Anatomy in Modena. He afterwards visited France, Holland, and England; and while in London, was so enamoured of John Hunter's Museum, that he did not rest until he had constructed a similar one at home. In 1783, he filled the anatomical chair at Pavia. He made, in the following year, a journey throughout the greater part of Germany, and in the course of it acquired the experience that made him one of the greatest clinical surgeons in Europe. On his return to Pavia, he published in rapid succession treatises on the anatomy of the Organs of Smell and Hearing; on the Nerves of the Heart, and on the minute anatomy of Bone. These, especially that on the innervation of the heart, which settled the question whether that viscus was supplied with nerves, gave S. a European reputation. His work on the Diseases of the Eye, published in 1801, was followed in 1804 by his observations on the Cure of Aneurism. But his greatest achievement was his work on Hernia, published in 1809. His reputation was now at its highest; but three years afterwards, he had to give up the work of public teaching, and entered, in 1814, on the office of Director of the Medical Faculty of Pavia. His next publication was some valuable observations on the operation for Stone. For the last years of his life, he suffered from almost total blindness, until, on the 30th of October 1832, he died at Pavia, of inflammation of the bladder. S.'s merits as an observer, a teacher, and a writer were very great. Industrious, scholarly, artistic, he appeared to great advantage in nearly every subject he undertook.

SCARPA'NTO (anc. *Carpathos*), an island in the Mediterranean, belonging to Turkey, midway between the islands of Rhodes and Crete. It is 32 miles long, and about 8 miles in extreme breadth, and its surface is covered with bare mountains, which reach the height of 4000 feet. The ruins of towns, which are found in several places, seem to indicate that formerly the island was well peopled. At present, the inhabitants are only about 5000 in number, and are mostly employed as carpenters and workers in wood, a trade of which they seem peculiarly fond, and in commerce.

SCARPE, in Heraldry, a diminutive of the bend sinister, being half the breadth of that ordinary.

SCARRON, Paul, the creator of French burlesque, was born at Paris in 1610. His father, a counsellor of parliament, was a man of fortune and good family; but he having married again after the death of Paul's mother, discord broke out between the second wife and her step-children, the result of which was that Paul had to leave the house. About 1634, he visited Italy, where he made the acquaintance of Poussin the painter. On his return to Paris, he delivered himself over to a life of very gross pleasure, the consequence of which was that, in less than four years, he was seized with permanent paralysis of the limbs. What makes this incident in his career still interesting is the fact, that it undoubtedly exercised no inconsiderable influence on the development of his peculiar genius, which, as a French critic justly says, was 'the image of his body.' His love of burlesque, of malicious buffoonery, of profane gaiety, was simply a way of escape through the gates of mockery from the *tourmens véhémens* of his incurable ailment. His scramble for the means of living is excusable when we consider his hapless infirmity. He wrote verses, flattering dedications, begging-letters for pensions, &c.; and in 1643 he even managed to get a benefice at Mans, which he held for three years, when he returned to Paris, and lived in a sort of elegant Bohemian style. He had a pension from Mazarin of 500 crowns; but when the cardinal declined (probably from avarice) to allow the *Typhon* to be dedicated to him, S. got absurdly indignant, and joining the Frondeurs, lampooned Mazarin with spleenful virulence. However, when the war of the Fronde was at an end, and Mazarin had triumphed, S. was ready with an ode to



Jule, autrefois l'objet de l'injuste satire.

This baseness, however, did not win him back his pension, which the 'object of his unjust satire' had withdrawn; and it might have fared hard with the poet, had other friends not started up—for example, Fouquet, who granted him a pension of 1600 crowns—and had he himself not been the most consummate beggar that ever lived. If he could not get a benefice or a purse of gold, or a lodge at court, he would take a load of firewood, or a carriage, pasties, capon, cheese, poodles, &c.—nothing came amiss; and his ample acknowledgments shewed how thoroughly he had mastered

the art of expressing gratitude. Doubtless his physical helplessness induced this bad habit, but his importunities were so pleasantly worded that they never estranged the friends on whom he fastened. In 1652, S. married Françoise d'Aubigné—a girl of 17, who subsequently became the mistress of Louis XIV., and is known as Madame Maintenon (q. v.). He died early in October 1660—the exact date is not known, but he was buried on the 7th. It is a proof of the charm of his company that his rooms were frequented by most of the men and women of his day who were distinguished either in literature or society. Among his works may be mentioned *Le Typhon*, *Virgile Travesti* (Par. 1648—1652), *La Mazarinade* (1649), *La Baronade Léandre et Héro*, *Ode Burlesque*, *La Relation du Combat des Purques et des Poëtes sur la Mort de Voiture*, *Poésies Diverses* (Par. 1643—1651), comprising sonnets, madrigals, epistles, satires, songs, &c.; *Le Roman Comique* (Par. 1651), a most amusing account of the life led by a company of strolling players—it is the best known, and perhaps the best of all S.'s productions; *Nouvelles Tragi-comiques*, from one of which (*Les Hypocrites*) Molière has taken the idea of Tartufe; besides a number of clever but coarse comedies. The editions of his works are very numerous, but the best is that of Bruzen de la Martinière (Amster., 10 vols., 1737; Par., 7 vols. 1786). Victor Fournel, to whom we are indebted for most of the information in this article, republished *Le Roman Comique*, in 1857, and *Le Virgile Travesti* in 1858.

SCA'TTERY ISLAND, a small islet in the estuary of the Shannon, three miles south-west of the town of Kilrush. Besides a fort, the islet contains fragments of several small churches, and an ancient round tower 120 feet high.

SCAUP DUCK (*Fuligula*—or *Nyroca*—*marila*), an oceanic species of duck, of the same genus with the Pochard (q. v.), an inhabitant of the northern parts of the world, spending the summer in arctic or subarctic regions, and visiting the coasts of Britain and of continental Europe as far south as the Mediterranean in winter, when it is also to be seen in great flocks in the United States, not only on the

Scaup Duck (*Fuligula marila*).

sea-coast, but on the Ohio, Mississippi, and other rivers. It breeds in fresh-water swamps. It is nearly equal in size to the Pochard. The male has the head, neck, and upper part of the breast and back black, the cheeks and sides of the neck glossed with rich green; the back white, spotted and striped with black lines; the wing-coverts darker than the back, the speculum white; the rump and tail-coverts black. The female has brown instead of black, and old females have a broad white band around the base of the bill. The flesh of the S. D. is tough, and has a strong fishy flavour.

SCEATTÆ. See NUMISMATICS.

SCENA. See THEATRE.

SCEPTICISM (Gr. *skeptomai*, 'I consider') strictly denotes that condition in which the mind is before it has arrived at conclusive opinions—when it is still in the act of reflecting, examining, or pondering over subjects of thought. Scepticism is therefore the opposite of dogmatism (see DOGMA). The notion of 'disbelief,' is quite a secondary meaning of the term. Among the Greeks a *skeptikos*, 'sceptic,' was originally only a thoughtful person, and the verb *skeptomai*, never acquired any other signification than 'to consider.' But inasmuch as the mass of men rush to conclusions with haste, and assert them with far more positiveness than their knowledge warrants, the discerning few of clearer vision or cooler head, are often brought into collision with popular beliefs—more especially in religion, the sphere in which popular beliefs are most numerous, most positive, and most inconsiderate—and are compelled by the violent shock given to their reason to 'doubt,' it may be to 'disbelieve' what they hear affirmed by the multitude with indefensible emphasis of speech. Thus it is that in common parlance a sceptic has come to mean an infidel, and scepticism infidelity. But the field of thought in which scepticism properly so-called has preferred to exercise itself is not religion but philosophy. Philosophical sceptics in all ages and countries have generally denied or at least doubted the trustworthiness of the senses as vehicles of absolute truth, and so have destroyed the very possibility of speculation. In ancient times, Pyrrhon (q. v.), in modern, David Hume (q. v.), are the most characteristic representatives of this kind of scepticism.

SCEPTRE (Gr. *skēptron*, staff; from *skēpto*, to send or thrust), originally a staff or walking-stick, hence in course of time, also a weapon of assault and of defence. At a very early period the privilege of carrying it came to be connected with the idea of authority and station. Both in the Old Testament and in Homer, the most solemn oaths are sworn by the sceptre, and Homer speaks of the sceptre as an attribute of kings, princes, and leaders of tribes. According to Homer, the sceptre descended from father to son, and might be committed to any one to denote the transfer of authority. Among the Persians, whole classes of persons vested with authority, including eunuchs, were distinguished as the 'sceptre-bearing classes.' The sceptre was in very early times a truncheon pierced with gold or silver studs. Ovid speaks of it as enriched with gems, and made of precious metals or ivory. The sceptre of the kings of Rome, which was afterwards borne by the consuls, was of ivory, and surmounted by an eagle. While no other ensign of sovereignty is of the same antiquity as the sceptre, it has kept its place as a symbol of royal authority through the middle ages and down to the present time. There has been considerable variety in its form; the sceptre of the kings of France of the first race was a gold rod as tall as the king himself.

SCHADOW-GODENHAUS, FRIEDR. WILH. VON, a distinguished German painter, of the Düsseldorf school, was born at Berlin, September 6, 1789. His father, Joh. Gottf. S., an eminent sculptor, died director of the Berlin Academy of Arts, in 1850. At first young S. did not give much promise of excellence, but during his first visit to Rome, the influence of Overbeck, Cornelius, Führich, Veit, &c., awoke his dormant genius, and both singly and in company with some of these artists, he executed several pictures remarkable for their

depth of religious sentiment; as 'An Explanation of the Dream of Joseph' and 'The Grief of Jacob when told of the Death of his Son.' While residing in the city of the pope, he passed over to Roman Catholicism. Scarcely had S. returned to Berlin when he was appointed professor of the academy, and soon gathered round him a host of brilliant pupils; but in 1826 he went to Düsseldorf as successor of Cornelius, in the direction of the notable academy there. His pupils followed him, and ever since the 'Düsseldorf School' has been associated specially with their names. S.'s principal works are 'Mignon' (1828); 'The Four Evangelists,' one of the finest productions of German art; 'The Wise and Foolish Virgins,' 'The Source of Life,' 'The Assumption,' three great allegorical pictures; and 'Heaven,' 'Purgatory,' and 'Hell.' S. was ennobled by the king of Prussia in 1843. He died in 1862.

SCHAFFHAU'SEN, the most northern canton of Switzerland, is bounded on all sides but the south by the duchy of Baden. Area, 117 sq. m.; pop. (1860) 35,964, of whom 33,000 are Protestants, and 2400 are Catholics. The chief river is the Rhine, which forms part of the southern boundary, and within the basin of which the canton is wholly included. The surface is hilly, especially in the north and east, and of the many rich valleys that slope southward to the Rhine, that of the Klettgau is famous for its unusual fertility, and for its wines, the bouquet of which is peculiarly fine. The climate is mild; the soil, which is mostly calcareous, is generally fruitful, and agriculture is the principal branch of industry. Grain, fruits, flax, hemp, and wine are the chief crops. Iron is obtained, but the manufactures are not important. About 20,000 tons of gypsum are obtained yearly at the town of Schleitheim (pop. 2000). The canton is divided into six districts.

SCHAFFHAUSEN, a town of Switzerland, capital of the canton of the same name, beautifully situated on the right bank of the Rhine, immediately above the celebrated falls of that river. Higher up the slope on which the town stands, is the curious castle of Munoth, and this edifice and the minster, founded in 1052, are the chief buildings. The town is remarkable for the antique architecture of its houses. The old wall and gateways of S. are also very picturesque. Pop. 7770, who are partly engaged in the manufacture of iron, cotton, and silk goods. The *Falls of Schaffhausen*, about three miles below the town, form, perhaps, the most imposing spectacle of the kind in Europe. The river is here 300 feet broad, and the entire descent is about 100 feet. From a projecting balcony which overhangs the roaring cataract, the visitor may appreciate the full grandeur of the fall.

SCHALL, JOHANN ADAM VON, a celebrated Jesuit missionary to China, was born of noble family at Cologne in 1591, and having made his studies and entered the Jesuit order in Rome, in 1611, he was selected, partly in consequence of his great knowledge of mathematics and astronomy, to form one of the mission to China in 1620. Having, with the characteristic skill and ability of his order, turned to good account among the Chinese his familiarity with mathematical and mechanical science, he not only succeeded in forming a flourishing mission, but was ultimately invited to the imperial court at Pekin, where he was entrusted with the compilation of the calendar, and the direction of the public mathematical school, being himself created a mandarin. Such was his favour with the emperor, that, contrary to all the received etiquette, he had the privilege of free access to the presence of the Emperor Chun-Tche, the founder of the Tartar dynasty (1645), and was honoured by visits from the emperor at four stated times in each year. Through this favour with the emperor, S. obtained an edict which authorised the building of Catholic churches, and the liberty of preaching throughout the empire; and in the space of 14 years the Jesuit missionaries in the several provinces are said to have received into the church 100,000 proselytes. On the death of this emperor, however, a change of policy fatal to the prospects of Christianity took place. The favourable edict above referred to was revoked; S. was thrown into prison and sentenced to death. He was afterwards liberated; but he was again imprisoned, and, at the end of a long incarceration, died August 15, 1669. He had acquired a perfect mastery of the Chinese language, in which he compiled numerous treatises upon scientific and religious subjects. A large MS. collection of his remains in Chinese, amounting to 14 volumes in 4to, is preserved in the Vatican Library. He also translated into Chinese several works, doctrinal and medical, especially some treatises of Father Lessius, a Flemish Jesuit, the most important of which was that *On the Providence of God.*—See Mailly's *Histoire Générale de la Chine* and Huc's *Le Christianisme en Chine.*

SCHÄ'SBURG, or SCHÄSSBURG (Magyar, *Segesvá*), a town of Austria, in Transylvania, on the great Kokel. It consists of the Burg or Upper-Town and the Lower-Town. Pop. 7962.

SCHAU'MBURG-LI'PPE, a principality and state of the German empire, formerly the county of Schaumburg, and bounded on the W. by Westphalia, and the N. by Hanover. Area, 212 sq. m.; pop. (1867) 31,186. It shares the physical characters of the surrounding states. The prince, who resides for the most part at Bückeburg (pop. 4214), has large possessions in Mecklenburg, Hanover, and Bohemia. The public revenue amounts to $81,480, and the expenses to the same sum. It had one vote in the *plenum*, and part of the 16th vote in the *curies*. It contributed to the force of the North German Confederation a contingent of 516 men. The line of S.-L., a branch of the House of Lippe (q. v.), divided from the main stem in the year 1613.

SCHEELE, CHARLES-WILLIAM, an eminent Swedish chemist, was born at Stralsund, 1742, and after receiving a brief and incomplete education, was apprenticed to an apothecary at Gothenburg, where he laid the foundation of his knowledge of chemistry. In 1767, he settled at Stockholm as an apothecary; and in 1770, removed to Upsala, where at that time the celebrated Bergmann was professor of chemistry. It was during his residence at Upsala that he carried on those investigations in chemical analysis which proved so fruitful in important and brilliant discoveries, and placed their author by the side of Linnæus and Berzelius, his countrymen—in the front rank of science. In 1777, he removed to Köping to take possession of a vacant apothecary business, but died of ague-fever, 24th May 1786, at a time when he was receiving the most tempting offers from England to persuade him to settle in that country. The chief of his discoveries were tartaric acid (1770), chlorine (1774), baryta (1774), oxygen (1777), and glycerine (1784) the second-last of which had been previously made known through the labours of Priestley, though S. was not aware of this till after his own discovery of it in 1777. In experimenting on arsenic and its acid, he discovered the arsenite of copper, which is known as a pigment under the name of *Scheele's Green* or *Mineral Green.* In 1782, during an eminently delicate and subtle investigation to determine

the nature of the colouring-matter in Prussian Blue, he succeeded in obtaining, for the first time, prussic acid in a separate form. The mode and results of his various investigations were communicated from time to time, in the form of memoirs, to the Academy of Stockholm, of which he was an associate, and also in his chief work, the *Chemical Treatise on Air and Fire* (Upsala, 1777), and in an *Essay on the Colouring Matter in Prussian Blue* (1782).

SCHEELE'S GREEN. See ARSENIOUS ACID.

SCHEFFER, ARY, a French painter, born at Dort, in Holland, 10th February 1795, studied under Guerin of Paris, and made his début as an artist in 1812. Some years later appeared his 'Mort de Saint-Louis,' 'Le Dévouement des Bourgeois de Calais,' and several *genre* pieces, such as 'La Veuve du Soldat,' 'Le Retour du Conscrit,' 'La Sœur de Charité,' 'La Scène d'Invasion,' &c., which have been popularised in France by engravings; but compared with his later performances, these early pictures have little merit. It was not till the 'Romantic' movement reached art that S. began to feel conscious of his peculiar power. The influence of Goethe and Byron became conspicuous in his choice of subjects, and to the remarkable facility of execution that had always marked him, he now added a subtilty and grace of imagination, that give an inexpressible charm to his works. The public admired his new style greatly, and lavished eulogy with liberal hand on his 'Marguerite à son Rouet,' 'Faust tourmenté par le Doute,' 'Marguerite à l'Eglise,' 'Marguerite au Sabbat,' 'Marguerite sortant de l'Eglise,' 'Marguerite au Jardin,' 'Marguerite à la Fontaine,' 'Les Mignons,' 'Le Larmoyeur,' 'Francesca de Rimini,' &c. Towards the year 1836, his art underwent its third and final phase—the religious. To this class belong his 'Le Christ Consolateur,' 'Le Christ Rémunérateur,' 'Les Bergers conduits par l'Ange,' 'Les Rois Mages déposant leurs Trésors,' 'Le Christ au Jardin des Oliviers,' 'Le Christ portant sa Croix,' 'Le Christ enseveli,' and 'Saint Augustin et sa Mère Sainte Monique,' some of which are well known in England by engravings. S. also executed some remarkable portraits; among others, those of La Fayette, Béranger, Lamartine. He died at Argenteuil, near Paris, 15th June 1858.

SCHELDT, THE (pron. *Skelt;* Lat. *Scaldis*, Fr. *l'Escaut*), rises in the French dep. of Aisne, flows northerly to Cambrai, Valenciennes, Bouchain, and Condé, when entering Belgium, it passes Doornik, Oudenarde, Ghent, Dendermonde, Rupelmonde, and Antwerp, having received, among other tributaries, the Lys, Dender, and Rupel. Navigable from its entrance into Belgium, the S. at Antwerp becomes a noble river, of sufficient depth for large ships. From Antwerp, the course is north-west, to Fort Bath, in the Netherlands, where, coming in contact with the island of South Beveland, it divides into two arms. The left or southern, called the Honte or Wester S., takes a westerly direction, south of the islands of Zeeland, and meets the North Sea at Flushing; the northern or right arm, called the Kreekerak, flows between Zeeland and North Brabant, near Bergen-op-zoom, dividing again into two branches, the left, called the Easter S., passing between the islands of Tholen and Schouwen on the right, and the Bevelands on the left, reaches the sea through the Roompot (*Romanorum portus*); the other branch, flowing between North Brabant and Zeeland, discharges itself by several passages. These several mouths of the S., forming various islands, are called the Zeeland streams.

The Dutch had long monopolised the navigation of the lower S.; and by the treaty signed in London (April 19, 1839), the Netherlands secured the right of levying 2*s.* 6*d.* per ton on all vessels. By a treaty signed at Brussels, July 16, 1863, this toll has been bought up, nominally by Belgium, but in reality from a sum of £750,000 paid to that country by the powers whose ships navigate the S., the proportion falling to Great Britain being fully £350,000.

SCHE'LLENBERG, a village in the south-east of Upper Bavaria, six miles south-west of the Austrian town of Salzburg, near which occurred the first battle of the 'War of the Spanish Succession,' in which the English took part. Maximilian-Emmanuel, elector of Bavaria, had fortified the hill of S. to resist the progress of Marlborough; but on July 4th, 1704, the work was attacked by the English, led on by Prince Ludwig of Baden, and carried by storm after a bloody fight.

SCHELLING, FRIEDR. WILH. JOS. VON, an illustrious German philosopher, was born at Leonberg, in Würtemberg, January 27, 1775, studied at Tübingen and Leipzig, and in 1798 proceeded to Jena, then the headquarters of speculative activity in Germany, through the influence of Reinhold and Fichte. S.'s philosophical tendencies were originally determined by Fichte; in fact, he was at first only an expounder, though an eloquent and independent one, of the Fichtian idealism, as one may see from his earliest speculative writings, *Über die Möglichkeit einer Form der Philosophie* (On the possibility of a Form of Philosophy, Tüb. 1795), *Vom Ich als Princip der Philosophie* (Of the Ego as the Principle of Philosophy, Tüb. 1795), and others. Gradually, however, S. diverged from his teacher, and commenced what is regarded as the second phase of his philosophy. Fichte's idealism now seemed to him one-sided and imperfect through its rigorous and exclusive subjectivity, and he sought to harmonise and complete it. The result of his speculations, in this direction, was the once famous *Identitätsphilosophie* (Philosophy of Identity), which claimed to shew that the only true knowledge, and, therefore, the only philosophy, was that of the Infinite-absolute, in which the 'real' and 'ideal,' 'nature' and 'spirit,' 'subject' and 'object,' are recognised as absolutely the same; and which affirmed the possibility of our attaining to such knowledge by a mysterious process, known as 'Intellectual Intuition.' The 'philosophy of identity,' though only the second stage in S.'s speculative career, is the most important, and is the one by which he is best known in England—Sir William Hamilton having elaborately discussed it, and endeavoured to demonstrate its untenableness in his essay on the 'Philosophy of the Conditioned' (see *Discussions in Philosophy and Literature, Education and University Reform*, 1852). The principal works in which it is more or less completely developed, are *Ideen zu einer Philosophie der Natur* (Ideas towards a Philosophy of Nature, Leips. 1797, 2d ed. 1803); *Von der Weltseele, eine Hypothese der Höhern Physik zur Erläuterung des allgemeinen Organismus* (Of the World-soul, an Hypothesis of the higher Physics in elucidation of the Universal Organism, Hamb. 1798, 3d ed. 1809); *Erste Entwurf eines Systems der Naturphilosophie* (First Attempt at a Systematic Philosophy of Nature, Jena, 1799); and *System des Transcendentalen Idealismus* (System of Transcendental Idealism, Tüb. 1800). In 1803, after the departure of Fichte from Jena, S. was appointed to succeed him, but in the following year went to Würzburg, whence, in 1808, he was called to Munich as secretary to the Academy of Arts, and was ennobled by King Maximilian-Joseph. Here he lived for 33 years, during

the last 14 of which he occupied the chair of philosophy in the newly-established university of Munich, but in 1841 he followed a call from Friedrich-Wilhelm IV. to Berlin, where he mainly resided for the rest of his life. He died at the baths of Ragaz, in Switzerland, August 20, 1854. We now revert to S.'s philosophical career. What may be regarded as its third period, if not its third phase, is chiefly marked by incessant controversy. With the exception of *Bruno, oder über das Göttliche und Natürliche Princip der Dinge* (Bruno, a Dialogue concerning the Divine and Natural Principle of Things, Berl. 1802), and the *Vorlesungen über die Methode des Akademischen Studiums* (Lectures on the Method of Academical Study, Stuttg. and Tüb. 1803), most of S.'s writings are polemical—often hotly so. The most notable are, his *Philosophie und Religion* (Tüb. 1804), in reply to Eschenmayer; *Denkmal der Schrift von den Göttlichen Dingen* (Tüb. 1812), in reply to Jacobi; and *Darlegung des Wahren Verhältnisses der Naturphilosophie zur verbesserten Fichte' schen Lehre* (Statement of the true relation of the Nature-philosophy to the improved Fichtian Doctrine, Tüb. 1806). Meanwhile, a most formidable adversary had risen up in his old college-friend, Hegel (q. v.), who was at first an ardent disciple of S.'s, just as Schelling had been of Fichte, but who had, in a similar manner, broken away, and was now pursuing an independent, and professedly antagonistic, course of speculation. During the reign of Hegelianism, S. preserved an almost unbroken silence. For more than 20 years he published almost nothing, but we know that he was far from being idle. He was observing narrowly the practical as well as the speculative results of the rival system, and maturing his own philosophy for the final phase which it assumed, and which he called variously, the 'positive,' the 'historical,' and the 'system of Freedom'—the design of which was to interpret, at once philosophically and reverentially, the history, and, especially, the religious history of mankind. S. admitted that his earlier speculations, though sound in themselves, attained only to 'negative' truth, and to shew that the most transcendental metaphysician need not be a Pantheist, but might be a believer in a Personal God, or even in a Trinity, with a whole Augsburg Confession to boot, he began to apply or develop in a practical way what he conceived to be the principles of his system. It cannot be said that the result has proved satisfactory, though many of his contemporaries thought it would—Neander, for example, dedicating to him, in the most eulogistic terms, the first volume of his *Kirchengeschichte*, on the ground that it was in harmony with S.'s new philosophy. The writings that contain the fruits of S.'s latest thinking were for the most part posthumously published, although a general idea of them had become known to the public through such lectures as those on the *Philosophy of Mythology*, and the *Philosophy of Revelation*. S.'s *Sämmtliche Werke* (14 vols., Stuttg. 1856—1861) were edited by his sons, Karl Friedr. Aug. and Hermann Schelling. His Correspondence was published at Munich in 1863. Various French writers, such as MM. Matter, Remusat, Cousin, Michelet, have tried (with indifferent success) to explain the great mystic to their countrymen; and English philosophical literature is dubiously associated with his name, through what may be called the somnambular plagiarisms of a kindred genius, Samuel Taylor Coleridge. These were first pointed out by Professor Ferrier in *Blackwood's Magazine*, March, 1840.

SCHE'MNITZ, the largest and most famous mining town of Hungary, stands in a narrow mountain gorge, at the height of 1054 feet, on a river of the same name, 70 miles north of Pesth. Together with its six suburbs, some of which, however, are at a distance of several miles, it has a population of 22,000; but the town proper has only 8500 inhabitants. The academy for mining and woodcraft, embracing collections of minerals and a chemical laboratory, is the principal building, and forms the chief architectural feature of the town. In 1854, 200 pupils attended the academy, and received lessons from six professors. A highly-esteemed kind of tobacco-pipe heads are manufactured here. The mines, which extend under the town, have been worked for centuries, though recently they have yielded but an inconsiderable profit. They produce gold and silver, as well as copper, iron, and sulphur, and give employment to 8000 workmen. Twelve of the mines belong to the crown, the others are private property.

SCHENE'CTADY, a city of New York, U. S., on the Erie Canal and the south bank of the Mohawk River, 16 miles north-west of Albany. It is the seat of Union College, and contains 12 churches, 2 banks, 2 newspapers, large machinery and locomotive works, 4 foundries, cotton-mills, and manufactories of shawls, agricultural implements, &c. S. was settled by the Dutch in 1661. In 1690, a large number of the inhabitants, were massacred by the French and Indians. Pop. in 1870, 11,026.

SCHE'RZO (Ital. jest, sport), in Music. A term applied to a passage or movement of a lively and sportive character, forming part of a musical composition of some length, as a symphony, quartett, or sonata.

SCHE'VENINGEN (pron. *Skāveningen*), a populous and thriving village in South Holland, is situated on the coast of the North Sea, about two miles from the Hague. Pop. nearly 8000. Fishing is the chief industry; ship-building, rope-spinning, and making sailcloth, being also carried on. It is the most fashionable sea-bathing resort in the Netherlands, and is visited by many distinguished strangers, there being an excellent 'Bath House,' and other hotels. In the neighbourhood, are summer residences of the royal family and nobility. A range of sand hills defends the village from the sea, which has, nevertheless, made so great encroachments that the Protestant church, originally built in the centre of the houses, is now close by the strand. The road from the Hague to S. is a long avenue of fine trees and wooded banks. In 1864, a tramway for passengers and goods was opened.

SCHIEDA'M (pron. *Skeedam'*), a town in South Holland, four miles west of Rotterdam, situated on the Schie, which, by a broad canal or haven, is connected with the Maas. Pop. in 1868, 19,325. The streets are generally narrow, irregularly built, and, compared with other Dutch towns, have a dirty appearance, from the smoky distilleries, malting-works, and grain-mills. It is a town so much engaged in manufacturing gin, and the preparatory processes, that the air and water smell and taste of it. In 1863, there were 236 distilleries; 74 works for preparing malt, &c., and 20 cooperages. The neighbouring meadows are rich in cattle, which are partly fed from the refuse of the distilleries. Grain is largely imported from Russia, Sweden, and Denmark. In 1863, 5514 inland vessels, with an aggregate tonnage of 115,202, and 552 sea-going ships, entered the haven. Nearly two-thirds of the population belong to the Protestant churches; the remainder, except 30 Jews, are Roman Catholics.

SCHILLER, JOHANN CHRISTOPH FRIEDRICH VON, one of the greatest poetical geniuses of Germany, was born at Marbach, a little town of Würtemberg, on November 11, 1759. His father, Joh. Kaspar

Schiller, was overseer of the nurseries attached to a country-seat of the Duke of Würtemberg. S. received his first formal instruction from the parish priest Moser, at Lorch; and in 1773, the duke, who had formed a favourable opinion both of S. and his father, offered to educate the boy, free of expense, at the military academy founded by him at the castle of Solitude, and afterwards transferred to Stuttgart under the name of Karls-schule. The offer was accepted, and entering the rigorous academy, S. tried to devote himself to jurisprudence. His success in the new study was small, and after two years, he exchanged it for medicine. But literature, especially poetry, was the secret idol of his soul, and its chief delight. Already the characteristics of his genius —his tendencies towards epic and dramatic idealism —were shewing themselves in his predilections. His first literary attempts of any moment were dramatic —*Der Student von Nassau* and *Cosmus von Medici* —which were consigned (doubtless not without reason) to the fire. Meanwhile, the poet's general intellectual culture and his professional studies went steadily on; and in 1780, he passed as a military surgeon, but with no liking for such a career. In 1778, S. completed the first sketch of his memorable drama, *Die Räuber* (The Robbers), the publication of which, in 1780, excited the most violent enthusiasm among the young all over Germany, so wild, and strong, and glowing were the passion and fancy displayed in it. Respectable people, dignitaries, functionaries, and the like, were, of course, deeply scandalised; and the duke himself, a 'Serene Highness' sort of man, was induced to lecture the poet on his delinquency, and forbade him to write any more poetry 'without submitting it to *his* inspection!' In 1782, *The Robbers* was brought upon the stage at Mannheim—the poet being present without the knowledge of his superiors, the result of which was arrest for a fortnight! This led to further complications; and finally, in October of the same year, S. fled from the harsh service of the duke into Franconia, and lived for a year under a feigned name at Bauerbach, near Meiningen, where he completed his *Fiesco* and *Cabale und Liebe*, begun at Stuttgart. *Don Carlos* was also sketched in outline here. In September 1783, he went back to Mannheim, and was for some time closely connected with actors and theatrical life. To this period belong several of his lesser poems. With the *Cabale und Liebe* above mentioned ended the first poetic period in S.'s career, otherwise known as the *Sturm und Drang* period, in which a burning energy of passion and a robust extravagance, passing often into sheer bombast of speech, are the predominant characteristics. In March 1785, S. left Mannheim, and proceeded to Leipzig, where he became acquainted, among others, with Huber and Körner, and wrote his beautiful *Lied an die Freude;* thence, after a few months, he went to Dresden, where he began the practice of composing during the night, which so fatally assisted in shortening his life. *Der Geisterseher* (The Ghost-seer), a strikingly powerful romance, was written here; and the drama of *Don Carlos* was completed. In 1787, he was invited to Weimar, and was at once warmly received by Herder and Wieland; but some years elapsed before Goethe and he could understand one another; after that, they became the closest friends. Henceforth, S. owed more to Goethe than to all other men: we may even call the later and best writings of S. inspirations of Goethe. The study of the spirit and literature of antiquity in particular exercised a wholesome influence over him, and in his *Götter Griechenlands* (Gods of Greece), which belongs to this stage, we see how calm, and clear, and sunny his once turbid and stormful imagination was gradually becoming. Reinhold of Jena introduced him to the Kantian philosophy, and for some little time S. was in danger of lapsing from a poet into a metaphysician. The philosophical and æsthetic treatises springing out of this new study were collected and published under the title of *Kleine prosaischen Schriften* (4 vols., Jena, 1792—1802). His *Geschichte des Dreissigjährigen Kriegs* (History of the Thirty Years' War) originally appeared in the *Taschenkalender für Damen* (1790—1793). On the occasion of the poet's marriage in 1790 with Charlotte von Lengefold, the Duke of Meiningen made him a *Hofrath* (privy-councillor); the French Republic also conferred on him the right of citizenship; and in 1802, the emperor raised him to the rank of nobility. While staying for a year with his relatives in Würtemberg, he wrote his exquisite *Briefe über ästhetische Erziehung* (Letters on Æsthetic Culture). This period, reaching to the close of 1794, is generally regarded as S.'s *transition* period; in poetic accomplishment, it is not rich, but in earnest, thoughtful, and manifold speculation it was highly important to the poet, and we find that it prepared the way for the last and most splendid development of his genius. After 1795, the finest of his lyrics and dramas were produced—as *Der Spaziergang* and the *Lied der Glocke* (Song of the Bell) in 1796, *Wallenstein* (1799), *Maria Stuart* (1800), *Die Jungfrau von Orléans* (1801), *Braut von Messina* (Bride of Messina, 1803), and finally his greatest drama, *Wilhelm Tell* (1804). But his health had been long giving way, partly owing to a natural weakness of constitution, and partly to incessant application to study; and on May 9, 1805, he expired, at the early age of 46. Ever since his death, the fame of S. has been on the increase; he has long been recognised as, next to Goethe, the greatest poet that Germany has produced, and innumerable editions of his works in whole or part have been published. The best account of him and his works is given by Carlyle in his *Life of Friedrich Schiller* (Lond. 1825).

SCHINKEL, Karl Friedr., a German architect of great celebrity in his own country, was born at Neuruppin, March 13, 1781, and studied the principles of drawing and design at Berlin under Professor Gilly. In 1803, he went to Italy to extend his professional knowledge; but on his return in 1805, he found the aspect of public affairs so threatening that he could obtain little employment, and was forced to betake himself to landscape-painting. In May 1811, he was elected a member of, and in 1820 a professor at, the Berlin Academy of Arts. Other offices and honours were also conferred on him. He died October 9, 1841. The designs to which he chiefly owes his reputation are those of the Royal Guard-house, the Memorial of the War of Liberation, the New Theatre, the New Potsdam Gate, the Artillery and Engineers' School, in Berlin; the Casino, in Potsdam; another in the gardens of Prince Karl at Blienike, near Potsdam; and a great number of castles, country-houses, churches, and public buildings. S. was a man of powerful and original genius; his designs are remarkable for the unity of idea by which they are pervaded, and the vigour, beauty, and harmony of their details.—See Kugler's *Karl Friedr. Schinkel* (Berl. 1842).

SCHI'NUS, a genus of trees and shrubs of the natural order *Anacardiaceæ*, natives of South America. The leaves so abound in a resinous or turpentine-like fluid, that upon the least swelling of the other portions of the leaf by moisture, it is discharged from the sacs which contain it. Thus they fill the air with fragrance after rain, or if thrown into water,

start and jump about as if alive, discharging jets of this peculiar fluid. The same phenomenon is exhibited by the leaves of some species of the kindred genus *Duvaua*, of which specimens are occasionally to be seen in our greenhouses. The leaves and twigs when bruised have a very strong odour of turpentine.

SCHISM, GREEK, the separation between the Greek and Latin churches, which originated in the 9th, and was completed in the 12th century. See GREEK CHURCH.

SCHISM, WESTERN, a celebrated disruption of communion in the Western Church, which arose out of a disputed claim to the succession to the papal throne. On the death of Gregory XI. in 1378, a Neapolitan, Bartolomeo Prignano, was chosen pope by the majority of the cardinals in a conclave at Rome under the name Urban VI. Soon afterwards, however, a number of these cardinals withdrew, revoked the election, which they declared not to have been free, owing to the violence of the factions in Rome by which the conclave had, according to them, been overawed; and, in consequence, they proceeded to choose another pope under the name Clement VII. The latter fixed his see at Avignon, while Urban VI. lived at Rome. Each party had its adherents, and in each a rival succession was maintained down to the council of Pisa in 1410, in which assembly both were deposed, and a third pope, John XXIII., was elected. This measure not having been acquiesced in by all, a new council was convened at Constance in 1417, in which not alone the former rivals, but even the new pontiff elected, by consent of the two parties, at Pisa, were set aside, and Otho Colonna was elected under the name of Martin V. In this election the whole body may be said to have acquiesced; but one of the claimants, Peter de Luna, called Benedict XIII., remained obstinate in the assertion of his right till his death in 1424. The schism, however, may be said to have terminated in 1417, having thus endured nearly 40 years.

SCHI'SMA, the name given to one of the very small intervals known in the theory of music, which amounts to the difference between the *Comma ditonicum* and *Comma syntonicum*. See COMMA.

SCHIST (Gr. *schistos*, split) is a term applied somewhat loosely to indurated clays, as bituminous schist and mica schist. It is more correctly confined to the metamorphic strata, which consist of plates of different minerals, as mica schist, made up of layers of quartz separated by laminæ of mica; chlorite schist, a green rock in which the layers of chlorite are separated by plates of granite or felspar; and hornblende schist, a black rock composed of layers of hornblende and felspar, with a little quartz.

SCHLA'NGENBAD, one of the most distinguished spas of Germany, on the northern frontier of the Rheingau district, 6 miles west of Wiesbaden, in a beautiful and secluded situation, embosomed amid wooded hills. The water of the baths has a temperature of 80° F., and contains the muriates and carbonates of lime, soda, and magnesia, with a slight excess of carbonic acid. The baths have a marvellous effect in beautifying the skin, and in soothing and tranquillising. The village is itself very small, and in the height of the season the pop. is only about 1000.

SCHLEGEL, AUGUST WILHELM VON, a distinguished critic, poet, and scholar, was born at Hanover, 8th September 1767, and studied at Göttingen, where he acquired a reputation by his devotion to philological and classical studies. He first began to assume a prominent position in literature, while a lecturer at Jena, contributing assiduously to Schiller's *Horen* and *Musen-Almanach*, and to the *Allgemeine Literaturzeitung*. About the same time, his translation of Shakspeare began to appear (9 vols. Berl. 1797—1810), the influence of which on German poetry and the German stage was equally great. Subsequently, the poet Tieck, with S.'s consent, undertook a revision of the work, together with a translation of such pieces as S. had omitted (12 vols. Berl. 1825, 1839, 1843); and from their conjoint labours, the people of Germany are able to form a faithful idea of the surpassing genius of our countryman. S. also delivered at Jena a series of lectures on æsthetics, and along with his brother, Friedrich, edited the *Athenaeum* (3 vols. Berl. 1796—1800), which in spite of, perhaps because of, the severity of its criticism, gave a lively and wholesome impulse to the poetry of its time. He published, besides, his first volume of poems (*Gedichte*, Tüb. 1800); and, again in company with his brother, the *Charakteristiken und Kritiken* (2 vols. Königsb. 1801). In 1802, S. left Jena for Berlin, where he gave a second series of lectures on literature, art, and the spirit of the time. Next year appeared his *Ion*, an antique tragedy of considerable merit. It was followed by his *Span. Theater* (2 vols. Berlin, 1803—1809), consisting of five pieces of Calderon's, admirably translated, the effect of which has been to make that poet quite a favourite with the German people; and his *Blumensträusse der Ital., Span., und Portug. Poesie* (Berl. 1804), a charming collection of lyrics from the sunny south, from the appearance of which dates the naturalisation in German verse of the metrical forms of the Romanic races. Probably his most valuable, and certainly his most widely popular work, was his *Vorlesungen über dramatische Kunst und Literatur* (3 vols. Heidelb. 1809—1811), originally delivered at Vienna, in the spring of 1808, and translated into most European languages. During 1811—1815, S. published a new collection of his poems (*Poetische Werke*), which contains his masterpieces, 'Arion,' 'Pygmalion,' 'St Lucas,' and is notable for the richness and variety of its poetic forms, as also for the singular facility and elegance of the versification. In 1818, S., now raised into the ranks of the nobility, and privileged to use the sacred *von* before his name, was appointed Professor of History in the university of Bonn, and devoted himself especially to the history of the fine arts and to philological research. He was one of the first students of Sanscrit in Germany, established a Sanscrit printing-office at Bonn, and an *Indische Bibliothek* (2 vols. Bonn, 1820—1826). Among the proofs of his scholarly activity in this department of knowledge, may be mentioned his edition of the *Bhagavad Gîta*, an episode from the epic poem, *Mahâbhârata*, with a Latin translation (2d ed. Bonn, 1846), and of part of the *Râmâyana* (Bonn, 1829—1839). His other works it is unnecessary to mention. S. was not happy in his domestic relations. He was twice married, first to a daughter of Professor Michaelis of Göttingen, and again to a daughter of Professor Paulus of Heidelberg, but in both cases a separation soon became necessary. S. was quarrelsome, jealous, and ungenerous in his relations with literary men, and did not even shrink from slander when his spleen was excited. He died 12th May 1845.

SCHLEGEL, KARL WILHELM FRIEDRICH VON, distinguished both for his scholarship and intellectual ability, was a brother of the preceding, and was born at Hanover, 10th March 1772. He

studied at Göttingen and Leipzig, and in 1797, published his first work, *Griechen und Römer* (The Greeks and Romans), which won praise from old Heyne. It was followed in the course of a year by his *Geschichte der Poesie der Griechen und Römer* (History of Greek and Roman Poetry), a sort of fragmentary continuation of the former. Both of these productions bore evidence of rich learning, independent thought, and a thorough appreciation of the principles and method of historic criticism; but the chief vehicle at this time for the dissemination of his philosophical views of literature was the sharp-fanged periodical called the *Athenaeum*, edited by himself and his brother, August Wilhelm. Proceeding to Jena, he started there as a *privat-docent*, holding lectures on philosophy, which met with great applause, and still editing the *Athenaeum*, to which he also began to contribute poems of a superior quality, and in the most diverse metres. In 1802, appeared his *Alarkos*, a tragedy, in which the antique-classical and new-romantic elements are singularly blended. From Jena, he soon went to Dresden, and thence to Paris, where he gave a few more of those philosophical prelections, in the manufacture of which both he and August Wilhelm were unhappily much too expert; edited the *Europa*, a monthly journal (2 vols. Frankf. 1803—1805); and applied himself assiduously to the languages of Southern Europe, and still more assiduously to Sanscrit, the fruits of which were seen in his treatise, *Ueber die Sprache und Weisheit der Indier* (Heidelb. 1808). See PHILOLOGY. During his residence in Paris, he also published a *Sammlung Romantischer Dichtungen des Mittelalters* (Collection of Medieval Romantic Poems, 2 vols. Par. 1804), and the pious-chivalric romance of *Lother und Maller* (Berl. 1805). On his return to Germany, he published a volume of dithyrambic and elegiac poems (*Gedichte*, Berl. 1809). At Cologne, he passed over to the Roman Catholic Church, a change to which his medieval studies powerfully contributed, and which, in its turn, no less powerfully affected his future literary career. In 1808, S. went to Vienna, where, in 1811, appeared his *Ueber die neuere Geschichte* (Lectures on Modern History), and in 1815, his *Geschichte der alten und neuen Literatur* (History of Ancient and Modern Literature). In 1822, a collected edition of his writings, in 12 vols. (*Sämmtliche Werke*), was published by himself. Subsequently, he delivered two series of lectures, one on the Philosophy of Life (*Philosophie des Lebens*, Vienna, 1828), and another on the Philosophy of History (*Philosophie der Geschichte*, Vienna, 1829), both of which are well known in England and other countries through the medium of translations. S. died 12th January 1829. His MSS. were published by his friend Windischmann (2 vols. Bonn, 1836—1837).

SCHLEIERMACHER, FRIEDRICH ERNST DANIEL, one of the greatest and most influential theologians of modern times, was born at Breslau, 21st November 1768. His boyish years were spent in the school kept by the Moravian brotherhood at Niesky, and here he first received those religious impressions the influence of which was visible in his whole after-life. In 1787, he proceeded to the university of Halle; and on the conclusion of his academic course, acted for some time as a teacher; but in 1794 became assistant-clergyman at Landsberg-on-the-Warthe, where he remained for two years. He then went to Berlin, and occupied himself partly in the translation of some of Blair's and Fawcett's Sermons, and in the redaction of the *Athenæum*, conducted by his friend Friedrich Schlegel; but the first work that won for him general celebrity was his *Reden über die Religion* (Discourses on Religion, Berl. 1799), which startled Germany from its spiritual torpor, vindicated the eternal necessity of religion, and sought to separate those elements of it that are essentially divine from the incrustations of dogma and the formalities of practice. Neander looked upon these *Reden* as making the turning-point in his spiritual career. They are now regarded as both making and marking an epoch in the theological history of Germany. The *Reden* were followed by the *Monologen*, and the *Briefe eines Predigers ausserhalb Berlin* in 1800. Two years later, he was appointed preacher at the Charity-house in the Prussian capital; and during 1804—1810, produced his famous translation of Plato, with commentary, which is considered in Germany, to this day, the most profound and penetrating treatise on the philosophy of the great Athenian, though English scholars are disposed to regard its criticism as decidedly too subjective, and in many important respects baseless. In 1801 appeared the first collection of his *Predigten* (Sermons), followed between 1808—1833 by no fewer than six other collections. They are masterpieces of penetrating and eloquent discussion, appealing equally to the heart and the intellect of hearers and readers. In 1802, S. went as court-preacher to Stolpe, where he published his *Grundlinien einer Kritik der bisherigen Sittenlehre;* and in 1804, was called to Halle as University-preacher and Professor of Theology and Philosophy. In 1807, he returned to Berlin, having previously published *Die Weihnachtsfeier, ein Gespräch* (Christmas Festival, a Dialogue, Halle, 1806), bearing on the calamitous state in which Germany then found herself, owing to the victorious insolence of the French. Among his next publications may be mentioned *Ueber den sogenannten ersten Brief des Paulus an den Timotheus* (Concerning the so-called first Epistle of Paul to Timothy, Berl. 1807). In 1809, he became pastor of Trinity Church, Berlin; and in 1810, when the university of Berlin was reopened, with a brilliant array of professors, under the rectorship of Fichte, no name shone more conspicuous than that of Schleiermacher. In 1811, he was chosen a member of the Berlin Academy of Sciences, in whose Transactions are to be found many valuable papers by S. on the ancient philosophy; and in 1814, secretary of the philosophical section. In 1817, he was appointed president of the synod assembled in Berlin. His latest, and perhaps his most important work is *Der Christliche Glaube nach den Grundsätzen der Evang. Kirche im Zusammenhange dargestellt* (The Christian Faith systematically presented according to the fundamental Propositions of the Evangelical Church, 2 vols. Berl. 1821—1822), in which his deepest and most Christian thought is visible. He died at Berlin, 12th February 1834. The list of S.'s disciples—i. e., of men who have derived the groundwork of their principles from him—is one of the most splendid that any theological reformer could shew, embracing, among others, the names of Neander, Nitzsch, Twesten, Olshausen, Lucke, Bleek, and Ullmann. In 1864, appeared a posthumous work of S., *Das Leben Jesu, Vorlesungen an der Universität zu Berlin im Jahr* 1832, in which he conceives of Jesus, as a man in whom the divine spirit works as perfectly as it possibly can in humanity, and treats his history accordingly. Strauss has replied in a critique (Berl. and Lond. 1865). S. was very far from what in England is called orthodox, but he was a great, earnest, devout Christian man, of massive understanding, and whose eloquence was scarcely less golden than that of Plato himself. Germany overflows with literature on S., his system, and his ideas.—For an account of his earlier life, see the

autobiographical sketch first published in Niedner's *Zeitschrift für historische Theologie* (1851); and for his later life, *Aus Schleiermacher's Leben in Briefen* (2 vols. Berl. 1858; translated into English by Frederica Rowan, 2 vols. Lond. 1860).

SCHLE'STADT, a fortified town of Alsace, in the former French department of Bas-Rhin, stands on the left bank of the Ill, and in the midst of a fruitful district, 28 miles south of Strasburg, on the Strasburg and Basel Railway. Pottery has long been manufactured here. Pop. 10,040.

SCHLESWICK. See SLESVIG.

SCHLOSSER, FRIEDR. CHRISTOPH, a distinguished German historian, was born at Jever, 17th November 1776, educated at Göttingen, and after spending many years as a private tutor and academic teacher, he was, in 1817, called to Heidelberg as a Professor of History, where he died, September 23, 1861. His principal writings (arranged in the order of time) are *Abälard und Dulcin* (Gotha, 1807); *Leben Beza's und des Peter Martyr Vermili* (Heidelb. 1809); *Geschichte der Bilderstürmenden Kaiser des Oeström. Reichs* (Frankf. 1812); *Weltgeschichte in Zusammenhängender Erzählung* (Frankf. 1817—1824); *Geschichte des* 18 *Jahrh.* (Heidelb. 1823); *Universalhistorische Uebersicht der Geschichte der Alten Welt und ihrer Cultur* (Frankf. 1826—1834); *Weltgeschichte für das Deutsche Volk* (1844—1853); and *Studien über Dante* (1856). Of these works, the most notable are the *Geschichte des* 18 *Jahrh.*, continued by S. in the later editions till the fall of Napoleon, and the *Weltgeschichte für das Deutsche Volk*, which have been translated into English and other tongues. S. is a keen, critical, and powerful writer, who judges men and events by a stern ethical standard.

SCHMALKALD, LEAGUE OF, the name given to the defensive alliance concluded provisionally for nine years at Schmalkalden (q. v.), 27th February 1531, between nine Protestant princes and eleven imperial cities, with whom other five princes and ten imperial cities subsequently made common cause; and the Elector of Saxony and the Landgrave of Hesse were appointed chiefs of the league, and empowered to manage its affairs. The object of this formidable alliance, which included the whole of Northern Germany, Denmark, Saxony, and Würtemberg, and portions of Bavaria and Switzerland, was for the common defence of the religion and political freedom of the Protestants against the Emperor Charles V. and the Catholic states. The league was not rendered superfluous by the religious peace of Nürnberg in 1532, and on the rumour that the emperor was meditating new hostile measures against the Protestants, another meeting of the confederates was held 24th December 1535, which resolved to raise a permanent army of 10,000 foot and 2000 cavalry, and to prolong the league for ten years. The confederation was further consolidated by articles of guarantee which were drawn up by Luther at Wittenberg in 1536, and being subscribed by the theologians present at the meeting of the league at Schmalkalden in February 1537, were called the *Articles of Schmalkald*. Against the league, the emperor, engaged as he was at the time in contests with the Turks and French, found himself unable to contend, though supported by the Holy League, a Catholic confederation formed in 1538, in opposition to the Protestant one. But impolitic management, mutual jealousies, and conflicting petty interests, dissipated their energies, and prevented united action. The 'War of Schmalkald' commenced by the advance of the army of the league, under Sebastian Schärtlin, into Swabia, to bar the approach of the imperial army from Italy. Schärtlin forced his way to the banks of the Danube, but the miserable jealousy of the Saxon princes paralysed his action. The emperor, by a proclamation bearing date 20th July 1546, put the two chiefs of the league under the ban of the empire; Maurice, Duke of Saxony, took possession of the electorate, by virtue of an imperial decree; and the Protestant army was forced to retreat. The Elector of Saxony reconquered his electorate in the autumn of 1546, but meantime the imperial army subdued the northern members of the League of S., and advanced into Franconia to meet the combined armies of Saxony and Hesse. The latter were totally routed at Mühlberg (24th April 1547), and both chiefs fell into the emperor's hands. This defeat, which has been ascribed to treason, and was perhaps as much owing to this cause as to weakness, finished the war. The object of the league, the guarantee of the liberty of religion to the Protestants, was subsequently effected by Maurice, now Elector of Saxony, who, by a brilliant feat of diplomacy and generalship, compelled the emperor to grant the treaty of Passau (31st July 1552), by which this freedom was secured.

SCHMA'LKALDEN, an old and interesting town of Prussia, province of Hesse-Nassau, at the confluence of the Stille and Schmalkald, 11 miles north of Meiningen. It is surrounded with double walls, contains two castles, and carries on considerable mining operations, especially in iron, and various manufactures, the chief of which are hardwares. Pop. 5600.

SCHNEE'BERG, a pleasantly-built and important mining town of Saxony, surrounded by mountains, 20 miles south-west of Chemnitz. Rich silver mines were formerly worked in the vicinity, and mining is still the employment of many of the inhabitants. The chief manufactures are silks, thread-lace, and blond. Pop. 7900.

SCHNEE'KOPPÉ, the culminating point of the mountain chain of the Riesengebirge. See BOHEMIA.

SCHOLARSHIP, a benefaction, generally the annual proceeds of a bequest permanently invested, paid for the maintenance of a student at a university. At the university of Oxford there are 40, and at Cambridge, 30 scholarships; the former ranging from £20 to £100, the latter from £25 to £60 yearly. In both universities, the scholars are chosen from the undergraduates, and are often elected before they have begun their attendance at the university. They are on the foundation, but their connection with the college is not so intimate as that of the Fellows. The regulations under which they are placed, and the advantages which they enjoy, differ in the different colleges. A number of the scholarships which were formerly restricted have recently been thrown open to public competition. The Bursaries (q. v.) of the Scottish universities are nearly analogous to the Scholarships of the English.

SCHOLA'STICS, or SCHOOLMEN, originally the name given to the teachers of rhetoric at the public schools under the Roman empire, but now used almost exclusively to denote the so-called philosophers of the middle ages. After the fall of the old classic civilisation, there ensued a long anarchy of barbarism, lasting from the 6th to the 8th c.; but from the time of Charlemagne, a visible improvement took place. That great monarch encouraged learning; and the monasteries as well as the schools which he established, became subsequently the seats of a revived culture of philosophy. Conformably, however, to the spirit of a time in which learning and literary skill were confined to churchmen, philosophical activity shewed itself chiefly in the domain of theology. This preparatory period of scholasticism—say from the 9th to the 11th

c.—embraces the distinguished names of Johannes Erigena Scotus (see ERIGENA), who cannot, however, be properly classed among the Scholastics; Gerbert of Aurillac, afterwards Pope Sylvester II. (q. v.); Berengarius (q. v.) of Tours; and Lanfranc (q. v.), Archbishop of Canterbury. A further development of Scholasticism occurred towards the middle of the 12th c., when Roscelinus opened up the question concerning the nature of universal conceptions, which led to the great struggle between the *Nominalists* (q. v.) and *Realists* (q. v.). This struggle terminated in the triumph of the latter; and henceforth, during the golden age of Scholasticism (the 12th and 13th centuries), it continued to be the prevalent mode of thought in philosophy. Still, however, Scholasticism regarded philosophy as dependent on theology. No one dreamed of doubting, or at least of disputing the truth of any of the church doctrines. These were alike too sacred and too certain to be so handled, and the only thing left for a humble philosopher to do was, in fact, to sort and systematise them: hence the expression *philosophia theologiæ ancilla* (philosophy is the handmaid of theology), which has found its way down to modern times. Whatever did not directly belong to ecclesiastical dogma, was either neglected or treated in accordance with the vague traditions of Platonic or Aristotelian thought handed down from antiquity. Hence sprung that vast array of artificial subtleties and distinctions which had no better foundation to rest on than gross ignorance of the matters discussed, combined with a restless speculativeness. The formulas of logic were abused through an irrational realism, which regarded them not only as a means to the attainment of philosophical knowledge, but as the material organon of philosophy itself. At first, the dialectic treatment of dogma was only fragmentary, as we see it in the principal Scholastics of the 12th c., Gilbert de la Porrée, Alanus ab Insulis, and Petrus Lombardus (q. v.). During the 12th c., however, the increased intercourse of the West with the Arabs and Greeks led to a more definite acquaintance with the physical and metaphysical writings of Aristotle, though still only through the medium of incomplete translations, and in this way the circle of vision of the Scholastics at least widened, if it did not become clearer. From this period dates the almost *papal* authority of the great Stagyrite in philosophy, and the rise of the vast and elaborate systems of medieval theology. The three chiefs of Scholasticism in this, its highest development, were Albertus Magnus (q. v.), Thomas Aquinas (q. v.), and Duns Scotus (q. v.); around each of whom stand groups of more or less independent scholars and followers. The celebrity of such teachers was largely increased by the want of books, which compelled their pupils to rely upon their oral communications, and necessitated those extraordinary public disputations which were the only means 'philosophers' had of advertising their wares in the middle ages. The honour paid to them by their admirers is visible in the epithets attached to their names; thus, Alanus is the *Doctor universalis;* Alexander Hales (q. v.), the *Doctor irrefragabilis;* Duns Scotus, the *Doctor subtilissimus;* Thomas Aquinas, the *Doctor angelicus;* Guillaume Durand of St Pourcain, the *Doctor resolutissimus*, &c.

With Thomas Aquinas and Duns Scotus, Scholasticism culminated. After their time, various causes co-operated to bring about its decline and fall. The mystical theology (see MYSTICISM) gradually developed its natural antagonism to speculations resting on a basis of formal logic, and not appealing to the human heart and spirit. Such men as St Bernard (q. v.) of Clairvaux, and the monks of St Victor at Paris, in the 12th c.; together with Bonaventura, in the 13th, were unconsciously hostile to the dominant style of thought: while in the 14th and 15th centuries, Tauler, Thomas à Kempis, Gerson, Nicholas of Clemangis, and others, deliberately set themselves against it. The very nature of the Scholastic thought was inimical to its own perpetuity. The hyper-logical, hair-splitting course which it followed produced rival systems, and results discordant with the doctrines of that theology which it undertook to support, until it finally laid down the astounding proposition, that a thing might be philosophically true and theologically false, and *vice versâ*. The quarrels of the two great orders—the Dominicans and the Franciscans—each of which took part with its metaphysical chief; the former being called Thomists (from Aquinas), and the latter, Scotists (from Duns Scotus), materially injured the common cause of Scholasticism; and the revival of Nominalism under William of Occam (q. v.), its most distinguished advocate, powerfully contributed to the same result; but it was not till after the revival of letters had done its work of enlightening the judgment and purifying the taste of Europe, that Scholasticism was visibly in danger. The Reformation shook the system to its foundations—Luther himself leading the assault with the strength and valour of a Cœur-de-Lion; but still, so tenaciously did it cling to the semblance of life, that in the universities it held its footing till the 17th c., and even later. In fact, in some Roman Catholic states, such as Spain, it is still almost the only kind of philosophy going. The two great intellectual reformers whose writings mark the transition from the medieval to the modern mode of thought, are Lord Bacon (q. v.) and Descartes (q. v.), who may be said to have administered the death-blow to Scholasticism. The literature of this phase of speculation is enormous, and few critics have ventured far into its cob-webbed regions. For example, the printed writings of Albertus Magnus, Thomas Aquinas, and Duns Scotus, amount to 51 folio volumes; but however glad we may be that the reign of Scholasticism is over, and however thankful to men like Laurentius Valla, Erasmus, Rudolf Agricola, and Ramus, who riddled its ancient and time-honoured flag with the sharp shot of their wit and logic, we ought never to forget, that in ages when the conditions of scientific knowledge or refined taste did not exist, these old monkish dialecticians kept alive the philosophical faculty in Europe by the vivacity and restless ingenuity with which they prosecuted their fantastic speculations.

SCHOMBURGK, SIR ROBERT HERMANN, a celebrated traveller, was born at Freiburg in Prussian Saxony, June 5, 1804. He began at an early age to apply himself to geographical science and natural history, and subsequently made an abortive attempt to succeed as a tobacco-manufacturer in Virginia, United States. In 1830, he went to Anegada, one of the Virgin Isles, and having, by the advice of the governor, carefully surveyed the island, and laid a report before the Royal Geographical Society, he was charged by that learned body with the survey of Guiana in 1835. This enterprise, which was surrounded with formidable difficulties, he satisfactorily achieved, and from time to time laid the results of his investigations before the Society, in whose *Journal* they were regularly published. It was during this exploration, and while he was ascending the Berbice River, that he discovered, January 1, 1837, the magnificent aquatic plant denominated the *Victoria regia* (q. v.). On his return to England in 1839, he was presented with the medal of the Geographical Society for his *Travels and Researches in British Guiana in* 1835—1839 (Lond.

1840), a work which largely contributed to almost every branch of natural science. In 1840, he returned to Guiana, this time under the auspices of the British government, to complete his survey of that country, and survey the boundary-line between it and Brazil; and on his return in 1844, after the completion of his labours, he received the honour of knighthood. The *Description of British Guiana*, a valuable work, was the fruit of this expedition. In 1847, he published an excellent and elaborate *History of Barbadoes*, and in the following year departed for San Domingo, whither he had been accredited as British consul and representative. In this new sphere, he continued to pursue his geographical and scientific researches, the results of which he communicated in Reports to the Geographical Society till 1853. In 1857, he was appointed British representative to the Siamese court at Bangkok. He died in 1865.

SCHÖNBEIN, CHRISTIAN FRIEDRICH, a German chemist, was born at Mitzingen in Würtemberg, 18th October, 1799, studied natural science at Tübingen and Erlangen, and in 1824—1825 taught chemical physics at Keilhau, near Rudolstadt. To increase his knowledge, he visited England in 1826, repairing thence to Paris; and in 1828 he was called to a chair in the vicinity of Basel, where his eminent qualifications were speedily recognised. In 1839 he discovered *Ozone* (q. v.), and invented *Gun-cotton* (q. v.) in 1845, obtaining from it by dissolution in ether the material called Collodion (q. v.). During his later years he confined himself chiefly to experiments with oxygen. Of his works, which generally first appeared in periodicals, the chief are—*Das Verhalten des Eisens zum Sauerstoff* (Basel, 1837), *Beiträge zur physikalischen Chemie* (Basel, 1844), *Ueber die Erzeugung des Ozons* (Basel, 1844), *Ueber die langsame und rasche Verbrennung der Körper in atmosphärischer Luft* (Basel, 1845). He died in September, 1868.

SCHÖNBRUNN, a royal palace in the outskirts of Vienna (q. v.), the summer residence of the imperial family.

SCHÖ'NEBECK, a manufacturing town of Prussia, ten miles south-east of Magdeburg, on the left bank of the Elbe. The chemical works, which give employment to from 250 to 300 men—the salt refineries, where the brine obtained from the abundant salt-springs is boiled down, and salt made to the annual value of 413,000 thalers—and the powder and paper mills, are the principal industrial establishments. Pop. (1868) 9273.

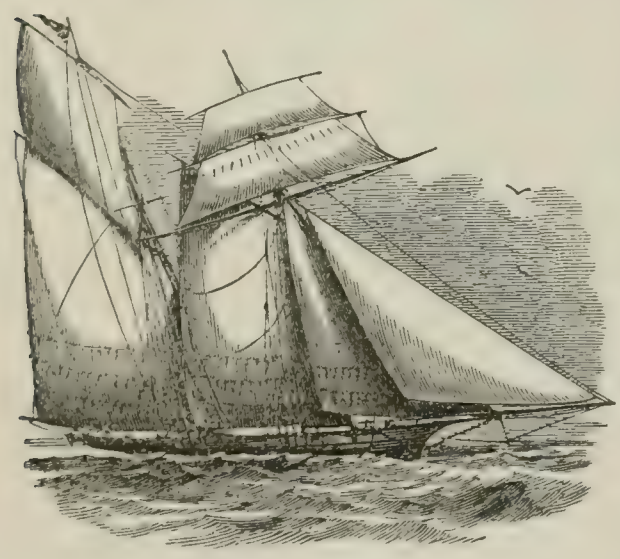
SCHOOLCRAFT, HENRY ROWE, American author, geologist, and ethnologist, was born at Watervliet (now Guilderland), New York, March 28, 1793. He entered Union College in his fifteenth year, and studied French, German, Hebrew, chemistry, and mineralogy. In 1817—1818, he visited the mining region west of the Mississippi, sent a collection of minerals and geological specimens to Washington, and wrote *A View of the Lead Mines of Missouri*, &c. (8vo, New York, 1819), and a narrative, since enlarged, entitled *Scenes and Adventures in the semi-alpine Region of the Ozark Mountains of Missouri and Arkansas* (8vo, Philadelphia, 1853). In 1820, he was appointed geologist of an exploring expedition to the Copper Regions of Lake Superior and the Upper Mississippi. He was afterwards secretary of a commission appointed to investigate Indian claims and negotiate treaties, at Chicago. As the result of these labours, he made a report to the government, and wrote also *Travels in the Central Portion of the Mississippi Valley* (8vo, New York, 1825). In 1822, he was appointed Indian agent for the north-western frontier, and established himself at Sault Ste Marie. In 1823, he married Miss Johnston, grand-daughter of an Indian chief, who had been educated in Europe. At this period, being in intimate relations with many Indian tribes, he devoted himself to the study of their history and ethnology. From 1828 to 1832, he was an active member of the legislature of Michigan Territory, and founded its Historical Society, and the Algic Society of Detroit. For his Lectures on the Indian Languages, he received the gold medal of the French Institute. Adding poetry to science, he wrote: *The Rise of the West; Geehale, an Indian Lament; Indian Melodies; The Man of Bronze, or Portraitures of Indian Character; Iosco, or the Vale of Norma;* also a grammar of the Algonquin language. In 1832, he was appointed to the command of an expedition which discovered the sources of the Mississippi, the *Narrative* of which was published (8vo, New York, 1834). As superintendent and disbursing agent for the Indians, he negotiated treaties by which the government acquired lands to the extent of 16,000,000 acres. He visited Europe in 1842, and the following year he made a tour, chiefly for the observation of Indian antiquities, in Western Virginia, Ohio, and Canada. In 1845, he collected the statistics of the Six Nations, and published *Notes on the Iroquois*, &c. (8vo, Albany, 1848). In 1847, the United States Congress authorised his publication of *Historical and Statistical Information concerning the History, Condition, and Prospects of the Indian Tribes of the United States, in six volumes quarto, with 336 Plates by Major Eastman and others* (Philadelphia, 1851—1857). He also published *Algic Researches; Thirty Years with the Indian Tribes of the North-western Frontier* (1853); *The Indian in his Wigwam; The Myth of Hiawatha*, &c. In 1847 he married his second wife, Miss Howard of South Carolina. He died in 1864.

SCHOOLMASTER, ARMY AND NAVY. In the army, the schoolmaster is a non-commissioned officer of the first class, ranking next to a sergeant-major. His pay varies with length of service, rising gradually from 2*s.* a day on appointment, to 6*s.* 6*d.* a day after long service. He has an advantage over other non-commissioned officers in quarters and certain allowances. To become an army schoolmaster, it is necessary either to be a certificated schoolmaster, or to have served the apprenticeship as a pupil-teacher, and to pass through a course of training for one year at the Royal Military Asylum, Chelsea. After the completion of the training, the candidate is required to enlist as a common soldier for ten years' general service, whereupon he is immediately promoted to the rank of schoolmaster. A few of the most deserving schoolmasters are promoted to be superintending schoolmasters, when they rank as ensigns, and have 8*s.* a day for pay. The duties of the schoolmaster are to teach the soldiers and their children the rudiments of general knowledge, to examine the girls' school, and to deliver lectures to the soldiers. There were, in 1865, 214 army schoolmasters, at a charge of £17,157.

In the navy, the schoolmaster is a chief petty officer, whose duties are analogous to those of the army schoolmaster, except that he has no pupils younger than the ship's boys. Among the subjects he teaches are the taking of solar and lunar observations, and the elements of navigation. His pay ranges from 2*s.* to 4*s.*

SCHOOLMISTRESS, ARMY, is a person attached to each regiment or corps for the purpose of instructing the daughters of soldiers and their sons under eight years old in the rudiments of English and in plain needlework. She must be a certified schoolmistress, or a pupil-teacher who

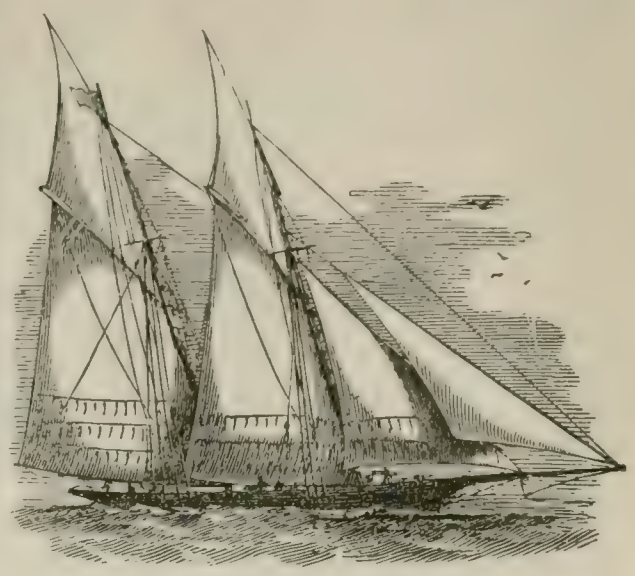
has served her apprenticeship. After admission to the service, she is specially trained for six months at one of four training institutions. This training is at the expense of government. The salary of a schoolmistress varies from £24 a year in the 3d class to £36 a year in the first class. Proper provision is made for the quarters and supplies of the schoolmistress, whose somewhat anomalous position among rough men calls for the most circumspect behaviour on her part. The annual charge (1865—1866) for army schoolmistresses amounted, for 169, to the sum of £4552.



SCHOOLS, Brothers of Christian, a religious congregation in the Roman Catholic Church, established for the religious and secular education of the poor. It originated in France in the end of the 17th c., and was organised by a charitable ecclesiastic, the Abbé de la Salle, canon of the church of Rheims. The members are all lay brothers, and are subject to one general head. Houses of the order are found in almost every country of Europe. In France, this congregation was one of those which were specially excepted from among the suppressed orders, and which were re-established in France by General Bonaparte in the concordat of 1801. It continues to flourish in that country, as also in Belgium, Italy, Southern Germany, Great Britain, and North America. The brethren are bound by the ordinary religious vows of poverty, chastity, and obedience. Their system of education has received the highest testimonies, and they still form one of the most flourishing of all the lay orders in the Roman Church, numbering, it is said, nearly 3000 members. Besides this order, which is of French origin, similar institutes have been formed under the same or analogous names in other countries, the several varieties of which it would be tedious to enumerate.—Sisters of the Christian Schools. Several congregations of women for the education of poor female children also exist in the Roman Catholic Church. A long catalogue of these, with the history of their origin, and their specific constitution, will be found in Wetser's *Kirchen-Lexicon*, vol. ix. pp. 782—784.

SCHOOLS, Public and Grammar. Under their respective heads, Gymnasiums, Elementary Schools, Evening Schools, Reformatory Schools, and Industrial Schools, have been treated of at sufficient length for the purposes of an encyclopædia. The list of educational institutions would, however, be incomplete were nothing to be said regarding the Public and Grammar schools of England. By the term 'public schools' are generally designated the ancient foundations of Winchester, Eton, Harrow, Westminster, Charter-house, Shrewsbury, St Paul's School, and Merchant Taylors'. But there exist more modern seminaries, which have been instituted chiefly on the model of these, such as Marlborough College, Cheltenham College, and Wellington College. Endowed Grammar Schools of old foundation exist in almost all the principal towns of England, and are frequented both by day pupils and boarders from the country. As almost all the independent and endowed grammar schools of England are taught by men whose notions of school discipline have been formed at one or other of the great public schools, these may fairly be added to those already enumerated as in point of fact Public schools. The course of instruction pursued, the methods of teaching, and the habits of life and of discipline, will be found to be substantially similar in all endowed middle schools, whether called Public or Grammar schools. A great number of these schools derive not only the *fixed* emoluments of the masters from old bequests, but also the means of boarding and educating a certain number of boys on the foundation. It was originally for these foundationers or collegians that a large proportion of the old schools were founded; but round them has grown up a large community composed of pupils from all parts of the British dominions, tutors, and keepers of boarding-houses. The foundationers consequently form simply the nucleus of these schools. The course of instruction is intended to prepare for the universities, and is consequently adapted to this purpose. Latin and Greek form the basis of the whole instruction; geography, ancient history, arithmetic, and mathematics being admitted to a very subordinate place in the curriculum. The school-time devoted to arithmetic and mathematics combined, for example, averages only about three hours a week. Except at Eton, it will be found that at least one modern language enters into the work of every school, that language being either French or German. There are, of course, tutors available at these educational seats for all usual branches of instruction, including music and drawing; but these subjects are alien to the proper work of the school, and do not affect the promotion of the pupils. At Rugby, the school course includes *both* French and German, and natural science is admitted as an alternative study with these. In the more modern institutions, such as Marlborough, Cheltenham, and Wellington Colleges, attempts have been made to provide a modern course of instruction, running parallel with the classical, for the benefit of those boys who either shew an inaptitude for classical studies, or who are not destined for the universities. That a sound education may be obtained by means of science and modern languages, cannot be questioned; but its value, as compared with classical discipline, even for those who do not contemplate a university course, or one of the learned professions, is still an open question. If, however, it be the case that there is a natural inaptitude in some boys for linguistic discipline, who *yet* possess capacity for scientific study or the acquisition of a modern language, we are driven to the conclusion, that such a course of study ought to be provided for this portion of the youth of Great Britain. Whether it ought to be provided at the existing grammar and public schools, is a subject at present keenly debated, but must be ultimately very much a question of finance. In Germany, many of the gymnasiums provide a course of modern or *real* study, and this, combined with the wide diffusion of model schools, under the name of *Real-schulen*, meets all the reasonable wants of that portion of the middle class which does not contemplate a professional life. In France, the *Lycées* provide an ancient and modern course, running parallel with each other, for all pupils above a certain age. Up to that age, all are taught the same subjects. In Scotland, the number of middle schools in important towns, either established by private enterprise or by some ancient statute, renders it unnecessary for boys to seek away from their homes the preparation necessary for either the Scottish universities or commercial life.

In 1870 the parliament of Great Britain passed an 'Elementary Education' act, by which school districts are to be established and provided with sufficient public schools; school-boards appointed and empowered to pay the fees due for any child whose parents are too poor to pay therefor, thus giving a free education to the poorest subject. See *Report of the Commissioner of Education for* 1870, by John Eaton, jr. (Washington, 1870); *Report on Education*, by J. W. Hoyt, United States Commissioner to Paris Exhibition (Washington, 1870); Normal Schools; National Education.



SCHOOLS, Regimental, in the British army, comprise the school for adults and boys above eight years of age, under the Schoolmaster (q. v.), and the infant and industrial schools under the Schoolmistress (q. v.), for girls and little boys. In the first, plain subjects are taught to soldiers who voluntarily attend, or to soldiers' children. The education is wholly secular: the only theological teaching being exposition of a portion of Scripture during the first half-hour of morning school; but even at this, attendance is at the option of the parents. The infant school is conducted on similar principles. The industrial school is to fit girls for the occupations of life, and to render them capable of entering domestic service; a grant of money is made by government for the provision of materials. There is a school of each sort in every battalion of infantry or regiment of cavalry, the total cost of which amounts for 1865 to £30,131. Adult soldiers are admitted gratuitously; for children, there is a nominal charge of 1*d.* each a month. The orphans of soldiers and the children of soldiers serving abroad are received at any neighbouring school without payment; those of pensioners, contractors, &c. at 3*d.* a month; and the children of officers at 5*s.* a month. It is forbidden that any difference should be made in the schools in the treatment of these different classes of pupils.

SCHOONER is a swift, sharply-built vessel, carrying usually two masts, though occasionally a greater number, and commonly is of small size. There are two classes of schooners—the 'fore-and-aft schooner,' or schooner proper, and the 'topsail schooner.' In the former, both foremast and mainmast are rigged like the mainmast of a cutter, with fore-and-aft sails. In the latter, the foremast carries a square topsail and a square topgallant-sail. Off a

Topsail Schooner.

wind, the former rig has a great advantage, as the schooner can sail up within 4½ or even 4 points of the wind; but before the wind, the square topsail gives the advantage to the topsail schooner; and as the latter can on occasion strike her squaresails, and set a fore-and-aft topsail in their place, she has usually the preference. No sailing-vessel is faster than a schooner of fine build, when she carries ample canvas; hence it is a favourite form for the larger class of yachts; and before the introduction of steam dispatch-vessels, was employed much in the packet service. Schooners are still employed in the navy as revenue cruisers; and to a great extent in the merchant service, for running small cargoes, and especially those of perishable goods, as fish or fresh fruit. They are easily managed by a

Fore-and-aft Rigged Schooner.

small crew; but from the sharpness of their build, have no great amount of stowage.

SCHOPENHAUER, Arthur, a German philosopher, son of Johanna Schopenhauer, an authoress of considerable distinction (born 1770, died 1838), was born at Danzig, 22d February 1788. He studied first at Göttingen, where the lectures of Schulze inspired him with a love of philosophy, and afterwards at Berlin and Jena, in the last of which places he graduated in 1813. During the same year, he published his first treatise, *Ueber die vierfache Wurzel des Satzes vom zureichenden Grunde* (Rudolst. 1813, 2d ed. Frankf. 1847), in which he lays down the logical basis of his future system. S. spent the winter of 1813 at Weimar, where he enjoyed the society of Goethe, and the orientalist Friedr. Maier, who first turned his attention to the ancient Indian literature and philosophy, the study of which exercised a great influence on his future development. He then proceeded to Dresden, where he published a treatise on Sight and Colour (*Ueber das Sehen und die Farben*, Leip. 1816), which was followed, three years later, by his great work, *Die Welt als Wille und Vorstellung* (The World considered as Will and Idea, Leip. 1819; 2d ed. 1844). After 1820, S. lived partly in Italy and partly in Berlin, up till 1831, when he fixed himself in Frankfurt-on-the-Maine, devoting himself uninterruptedly to the elaboration of his system. The fruits of his studies were *Ueber den Willen in der Natur* (Frankf. 1836); *Ueber die Freiheit des Willens*, *Ueber das Fundament der Moral*, the supplements to his principal work, which appear in the 2d edition of 1844; and *Parerga und Paralipomena* (Berl. 1851). He died September 21, 1860. The fundamental doctrine of S. is, that the only essential reality in the universe is will; that what are called appearances exist only in our subjective representations, and are merely forms under which single original will shews itself. This will is not necessarily accompanied by self-consciousness, though it ever strives after its attainment, and hence S. declared himself the uncompromising opponent of all the contemporary systems—those of Fichte, Schelling, and Hegel—in which the 'Absolute Reason,' 'Consciousness,' &c., are posited as the necessary basis of thought. For his great rivals, S. professed the most unmeasured scorn—calling Hegel, for example, a mere 'scribbler of nonsense'—and in return was treated by them with such

sovereign contempt, that for years his name was almost unknown to the majority of German students. His theories of ethics and æsthetics also rest on peculiar and not very intelligible grounds. The best account of S.'s philosophy is to be found in Frauenstädt's *Briefe über die Schopenhauersche Philosophie* (Leip. 1854).

SCHORL. See TOURMALINE.

SCHORL ROCK is a granitoid rock, in which the mica is replaced by schorl or tourmaline. Some specimens occur in which the felspar is also absent, and the mass is composed entirely of quartz and schorl. Schorl rocks are rare, occurring probably only as small bosses in granite.

SCHOTTI'SCHE (Ger. *Scottish*) a somewhat fanciful name given to a slow modern dance in $\frac{2}{4}$ time.

SCHOUW'EN (frequently also called LAND-VAN-ZIERIKZEE), an insular portion of the province of Zeeland (q. v.), bounded on the S. by the Scheldt, on the N. by the most southern branch of the Maas, and on the W. by the North Sea. Area, 60 sq. m.; pop. 15,600. The surface is low, and the island is protected on both sides by dykes. Agriculture is the chief employment of the inhabitants; the soil is fertile, and the principal crops are grain, oil-seeds, and flax. Seafowl in immense flocks breed on the south side of the island, and the sale of their eggs is an important item in the trade of Zierikzee (pop. 7800), which is the principal town.

SCHREVELIUS, CORNELIUS, a Dutch scholar, whose name was once better known than it is now, was born at Haarlem in 1615, and educated mainly by his father. In 1642, he succeeded his father as rector of the university of Leyden, and died 11th September 1664. S. was a laborious and erudite man, but possessed little critical discernment. His most notable performance was a *Lexicon Manuale, Græco-Latinum et Latino-Græcum* (Leyden, 1654, 1657, 1664), of which there have been innumerable editions. It was long extensively used as a text-book in English schools, and in the absence of anything better, deserved perhaps the respect which it obtained; but otherwise it cannot be pronounced a good dictionary. It is not at all exhaustive of the words in the Greek language; it does not sufficiently explain their different meanings, and its etymologies are often erroneous and inept. S. also executed many *variorum* editions of the classics, Juvenal (1648), Hesiod (1650), Terence (1651), Virgil (1652), Horace (1653), Homer (1656), Martial (1656), Lucan (1658), Quintus Curtius (1658), Justin (1659), Cicero (1661), Ovid (1662), and Claudian (1665). These editions are remarkable for their correctness, and for the excellence of the paper and typography, but the notes are deficient both in taste and acumen.

SCHUBERT, FRANZ, a German musical composer, who was born at Vienna in 1807, and died at the early age of 25. During his lifetime, his works attracted little notice, but they acquired a high and deserved reputation after his death, and have gained for their composer a large share of posthumous fame. His songs and ballads are hardly to be surpassed for masterly construction and richness of fancy, while they are full of simple, ornate, and expressive melody. S. also composed several operas, symphonies, sonatas, and other larger works.

SCHUMANN, ROBERT, a modern German musical composer of considerable note. He was born at Zwickau, in Saxony, in 1815, and studied chiefly at Leipzig. He is looked on in Germany as one of the founders of a new musical school, of which the other principal exponent is Richard Wagner. This school has undertaken to say what the 'music of the future,' or as some of the school express it, 'work of art of the future,' is to be. Whatever may be said as to S.'s relation to the future, his influence on the music of the present day has been very considerable. English musicians have, however, hesitated to agree with his countrymen in placing him on an equally exalted pinnacle with Beethoven. His compositions evince deep study of Sebastian Bach, as well as a large share of individuality, freshness, and scientific knowledge. They continually surprise us by startling modulations, and the frequent interruptions in the time impart to them an air of eccentricity. S.'s works comprise several symphonies, a cantata called *Paradise and the Peri*, and a number of small pieces, which have obtained more favour in this country than his larger compositions. S. married Mademoiselle Clara Wieck, one of the most celebrated of living pianists, and died in 1856.

SCHUY'LKILL, a river of Pennsylvania, U. S., which rises in the carboniferous highlands of the eastern centre of the state, and flowing 120 miles south-east, empties into the river Delaware 5 miles below Philadelphia.

SCHWANTHALER, LUDWIG MICHAEL, a celebrated German sculptor, was born in 1802 at Munich, where his father, Franz Schwanthaler, practised the same art. Young S. entered his father's workshop at the age of 16; and on the death of the latter in 1821, he undertook to carry on his father's business. His first important commissions were received in 1824 from King Maximilian. After a brief residence in Rome, he set up a studio of his own at Munich, and shortly after executed for the *Glyptothek* there two fine bas-reliefs from Homer: 'Achilles struggling in the Scamander,' and the 'Battle by the Ships,' besides a statue of Shakspeare for the saloon of the theatre, and the Bacchus-frieze for the Banqueting-hall in the palace of Duke Maximilian. In 1832, he revisited Rome, for the purpose of preparing models for that portion of the national monument of Valhalla intrusted to his supervision. He remained two years. On his return to Munich, he began his bas-reliefs to illustrate Pindar's *Epinikia* (Triumphal Odes) and the myth of Aphrodite, the latter of which is a frieze. In 1835, he was appointed professor at the Munich Academy. Henceforth, the interest of his career is mainly professional; but the number of his works is singularly great, while their excellence is such as to place him in the first rank of German sculptors. His distinguishing characteristics are a thorough originality of design, and boldness of imagination; while the extraordinary extent of his acquaintance with the sculpture of Greece and of the Middle Ages gave a great richness and variety to his execution of details. Among his works may be mentioned 24 statuettes in the *Pinakothek* at Munich; the great bas-relief frieze (in the Barbarossa Hall), more than 200 feet long; the models for the 12 statues of the Ancestors of the House of Wittelsbach, the 15 colossal statues for the front pediment of the Valhalla, the models of the 15 statues of the 'Battle of Arminius' for the northern end of the same structure, and the model of the colossal statue of Bavaria, 54 feet high; a marble statue of the Emperor Rudolf for the cathedral of Spires, models for the statues of Goethe and Jean Paul Richter, a statue of Mozart, marble groups of Ceres and Proserpina (at Berlin), &c., besides numerous other works executed by his pupils from his designs and suggestions. He died in 1848.

SCHWARZ, CHRISTIAN FRIEDRICH, a distinguished German missionary, was born at Sonnenburg, in Brandenburg, October 26, 1726. He studied at Halle, and having resolved to become a

missionary in the East Indies, obtained ordination at Copenhagen, with the view of joining the Danish mission at Tranquebar, where he arrived in 1750. His career is a beautiful example of what may be accomplished when piety, integrity, good sense, and a charity that knows how to prevent the virtue of zeal from lapsing into the vice of fanaticism, unite harmoniously in a man. After labouring 15 years at Tranquebar, he went to Trichinopoly, where he founded a church and school, and also acted as chaplain to the garrison. Here the fruits of his long and consistent career of pious activity gradually began to shew themselves in considerable conversions from Hinduism. In 1777, another missionary was sent to his assistance; and by the permission of the Rajah of Tanjore, whose friendship he had acquired, he built a church in that city. So highly did the native rulers admire his integrity, that once, when Hyder Ali, of Mysore, was arranging terms of peace with the Madras government, he demanded that S. should act as their agent—'him, and no other one,' said the Sultan, 'will I receive and trust.' On this occasion, S. resided three months at Seringapatam. During the terrible Carnatic war which soon after followed (1781—1783), and for which S. thought the British were to blame, a striking testimony was given of that universal respect entertained for his character. The inhabitants and garrison of Tanjore were dying of starvation, and neither the British nor the Rajah could induce the cultivators to sell them provisions. In despair, S. was appealed to, and when he gave his word that payment should be made, the farmers believed him, and sent the requisite supplies. On the death of the Rajah of Tanjore in 1787, S. was appointed tutor and guardian of his young son, Maha Sarboji, who turned out, under S.'s care, one of the most accomplished sovereigns in or out of India. S. died February 13, 1798.

SCHWARZBURG, House of, one of the oldest German families, founded about the middle of the 12th c., by Sizzo, Count of Schwarzburg and Käsernburg. The two sons of Sizzo were Heinrich, who succeeded his father as Count of Schwarzburg, and Günther, who became Count of Käsernburg. The former, dying childless in 1184, his possessions went to his brother, who left two sons, Günther, who continued the family of the Counts of Käsernburg, and Heinrich, from whom sprung the Counts of Schwarzburg. In 1349, Günther XXI., the younger son of Heinrich XII., was elected Emperor of Germany, but he died within the year of his election. Count Günther XL. of Schwarzburg and Arnstadt, who introduced (1541) the reformation into his states, was the common ancestor of the two existing lines of the Schwarzburg family; his son, Johann Günther, founding the line of Schwarzburg-Sondershausen (q. v.), and Albert, that of Schwarzburg-Rudolstadt (q. v.).

SCHWA'RZBURG-RU'DOLSTADT, a German principality, bounded on the E. by Weimar, Altenburg, and Meiningen, with a detached part, 30 miles to the north, in Prussian Saxony. Area, 367 sq. m.; pop. (December 1867) 75,074, of whom 74,907 were Lutherans. It consists of the Upper Lordship (*Rudolstadt*, 282 sq. m.) and the Lower Lordship (*Frankenhausen*, 85 sq. m.). The Schwarza, Ilm, and Saale water the surface, which is for the most part covered with spurs of the Thuringer-wald. The ordinary crops are raised, and timber, salt, and metals are the principal products. The principality contains many spots distinguished for beautiful scenery; and besides the vale of the Schwarza, the convent-ruins of Paulenzelle, and the remains of the castle of Kyffhausen, attract many visitors. S. had one vote in the *plenum*, and a portion of the 15th vote in the *curies*. Schwarzburg-Rudolstadt was a state of the North German Confederation, and now (1871) of the German empire.

SCHWA'RZBURG-SO'NDERSHAUSEN, a principality and state of the German empire, is, with the exception of two small detached portions, surrounded by Prussian Saxony. Area, 324 sq. m.; pop. (Dec., 1867) 67,533. It consists of a Lower Lordship (*Sondershausen*, 187 sq. m.) and an Upper Lordship (*Arnstadt*, 137 sq. m.). The former of these, watered by the Helbe and Wipper, is fertile and agricultural; while the latter is mountainous, and is the seat of active manufactures. S. possessed a vote in the *plenum*, and a part of the 15th vote in the *curies*. This principality contributed a contingent of 826 men to the old German Confederation.

SCHWARZENBERG, a princely family of Germany, dates from 1420, when *Erkinger von Seinsheim* purchased the lordship of S. in Franconia, and was raised (1429) by the Emperor Sigismund to the dignity of Baron of the Empire. Two of this family have acquired a European reputation: the first, Adam, Count of S., who was born in 1587, and became prime-minister and adviser of Georg-Wilhelm, Elector of Brandenburg. He was all-powerful during the Thirty Years' War, and brought down terrible calamities on Brandenburg by his obstinate adherence to the alliance with Austria against the Protestant league, for which he was punished after the accession of the 'Great Elector,' in 1640, by being despoiled of his power, and imprisoned in the fortress of Spandau, where he died 17th March 1641. The other, Karl Philipp, Prince of S., was born at Vienna, 15th April 1771, first served against the Turks, and had risen to the grade of lieutenant field-marshal in 1799, at which date he raised a regiment of Hulans at his own cost. He was under the orders of Mack in the campaign of 1805, and commanded a division at Ulm; but when he saw that the battle was lost, he cut his way through the French army, and retired with his regiments to Eger, afterwards taking part in the great battle of Austerlitz. He was ambassador at the Russian court in 1808, by the express wish of the Emperor Alexander; fought at Wagram in 1809; and after the treaty of Vienna, conducted the negotiations preliminary to the matrimonial connection of Napoleon with the Hapsburg family; and both in this capacity and as ambassador at Paris, so gained the esteem of Napoleon, that the latter expressly demanded for him the post of general-in-chief of the Austrian contingent of 30,000 men which had been sent to aid France against Russia in 1812. S. with his little army entered Russia from Galicia, passed the Bug, and achieved some slight successes, but was afterwards driven into the 'duchy of Warsaw' (see Poland), and took up a position at Pultusk, where he concluded with the Russians an armistice which secured the French retreat. S. was much blamed for his dilatory conduct at the time; and his tardiness, ascribed by the French historians to secret instructions from his own government, has since been much animadverted upon by them; but nevertheless Napoleon concealed any dissatisfaction he might have felt, and demanded (1813) for him from the Austrian government the baton of field-marshal. After a brief sojourn at Paris, S. was appointed to the command of the Austrian army of observation in Bohemia; and when Austria joined the allied powers, he became generalissimo of the armies of the coalition; gained the victory of Leipzig (q. v.), and introduced a cautious system of tactics, which insured a progressive hemming-in of the French, and in spite of their occasional successes, completely wore them out. On the return of Napoleon from

Elba, he obtained the command of the allied army on the Upper Rhine, and a second time entered France. On his return to Vienna, he was made president of the imperial council for war, received an extensive grant of lands in Hungary, and was allowed to engrave the imperial arms of Austria on his escutcheon. He died of apoplexy at Leipzig, 15th October 1820.—His nephew, FELIX LUDWIG JOHANN FRIEDRICH, born October 2, 1800, distinguished himself in the Italian campaign of 1848, was placed at the head of affairs at Vienna, called in the aid of the Russians against Hungary, and pursued a bold policy in Germany. He died at Vienna, April 5, 1852.

SCHWEDT, a handsome town of Prussia, in the province of Brandenburg, on the Oder, 31 miles south-south-west of Stettin. Weaving, brewing, the manufacture of starch and of tobacco, which is here extensively grown and sold, are the principal branches of industry. Pop. (1868) 9039.

SCHWEI'DNITZ, a charmingly situated town of Prussian Silesia, on the left bank of the Weistritz, 42 miles south-east of Liegnitz, and about the same distance south-west of Breslau by railway. It is in part fortified. Linen and woollen goods, leather, tobacco, and starch are manufactured; and the fairs for corn, cattle, and yarn are much frequented. S. was besieged and taken four times within 50 years, the last time by the French in 1807, when the defences were in great part destroyed. Pop. (1868) 15,768.

SCHWEI'NFURT, an ancient, and long an imperial free city, the *Trajectus Suevorum* of the Romans, now a town of Bavaria, in Lower Franconia, on the Main, 29 miles north-east of Wurzburg by railway. It contains a beautiful market-place, in which important cattle and wool markets are held. Wine-culture, sugar-refining, and manufactures of chemicals and dyeing materials, as white-lead, ultramarine, Schweinfurt Green, &c., are carried on. See GREEN. Pop. 9748.

SCHWE'RIN, capital of the grand duchy of Mecklenburg-Schwerin, is agreeably situated on the west shore of the Schweriner See. The Schweriner See, or Lake of Schwerin, is 14 miles in length, and 3 miles broad, and abounds in fish. S. is divided into the old town, the new town, and the suburb, is well built, and contains a Gothic cathedral, one of the finest edifices of the kind in Northern Germany, begun in 1248, and finished in the 15th century. The ducal castle, occupying the site of the former castle, erected by Wallenstein, stands on a small island. Little trade is carried on. Pop. (1867) 25,053.

SCHWYZ, one of the mountain cantons in the middle of Switzerland, is bounded on the N. by the canton of St Gall and the canton and Lake of Zürich, and on the S. by the canton of Uri and the Lake of Lucerne. Area, 353 sq. m.; pop. (December 1860), 45,039, of whom 44,509 are Catholics. The whole surface is covered with mountains, except small tracts in the south-west and north-east; but there are no glaciers nor any everlasting snow except on the Rieselstock, 8890 feet high, on the east frontier. The canton comprises a third part of Lake Zug, the most northern angle of the Lake of the Four Cantons, the whole of the mountain-mass of the Righi (q. v.), the plain in which lies the small Lake Lowerz, and the valleys of the Muotta, Sihl, and Aa, which are the principal rivers. Cattle-breeding is the employment of almost the whole of the inhabitants, and the number of cattle is estimated at about 20,000. Only about one-thirtieth of the whole area is cultivable; fruits and wine are cultivated to some extent; and cattle, cheese, and timber are exported. Such woven fabrics as are required for home use are almost the only manufactures.

S., one of the three original cantons, and also one of the Four Forest Cantons, has supplied the name to the whole country of which it forms a part. The government is a pure democracy.—SCHWYZ, the capital, is a small town, containing a beautiful parish church, and most picturesquely situated 17 miles east of Lucerne.

SCIA'CCA (anc. *Thermæ Selunticæ*), a city of Sicily, in the province, and 30 miles west-north-west of the city of Girgenti, stands on the slope of a hill, the foot of which is bathed by the sea, and is defended by the castle of Luna. It is surrounded by old walls, and has a fine cathedral. Outside the walls are the hot springs; and upon a neighbouring height, there are the so-called *Stufe di St Calogero*. There is a well, at the bottom of which a subterranean noise is heard resembling that of a torrent of rain or of a cascade. The baths are frequented by invalids, and have several grottoes with seats hollowed out in the rock for the accommodation of the bathers. Pop. 13,690.

S. is a seaport well adapted for the exportation of grain, and has many store-houses. It was the birthplace of Agathocles, tyrant of Syracuse, and of Fazelli the historian.

SCIÆ'NIDÆ, a family of acanthopterous fishes, somewhat resembling perches; having a compressed body; a simple or double dorsal fin, the first part spiny; the gill-covers variously armed; the head generally inflated, and its bones cavernous; the scales ctenoid, and in general obliquely ranged. The air-bladder is often furnished with branching appendages. The S. are divided into many genera, and widely distributed. Most of them are marine, but a few inhabit fresh water. Only two species are reckoned as British, the Maigre (q. v.) and the Bearded Umbrina (q. v.), both excellent for the table, as are many others of the family. The power of emitting sounds which belongs to the maigre is possessed also by others of the family in a remarkable degree. Among these are species of *Pogonias*, as *P. chromis*, which inhabits the coasts of the U. States, &c., and is known, as are others of the family, by the name DRUMFISH, because the sound which it emits resembles that of a drum. It attains a large size, and its flesh is very good, but the tail is often infested with *Filariæ*. In vessels anchored on the coasts which it inhabits, sleep is sometimes almost impossible from the continual drumming carried on all night, accompanied with a tremulous motion of the vessel. How the sound is produced, is not well known.

SCIA'TICA is the term given to neuralgia of the great sciatic nerve. See NERVOUS SYSTEM. It has been shewn by Graves to be a frequent complication of gout; but rheumatism, or, perhaps, rather the exposure to cold and wet which so often sets up rheumatism, is its most common cause. It is one of the most obstinate forms of neuralgia. It is characterised by irregular pains about the hip, especially between the great trochanter of the thigh-bone and the bony process on which the body rests when sitting, spreading into neighbouring parts, and running down the back of the thigh to the leg and foot; or the pains may occupy only isolated parts, as the knee-joint, the calf of the leg, or the sole of the foot. The treatment is the same as that of neuralgia generally, except when the disease is merely a complication of gout, in which case the primary disease must be attacked as well as the sciatica.

SCIATI'C STAY (possibly a corruption of *Asiatic*), in merchant-vessels, is a strong rope

fastened between the main and foremast heads. When loading or unloading, a travelling tackle is suspended to it, which can be brought over the fore or main-hatchway as occasion demands.

SCIENCES, the name for such portions of human knowledge as have been more or less generalised, systematised, and verified. Generality as opposed to mere particulars, system as opposed to random arrangement, and verification as opposed to looseness of assumption, concur in that superior kind of knowledge dignified by the title in question. Geography, Chemistry, and Political Economy are now sciences. The first has been so for many ages, although greatly advanced in recent times; the two last, scarcely more than a century. Chemical facts and maxims of political economy had been known from a much earlier date, but they did not in either case amount to science; the generalities were few or bad, system and certainty were both wanting. In the different branches of Natural History—Mineralogy, Botany, Zoology—there had been a large store of accumulated facts before any one branch could be called a science. The *quality* of the knowledge is of more consequence than the quantity.

The term *Philosophy* (q. v.) is to a certain extent, but not altogether, coincident with science, being applied to the early efforts and strainings after the explanation of the universe, that preceded exact science in any department. Both names denote the pursuit of knowledge as knowledge, or for intellectual satisfaction, in contrast to the search that is limited to immediate practice or utility.

The sciences have been variously classified, and the principles of their classification have been a subject of discussion. We shall here describe the mode of classifying them in accordance with present usage, and with the principles most generally agreed upon.

It is convenient to prepare the way by distinguishing between Theoretical Sciences, which are the sciences properly so called, and Practical Sciences. A Theoretical Science embraces a distinct department of nature, and is so arranged as to give, in the most compact form, the entire body of ascertained (scientific) knowledge in that department: such are Mathematics, Chemistry, Physiology, Zoology. A Practical Science is the application of scientifically obtained facts and laws in one or more departments to some practical *end*, which end rules the selection and arrangement of the whole; as, for example, Navigation, Engineering, Mining, Medicine. Navigation selects from the Theoretical Sciences—Mathematics, Astronomy, Optics, Meteorology, &c.—whatever is available for guiding a ship on the seas, and converts the knowledge into rules or prescriptions for that purpose. The arts that can thus draw upon the exact sciences are by so much the more certain in their operation; they are the scientific arts.

Another distinction must be made before laying down the systematic order of the Theoretical Sciences. A certain number of these sciences have for their subject-matter each a separate department of natural forces or powers; thus, Biology deals with the department of Organised Beings, Psychology with Mind. Others deal with the application of powers elsewhere recognised to some region of concrete facts or phenomena. Thus, Geology does not discuss any natural powers not found in other sciences, but seeks to apply the laws of Physics, Chemistry, and Biology to account for the appearances of the earth's crust. The sciences that embrace peculiar natural powers are called Abstract, General, or Fundamental Sciences; those that apply the powers treated of under these to regions of concrete phenomena are called Concrete, Derived, or Applied Sciences.

The Abstract or Theoretical Sciences, as most commonly recognised, are these six: Mathematics, Physics, Chemistry, Biology (Vegetable and Animal Physiology), Psychology (mind), Sociology (society). The Concrete Sciences are the Natural History Group—Meteorology, Mineralogy, Botany, Zoology, Geology, also Geography, and we might, with some explanations, add Astronomy. The Abstract or Fundamental Sciences have a definite sequence, determining the proper order for the learner, and also the order of their arriving at perfection. We proceed from the simple to the complex, from the independent to the dependent. Thus, MATHEMATICS relates to *Quantity*, the most pervading, simple, fundamental, and independent attribute of the universe. The consideration of this attribute has therefore a natural priority; its laws underlie all other laws. As Mathematics is at present understood, it has an Abstract department, which treats of quantity in its most general form, or as applied to nothing in particular—including Arithmetic, Algebra, and the Calculus—and a Concrete or Applied department—viz., *Geometry*, or Quantity in Space or Extension. It has been suggested that General Mechanics, or the estimation of Quantity in *Force*, should be considered a second Concrete department. But usually Mechanics ranks with the next Fundamental Science in order, called Physics.

NATURAL PHILOSOPHY has long been considered the name of a distinct department of science: the designation PHYSICS is now more common. This science succeeds Mathematics, and precedes Chemistry. Of all the fundamental sciences, it has the least unity, being an aggregate of subjects with more or less connection. Mechanics, Hydrostatics, Hydraulics, Pneumatics, Acoustics, Astronomy, are all closely related; they represent the phenomenon of movement in *mass*, as applied to all the three states of matter, Solid, Liquid, and Gas. The remaining subjects—Heat, Light, and Electricity—together with the attractions and repulsions that determine Cohesion, Crystallisation, &c., are described as relating to movement in the *molecule*. We have thus Molar Physics and Molecular Physics; and the tendency is now to treat the two separately.

CHEMISTRY lies between Physics and Biology, reposing upon the one, and supporting the other. It assumes all the physical laws, both molar and molecular, as known, and proceeds to consider the special phenomenon of the composition and decomposition of bodies considered as taking place in definite proportions, and leading to change of properties. The composition of a cup of tea from water, sugar, milk, and infusion of tea-leaf, is physical; the composition of marble from oxygen, carbon, and calcium, is chemical. In the one case, the properties of the separate ingredients are still discernible: in the other, these are merged and untraceable.

BIOLOGY, or the science of living organisation, involves mathematical, physical, and chemical laws, in company with certain others, called vital. It is most usually expounded under the designations Vegetable and Animal Physiology; and in the Concrete departments Botany, Zoology, and Anthropology.

PSYCHOLOGY, or the Science of MIND, makes a wide transition, the widest that can be taken within the whole circle of the sciences, from the so-called material world, to the world of Feeling, Volition, and Intellect. The main source of our knowledge of mind is self-consciousness; and it is only from

the intimate connection of mind with a living organism, that the subject is a proper sequel to Biology. Not until lately has any insight into mind been obtained through the consideration of the physical organ—the brain; so that Psychology might have been placed anywhere, but for another consideration that helps to determine the order of the sciences—viz., that the *discipline*, or method, of the simpler sciences is a preparation for the more abstruse. Mathematics and Physics especially are an admirable training of the intellect for the studies connected with mind proper, although the laws of Physics may not of themselves throw any direct light on the successions of thought and feeling.

These five sciences embrace all the fundamental laws of the world, and, if perfect, their application would suffice to account for the whole course of nature. To a person fully versed in them, no phenomenon of the explained universe can appear strange; the Concrete sciences and the Practical sciences contain nothing fundamentally new. They constitute a liberal scientific education. It is not uncommon, however, to rank SOCIOLOGY, or the Laws of Man in Society, as a sixth primary science following on Psychology, of which it is a special development.

Dr Neil Arnott, in his work on *Physics*, first published in 1828, gave as the primary departments of Nature—Physics, Chemistry, Life, and Mind (under which he would include the Laws of Society). He did not discard Mathematics, but looked upon it as a system of technical mensuration, created by the mind to facilitate the study of the other sciences, as well as the useful arts. The natural laws expressed by Mathematics are few and simple, and the body of the science consists of a vast scheme of numerical computation, whose value appears in its applications to Astronomy and the other physical sciences.

Auguste Comte, who, in his *Cours de Philosophie Positive*, went over the entire circle of the Theoretical, Abstract, or Fundamental sciences, enumerated these as follows: Mathematics, Astronomy, Physics, Chemistry, Biology, Sociology. He thus detaches Astronomy from Physics, considering it as the abstract science that brings forward and works out the Law of Gravitation. He has no distinct science of Psychology, an omission that has been generally condemned.

Mr Herbert Spencer, in a tract on the *Classification of the Sciences*, takes exception to the scheme of Comte, and proposes a threefold division, according to the gradations of Concreteness in the subject-matter. The first group is termed ABSTRACT SCIENCE, and treats of the *forms* of phenomena detached from their embodiments. The most comprehensive forms are Space and Time; and the sciences corresponding are Mathematics and Logic. The second group is ABSTRACT-CONCRETE SCIENCE, or the phenomena of nature analysed into their separate elements—Gravity in the abstract, Heat in the abstract—as in Physics and Chemistry. These are two of the fundamental sciences in every scheme, and they are called Abstract-Concrete by Mr Spencer, in comparison with the foregoing class. The great principle, of recent introduction, termed the Law of Correlation, Conservation, or Persistence of Force, serves to connect Physics with Chemistry, and imparts to the two taken jointly a greater unity than belongs to Physics singly. The third and last group is CONCRETE SCIENCE, or natural phenomena in their totalities, or as united in actual things—Astronomy, Biology, Psychology, Sociology, Geology, &c. Mr John Stuart Mill, in an article in the *Westminster Review*, April 1865, has described Comte's scheme at length, and also criticised that of Spencer.

It may be held as generally admitted that Mathematics, Physics, Chemistry, Biology, and Psychology, with or without Sociology, are the sequence of the primary or fundamental sciences, and that the Natural History group, from not containing any new laws of nature, are not fundamental. Astronomy, or the laws of the solar system, and of the other celestial bodies, might be called a Natural History or Concrete science, if we supposed a prior abstract science that discussed the operation of gravity, together with the laws of motion in bodies generally, or without special application to the existing solar and sidereal systems. The first book of Newton's *Principia* would be the Abstract, the third book the Concrete, form of the science.

The Practical Sciences do not admit of any regular classification. They are as numerous as the separate ends of human life that can receive aid from science, or from knowledge scientifically constituted. Connected with Mind and Society, we have Ethics, Logic, Rhetoric, Grammar, Philology, Education, Law, Jurisprudence, Politics, Political Economy, &c. In the manual and mechanical arts, there are Navigation, Practical Mechanics, Engineering Civil and Military, Mining and Metallurgy, Chemistry applied to Dyeing, Bleaching, &c.

The medical department contains Medicine, Surgery, Midwifery, Materia Medica, Medical Jurisprudence. A science of Living, or of the production of Happiness by a skilled application of all existing resources, was greatly desiderated by Plato, and would be the crowning practical science.

SCI'LLA. See SQUILL.

SCI'LLY ISLANDS. These islands, situated a little west of 6° W. long., and about 50° N. lat., are the most southern parts of the United Kingdom of Great Britain, if we except the Channel Islands. The group consists of about 40, comprising a circuit of about 30 miles; and their general denomination is derived from a very small island, about an acre in extent, and almost inaccessible, called Scilly, probably from its position near dangerous rocks, similar to that of Scylla near Sicily. By the ancients, these islands

Scilly Islands.

were named Cassiterides, Hesperides, and Silurie Insulæ. It would seem that the term Cassiterides, or 'Tin Islands,' under which they were known to the Greeks and Romans, was once applied to the peninsula of Cornwall, or at least before the Roman settlement in Britain, there was some confusion between the S. I. and the peninsula of Cornwall. The inhabitants of Cornwall are said to have brought tin to these islands, where it was shipped off by foreign merchants.

Numerous remains may be seen of rude pillars,

circles of stones, kistvaens, rock-basins, and cromlechs. The granite of which the islands are composed is, in general, of a rather coarse quality, and from its colour, iron seems to be frequently associated with it. There are metalliferous veins, or lodes, in some of the rocks, but none that could have yielded any considerable quantity of ore. The S. I. were in 936 granted by Athelstane to some monks who settled at Tresco. They were afterwards granted to the Abbey of Tavistock by Henry I., and were conferred by Queen Elizabeth on the Godolphin family. They are now the property of the crown.

Only six of the islands are inhabited. St Mary's, the largest, comprises 1528 acres; Tresco, 697; St Martin's, 515; St Agnes (a light-house station), 313; Sampson and Bryher, 269. The inhabitants are chiefly engaged in agriculture. Barley, oats, and a little wheat are grown. Large quantities of potatoes are sent to London and Bristol. Fishing, though not to any great extent, occupies some portion of the population. The climate is mild. The soil is in general sandy, but in Tresco and St Agnes it is remarkably fertile. The cliffs abound with sea-fowl, and are covered with samphire.

St Mary's is the largest of the Scilly group, and exceeds in population all the other islands together. It is nine miles in circumference, and contains about 1500 inhabitants. Hugh Town is the capital, and contains an odd mixture of old-fashioned and neat modern houses. The pier, built in 1750 by Lord Godolphin, has been much improved by Mr Smith, the present lessee of the islands. The custom-house and post-office are in the centre of the town. Some remains of the old church are still seen in the fields, on the southern side of the island. The modern church, at the east end of the main street, is seated on rising ground, and forms a conspicuous object in the panorama of the islands.

At Tresco are the remains of an abbey founded in the 10th century. Among the objects of curiosity on this island are the ruins of Oliver Cromwell's camp, castle, and battery, built by the Parliamentarians under Blake and Ayscough. At Dolphin Down may be seen traces of ancient mining.

St Agnes is about three miles south-west from St Mary's. It is well cultivated, and is surrounded by some fine rock-scenery. The principal attraction is the light-house, 78 feet high, containing a revolving light, seen at a distance of 18 miles.

Scimitar.

SCI'MITAR, a description of sword used among eastern nations. It is considerably curved, and has its edge on the convex side. Being usually of high temper, and its shape favourable to incision, it forms an admirable cutting instrument, but is powerless as a thrusting weapon. The scimitar is not, however, any match for the bayonet.

SCINK, or SKINK (*Scincus officinalis*), a saurian reptile, found in the north of Africa, and in some parts of Asia. It is from six to eight inches long, generally of a reddish-dun colour, with darker transverse bands, a wedge-shaped head, and four pretty strong limbs. It has been in great repute for imaginary medicinal virtues from remote times; it was largely imported on this account into ancient Rome, and is still in high esteem in the East, dried scinks finding a ready sale in many places, as Cairo and Alexandria. There is almost no disease for which it has not been supposed to be a cure.—The S. belongs to the family *Scincidæ*. In North America it is represented by numerous species of *Eumeces*, of which *E. fasciatus* is abundant in the east and south. The S. and E. are in general appearance quite lizard-like; but in some

Scink (*Scincus officinalis*).

of the allied genera the limbs become rudimentary, or nearly so. In some, one of the pairs is wanting; and even the Australian Slow-worms (*Siaphus*) are reckoned in this family, in which the limbs are not manifest externally. Among the genera in which the four limbs are all externally manifest, although very small and imperfect, is *Seps*, sometimes made the type of a separate family, *Sepsidæ*, in which the body is much elongated and snake-like.

SCINTILLA'TION (Lat. *scintilla*), a term applied to denote the sparkling or flickering of the stars. The phenomenon is not yet quite explained, but that it is certainly due to the earth's atmosphere is proved by the following facts, which embrace nearly all that is known on the subject. If, on a clear evening, we look at a bright star, such as Sirius, we observe that the intensity and colour of its light are constantly changing—from great brilliancy to almost total obscurity, from bright red to fine blue, and so on. As it rises above the horizon, these appearances diminish in intensity; and stars near the zenith scarcely scintillate at all. Again, the amount of the scintillation depends upon the character of the weather—on some evenings, all large stars appear to scintillate strongly; on others, there is barely a trace of the appearance. It is commonly said that a planet can be distinguished from a star by the absence of scintillation. This is nearly, but not quite, true; for feeble scintillations have been occasionally observed in Mars and Venus, but very rarely in Jupiter and Saturn. One of the reasons of the non-scintillation of planets seems to be their finite apparent size; for all the more conspicuous planets shew a sensible disc even in a poor telescope, while no instrument that has ever been constructed has shewn a real disc in a star. Thus, a single particle or vesicle of vapour may be large enough to conceal a star for an instant, while it could have no such effect on a planet. It is pretty certain that scintillation is not due to unequally heated masses of air, since it usually modifies only the *appearance*, not the *position*, of a star. Another cause is easily seen in the comparatively feeble light of the planets. It is well ascertained that the scintillation is much less when viewed from the top of a mountain.—For a good idea of what is known, and what we desire still to know, on this subject, see a paper by Professor Dufour, *Philosophical Magazine*, 1860.

SCI'O, one of the most beautiful islands in the Ægean Sea, belongs to Turkey, and lies seven miles

off the coast of Asia Minor, at the entrance to the Gulf of Smyrna. It is 32 miles long, and 18 miles in greatest breadth. Area, 400 sq. m.; pop. about 38,000. It is mountainous in the north, and is extremely fertile. Silk, figs, cheese, wool, and gum-mastic are its principal products; and its wine, which was famous in ancient times, is still esteemed. Kastro, the capital, a thriving and handsome town of 18,800 inhabitants, stands on the east coast, has a harbour, a castle, and two light-houses, and carries on a growing trade in fruits, confectionery, and silk and woollen goods.

In early times, S. formed one of the 12 Ionian states, and it contributed 100 ships to the Greek force that fought and was defeated by the Persians in the sea-fight of Miletus (494 B.C.). In more recent times, the island was taken by the Genoese in 1346, and in 1566 by the Turks, in whose hands it has since, except for a short interval, remained. It was conferred as private property upon the Sultana, enjoyed her protection, and consequently prospered. After it had enjoyed a long period of ease and wealth, a dreadful calamity befell the island at the outbreak of the Greek insurrection. A number of the Sciotes having, in 1822, joined the Samians, who had revolted, the island was attacked by a Turkish fleet and army, and the inhabitants, enervated by peace and wealth, were indiscriminately massacred; 25,000 fell by the sword, 45,000 were sold as slaves, and 15,000 escaped from the island. Subsequently, however, many of the Sciote families returned, and now the island is fast recovering the blow it sustained. Trade is returning; and the vineyards, and the olive, citron, and mastic groves are again flourishing.

SCIO'GRAPHY, the drawing of Sections (q. v.) of buildings, so as to shew the interior of them.

SCIOPPIUS (Latinised form of *Schoppe*), KASPAR, a noted classical scholar and controversialist, was born at Neumark, in the Palatinate, 27th May 1576; studied at Heidelberg, Altdorf, and Ingolstadt; and in 1597, visited Italy, Bohemia, Poland, and Holland. Already he had become celebrated by his Latin verse and his notes upon different Latin authors. Next year, he abjured Protestantism, and became a Roman Catholic, in consequence of which he was decorated by the pope with various titles, and received a pension of 600 florins, together with a residence in the Vatican. Henceforth, his career is a series of fierce onslaughts chiefly on his former co-religionists, but also directed against all whom accident or malice led him to hate. The first person whom he selected for attack was the illustrious Scaliger (q. v.), against whom, in 1607, he launched his *Scaliger Hypobolimæus* (Mainz). In this production, Henry IV. is also assailed. Sent in 1608 by the court of Rome to the diet of Ratisbon, for the purpose of observing the religious condition of Germany, he published in the same year more than twenty pamphlets against the Protestants, recommending the Catholic powers to use every means for their extermination. Such sentiments were, of course, highly satisfactory to the emperor of Germany, who was a devoted Catholic; and, in consequence, S., on visiting Vienna, met with a favourable reception, and was raised to the dignity of count-palatine. In 1611, he fired off two libels against King James I. of England; the first was entitled *Ecclesiasticus Autoritati Ser. D. Jacobi, Mag. Brit. Regis, Oppositus* (Hartberg); and the second, *Collyrium Regium*, &c. Some three years after, when staying at Madrid, he was dreadfully beaten by the domestics of Lord Digby, the English ambassador, in retaliation for the abuse of his sovereign. S. fled from Spain to Ingolstadt, where he issued his *Legatus Latro* against the ambassador. In 1618, S. went to Milan, where he resided for the next twelve years, devoting himself partly to philological studies, and partly to theological warfare. He died, 19th November 1649. S. was a prodigious scholar, and might have rivalled Scaliger himsel in reputation, as he did in learning, had it not been for the infirmities of his temper and judgment. To this day, his works, especially those on the Latin language, are reckoned valuable. The principal are: *Poemata Varia* (Heidelb. 1593); *Verisimilium Libri Quatuor*, &c. (Nürnb. 1596); *Suspectæ Lectiones* (Nürnb. 1597); *De Arte Critica* (Nürnb. 1597); *Symbola Critica in Apuleii Opera* (Augsburg, 1605); *Observationes Linguæ Latinæ* (Frankf. 1609); *De Rhetoricarum Exercitationum Generibus* (Mil. 1628); *Grammatica Philosophica, sive Institutiones Grammaticæ Latinæ* (Mil. 1628); *Paradoxa Literaria* (Mil. 1628); *Mercurius Bilinguis*, &c. (Mil. 1628); *Rudimenta Grammaticæ Philosophicæ* (Mil. 1629); *Astrologia Ecclesiastica* (1634); *De Scholarum et Studiorum Ratione* (Pad. 1636); *Mercurius Quadrilinguis* (Basel, 1637), &c.

SCIO'TO, a river of Ohio, U.S., rises in the high lands of the north-west portion of the state, flows south-east to Columbus, then south to its junction at Portsmouth with the river Ohio. It is 200 miles long, flows through a rich valley, is navigable 130 miles, and for 90 miles feeds the Ohio and Erie Canal. It is crossed by numerous railways.

SCI'PIO, PUBLIUS CORNELIUS, surnamed AFRICANUS MAJOR, one of the most accomplished warriors of ancient Rome, but whose reputation is perhaps somewhat greater than his merits, was born 237 or 234 B.C. He is first mentioned as taking part, though only a youth, in the battle of the Ticinus (218 B.C.), where he saved his father's life. Two years later, he fought at Cannæ as a military tribune, and was one of the few Roman officers who escaped from that disastrous field. In 212 B.C., he was elected ædile, though not legally qualified by age, and in the following year, proconsul, with command of the Roman forces in Spain. His appearance there restored fortune to the Roman arms. By a bold and sudden march, he captured *Nova Carthago*, the stronghold of the Carthaginians, and obtained an immense booty. His humane and courteous manners won over many of the native chiefs; and when he commenced the campaign of 209 B.C., his superiority over his opponents in address, if not in generalship, was manifest. At Bæcula, in the valley of the Guadalquivir, he defeated Hasdrubal with heavy loss, but could not prevent him from crossing the Pyrenees to the assistance of Hannibal. In 207 B.C., he won a more decisive victory over the other Hasdrubal, son of Gisco and Mago, at an unknown place called Silpia, or Elinga, somewhere in Andalusia—the effect of which was to place the whole of Spain in the hands of the Romans. Soon after, he returned to Rome, where he was elected consul (205 B.C.), though he had not yet filled the office of prætor; and in the following year he sailed from Lilybæum, in Sicily, at the head of a large army, for the invasion of Africa. His successes compelled the Carthaginian senate to recall Hannibal from Italy. This was the very thing that S. desired, and had laboured to achieve. After some abortive efforts at reconciliation, the great struggle between Rome and Carthage, between S. and Hannibal, was terminated by the battle fought at Naragra, on the Bagradas, near Zama, 19th October 202 B.C., in which the Carthaginian troops were routed with immense slaughter. Hannibal advised his countrymen

to abandon what had now become a hopeless and ruinous contest, and his advice was taken. Peace was concluded in the following year, when S. returned to Rome, and enjoyed a triumph. The surname of AFRICANUS was conferred on him; and so extravagant was the popular gratitude, that it was proposed to make him consul and dictator for life, honours that would have been the destruction of the constitution, but which S. was either wise enough or magnanimous enough to refuse. When his brother, Lucius, in 190, obtained the command of the army destined to invade the territories of Antiochus, S. served under him as legate; in fact, it was only when he offered to do so, that the senate granted Lucius the province of Greece. The latter was victorious in the war, and on his return to Rome (189 B.C.), assumed (in imitation of his brother) the surname of ASIATICUS. But the clouds were now gathering heavily round the Scipios. In 187 B.C., Cato Major and others induced two tribunes to prosecute Lucius for allowing himself to be bribed by Antiochus in the late war. He was declared guilty by the senate; his property was confiscated; and he himself would have been thrown into prison, had not his brother forcibly rescued him from the hands of the officers of justice. In 185 B.C., S. himself was accused by the tribune, M. Nævius; but instead of refuting the charges brought against him (and which were probably groundless), he delivered, on the first day of his trial, a eulogy on his own achievements, and opened the second day by reminding the citizens that it was the anniversary of the battle of Zama, and therefore not a time for angry squabbling, but for religious services. He then summoned the people to follow him to the Capitol, to give thanks to the immortal gods, to pray that Rome might never want citizens like himself. His audience were electrified, and the thing was done before opposition became possible. To resume the trial, was out of the question; but S. felt that popular enthusiasm was not to be depended on; that the power of the oligarchy—of that compact body of ambitious and exclusive nobles—was irresistible; that its hatred of him was unappeasable, and that his day was over. He retired to his country-seat at Liternum, in Campania, where he spent the remainder of his life, and where he died, 183 or 185 B.C.—S. is commonly regarded as the greatest Roman general before Julius Cæsar; and certainly, in the brilliancy of his gifts and accomplishments, he was unsurpassed; but if his career be strictly criticised, it will be found that he owed as much to fortune as to genius. Nevertheless, he won a multitude of splendid successes, and made the most of his great advantages. His beauty, bravery, and courtesy; his proud, yet pious belief that the gods favoured him with their inspiration, won him the love and reverence of soldiers and women; and his magnanimity towards his fallen rival, who flitted about the eastern courts in dreary exile, is a bright feature in his character, and nobly distinguishes him from the cruel-hearted oligarchs of the senate.

SCIPIO ÆMILIANUS, PUBLIUS CORNELIUS, surnamed AFRICANUS MINOR, born 185 B.C., was a younger son of Lucius Æmilius Paulus, who conquered Macedon, but was adopted by his kinsman, Publius Scipio, son of the great Scipio, who had married the daughter of that Lucius Æmilius Paulus who fell at Cannæ. S. accompanied his father on his expedition against Macedon, and fought at the decisive battle of Pydna, 168 B.C. In Greece, he made the acquaintance of Polybius the historian, who afterwards became one of his closest and most valued friends. In 151 B.C., he went to Spain as military tribune, in the wake of the consul Lucius Lucullus, where he distinguished himself alike by his valour and his virtue. Two years later, began the third and last Punic war, which mainly consisted in the siege of Carthage. S. still held the subordinate position of military tribune; but the incapacity of the consuls, Manius Manilius and Lucius Calpurnius Piso, and the brilliant manner in which he rectified their blunders, fixed all eyes upon him. The favourite both of the Roman army and the Roman people, S. was at length, in 147 B.C., when only a candidate for the ædileship, elected consul by an extraordinary decree of the Comitia, and invested with supreme command; old Cato, who could with difficulty be got to praise any one, applying to the young hero and his incapable comrades (according to Plutarch) the Homeric line—

> He only is a living man; the rest are flitting shades.

The story of the siege of Carthage, the despairing heroism of its inhabitants, the determined resolution, the sleepless vigilance, the incessant labours of S., are too well known to require description. Suffice it to say, that after a protracted defence of months, the city was finally taken by storm in the spring of 146 B.C.; and by the orders of the senate, it was levelled to the ground, and the ploughshare driven over its site. S., a man of noble and refined soul, obeyed the savage behest with sorrow, even with horror. As he gazed on the ruin he had wrought, the thought flashed across his mind that some day Rome too might perish, and the words of the *Iliad* rose to his lips—

> The day shall come when sacred Troy shall perish,
> And Priam and his people shall be slain.

S., though probably the most accomplished Roman gentleman of his age, was rigorous in his observance of the antique Roman virtues; and when holding the office of censor in 142 B.C., he strove to follow in the footsteps of Cato. But his efforts to repress the increasing luxury and immorality of the capital were frustrated by the opposition of his colleague, Lucius Mummius, the rough conqueror of Corinth. In 139 B.C., S. was accused of the *crimen majestatis* by the tribune Tiberius Claudius Asellus, but was acquitted, and soon after was sent to Egypt and Asia on a special embassy. Meanwhile, however, affairs had gone badly in Spain. Viriathus, the Lusitanian patriot, had again and again inflicted the most disgraceful defeats on the Roman armies, and his example had roused the hopes of the Celtiberian tribes, who also rushed to war against the common foe. The contest continued with varying success; but the interest centres in the city of Numantia, whose inhabitants displayed amazing courage in the struggle with Rome. For long it seemed as if the Numantines were invincible—one consul after another finding their subjugation too hard a task—but at length, in 134 B.C., S., re-elected consul, was sent over to Spain; and after a siege of eight months, forced the citizens, who were dying of hunger, to surrender, and utterly destroyed their homes. He then returned to Rome, where he took a prominent part in political affairs, appearing as the leader of the aristocractic party, in consequence of which his popularity with the democratic party greatly declined. Although a brother-in-law of Tiberius Gracchus, whose sister, Sempronia, he had married, he rather disclaimed any sympathy with his political aims; and when he heard of the murder of his kinsman, quoted his favourite Homer: 'So perish all who do the like again.' His attempt (129 B.C.) to rescind that portion of the agrarian law of Tiberius Gracchus relating to the lands of the *Socii*, excited the most furious indignation. When he went home from

the senate, he had to be accompanied by a guard. Next morning, he was found dead in his bed; the prevailing suspicion being, that he was murdered either by or at the instigation of Papirius Carbo, his most rancorous political enemy. S. was neither a rigid aristocrat nor a flatterer of the people. Inferior in splendour of genius to his adoptive grandfather, he surpassed him in purity of character, in simplicity of patriotism, and in liberality of culture.

SCI'RPUS, a genus of plants of the natural order *Cyperaceæ*. The English name Club-rush is sometimes given to them. The Common Bulrush (q. v.) is a familiar example. There are several British species, some of them very small in comparison with the Bulrush, as *S. cæspitosus*, called *Deer's Hair* in the Highlands of Scotland, which is only two or three inches high, and abounds in moors, affording food to sheep in spring. The root-stocks of *S. dubius* are eaten by the natives of the south of India; as are the tubers of *S. tuberosus*, which is cultivated by the Chinese in tanks and ponds. *S. cæspitosus*, *lacustris*, and other species are common in the United States.

SCI'RRHUS (Gr. hard), a term applied to a kind of Cancer (q. v.).

SCITAMI'NEÆ, or ZINGIBERA'CEÆ, a natural order of endogenous plants, herbaceous perennials. There are about 250 known species, among which are the different kinds of Ginger, Galangale, Zedoary, Cardamom, Grains of Paradise, Turmeric, &c. Most of them are notable for their aromatic properties, which reside chiefly in their root-stocks or in their seeds. The root-stocks of some, particularly when young, contain much starch, which is used as arrow-root. All the species are tropical or subtropical.

SCIU'RIDAE. See SQUIRREL.

SCLERODE'RMI, Cuvier's name for the family of fishes called *Balistidæ* by Müller. See BALISTES.

SCLEROGE'NIDAE. See MAILED CHEEKS.

SCLERO'STOMA (from the Gr. *scleros*, hard, and *stoma*, the mouth) is the term applied to a well-known genus of the family of *Strongylidæ*, belonging to the order of round worms or Nematoda (q. v.). One species, the *Sclerostoma syngamus*, is of special interest, as being the cause of the disease in poultry known as the Gapes (q. v.). Since the article GAPES was published, it has been ascertained that the entozoon which infests the windpipe of the diseased birds is not a trematoid (or fluke-like) worm, but a round worm, possessing many very singular properties. Dr Cobbold, to whom we are mainly indebted for our knowledge of this worm, removed from a chloroformed fowl with the gapes, seven sclerostomata. 'Six of these parasites were united in pairs, the odd worm being a female, from which the male had in all likelihood been rudely torn during the withdrawal of the forceps' (*Entozoa*, 1864, p. 86). The females thus extracted had an average length of $\frac{6}{8}$ths of an inch; while the males scarcely exceeded $\frac{1}{8}$th of an inch. In both sexes, the breadth of the body was nearly uniform throughout, being about $\frac{1}{35}$th of an inch in the female, and only $\frac{1}{55}$th of an inch in the male. The mouth of the female is furnished with six prominent chitinous lips. According to Siebold, after sexual congress, 'there is ultimately a lasting continuity of the sexes by means of an actual growing together'—one of the most remarkable facts ever recorded in natural history. Hence the eggs, which are comparatively large, and many of which contain fully-formed embryos, can only escape by a breaking-up of the body of the parent. 'By whatever mode,' says Dr Cobbold, 'the young make their *exit* from the shell, it is manifest, that prior to their expulsion, they are sufficiently developed to undertake an active migration. Their next habitation may occur within the bodies of certain insect larvæ, or even in small land molluscs; but I think it more likely that they either enter the substance of vegetable matters, or bury themselves in the soil at a short distance from the surface.'

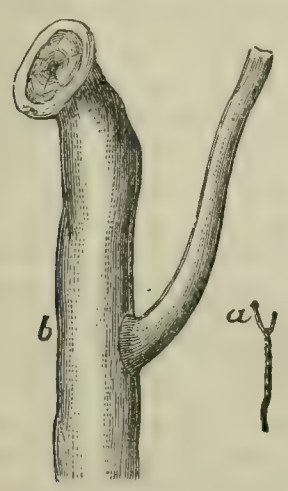


Fig. 1.—Sclerostoma syngamus.
a, Male and female—natural size; *b*, upper part of the same, enlarged (from Cobbold). The male is the smaller worm on the right side of these figures.

Considering that this worm infests the trachea of the domestic fowl, the turkey, the pheasant, and the partridge, as well as of many birds of less importance (as the magpie, the black stork, the starling, the swift, &c.), it is of the greatest importance to

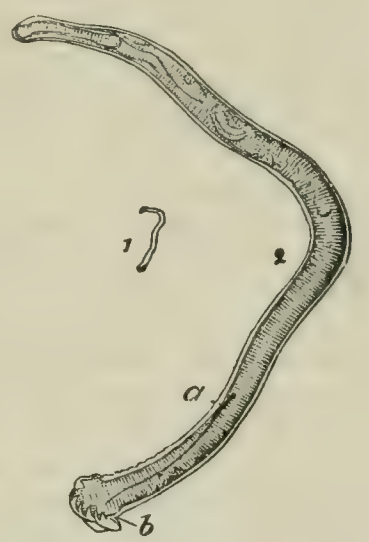

Fig. 2.—Sclerostoma duodenale—Male specimen.
1, The natural size; 2, the same magnified, and seen laterally; *a*, generative organ; *b*, region of anus.

check its development. With this view, the worms must not only be removed by the means described in the article GAPES, and more fully in Cobbold's *Entozoa*, pp. 90, 91, but they must be *totally destroyed* after their removal. If they be merely killed, and thrown on the ground, the mature eggs will probably remain uninjured; and when decomposition sets in, the young embryos will, sooner or later, escape from the shells, migrate in the soil or elsewhere, and ultimately find their way—how, we cannot tell—into the air-passages of certain birds, in the same manner as their parents did before them.

Dr Cobbold, whose classification of intestinal worms will doubtless for many years be the standard one, places the *Dochmius anchylostomum*, or *Anchylostoma duodenale* (see STRONGYLIDÆ), in this genus, with the name of *Sclerostoma duodenale*. This worm, which usually measures about $\frac{1}{3}$d of an inch in length, is especially characterised by an asymmetrical disposition of four horny, conical, oval papillæ, of unequal size, forming the so-called teeth. The female is larger than the male in about the ratio of

4 to 3, and is the more numerous in the ratio of 3 to 1. This worm was first discovered by Dubini at Milan in 1838, and though at first thought rare, is now known to be tolerably common throughout Northern Italy. It is remarkably abundant in Egypt, where Pruner found it in nearly every corpse, sometimes, in hundreds of specimens, in the jejunum, and to a less extent in the duodenum. Griesinger, in his Memoir *On the Frequency of Entozoa in Egypt, and the Diseases they occasion* (1854), considers that about one-fourth of the population are constantly suffering from a severe anæmic chlorosis, occasioned solely by the presence of this parasite. A tolerably full account of this disorder, and of the treatment to be adopted, is given by Küchenmeister in his *Manual of Parasites*, vol. i. pp. 386—389.

SCLERO'TIUM, a spurious genus of fungi, now regarded as merely the mycelium of fungi, and these probably of very different kinds, which have been arrested in their development, assuming a peculiar form. This form is that of a fleshy mass, often a ball. Examples are to be found among almost all kinds of decaying vegetable matter, as fruits, esculent roots, &c. When a crop of onions rots off, as is often the case, to the vexation of the gardener, a S. will generally be found attached to the bulbs in the form of little irregular black masses, or as a multitude of small granules. On the under side of decaying cabbage-leaves, and scattered on the ground beneath the plant to which they belong, may in like manner be seen little balls, varying from white or reddish-brown to dark brown and black, in size about equal to cabbage-seeds, whence stories of showers of seeds have sometimes originated.

SCO'LEX. See TAPE-WORMS.

SCOLOPA'CIDÆ, a family of birds of the order *Grallæ*, having a long, feeble, soft, and somewhat flexible bill, which is remarkably furnished with nerves, particularly towards the tip, so as to be extremely sensitive, whilst many of them have also a peculiar muscle, enabling them to separate the points of the mandibles the moment that their prey is felt. They are thus admirably fitted for seeking their food—which generally consists of worms, slugs, &c.—in mud, soft earth, or wet sand. The membrane of the tip of the bill is almost pulpy in many of them. The species are numerous, and very widely distributed, generally inhabitants of swampy or very moist places. Snipes, woodcocks, sandpipers, and curlews are familiar examples.

SCOLOPE'NDRA. See CENTIPEDE.

SCOLOPE'NDRIUM. See HART'S TONGUE.

SCOLY'TUS, a genus of coleopterous insects of the family *Xylophagi*. See BARK-BEETLE. One

Scolytus destructor, and Section of Wood, shewing the burrows of the larvæ.

species, *S. destructor*, a beetle only about one-sixth of an inch in length, of a dull colour, with short antennæ, thickened at the extremity, has of late years destroyed great numbers of fine elms in the neighbourhood of London and elsewhere in England. The female insect burrows in the wood, and lays a row of eggs; the larvæ, as soon as they are hatched, begin to feed upon the wood, and eat their way in long tunnels, diverging on all sides from the original one. This pest appears to be spreading in England.

SCOMBERESO'CIDÆ, a family of fishes, of the order *Synentognathi*, having the maxillary bones united with the elongated premaxillaries at the corners of the mouth. The Flying-fish (*Exocœtus*) belongs to this family. The Gar-fish and the Saury Pike are the only species common on the British coasts. Until the *Synentognathi* were recognised as a separate order, the S. were reckoned as belonging to the *Esocidæ*, or pike family.

SCO'MBRIDÆ, a large family of Distegous acanthopterous fishes, containing many species highly esteemed as articles of food, and some of them of great value on account of the abundance in which they are caught. Some of them attain a large size. They have a smooth body, covered generally with small scales, and often very beautifully coloured; the tail-fin generally large, and the tail very muscular and powerful. The gill-covers have no armature. The sides of the tail are often keeled and armed with sharp-keeled scales. The front spines of the anal fin are generally detached, and sometimes those of the first dorsal fin. The second dorsal fin is often represented by numerous finlets, as in the Mackerel (q. v.). To the same tribe with the mackerel, characterised by finlets and by the want of armature on the lateral line, belong the Bonito (q. v.), the Tunny (q. v.), the Albacore (see TUNNY), and the Seirfish (q. v.). The importance of the Mackerel fishery is well known, also that of the Tunny fishery of the Mediterranean. The Sword-fish (q. v.) is an example of another group, comprising only a few species, having no finlets, and remarkably characterised by the dagger-like prolongation of the muzzle. The Pilot-fish (q. v.) belongs to a tribe having the first dorsal represented by isolated spines. There are other tribes or groups, some having the lateral line cuirassed, some not having this armature, and not having finlets nor detached spines. The Dory (q. v.) and allied genera, often regarded as forming a tribe of S., have been constituted into a distinct family, *Zeïdæ*.—The S. are all marine. They are more numerous in warm than in cold climates, although some are found in very northern seas, of which the mackerel is the most important instance. It and the Scad (q. v.), or Horse Mackerel, are the only species common on the British coasts, although several others are known as of rare occurrence.

SCONCE, in Fortification, is a term applied to any small redoubt or fort, detached from the main works for some local object, as the defence of a pass or ford, &c. The word is not now often used.

SCONCE, a candlestick affixed to a wall by a bracket, and frequently with a mirror or other reflector.

SCONE (pronounced *Scoon*), a parish in Perthshire, lying on the left bank of the Tay, about two miles from Perth. It is famous as the seat of one of the most venerable of Scottish abbeys. S. is first mentioned in the beginning of the 10th c., when a council was held there in the 6th year of the reign of King Constantine, at which time it is styled, by the Chronicle which records the fact, *regalis civitas*, the royal city. A monastery was built at S. probably about the same period, and thither the stone seat was brought from Iona on which the kings of the Scots were inaugurated, and

which was carried by Edward I. of England to Westminster Abbey. In place of the ancient monastery, an abbey of Canons Regular was founded by Alexander I., in 1115, and there the sovereigns continued to be inaugurated and crowned. Alexander III., the last of the ancient race of kings, and Robert Bruce, the founder of the new dynasty, were crowned at S.; but after the accession of the House of Stuart, the coronation sometimes took place in other churches. In the summer of 1559, when Perth was held by the Lords of the Congregation, a disorderly multitude of their adherents assaulted the monastery of S., set it on fire, and left it a blackened ruin. The last coronation which was celebrated at S. was that of Charles II., on the 1st of January 1651. The abbey-church had never been restored, and the solemnity took place in the parish kirk, the crown being placed on the king's head by the Marquis of Argyle. In January 1716, the Jacobite leaders endeavoured to encourage their followers by fixing a day for the coronation of the Chevalier at S., but the design was abandoned. In the reign of James VI., the abbey of S. was erected into a temporal lordship in favour of Sir David Murray, afterwards created Viscount of Stormont. The great chief-justice, the Earl of Mansfield, a younger son of the fifth Viscount Stormont, was born at S.; and the Scottish peerage is now merged in the British earldom. The Viscounts of Stormont had a residence near the site of the abbey, and hence known as the Palace of Scone. The present palace was erected on the same site in the beginning of this century.

SCO'PAS, a celebrated Greek sculptor and architect, belonging to the later Attic school, the head of which was Praxiteles (q. v.), was born in the island of Paros, and flourished during the first half of the 4th c. B.C. Nothing is known regarding his life or the period of his death. His principal architectural works are: 'The Temple of Athena Alla at Tegea,' the first both in point of size and beauty in the Peloponnesus; 'The (second) Temple of Diana at Ephesus' (though Deinocrates is also and even more generally named as the architect of this building); some of the bas-reliefs in the famous Mausoleum erected by Artemisia, queen of Caria, in memory of her husband (and now in the British Museum). His sculptures, by which we mean his single statues and groups illustrating the divinities of Greek mythology, were very numerous, and for the most part were executed in marble. They embrace subjects from the myths of Aphrodite (Venus), Dionysus (Bacchus), Apollo, Artemis (Diana), &c. But perhaps the noblest, and certainly the most famous piece of sculpture executed by S., was that which latterly stood in the Flaminian Circus at Rome, and represented Achilles conducted to the island of Leuce by the divinities of the sea. It included statues of Neptune, Thetis, the Nereids, Tritons, and a variety of sea-monsters, and according to Pliny, the whole was so beautiful, that it would have been sufficient to have immortalised S., even if he had done nothing more.

SCOPE'LIDÆ. See SALMONIDÆ.

SCORE, in Music, compositions for several voices or instruments, or for an orchestra, so written, that each part has a separate staff for itself, these staves being placed over each other, bar corresponding to bar. It is so called because the bars are *scored* or drawn through all the parts from top to bottom. Occasionally, where there is a deficiency of staves for all the parts, or where any of the parts have so little to do that it is not worth while to assign them a separate staff, parts related to or connected with each other, as two flutes, two clarionets, or three trombones, may be written on the same staff together. The arrangement or distribution of the parts in a score is matter of some importance. As a general rule, the highest part should be placed uppermost, then the next lower, and gradually descending. All the parts of a chorus should be placed together. Perfection in reading score is not very easily attained, but is necessary for a thoroughly trained musician. The student of music who can read or play the great master-works from the score, will become far more intimately acquainted with them than he could by mere pianoforte arrangements, and will come to understand the means by which their composers have produced the wonderful effects that are to be found in their music. The use of so large a number of clefs, and the practice which has obtained of writing parts for particular instruments in other keys, have added greatly to the difficulty of studying the score. Among various suggestions for simplifying the score, one which was lately advocated in Brown's *Elements of Musical Science*, consists in the use of but one clef, the bass or F clef, the other parts being distinguished from the bass by short bars attached to the clef, which direct the performer to take the notes one, two, or three octaves higher.

SCORESBY, WILLIAM, D.D., a celebrated Arctic explorer and savant, was the son of William Scoresby, the most distinguished whale-fisher of his time, and was born at Cropton in Yorkshire, October 5, 1789. He commenced a seafaring life at the age of ten, and in his 21st year succeeded his father as commander of the *Resolution*, and carried on the business of whale-fishing. After having made 17 voyages to the Spitzbergen and Greenland whaling-grounds, he published the results of his observations of the countries within the Arctic Circle in *An Account of the Arctic Regions* (2 vols., 1820), a work which not only increased and extended the author's reputation, but added largely to the sciences of meteorology, hydrography, and natural history. In 1822, he explored the east coast of Greenland, a tract hitherto wholly unknown, and published in the following year at Edinburgh an account of this expedition and its fruits. In 1824, he was elected a Fellow of the Royal Society of London, and some time after was chosen *correspondant* of the French Institute. He had retired from his profession in 1822, and now proceeded to give effect to a strong desire which had long possessed him, of becoming an authorised teacher of religion, by entering himself at Queen's College, Cambridge; he graduated as B.D. in 1834, subsequently (1839) received the degree of D.D., and laboured faithfully and zealously, first at Liverpool and afterwards at Bradford, till failing health compelled him to retire to Torquay. He still continued his physical researches, giving special attention to terrestrial magnetism, especially in its relation to navigation; and published the results, many of which were of great value and interest, in the form of Memoirs, in the *Philosophical Transactions*, the *Transactions of the Royal Society of Edinburgh*, the *Reports of the British Association*, and subsequently in an improved form in his *Magnetical Investigations* (Lond. 2 vols. 1839—1852). For the better prosecution of these researches, he made a voyage to the United States in 1847, and to Australia in 1853, returning from the last-named country in 1856, enfeebled in health by the arduous labours which he had undergone. He died at Torquay on March 21, 1857. Besides his work on *Zoistic Magnetism*, which described a series of researches entered into for the purpose of eliciting some natural connection between magnetic and mesmeric agencies, he published various works of a religious nature.

His life has been written by his nephew, R. E. Scoresby-Jackson (Lond. 1861).

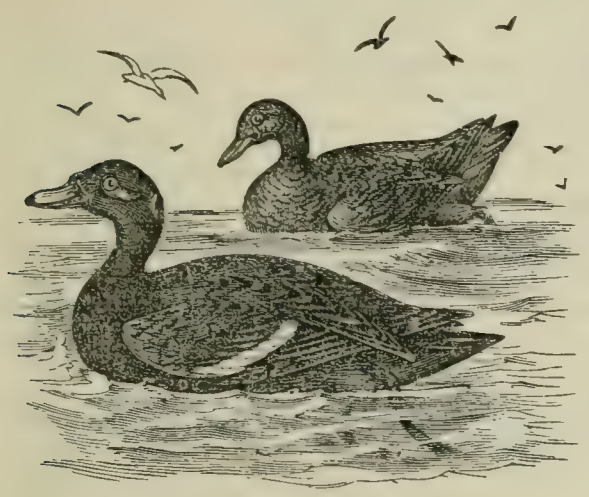
SCO'RIÆ are the cinders and slags of volcanoes, more or less porous from the expansion of the gases contained in the melted materials. See VOLCANIC ROCKS.

SCORPÆ'NA, a genus of fishes, of the family of *Mailed Cheeks*. The head is large and compressed, more or less armed with spines or tubercles. The body is of a somewhat perch-like form. Some of the *Scorpænæ* are remarkable for their ugliness; some exhibit very fine colours. They are numerous in the Mediterranean, and widely distributed in the seas of warm climates. They frequent rocky shores in shoals, and feed on crustaceans, small fishes, &c. They are popularly called *Hog-fish* and *Scorpion-fish*. The flesh is dry and tasteless, but the liver yields a useful oil.—The Bergylt (q. v.) belongs to a nearly allied genus.

SCO'RPION (*Scorpio*), a genus of *Arachnida*, of the order *Pulmonaria*, formerly including the whole of the family *Scorpionidæ*, to all of which the popular name is still extended. Scorpions are natives of warm climates, both in the eastern and western hemispheres. The species are numerous. They have the body elongated, and no marked division between the thorax and abdomen. Six segments of the abdomen are broad; but the last six are narrow, forming a tail; and the last segment is modified into a curved and sharp sting, having two pores on its lower side, from which the venom flows, supplied by two poison glands in the base of the segment. The palpi are modified into pincers or claws like those of the lobster, by means of which prey is seized. There are four spiracles or breathing pores on each side of the abdomen. There are two remarkable comb-like appendages on the under surface of the thorax, the use of which is unknown. The number of eyes is various; in the restricted genus *Scorpio*, of which the COMMON S. (*S. Europæus*) of the south of Europe is an example, there are only

Scorpion (*Scorpio Europæus*).

six; but in some of the genera eight and twelve. Scorpions feed on beetles and other insects, and after seizing them, pierce them with the sting before eating them. They also eat the eggs of spiders, &c. They lurk under stones and in holes and crevices, but come forth to seek their prey, running with great activity. In running, they carry the tail curled over the back. When alarmed or irritated, they shew great fierceness, evidently aware of the power of their sting, and moving it in all directions, as if threatening an adversary. They are universally disliked, and not a little dreaded, being apt to get into houses, and into beds, hiding themselves under pillows, in shoes, boots, &c., so that accidents are very frequent in countries where they abound. The sting of a S. is seldom fatal, but even that of the Common European S. is very painful, and that of some of the largest species—which are six inches long—is much more severe, attended with much nausea and constitutional derangement, nor do the effects soon cease. It is of use to press a large key or other tube on the wound, so as to force out part of the poison. The best remedy is ammonia, internally administered, and also applied externally.



The female S. displays great regard for her young, which she carries for some time clinging in great numbers to her back, limbs, and tail.

SCORZONE'RA, a genus of plants of the natural order *Compositæ*, suborder *Cichoraceæ*, having yellow or rarely rose-coloured flowers. The species are numerous, mostly natives of the south of Europe and the East. No species is found in Britain. The Common S. of our kitchen-gardens, *S. Hispanica*, a native of the south of Europe, has long been cultivated for its esculent roots. The root is black externally, white within, about the thickness of a man's finger, long, and tapering very gradually, whence the name *Viper's Grass*, sometimes given to the plant, the root being supposed to resemble a viper. It contains a white milky juice, and has a mild sweetish mucilaginous taste; it is very pleasant when boiled, the outer rind being first scraped off, and the root steeped in water, to abstract part of its bitterness. The leaves are an inferior substitute for mulberry leaves in feeding silkworms.—Other species of S. are used in the same way.

SCOT, REGINALD, a writer who has acquired an honourable reputation as an early disbeliever in the reality of witchcraft, was a younger son of Sir John Scot of Scotshall, near Smeethe in the county of Kent, and was born in the first half of the 16th century. He studied at Oxford, and on his return home devoted himself exclusively to learned pursuits. Nothing further is known regarding him except that he died in 1599. His famous work, entitled *The Discoverie of Witchcraft*, was published in 1584, and is designed to demonstrate the absurdity of the prevalent belief on the subject. It is full of learning, and is marked in many passages by sound sense and humane feeling, qualities that naturally excited the antipathy of a person like King James, who wrote his *Dæmonology*, as he tells us, 'chiefly against the damnable opinions of Wierus and Scot; the latter of whom is not ashamed in public print to deny there can be such a thing as witchcraft.' But the 'British Solomon' only reflected the general ignorance and superstition of his age, and S. had to run the gantlet of a series of 'Answers' and 'Refutations' by a number of 'eminent' divines, as well as by Glanvil, the author of the *Scepsis Scientifica*. S.'s book was ordered to be burned by the common hangman, and copies of it are now extremely rare. Besides *The Discoverie of Witchcraft*, S. wrote *A Perfect Platform of a Hop Garden*.

SCOTCH STATUTES frequently mean the ancient acts of parliament beginning with the reign of James I. of Scotland, and continuing down to the Union of England and Scotland. There are also many statutes passed since that date which are applicable exclusively to Scotland, and these are to be found among the statutes at large. The rules of construction of Scotch statutes do not differ from those affecting English or British statutes. One peculiarity, however, distinguishes the old Scotch statutes prior to the Union, which is this, that those statutes lost their force by desuetude, that is by mere lapse of time, coupled with neglect or non-observance, or at least with a contrary usage. In England, on the other hand, a statute, however ancient and however little acted upon, continues law until it is expressly, or by strong implication, repealed by some subsequent statute. Acts of Sederunt—that is, rules of practice passed by the Court of Session—are also subject to the law of desuetude.

SCO'TER (*Oidemia*), a genus of the oceanic section of ducks, having a short broad bill with an elevated knob at the base of the upper mandible, the tip much flattened, and terminated by a large flat nail, the mandibles laminated with broad strong widely separated plates; the wings of moderate length; the tail short and acute; the feet very large; the plumage generally very dark. Their food consists chiefly of marine shell-fish, crustaceans, &c. They obtain their food by diving.—The COMMON S., or BLACK S. (*O. Americana*), is about the size of the common duck. The whole plumage of the male is deep black; the bill and legs are also black, except a line of orange along the ridge of the upper mandible. The female is dark brown. The black S. is abundant in winter on many parts of the American coast, migrating to more northern regions in spring. The flesh is oily, and has a fishy taste; but being therefore permitted to Roman Catholics during Lent, is in great request in some countries, so that at Marseille, Aix, and other places in the south of France, arrangements are made by the magistrates

Velvet Scoter (*Oidemia fusca*).

for an annual shooting or *battue* of scoters, and great numbers are killed.—The VELVET SCOTER (*O. fusca*) is a less common winter visitant of Britain, plentiful only in Orkney.

SCO'TIA. See MOULDING.

SCO'TLAND. For the Geography, see GREAT BRITAIN. *History.*—An account has been given under the article Picts (q. v.) of the early inhabitants of the country which has long been known by the name of Scotland. The original Scotia or S. was Ireland, and the Scoti or Scots, at their first appearance in authentic history, were the people of Ireland. The Scots were a Celtic race, and their original seat in Northern Britain was in Argyle, which they acquired by colonisation or conquest, before the end of the 5th c., and from whence they spread themselves along the western coast from the Firth of Clyde to the modern Ross. The name of S. seems first to have been given to the united kingdom of the Picts and Scots in the 10th century. It was then sometimes styled, by way of distinction, *Scotia Nova* (New Scotland), and it was a considerable time afterwards before the name of S. was applied to it, to the exclusion of Ireland. This interchange of names was a fruitful source of dispute between Irish and Scottish writers in the 16th and following centuries, and it can hardly be said that even now the controversy is entirely at an end.

The first prince of the British Scots mentioned in our authentic annals was Fergus, son of Erc, who crossed over to Britain about the year 503. His nation had been converted to Christianity by St Patrick, and Fergus himself is said to have received the blessing of the saint in his early years. His great-grandson, Conal, was king of the British Scots when Columba (q. v.) began the conversion of the Northern Picts; and by that prince, according to the best authorities, Iona was given for the use of the mission. Conal was succeeded by his nephew, Aidan, who was inaugurated as sovereign by St Columba in the island of Iona—a ceremony which Scottish writers, misled by the great French antiquary Martene, long believed to be the first example of the benediction of kings. Aidan was a powerful prince, and more than once successfully invaded the English border, but towards the end of his reign he received a severe defeat from the Northumbrian sovereign Ethelfrid at the battle of Degsestan.

The history of Aidan's successors is obscure and uninteresting, except to the professed students of our early history. Their kingdom was overshadowed by the more powerful monarchy of the Picts, with which, as well as with its neighbours in the south—the Britons of Cumbria—it was engaged in almost unceasing conflict. The Scots were for a time under some sort of subjection to the English of Northumbria, but recovered their independence on the defeat and death of King Egfrid in battle with the Picts at Nechtansmere in 685. In the middle of the 9th c., by a revolution, the exact nature of which has never been ascertained, the Scots acquired a predominance in Northern Britain. Kenneth, son of Alpin, the lineal descendant of Fergus and Aidan, succeeded his father as king of the Scots in 836. The Pictish kingdom was weakened by civil dissension and a disputed claim to the crown. Kenneth laid claim to it as the true heir in the female line, and was acknowledged king in the year 843.

King Kenneth transferred his residence to Forteviot in Stratherne, which had been the Pictish capital, fixing soon afterwards the ecclesiastical metropolis of the united kingdom at Dunkeld, where he built a church, dedicated to St Columba. The Picts and Scots, each speaking a dialect of the Celtic tongue, gradually coalesced into one people, whose territory extended from the Firths of Forth and Clyde to the northern extremity of Britain. The crown descended to a line of princes of the family of Kenneth, whose rule gave a unity and comparative tranquillity to the Scots of Britain, which those of Ireland, at no time really united under one prince, never possessed, and the good effects of which, as contrasted with the state of the sister island, are experienced to the present day. The first interruption to the descent of the crown in the line of Kenneth was the reign of a usurper named Grig, round whose name, amplified to Gregory by the writers of a later age, a cloud of legendary fiction gathered. The old family was restored on his expulsion in 893.

The reign of Constantine, son of Aodh, who succeeded in 904, was a remarkable one. In his time, it is probable that the seat of the ecclesiastical primacy was transferred from Dunkeld to St Andrews, and that the regal residence was fixed at Scone. At the latter place, in the sixth year of his reign, the chronicles mention that Constantine, the king, Kellach, the bishop, and the Scots, swore to observe the laws and discipline of the faith and the rights of the churches and the gospels. This seems to indicate the meeting of some sort of council, civil or ecclesiastical, or more probably a combination of both, according to the form prevalent at this period both among the Celtic and the Teutonic nations. Even before the establishment of the kingdom of the Picts and Scots in the person of Kenneth,

Northern Britain had experienced the attacks of a new enemy, the Scandinavian invaders, generally spoken of under the name of Danes. Constantine resisted them bravely, but towards the end of his reign he entered into an alliance with them in opposition to the English. A powerful army, composed of Scots and Picts, Britons and Danes, disembarked on the Humber, and was encountered at Brunanburgh by Athelstane, king of England. A battle was fought there, the first of a series of unfortunate combats by Scottish princes on English ground. The confederate army was defeated, and though Constantine escaped, his son was among the slain. Weary of strife, the king soon afterwards retired to the Culdee monastery at St Andrews, of which he became abbot, and where he died in 953.

During the reign of Malcolm the first of that name, and the successor of Constantine, a portion of the Cumbrian kingdom, including the modern Cumberland and part of Westmoreland, which had been wrested from the Britons by Edmund, king of England, was bestowed by that prince on the Scottish sovereign. This grant was the foundation of that claim of homage made by the English kings on the Scottish sovereigns, which afterwards became the cause or the pretext for the great struggle between the two nations. The northern kingdom was still further increased in the reign of Kenneth, son of Malcolm, by the acquisition of Lothian, and of Northern Cumbria, or Strathclyde. The former province, formerly a part of the Northumbrian kingdom, and entirely English in its population, was bestowed on Kenneth by Edgar, king of England. The Cumbrian kingdom, which had at one time extended along the west coast from the Firth of Clyde to the border of Wales, had been weakened by the loss of its southern territories; and it now fell under the dominion of the Scottish king. The last addition to Scotland in the south took place under Malcolm II., son of Kenneth, who acquired the Merse and Teviotdale from the Earl of Northumbria, and thus advanced his kingdom on the eastern border to the Tweed. The reign of Malcolm II. extended from 1003 to 1033. The kings who immediately followed are better known to the general readers than any of their predecessors, poetry having made their names familiar to every one. Malcolm's successor was his grandson, Duncan, whose brief reign was followed by that of Macbeth (q. v.). The latter was a vigorous and prudent ruler, munificent to the church, and famous as the only Scottish king who made a pilgrimage to Rome. But although by marriage he was connected with the royal line, he was unable to secure the affection of his subjects. Malcolm, the eldest son of Duncan, assisted by his kinsman, Siward, Earl of Northumbria, invaded Scotland. The usurper was defeated and slain at Lumphanan, in Mar, in 1056, and Malcolm was acknowledged as king.

The long reign of Malcolm III. was the commencement of a great social and political revolution in Scotland. His residence in England, and still more his marriage with the English Princess Margaret, the sister of Edgar Atheling, led to the introduction of English customs, the English language, and an English population into the northern and western districts of the kingdom, which hitherto had been for the most part inhabited by a Celtic race. The influx of English colonists was increased by the tyranny of William the Conqueror and his Norman followers. All received a ready welcome from the Scottish king, whose object it was to assimilate the condition of the Scots in every respect to that of their fellow-subjects in Lothian; and what his stern, though generous, character might have failed to accomplish, was brought about by the winning gentleness and Christian graces of his English queen.

Malcolm fell in battle before Alnwick Castle in the year 1093, and Margaret survived only a few days. On this event, it seemed as if the work of their reign was about to be utterly overthrown. The Celtic people of Scotland, attached to their old customs, and disregarding the claims of Malcolm's children, raised his brother, Donald Bane, to the throne. The success, however, of this attempt to restore a barbarism which the better part of the nation had outgrown, was of brief duration; Donald was dethroned, and Edgar, the eldest surviving son of Malcolm and Margaret, was acknowledged as king. The very name of the new sovereign marked the ascendency of English influence. That influence, and all the beneficial effects with which it was attended, continued to increase during the reigns of Edgar and his brother and successor, Alexander I. The change went steadily on under the wise and beneficent rule of David (q. v.), the youngest son of Malcolm. His reign, which extended from 1124 to 1153, was devoted to the task of ameliorating the condition of his subjects, and never was such a work more nobly accomplished. David was in every respect the model of a Christian king. Pious, generous, and humane, he was at the same time active and just, conforming himself to the principles of religion and the rules of the church with all the devotion of his mother, but never forgetting that to him, not to the clergy, God had committed the government of his kingdom. He was all that Alfred was to England, and more than St Lewis was to France. Had he reigned over a more powerful nation, his name would have been one of the best known among those of the princes of Christendom. As it is, every Scottish scholar has delighted to do his character justice. At the time of David's accession, Scotland was still but partially civilised, and it depended in a great measure on the character of its ruler whether it was to advance or recede. It received a permanent stamp from the government of David. The Celtic people were improved morally, socially, and ecclesiastically, and all along the eastern coast were planted Norman, English, and Flemish colonies, which gradually penetrated into the inland districts, and established the language and manners of that Teutonic race which forms the population of the greater part of Scotland. David encouraged and secured the new institutions by introducing a system of written law, which gradually superseded the old Celtic traditionary usages, the first genuine collections of Scottish legislation belonging to his reign. David was as great a reformer in the church as in the state. The ecclesiastical system prevalent in Scotland almost up to his time differed in some points from that established in England and on the continent, bearing a great resemblance to that of Ireland, from which it was indeed derived. David established dioceses, encouraged the erection and endowment of parishes, provided for the maintenance of the clergy by means of tithes, and displacing the old Celtic monastic bodies, introduced the Benedictine and Augustinian orders.

David, though devoting his energies to the improvement of his subjects in the manner which has been mentioned, did not forget duties of a less agreeable kind. He knew that a Scottish king really held his crown by the tenure of the sword, and none of his fierce ancestors was a more intrepid warrior than the accomplished and saintly David. His skill and courage were shewn, though without success, at the Battle of the Standard. As the representative through his mother of the ancient kings of England, he had many friends in that

country; and had the Scottish army been successful, the history of the two kingdoms might in some respects have been different. As it was, he contented himself with maintaining the cause of his sister's child, the Empress Matilda, against King Stephen.

David's grandson and successor, Malcolm IV., reigned for twelve years, and the next king was William the Lion, Malcolm's brother, who ruled from 1165 to 1214. These princes pursued the policy of their grandfather with equal resolution, though sometimes with less success. They were embarrassed by their connection with the English King Henry II., who took advantage of his superior power and ability to impose unwise and unjust restraints on the independence of the Scottish sovereigns and their kingdom—a policy which laid the foundation of the unhappy national strife of after years. This was averted for a time by the concessions of Richard I. in 1189. 'For more than a century,' says Lord Hailes, 'there was no national quarrel, no national war between the two kingdoms —a blessed period.' That period was well employed by the next two kings, Alexander II. and Alexander III., the son and grandson of William the Lion, to consolidate the institutions of their kingdom, and extend and confirm what had been begun by David. Alexander III. was one of the ablest and best of the Scottish kings. By a treaty with the king of Norway, he added to his kingdom Man and the other islands of the Western Sea, held by the Norwegians. His sudden death, in 1286, was one of the greatest calamities with which Scotland could have been afflicted. It closed a period of prosperity—a course of improvement—which the kingdom did not again enjoy for nearly 500 years. The history of this interesting period has yet to be written. The only modern account of any value is that in the accurate but meagre Annals of Lord Hailes. Tytler begins his History with the reign of Alexander III.; and Robertson, in his narrative of two reigns—which in popular language is called the History of Scotland, just as Lord Macaulay's similar work is called the History of England—speaks of what took place during the whole time from the union with the Picts to the death of Alexander III., as 'events which may be slightly touched, but merit no particular or laborious inquiry.'

On the death of the infant grand-daughter and heiress of Alexander III., in 1290, the succession to the crown was disputed. The question between the two chief claimants, Baliol and Bruce (q. v.), was not free from doubt according to the customs of the time; and Edward I. of England, to whom the decision was referred, appears at first to have acted with good faith. But this great king, who had already subdued Wales, was now bent on uniting the British Islands under one sceptre; and in the pursuit of that object he sacrificed humanity, honour, and justice. The results were most deplorable. The national spirit of the Scots was finally roused, and after a long struggle under Wallace and Bruce they secured their independence on the field of Bannockburn (q.v.). The battle of freedom was won; but it was at the expense of tranquillity and civilisation. The border counties were continually wasted by the English; the central provinces were the scene of frequent warfare among the chief nobles; and the highland districts became more and more the seat of barbarism, the Celtic tribes reacquiring something of their old ascendency, just as they did in Ireland in the troubled times which followed the invasion of Edward Bruce. The strong arm of King Robert might have repressed these disorders, had his life been longer spared after the treaty of Northampton; but his death, and the accession of an infant son, again plunged the country into all the miseries of foreign and civil war. When that son, David II., grew up to manhood, he proved in every respect unworthy of his great father. His reign, and that of his successors Robert II. and Robert III., the two first princes of the House of Stewart, were the most wretched period of Scottish history. In the year 1411, half of the kingdom would have become absolutely barbarous, if the invasion of the Lord of the Isles had not been repulsed at Harlaw (q. v.), by the skill of the Earl of Mar, and the bravery of the lowland knights and burgesses.

A happier time began to dawn on the release of James I., in 1424, from his English captivity. The events of the following period are better known, and a brief notice of the most important will be sufficient. Reference may be made for details to the accounts of the particular kings. The vigorous rule of James I. had restored a tranquillity to which his kingdom had long been unaccustomed; but strife and discord were again brought back on his assassination. One of the most calamitous features of the time, was a succession of minorities in the sovereign. James himself had succeeded when a child and a captive; James II., James III., James IV., James V., Mary, and James VI., all succeeded while under age, and all, except James IV., when little more than infants. The courage and ability shewn by almost all the Stewart princes were insufficient to repair the mischiefs done by others in the beginning of their reigns, and to abate the great curse of the country—the unlimited power and constant feuds of the nobles. The last addition to the Scottish kingdom was made in the reign of James III., when the islands of Orkney and Zetland were made over to him as the dowry of his queen, Margaret of Denmark. The marriage of James IV. with Margaret of England was far more important in its ultimate results, and brought about in the reign of his great-grandson that peaceful union with England which the death of the Maiden of Norway had prevented in the 13th century. Many good laws were enacted during the reigns of the Jameses; but the wisdom of the Scottish legislature was more shewn in framing them than the vigour of the government in enforcing them. Among the most important improvements of the period was the establishment of universities—the first of which, that of St Andrews, was founded during the minority of James I.—and the institution of the College of Justice in the reign of James V.

During the reign of the fifth James, religious discord added another element to the evils with which Scotland was afflicted. The practical corruptions of the church were greater than they were almost in any other country in Europe, and one of the consequences was, that the principles of the Reformation were pushed further than elsewhere. The first great ecclesiastical struggle had hardly ceased, by the overthrow of the Roman Catholic system, when the strife began anew in the Reformed Communion in the shape of a contest between Episcopacy and Presbyterianism, the former being supported by the sovereign, the latter by the common people, the nobles throwing their weight into either scale as it suited their policy at the time. James VI. struggled hard to establish an absolute supremacy, both in church and state, in opposition to a powerful party, which admitted no royal authority whatever in the former, and very little in the latter. After his accession to the English crown, he was apparently successful in carrying out his designs, but during the reign of his son, Charles I., the contest again broke out with increased bitterness. The nobility, whose rapacity

had been checked by the sovereign, joined the popular party. The opponents of the crown bound themselves together, first by the National Covenant, and afterwards in alliance with the English Puritans, by the Solemn League and Covenant. Their efforts were completely successful, but their success led to the utter overthrow of the monarchy by Cromwell.

The restoration of Charles II. was welcomed by all classes, wearied as they were of a foreign and military rule, but especially by the nobles and gentry, who had learned by bitter experience that the humiliation of the sovereign was necessarily followed by the degradation of their order. Had the government of Charles II. and James VII. been reasonably just and moderate, it could hardly have failed in securing general support; but unfortunately it was more oppressive and more corrupt than any which Scotland had experienced since the regencies in the minority of James VI. The natural result was the revolution, which seated William and Mary on the throne.

Hardly had the majority of the nation been successful in this, when many of them began to repent of what they had done, and Jacobitism became more popular than royalist principles had ever been when the House of Stewart was on the throne. The discontent was greatly increased by the fears entertained of English influence. The state of matters grew so threatening after the accession of Queen Anne, that the ruling English statesmen became satisfied that nothing short of an incorporating union between the two kingdoms could avert the danger of a disputed succession to the throne, and of a civil war. Supported by some of the ablest and most influential persons in Scotland, they were successful in carrying through their design, though it was opposed by a majority of the Scottish people. The Act of Union was formally ratified by the parliament of Scotland on the 16th of January 1707. It subsequently received the royal assent, and came into operation on the 1st of May of the same year. The union continued to be unpopular in Scotland for many years, an unpopularity increased by the corrupt means freely used to carry it through. But the discontent gradually ceased, and the ultimate consequences of the measure have been most beneficial to both kingdoms.

A few words may be added regarding the parliament of Scotland. That body was originally composed, like the English parliament, of three classes—the ecclesiastics (consisting of bishops, abbots, and priors), the barons, and the burgesses. The spiritual lords, during the establishment of Episcopacy after the Reformation, were composed of bishops only. When Presbyterianism was established at the time of the Covenant, and when it was formally ratified by law at the Revolution, the ecclesiastical estate ceased to have any place in parliament. The barons, or immediate vassals of the crown, at first sat in their own right, whether holding peerages or not; but afterwards the peers alone sat, the others sending their representatives. The burgesses were the representatives of the burghs. All the three estates sat to the very last in one house, the sovereign presiding in person, or through a commissioner named by him.

It would be impossible within reasonable limits to give a complete account of the original authorities for the history of Scotland. The principal ones are the following. For the period before the accession of David I.—Venerable Bede, the Early Lives of the Saints, the Irish Annals, the brief Scottish Chronicles published by Innes and Pinkerton, and the ancient English Chroniclers. For the subsequent period down to the Reformation—the Chronicles of Melrose and Lanercost, the Scotichronicon of Fordun and Bower, Winton's Chronicle, Leslie's and Buchanan's Histories, the English Chroniclers, the Ecclesiastical Chartularies, and the Acts of the Scottish Parliament. For the period from the Reformation to the Union—Knox's, Calderwood's, and Spottiswood's Histories, Baillie's Letters, Wodrow's and Burnet's Histories, the Acts of Parliament, and the State Papers. The chief modern authorities are Innes's *Critical Essay on the Ancient Inhabitants of Scotland*, Pinkerton's *Inquiry into the History of Scotland*, Chalmers's *Caledonia*, Hailes's *Annals*, and Tytler's, Robertson's, Laing's, and Burton's *Histories of Scotland*, and the *Domestic Annals of Scotland*, by R. Chambers.

SCOTLAND, CHURCH OF. An account has already been given of the conversion to Christianity of the early inhabitants of Scotland, see COLUMBA, CULDEES, NINIAN, PICTS, SCOTLAND, *History*. The doctrines of the ancient Scottish Church were precisely the same as those of the rest of Western Christendom. In ritual there were some points of difference, but they were so slight, that the most important related to the time of observing the Easter festival. In these, also, the Scots gradually conformed to the usage of the Roman and English Churches. In one point, however, there continued for several centuries to be a marked distinction between the Scots and Irish on the one hand, and the churches of England and the continent on the other. This was in reference to ecclesiastical government. The Scots recognised the same orders of the ministry, bishops, priests, and deacons, as other Christians did; and, like them, they held that ordination could be given only by bishops. But they acknowledged no such supremacy of jurisdiction in the Episcopal order as was held by other churches. In Scotland, there were neither dioceses nor parishes; but there were numerous monasteries, in which the abbots, whether bishops or priests, bore the chief rule, all being in subordination to the successor of St Columba, the presbyter-abbot of Iona, who, in virtue of that office, was primate of the Picts and Scots.

When Iona was desolated by the Northmen, the primacy seems to have been transferred in the middle of the 9th c. to the Abbots of Dunkeld, and about fifty years afterwards to the Bishops of St Andrews, who became known as *Episcopi Scotorum*, the bishops of the Scots. Slowly at first, but gradually an assimilation to the English and continental practices began, a change rendered more easy by the Scottish dominion being extended over Lothian, in which the ecclesiastical system was the same as that of England. A great impulse was given in the same direction by the marriage of Malcolm III., king of the Scots, with Margaret the sister of Edgar Atheling. The king and queen used their utmost efforts to introduce the English usages in ecclesiastical as in other matters; and Margaret herself held repeated conferences for that purpose with the chief Scottish ecclesiastics, at which her husband acted as interpreter. The principal points in which she attempted to bring about a reform were the commencement of the Lent fast, the superstitious infrequency of receiving the communion, and the lax observance of Sunday and of the Scriptural and canonical restrictions on marriage between relations.

The reform begun by Malcolm and Margaret was fully carried out by their youngest son, David I. These improvements were completed by his successors, and before the end of the 12th c. the ecclesiastical system of S. differed in no important point

from that of the rest of Europe. Some Scottish writers have lamented the change, as being one from purity of belief and practice to superstition and immorality. This is undoubtedly a mistake. The Celtic Church had become very corrupt, and the clergy were inferior both in learning and morals to their brethren in the south. King David was a reformer in the best sense of the word, and it does not detract from the character of his reformation, that as time went on the Scottish Church became involved in those superstitions with which the rest of Christendom was overspread.

The ritual of the Scottish medieval church was almost the same as that of England, the Salisbury Missal and Breviary being the models of the Liturgies and Office Books used in Scotland. The external system of the church—cathedral, parochial, and monastic—was also in almost every point identical. The chief monastic orders were the Benedictine, and its most important branches the Cluniac and Cistercian, the canons regular of St Augustine, and the Reformed Premonstratensian canons. The Cluniacs and Cistercians were in strict subordination to the mother-houses of their orders at Cluny and Citeaux. In the 13th c. the Dominican, Franciscan, and Carmelite friars were introduced into Scotland. The chapters of all the Scottish cathedrals, except those of St Andrews and Whithorn, were composed of secular canons—the chief dignitaries being a dean, archdeacon, chancellor, precentor, and treasurer. The prior and canons regular of the Augustinian monastery at St Andrews formed the chapter of that see, and the prior and Premonstratensian canons of Whithorn formed the chapter of the cathedral of Galloway. There were twelve dioceses in the Scottish Church, to which Orkney was added on the transference of those islands to the Scottish sovereign in the 15th century. The twelve dioceses were Caithness, Ross, Moray, Aberdeen, Brechin, Dunkeld, Dunblane, St Andrews, Argyle, the Isles, Glasgow, and Galloway. The larger of these dioceses were divided, like the English dioceses, into rural deaneries. The single point in which the medieval church down to the 15th c. differed from that of England and other churches of the west, was in its having no metropolitan. St Andrews, and next to it Glasgow, had a certain precedence; the bishops of the former see, and failing them the bishops of the latter, having the privilege of crowning and anointing the sovereign. But they had no jurisdiction over the other sees, nor did their bishops bear the style of archbishop. This led to claims on the part of the Archbishops of York to metropolitan authority in S., which had no foundation except in regard to the southern portion of the diocese of St Andrews, and the see of Galloway, the bishops of which were, for several centuries, suffragans of York. The court of Rome found it convenient, for the sake of its own privileges, to encourage this anomalous system; but to provide for the meetings of the Scottish bishops in provincial council, a bull of Pope Honorius III., in 1225, authorised them to meet in synod. In virtue of this bull, the bishops, abbots, priors, and other chief ecclesiastics, with representatives of the capitular, collegiate, and conventual bodies, assembled annually in provincial synod, sitting in one house, under the presidency of a conservator chosen by and from the bishops. The chief government of the church under the pope thus devolved on these synods, and their elective presidents. This continued until the erection of St Andrews into an archiepiscopal and metropolitan see, in virtue of a bull of Pope Sixtus IV., in 1472. By this bull all the Scottish sees were made suffragans to that of St Andrews, whose bishops were now to be styled archbishops.

In 1492 Glasgow was raised to the dignity of a metropolitan see by a bull of Pope Innocent VIII., and the Bishops of Dunkeld, Dunblane, Galloway, and Argyle were made suffragans to its archbishop, an arrangement which was soon afterwards altered to some extent—Dunkeld and Dunblane being reannexed to St Andrews, and Glasgow having for its suffragan sees those of Galloway, Argyle, and the Isles. This last arrangement continued till the Reformation; and afterwards, during the establishment of Episcopacy—the two Scottish archbishops occupying towards each other precisely the same position as the Archbishops of Canterbury and York, and being sometimes involved in the same unseemly broils, in regard to jurisdiction and precedence, which long existed between the English metropolitans.

S. shared in all the errors of belief and superstitious practices in worship to which the rest of Christendom was subjected, and the ignorance and immorality of the clergy were far worse than they were in England, or perhaps anywhere in Europe, except in the Scandinavian churches. The desire for reformation which led to the proceedings of Huss and Wickliffe, produced similar effects in the Scottish kingdom. As early as the year 1406 or 1407, James Resby, an English priest, and a disciple of Wickliffe, was burned at Perth; and in 1433, Paul Crawar, a German Hussite, was burned at St Andrews. The opinions of Wickliffe continued to be privately taught, particularly in the south-western counties, where his followers were known by the name of the Lollards of Kyle. In the following century, the intercourse with the continent was frequent and close, and the effects of Luther's preaching and writings were soon felt in Scotland. In the year 1525, the importation of Lutheran books, and the propagation of the Reformer's tenets, were forbidden by an act of the Scottish parliament; and in February 1528, Patrick Hamilton, abbot of Ferne, was burned at St Andrews for teaching and publishing Lutheran doctrines. The piety of Hamilton, and the patience with which he bore his sufferings, induced others to follow his teaching and example. Several persons, both ecclesiastics and laymen, were subsequently burned, and many more fled to England or the continent.

The persecution, though encouraged or permitted by the bishops, was disapproved of by some ecclesiastics of learning and influence, who were desirous of effecting a reform in the church without breaking off from communion with the hierarchy. The efforts of this school were unsuccessful, and the Scottish nation was gradually divided into two parties—one of which, headed by the bishops, and supported by the state, was determined to resist all change; and the other, composed of a considerable number of the clergy both regular and secular, of the gentry, and of the burgesses of the large towns, was disposed to carry its reforming principles far beyond what had been done by Luther and Melancthon. These two parties came into deadly conflict in 1546. On the 28th of February in that year, George Wishart, the most eloquent of the Reforming preachers, was condemned to death by an ecclesiastical court—at which Cardinal Beaton, Archbishop of St Andrews, presided—and was burned. On the 28th of May following, the cardinal was murdered by Norman Leslie and other adherents of the Reforming party. The struggle continued during the regency of the Earl of Arran and that of Mary of Lorraine, the mother of Mary, the young queen of Scots.

In the year 1559 the Reformers became strong enough to set the regent at defiance. Various

circumstances encouraged them to demand freedom for their opinions, particularly the death of Mary of England and the accession of Elizabeth. They were further animated at this time by the return from Geneva of their chief preacher, John Knox. The conflict was to be decided by other than spiritual weapons. The regent and the Reformed, now known by the name of the Congregation, met in open warfare. The contest was carried on for a twelvemonth, and ended in the triumph of the Congregation. A parliament met at Edinburgh on the 1st of August 1560. The Reforming party had the complete ascendency, and succeeded in passing several acts, by which the jurisdiction of the pope was abolished, the mass was proscribed, and a Confession of Faith, drawn up by Knox and his associates, was ratified, the spiritual lords making a faint resistance.

The new Confession of Faith adhered, in all essential articles of belief, to the ancient creeds of the church. In regard to the sacraments, it differed entirely from the recent corrupt teaching of the Western Church; but its language, on the whole, was moderate and conciliatory. In reference to ceremonies and the details of church polity, it declared that such things were temporary in their nature, and not appointed for all times and places, and that they ought to be altered when they fostered superstition and ceased to be conducive to edification.

A Book of Discipline was soon afterwards drawn up by the compilers of the Confession, which was generally approved of, but did not receive the sanction of parliament. It followed out in detail the principles laid down in the Confession. In regard to the office-bearers of the church various orders were mentioned, but three were specially of importance—ministers, elders, and deacons. Ministers were to be chosen by each several congregation, but were to be examined and admitted in public by the ministers and elders of the church. No other ceremony, such as imposition of hands, was to be used. The elders and deacons were to be chosen yearly in each congregation, and were not to receive any stipend, because their office was only to be from year to year, and because they were not to be debarred from attending to their own private occupations. In order to the better provision for the wants of the time, certain persons, called superintendents, were appointed in particular districts, with power to plant and erect churches, and to appoint ministers within the bounds of their jurisdiction.

The chief governing as well as legislative and judicial power in the Reformed Church was intrusted to a General Assembly, which met half-yearly or yearly, and was composed of the superintendents, ministers, and lay commissioners, and which gradually, by the introduction of the system of representation, assumed the form and more than the power of a parliament.

The worship of the Reformed Church was modelled on that established by Calvin at Geneva. It was embodied in a formulary called the Book of Common Order, which for nearly a century continued to be generally used. It contained forms for the ordinary worship both on Sundays and week-days, and for the administration of the sacraments, and for certain other occasions. The minister was not absolutely restricted to these forms. Except in the singing of Psalms, the people took no direct part in ordinary worship, and there was no distinction of ecclesiastical seasons, all holydays whatever except Sunday being abolished.

The form of church government established at the Reformation did not remain long undisturbed. Some of the most zealous Protestants thought the danger to which the church was exposed from state tyranny and aristocratical oppression, could best be met by restoring the bishops to their ancient position both in the church and in the parliament; while others, of equal zeal and sincerity, saw in this only the commencement of a plan for bringing back all the errors of popery. A scheme of this kind was actually established for some time, and the sees were filled with Protestant bishops set apart for the office by their brethren of the ministry. It was almost immediately attacked by some of the ministers, who soon found a leader in Andrew Melville, a scholar of considerable eminence, who returned to Scotland in 1574, after a residence in Geneva, during which he had ardently embraced the new opinions as to ecclesiastical government maintained by Beza.

The struggle continued for some years, the bishops being encouraged by the sovereign and his advisers, whose support was frequently of little real advantage to them, and Melville receiving the zealous assistance of many of the ministers, and of the great body of the common people, who sympathised with him in his democratical theories of civil and ecclesiastical government. Melville was at last entirely successful. His opinions were embodied in what was called the Second Book of Discipline, which received the formal sanction of the General Assembly in 1581. This formulary differed very much from the First Book. It laid down authoritatively those principles in regard to ecclesiastical authority which the English Puritans were vainly striving to establish in the southern kingdom, and was in reality an attempt to make the civil power subordinate to the ecclesiastical, even in matters secular. It recognised four orders of office-bearers in the church, the Pastor, Minister, or Bishop, the Doctor, the Presbyter or Elder, and the Deacon. These were to be set apart by ordination, and the imposition of the hands of the eldership, but no one was to be intruded into any office contrary to the will of the congregation, or without the voice of the eldership. Four sorts of church courts, each rising above the other, were sanctioned; first, of particular congregations one or more; second, of a province, or what was afterwards called the Provincial Synod; third, of a whole nation; and fourth, of the universal church. What is generally regarded as the most essential feature of the Presbyterian system—the Presbytery—was not yet introduced in its proper form, the lowest court being a combination of what were afterwards known as the Presbytery and the Kirk-Session. It was, however, introduced before the year 1592, when the privileges of general and provincial assemblies, presbyteries, and parochial sessions were ratified by parliament, though the Book of Discipline itself did not receive any formal sanction.

King James had agreed to the establishment of Presbyterianism, but personally, and as a sovereign he disliked its discipline, and he soon endeavoured to overthrow it. His accession to the crown of England enabled him to do this with more authority. He gradually obtained from the General Assembly a recognition of the civil rights of the bishops, and this led to the restoration of their ecclesiastical privileges. His changes were sanctioned by a General Assembly which met at Glasgow in 1610, and in the course of the same year Episcopacy was restored in reality, as well as in name, by the consecration of three Scottish prelates, by four of the English bishops, at London.

The king wished to assimilate the Scottish Church, as far as possible, to that of England, and his next important movement was the establishment of what

are called the Five Articles of Perth. See PERTH, THE FIVE ARTICLES OF.

These various changes excited great dissatisfaction in Scotland, particularly in the southern counties, but it gradually abated to a considerable extent, and might have altogether ceased, had not further innovations been attempted. It was the wish of James to introduce a prayer-book like that of the English Church, in place of the Book of Common Order, but he saw the danger with which the proposal was attended, and gave it up or postponed it. His son Charles was as inferior to his father in prudence, as he excelled him in conscientiousness and religious zeal. During his first visit to Scotland he added another bishopric—that of Edinburgh—to the dioceses of the Scottish Church. Most unwisely, and most improperly, he endeavoured by his royal authority to introduce into that church a Book of Canons and a Liturgy framed on the model of those of England. The king had many loyal supporters in all parts of Scotland, and in the north Episcopacy was preferred by the people to Presbyterianism. But the storm of popular indignation which was now roused swept everything before it. The king's opponents banded themselves together by the National Covenant, and at a General Assembly held at Glasgow abolished the Perth Articles and Episcopacy, and re-established Presbyterianism. Charles attempted to maintain his claim by the sword, but was unsuccessful, and obliged to ratify in parliament all that had been done by his opponents.

Had the Covenanters been satisfied with the victory which they had won, Presbyterianism might have remained the established religion of the Scottish kingdom. But they could not resist the entreaties for aid from the English Puritans, or rather they yielded to the delusion of extending their own discipline over the churches of England and Ireland. They just attempted, in an opposite direction, what James and Charles had failed to accomplish. For a time their policy seemed to triumph. The Solemn League and Covenant of the three kingdoms, after having been approved by the General Assembly in Scotland, was signed by the Assembly of Divines which the parliament had summoned to meet at Westminster, and by the parliament itself. The ecclesiastical documents which were afterwards drawn up, originated with the Assembly of Divines, but were sanctioned by the Assembly in Scotland. The principal of these were a Directory for Public Worship, a Confession of Faith, and a Larger and Shorter Catechism. See ASSEMBLY OF DIVINES, and CREEDS AND CONFESSIONS. The first of these documents was intended to supersede the Book of Common Prayer in England, and, indirectly, the Book of Common Order in Scotland. It laid down certain general rules in regard to public worship and the administration of the sacraments, but left very much to the discretion of the particular ministers and congregations.

The union between the Scottish and English Puritans was dissolved by the ascendency of the Independents. Scotland, distracted by civil and ecclesiastical dissension, was unable to defend itself against Cromwell. It was conquered and kept thoroughly under subjection by the English army, which forbade the meetings of the General Assembly, but left the other courts and the rest of the church system as they were before. At the Restoration, the higher classes generally, who had suffered under the ecclesiastical tyranny of the ministers, were zealous for the re-establishment of Episcopacy. The greater part of the nation, except in the south-western provinces, was indifferent, and the king experienced no difficulty in restoring the bishops to their former rights both in church and state. But Episcopacy alone was restored; there was no attempt to introduce a liturgy, or even to enforce the observance of the Perth Articles. The new primate, Archbishop Sharp, was an able man, of good moral character, but ambitious and overbearing, and the Covenanters never forgave his change from Presbyterianism, though he had always belonged to the more moderate of the two parties into which the church was divided. He was almost the only one of the bishops who enjoyed political influence; and unfortunately for himself and the hierarchy, that influence was generally used to encourage, not to restrain, the severe measures of the government. When the primate was assassinated, that severity became a cruel tyranny, and many who had no predilection for any particular ecclesiastical opinions were ready to welcome the change which took place at the Revolution.

When the Scottish Estates met in 1689, to consider what course was to be adopted in the northern kingdom, the bishops declined to abandon King James. Whatever might have been the consequences had they taken an opposite course, this resolution was fatal to the Episcopal establishment. William and Mary were called to the throne, and Prelacy was declared to be an insupportable grievance, and was abolished. In the following year, Presbyterianism was re-established, and the Westminster Confession of Faith was ratified as the national standard of belief, and the right of patrons to nominate to ecclesiastical benefices was taken away. In the end of the same year a General Assembly was held, the first which had been allowed to meet since its dissolution by the order of Cromwell. It was composed, as before, of ministers and elders from the various presbyteries, and of elders from the burghs and universities, and was presided over by a lay commissioner, named by the crown, and a minister elected by the members as moderator. With the exception of some years in the reign of William, the Assembly has continued to meet annually since the Revolution, and to transact business during the periods when it was not in session by a commission named by itself for the purpose. See ASSEMBLY, GENERAL. The other chief ecclesiastical events of William's reign were a series of vain attempts on the part of the sovereign to bring about a comprehension of the Episcopal clergy with those of the Establishment, and the passing by the Assembly in 1697 of what was called the 'Barrier Act' (q. v.), which guarded against sudden legislation, by providing that no permanent act should be passed until it had received the approbation of the majority of the presbyteries.

During the reign of Queen Anne, and in the year 1707, England and Scotland were united into one kingdom. A special statute was passed for the security of the Protestant religion and Presbyterian church government in the latter country; providing that these should continue without any alteration in time to come, and confirming the act of William and Mary, which ratified the Confession of Faith, and settled the Presbyterian form of church government.

In the year 1712, an act was passed by the British parliament which restored to patrons in Scotland their right of presentation to benefices. This statute excited great discontent among the members of the Established Church, and for many years attempts were made to obtain a repeal of it. These attempts were unsuccessful, but its provisions were long practically disregarded. When at length the General Assembly began to act upon it, the dissatisfaction increased among those who

held the divine right of the people to choose their own ministers. The leader of the discontented party was a minister named Ebenezer Erskine, and he with his adherents, in the year 1733, finally separated from the Establishment, and formed a communion which took the title of the Associate Presbytery, though its members were popularly known as the Seceders. The Seceders themselves were soon divided by a very absurd dispute into two bodies, called the Burgher and Antiburgher Synods. In the year 1761, another secession from the Establishment took place in connection with the law of patronage; and the separated body assumed the name of the Presbytery of Relief.

There were no further secessions from the church; but its members were divided into two parties, known as the Moderates and the Evangelicals (q. v.), the former of whom were favourable, the latter hostile to the law of patronage. For many years the Moderates, headed by Dr Robertson the historian and others of his school, and supported by the influence of the government, maintained an ascendency in the General Assembly and throughout the country. In the latter years of George III., and during the reign of George IV., this ascendency began to decrease. The political excitement which prevailed in the beginning of the reign of William IV. strongly affected the Scottish Establishment, which from its very constitution is peculiarly liable to be moved by the impulses of popular feeling. The two parties in the General Assembly engaged in a struggle more fierce than any in which they had yet met; and the subject of dispute, as before, was immediately connected with the law of patronage. Dr Chalmers, the most distinguished minister in Scotland, added the whole weight of his influence to the popular party, and in 1834 an interim act of Assembly was passed, known as the Veto Act, which declared it to be a fundamental law of the church that no pastor should be intruded on any congregation contrary to the will of the people, and laid down certain rules for carrying out this principle. The legality of this act was doubted; and in connection with a presentation to the parish of Auchterarder, the presentee, on being rejected by the presbytery in terms of the Veto Act, appealed, with concurrence of the patron, to the Court of Session—the supreme civil court in Scotland. That court decided that the conduct of the presbytery in rejecting the presentee was illegal, and their judgment was affirmed by the House of Lords. Other cases of a similar nature followed, and something like a conflict took place between the civil and ecclesiastical courts, the former enforcing their sentences by civil penalties, the latter suspending and deposing the ministers who obeyed the injunctions of the Court of Session. In the General Assembly of 1843 the dispute came to a crisis. A large number of ministers and elders of the popular party left the Assembly, and met apart in a similar body, of which Dr Chalmers was chosen moderator. They formed themselves into a separate communion under the title of 'The Free Church of Scotland,' and gave up their benefices in the Established Church, and all connection whatever with that body. The Free Church carried off about one-half of the members of the Establishment, and became a rival communion in most of the parishes of Scotland. See FREE CHURCH.

Before the commencement of this great struggle, and again soon after its conclusion, the divisions connected with the older separation were partially healed. In 1820 the Burgher and Antiburgher Seceders were united under the name of the Associate Synod of the Secession Church; and in 1847 this Associate Synod and the Relief Synod were united under the name of 'The United Presbyterian Church' (q. v.). Negotiations are at present in progress for an union of the United Presbyterian Church and the Free Church.

A few remarks may be added on the history of Scottish Episcopacy subsequently to the Revolution. It is a common but erroneous opinion that almost all the Episcopal clergy were Jacobites from the time of the accession of William and Mary. The bishops were so; but a large number, probably a considerable majority of the clergy, had at first no objection to take the oath of allegiance to the new government. During the reign of Queen Anne, the Episcopal clergy were well disposed to the government, knowing the queen's good wishes to their communion. They were frequently harassed by the courts of the Establishment; but all who were willing to take the oaths obtained an ample protection for their worship on the passing of the Toleration Act of 1712. On the death of the queen, almost all the clergy, and most of the laity, were involved directly or indirectly in the attempts to overthrow the Hanoverian dynasty, and it was this which finally made the names of Episcopalian and Jacobite for many years to be convertible terms.

In the meantime, the succession of bishops had been kept up by new consecrations, and after some years the dioceses, though diminished in number, were regularly filled. An important change took place in the forms of worship. No longer trammelled by their connection with the state, they adopted liturgical forms similar to those in the English Prayer-book, and in almost all cases identical, except that many of the congregations used an Office for the communion modelled on that of the Scottish Liturgy of King Charles I. The Episcopalians took no such open part in the insurrection of 1745 as they did in that of 1715, but their sympathies were known to be with the House of Stewart; and the government carried through parliament some intolerant acts, which were put in execution with great harshness, and which for many years suppressed all public worship in the Episcopal communion. It was only after the accession of George III. that these statutes ceased to be actively enforced; and it was not till 1792 that the Episcopalians, who from the death of Prince Charles had acknowledged the reigning dynasty, were relieved from the penal laws. The act which gave this relief imposed restrictions on their clergy officiating in England, and prohibited their holding benefices in the English Church. In 1804, the bishops and clergy agreed to adopt the Thirty-nine Articles of the Church of England, and in 1863, the Prayer-book was adopted as the authorised service-book of the Episcopal Church, permission being given in certain cases to use the Scottish Communion Office. The restrictions imposed on the Scottish clergy by the act of 1792 were modified by an act passed in 1840; and in 1864 they were entirely removed, the right being reserved to bishops in England and Ireland to refuse institution to a Scottish clergyman without assigning any reason, on his first presentation to a benefice in England or Ireland, but not after he should have once held such benefice.

The dioceses of the Scottish Episcopal Church are seven in number, viz., Moray, Aberdeen, Brechin, Argyle, St Andrews, Edinburgh, and Glasgow. The bishops are chosen by the clergy of the diocese, and by representatives of the lay communicants, a majority of both orders being necessary to a valid election. One of the bishops, under the name of Primus, chosen by the other bishops, presides at all meetings of the bishops, and has certain other privileges, but possesses no metropolitan authority

The highest judicial body is the Episcopal College, composed of all the bishops. The highest legislative body is a General Synod, composed of two houses, the one of the bishops, the other of the deans and the representatives of the clergy.

The chief original authorities for the ecclesiastical history of Scotland down to the Revolution are the same as those mentioned in the article on the Civil History (q. v.). The chief modern authorities are: Cook's *History of the Reformation* and *History of the Church of Scotland;* Cunningham's *Church History of Scotland;* Grub's *Ecclesiastical History of Scotland.*

SCOTLAND, ROYAL ARMS OF. The arms of Scotland are—Or, a lion rampant gules, armed and langued azure, within a double tressure flory counterflory of fleurs-de-lis of the second. Supporters—Two unicorns argent armed maned and unguled or, gorged with open crowns, with chains affixed thereto, and reflexed over the back of the last. Crest—A lion sejant affronté gules crowned

Royal Arms of Scotland, previous to the Union.

or, holding in the dexter paw a sword, and in the sinister a sceptre, both erect proper.

The lion is first seen on the seal of Alexander II., and the tressure on that of Alexander III. The unicorn supporters do not appear on any of the royal seals of Scotland till the time of Queen Mary, on whose first Great Seal (1550) they are represented as chained and gorged with crowns. They were, however, sculptured on Melrose Abbey as early as 1505.

In 1603, in consequence of the union of the crowns of England and Scotland, the Scottish arms came to be quartered with those of England and Ireland, while one of the English lions was adopted as a supporter. Precedence was, however, given within Scotland to the Scottish ensigns, which occupied the first and fourth quarters, and the unicorn also obtained the place of honour, being dexter supporter. From about the time of Charles I. to 1707, it became the practice to represent the unicorn as not merely gorged with an open crown, but crowned with an imperial crown. The Treaty of Union of 1707 declared (Art. 1) that the ensigns of the United Kingdom should be in future such as her majesty should appoint 'on all flags, banners, standards, and ensigns, both on sea and land;' the same mode of marshalling being adopted in England and Scotland. But Art. 24 has been sometimes supposed to leave room for a different mode of marshalling on the seals in use in matters relating exclusively to Scotland, and on the Great and other seals of Scotland. Since, as well as before the Union, precedence has been given to Scotland. The question of the proper marshalling of the royal arms within Scotland was raised in 1853 by a petition to the Queen by the magistrates of Brechin; a reference was made by the Home Office in the first instance to Garter King-at-Arms, and Garter's report was transmitted to the office of the Lord Lyon, where it was returned with observations by the Lyon Depute, who considered Scotland entitled to precedence on the judicial seals of the country; and his views have since continued to be acted on.

SCOTT, DAVID, a remarkable Scottish painter, was born in Edinburgh, October 10, or 12, 1806. He may be said to have commenced his career as an artist by an apprenticeship to his father, who was a landscape engraver; but endowed as he was with a deep, stern, sombre genius, it was soon visible to all who knew him that he was meant to be a painter. The first production that he ventured to send to the British Institution, 'Lot and his Daughters fleeing from the Cities of the Plain,' was returned as too large; but S. was too 'imperiously original' to take advice, and went on courageously painting pictures which, it has been said, 'would have required a hall for their exhibition, and which the public would neither admire nor buy.' In 1831, he exhibited the 'Monograms of Man,' a series of singularly suggestive sketches; and the first of his illustrations to Coleridge's *Ancient Mariner*, which are almost equal to the poem itself in weird and vivid beauty. In 1832, among others, 'Sarpedon carried by Sleep and Death,' a very fine work. In the autumn of the same year he set out for Rome, visiting most of the famous artistic cities on his way. Nothing, however, that he saw in Italy or France, materially affected the bent of his genius, and his picture of 'Discord, or the Household Gods Destroyed,' painted there, exhibits all the peculiarities of his style and thought in a rampant and even repellent manner. In 1834 he returned to Edinburgh, and resumed his solitary brush. Passing over several interesting works, we may specially mention, as belonging to the year 1838, 'Ariel and Caliban,' and the 'Alchymist,' two of his best efforts in point of execution. Between 1840 and 1843, his chief productions were 'Philoctetes,' 'Queen Elizabeth in the Globe Theatre,' 'The Duke of Gloucester taken into the Water-gate of Calais,' 'Silenus praising Wine,' 'Richard III.;' his illustrations (40 in number) of *The Pilgrim's Progress*, in which, as in those of *The Ancien Mariner*, he rivals the genius of the author he illustrates. In 1847, he produced the masterpiece of his whole career, 'Vasco de Gama encountering the Spirit of the Cape.' But S., always delicate, and even drooping in health, had now exhausted himself, and on the 5th of March 1849 he died, when fame was only beginning to encircle his name. S.

contributed some vigorous essays on 'The Characteristics of the Great Masters' to *Blackwood's Magazine*. An unusually interesting *Memoir* by his brother, W. B. Scott, was published in 1850.

SCOTT, Sir Michael, a medieval scholar and philosopher of the 13th c., whose real history is not only obscure but positively unknown. Boece identifies him with a Michael Scott of Balweary, in the parish of Kirkcaldy, in Fifeshire, who, along with Sir Michael de Wemyss, was sent to Norway in 1290, by the Scottish Estates, to bring home the 'Maiden of Norway,' and his death is fixed in the following year. But Sir Robert Sibbald, in his *History of Fife and Kinross* (published in the reign of Charles II.), speaks of a certain indenture, dated 1294, to which S.'s name was affixed, and in another part of the same book states that he went on a second embassy to Norway, in 1310, to demand the cession of the Orkneys. If we may rely upon Sir Robert's statement, it is hardly possible that the Scotch 'wizard' of European renown could have been the same person as Michael Scott of Balweary, because (as the story goes) after studying at Oxford or Paris, he went to the court of Frederic II., and wrote there some books at the request of that monarch. Now Frederic died in 1250, and supposing 'the wizard' not more than 30 years old at that time, this would make him 70 when he went to Norway the first time to bring home the 'Maiden,' and 90 on his second visit to demand the cession of the Orkneys; neither of which things is likely. Hector Boece, it should be observed, is our sole authority for the identification of Michael Scott of Balweary with the wizard, while, on the other hand, Dempster, in his *Historia Ecclesiastica Gentis Scotorum* (Bologna, 1627), distinctly avers that the name *Scotus*, borne by the latter, was that of his nation and not of his family—Michael, 'the Scot.' It has been suggested that the ambassador may have been the son of the wizard, and that Boece may have confounded the two—a supposition probable enough in itself, but for which, in the absence of evidence, nothing can be said. The legend is further complicated by the fact that it appears to be English as well as Scottish. Cumberland claims the magic hero for herself. Camden, in his *Britannia* (1586), asserts that he was a monk of Ulme or Holme Cultram in that country, about 1290, 'who applied himself so closely to the mathematics, and other abstract parts of learning, that he was generally looked on as a conjurer; and a vain credulous humour has handed down I know not what miracles done by him.' He likewise states that S.'s 'magic books' were preserved there, but adds that they were then mouldering into dust; and Satchells (see his rhyming *History of the Right Honourable Name of Scott*) declares that he examined a huge tome which was held to be the wizard's, at Burgh-under-Bowness in 1629. According to the Scottish legend, he was buried in the Abbey of Melrose, and the Border was the scene of many of his most wonderful exploits, such as the cleaving of the Eildon Hills into three separate cones, and his bridling of the river Tweed! Dante mentions him in his *Inferno* (some years before 1321), in a way that shews that already his fame as a magician had spread over the continent, and suggests the suspicion that he must have died sooner than is commonly believed. All, however, that any one who rationally looks at the legend can believe is, that a certain Michael Scott, or Michael the Scot, flourished in the 13th c., and was mistaken by the common people of his country for a wizard or magician, probably on account of his skill as an experimentalist in natural philosophy. The writings attributed to him indicate that his studies lay in this direction.

SCOTT, Sir Walter, the fourth child of Walter Scott, Writer to the Signet in Edinburgh, was born in that city on the 15th August 1771. He came of the old Border family, the Scotts of Harden, an offshoot from the house of Buccleuch. Though he matured into a man of robust health, and of strength nearly herculean, as a child he was feeble and sickly, and very early he was smitten with a lameness which remained with him through life. His childhood was passed for the most part at Sandyknowe, the farm of his grandfather, in Roxburghshire. Here the foundations of his mind were laid; and his early and delighted familiarity with the ballads and legends then floating over all that part of the country, probably did more than any other influence to determine the sphere and modes of his future literary activity. Between the years 1779 and 1783 he attended the High School of Edinburgh, where, despite occasional flashes of talent, he shone considerably more on the playground as a bold, high-spirited, and indomitable little fellow, with an odd turn for story-telling, than within he did as a student. In 1783, he went to the University, and for three years he remained there, as it seemed, not greatly to his advantage. Afterwards, in the height of his fame, he was wont to speak with deep regret of his neglect of his early opportunities. But though leaving college but scantly furnished with the knowledge formally taught there, in a desultory way of his own he had been hiving up stores of valuable, though unassorted information. From his earliest childhood onward, he was a ravenous and insatiable reader; his memory was of extraordinary range and tenacity, and of what he either read or observed he seems to have forgot almost nothing. Of Latin, he knew little, of Greek less; but a serviceable, if somewhat inexact knowledge of French, Italian, Spanish, and German he had acquired, and he continued to retain. On the whole, for his special purposes, his education was perhaps as available as if he had been the pride of all his preceptors. In 1786, he was articled apprentice to his father, in whose office he worked as a clerk till 1792, in which year he was called to the bar. In his profession he had fair success, and in 1797 he was married to Charlotte Margaret Carpenter, a lady of French birth and parentage. Towards the end of 1799, through the interest of his friends Lord Melville and the Duke of Buccleuch, he was made sheriff-depute of Selkirkshire, an appointment which brought him £300 a year, with not very much to do for it. Meantime, in a tentative and intermittent way, his leisure had been occupied with literature, which more and more distinctly announced itself as the main business of his life. His first publication, a translation of Burger's ballads, *Lenore* and *The Wild Huntsman*, was issued in 1796. In 1798 appeared his translation of Goethe's drama of *Goetz von Berlichingen;* and in the year following he wrote the fine ballads, *Glenfinlas*, the *Eve of St John*, and the *Grey Brother*. The year 1802 gave to the world the first two volumes of his *Border Minstrelsy*, which were followed in 1803 by a third and final one. This work, the fruit of those 'raids'—as he called them—over the Border counties, in which he had been wont to spend his vacations, was most favourably received by the public, and at once won for him a prominent place among the literary men of the time. In 1804, he issued an edition of the old poem *Sir Tristrem*, admirably edited and elucidated by valuable dissertations. Meantime *The Lay of the Last Minstrel* had been in progress, and by its publication in 1805, S. became at a bound the most popular author of his day. During the next ten years, besides a mass of miscellaneous work, the

most important items of which were elaborate editions of Dryden (1808) and of Swift (1814), including in either case a Life, he gave to the world the poems *Marmion* (1808), *The Lady of the Lake* (1810), *The Vision of Don Roderick* (1811), *Rokeby* (1812), *The Bridal of Triermain*, anonymously published (1813), *The Lord of the Isles*, and *The Field of Waterloo*. The enthusiasm with which the earlier of these works were received somewhat began to abate as the series proceeded. The charm of novelty was no longer felt; moreover, a distinct deterioration in quality is not in the later poems to be denied; and in the bold outburst of Byron, with his deeper vein of sentiment and concentrated energy of passion, a formidable rival had appeared. All this S. distinctly noted, and after what he felt as the comparative failure of *The Lord of the Isles* in 1815, with the trivial exception of the anonymous piece *Harold the Dauntless* (1817), he published no more poetry. But already in *Waverley*, which appeared without his name in 1814, he had achieved the first of a new and more splendid series of triumphs. *Guy Mannering*, *The Antiquary*, *The Black Dwarf*, *Old Mortality*, *Rob Roy*, and *The Heart of Midlothian* rapidly followed, and the 'Great Unknown,' as he was called (whom yet every one could very well guess to be no other than Walter S.), became the idol of the hour. The rest of the famous series, known as the Waverley Novels, it would be idle to mention in detail. From this time onward, for some years, S. stood on such a pinnacle of fame and brilliant social prosperity as no other British man of letters has ever gone near to reach. He resided chiefly at Abbotsford, the 'romance in stone' he had built himself in the Border country which he loved, and thither, as 'Pilgrims of his Genius,' summer after summer repaired crowds of the noble and the distinguished, to partake the princely hospitalities of a man whom they found as delightful in the easy intercourse of his home, as before they had found him in his writings. In 1820, to set a seal upon all this distinction, a baronetcy was bestowed upon him as a special mark of the royal favour. But the stately fabric of his fortunes, secure as it seemed, was in secret built upon the shifting sands of commercial speculation, and in the disastrous crisis of the year 1826 a huge ruin smote it. In 1805, S.'s income, as calculated by his biographer, was something nigh £1000 a year, irrespective of what literature might bring him; a handsome competency, shortly by his appointment to a clerkship of the Court of Session, to have an increment at first of £800, subsequently of £1300. But what was ample for all prosaic needs, seemed poor to his imagination with its fond and glittering dreams. Already some such vision, as at Abbotsford was afterwards realised, flitted before his mind's eye, and it was the darling ambition of his heart to re-create and leave behind him, in the founding of a family, some image of the olden glories which were the life of his literary inspirations. In the year above mentioned, lured by the prospect of profit, and without the knowledge of his friends, he joined James Ballantyne, an old schoolfellow, in the establishment of a large printing business in Edinburgh. To this, a few years afterwards, a publishing business was added, under the nominal conduct of John Ballantyne, a brother of James; S., in the new adventure, becoming as before a partner. Gradually the affairs of the two firms became complicated with those of the great house of Constable & Co., in the sudden collapse of which S. found himself one forenoon a bankrupt, with personal liabilities to the extent of something like £150,000.

'In the reproof of chance
Lies the true proof of men'—

and now, in this challenge of adverse fate, S.'s manhood and proud integrity were most nobly approved. With his creditors, composition would have been easy; but this usual course he disdained. 'God granting him time and health,' he said, he would owe no man a penny. And somewhat declined as he now was from the first vigour and elasticity of his strength, he set himself by the labour of his pen to liquidate this enormous debt.

Breaking up his establishment at Abbotsford, where the wife whom he loved lay dying, he hired a lodging in Edinburgh, and there for some years, with stern and unfaltering resolution, he toiled at his prodigious task. The stream of novels flowed as formerly; a *History of Napoleon*, in eight volumes, was undertaken and completed, with much other miscellaneous work; and within the space of two years, S. had realised for his creditors the amazing sum of nearly £40,000. A new and annotated edition of the novels was issued with immense success, and there seemed every prospect that, within a reasonable period, S. might again front the world, as he had pledged himself to do, not owing to any man a penny. In this hope he toiled on; but the limits of endurance had been reached, and the springs of the outworn brain broke in that stress of cruel and long-continued effort. In 1830 he was smitten down with paralysis, from which he never thoroughly rallied. It was hoped that the climate of Italy might benefit him; and by the government of the day a frigate was placed at his disposal in which to proceed thither. But in Italy he pined for the home to which he returned only to die. At Abbotsford, on the 21st September 1832, he died with his children round him and the murmur of the Tweed in his ears. On the 26th, he was buried beside his wife in the old Abbey of Dryburgh.

In estimate of S. as an author, a few words must suffice. As regards his poetry, there is now little difference of opinion. Its merits, if somewhat superficial, are very genuine, and continue to secure for it some portion of the popular favour with which it was at first received. Deficient in certain of the higher and deeper qualities, and in those refinements of finish which we are of late accustomed to exact, it is admirable in its frank *abandon*, in its boldness and breadth of effect, its succession of clear pictures, its careless, rapid, easy narrative, unfailing life, spirit, vigorous and fiery movement. As a lyrist, S. specially excelled; and scattered hither and thither in his works are to be found little snatches of ballad and song scarcely surpassed in the language. The rank of S. as a writer of prose fiction, it is not so easy to fix with anything like precision. So imposing to the mind is his immense *prestige* as a novelist, that even at this date it is difficult to *criticise* him coolly; but it is not without risk of awakening some under-murmur of dissent, that the absolute supremacy can now be assigned him which at one time, almost without question, used to be conceded as his due. Nor is the dissent without some just ground of reason. S., with the artistic instinct granted him in largest measure, had little of the artistic conscience. Writing with the haste of the *improvisatore*, he could exercise over his work, as it proceeded, no jealous rigour of supervision; and on its appearance he was amply pleased with it if the public paid him handsomely. Hence he is an exceedingly irregular writer; many of his works are in structure most lax and careless, and some of the very greatest of them are disgraced by occasional infusions of obviously inferior matter. Yet, all reasonable deductions made, it may be doubtful whether in mass and stature he is quite reached by any other novelist who could be mentioned. To class him, or even speak of him, along

with Shakspeare, is absurd; but it is scarcely absurd perhaps to say that, *since* Shakspeare, to no British man has such wealth in this kind been intrusted. If, as we believe, the final test of greatness in this field be the power to vitalise character, to enrich our experience by imaginative contact with beings ever after more intimately distinct and real for us than the men we daily shake hands with, very few writers can be held to surpass Scott. Further, he invented the historical novel, and in doing so, created a distinct literature, brought life into our conceptions of the past, and revolutionised our methods of writing history itself by a vivid infusion into them of picturesque and imaginative elements. On his *Scotch* novels his fame most securely rests; the others, for the most part, being obviously at times even painfully inferior. S.'s was essentially a great, shrewd, sagacious, *practical* intelligence; on the speculative side he was not so properly weak as entirely defective.

SCOTT, WINFIELD, American general, was born at Petersburg, Virginia, of Scottish ancestry, January 13, 1786, was educated at William and Mary College, and studied the profession of law; but in 1808, having a genius for military pursuits, he was appointed captain of light artillery in General Wilkinson's division, stationed at Baton Rouge, Louisiana, but was suspended for having accused his general of complicity with the conspiracy of Aaron Burr. At the commencement of the war of 1812, he was appointed lieutenant-colonel, and sent to the Canadian frontier. He crossed with his regiment at Queenstown Heights, where the American troops were at first successful; but on the British receiving reinforcements, they were repulsed with heavy loss, and S. was taken prisoner. The following year, having been exchanged, he was appointed adjutant-general, and was wounded by the explosion which followed the assault on Fort George. In 1814, as brigadier-general, he established a camp of instruction, and from April to July drilled his raw levies in the French tactics with such effect, that on the 3d of July he took Fort Erie, opposite Buffalo, by assault; and on the 5th fought a sharp drawn battle at Chippewa, and twenty days after, the famous frontier battle of Lundy's Lane, in which he had two horses killed under him, and was twice wounded, the last time severely. He was raised to the rank of major-general, and compiled the General Regulations of the Army, and translated and adapted from the French the system of Infantry Tactics, which was afterwards the text-book of the American army. In the Indian hostilities of the American frontier, in the excitement attending the threat of Nullification in South Carolina, and in the Seminole war, General S. manifested those qualities of wisdom and moderation which made him rather a pacificator than a warrior. During the Canadian revolt of 1837—1838, he displayed great tact in allaying the excited passions of the frontier. In 1841 he was appointed commander-in-chief of the U. S. army, and in 1846 directed the military operations in the war against Mexico. Taking the field in person, he, March 9, 1847, landed 12,000 men at Vera Cruz, and invested and bombarded the city, which capitulated on the 26th. April 18th he carried the heights of Cerro Gordo, on the 19th he took Jalapa, on the 22d Perote, and on May 15th Puebla, where, owing to his heavy losses, chiefly by diseases incident to the climate, he was obliged to wait for reinforcements. On the 10th of August he advanced, with 10,780 men, to encounter the larger forces and strong positions of General Santa Anna. He turned El Penon, and won the brilliant victories of Contreras and Churubusco. Santa Anna entered upon negotiations only to gain time and strengthen his defences. These were followed by the sharp and sanguinary battles of Molino del Rey and Churubusco, September 8th, strong positions skilfully and bravely defended by superior numbers; and on the 14th S. entered the city of Mexico at the head of less than 8000 soldiers. Peace was negotiated with the cession of New Mexico and California to the United States, and the victorious general was welcomed home with the liveliest demonstrations. In 1852 General S. was the candidate of the Whig party for the presidency, but was defeated by one of his subordinate officers, General Franklin Pierce. In 1855, was created for him the office of lieutenant-general. At the beginning of the war of Secession in 1861, he foresaw more than many others its extent and serious character, and advised the calling out a much larger force than was first brought into the field. He had even suggested the advisability of allowing the 'wayward sisters to part in peace.' Age and growing infirmities compelled him in November, 1861, to retire, and, after visiting Europe, he died at West Point in May, 1866. See *Memoirs*, by himself (2 vols., New York, 1864).

SCOTTISH LANGUAGE AND LITERATURE. The remarks which follow are merely supplementary to the articles on ANGLO-SAXON LANGUAGE AND LITERATURE, ENGLISH LANGUAGE, and ENGLISH LITERATURE (q. v.). Reference is made in the second of these articles to the different opinions which have prevailed regarding the origin of the dialects of the north-eastern provinces of Scotland. There can hardly be a doubt that the true explanation is that which is preferred by the writer of the article—that the language of those districts, like that of the south-eastern provinces of the Scottish kingdom, was 'as decidedly Anglo-Saxon in its form and substance as that of Norfolk or Yorkshire.' This is also the opinion of Mr Latham, as expressed in the brief chapter of his work on the English Language, in which he treats of 'the Lowland Scotch.' He adds, in reference to the claims of the latter to be considered a separate language, that the Lowland Scotch means 'the *literary* Lowland Scotch which, under the first five Stewarts, was as truly an independent language as compared with the English, as Swedish is to Danish, Portuguese to Spanish, or *vice versa*.' This is expressed with substantial justice, though it would have been more accurate to speak of the Scotch as an independent tongue from the reign of the first prince of the House of Stewart to the accession of James VI. to the English crown.

The history of Scottish literature may be divided into two periods; the first extending from the date of the earliest composition in the language of Northern Britain to the union of England and Scotland under one king, the second from that time to the present day.

During the earlier period Scotland was an independent kingdom, politically separate from England, and, as a general rule, bitterly opposed to English influence—forming in that respect a contrast to what it was before the decease of Alexander III. A well-known brief lament for the death of that king preserved by Winton, and marked by considerable beauty and pathos, is generally supposed to be one of the earliest specimens of Scottish poetry which has come down to us. The first Scottish *poet*—in the proper sense of the word—was John Barbour, archdeacon of Aberdeen, who was born in the first half of the 14th c., and died in 1395. His great work — the only one which has been preserved — is his poem of *The Bruce*, in which he celebrates the struggles and final victory of the Scottish king, Robert I. The poem is not unworthy of such a hero, and is superior to any composition by English

writers of the same century, with the exception of Chaucer. It has frequently been remarked that the language of Barbour is as intelligible to a reader of the present time as that of the father of English poetry. There are editions of *The Bruce* by Pinkerton and Jamieson, but the latest and best is that by Mr Cosmo Innes.

The 15th c., during which England produced no poetical writer of eminence, was fertile in Scottish poets. First in rank, and hardly inferior to any in genius, was James I., king of Scotland, the author of *The King's Quair*. Before him, in point of time, was Andrew Winton, prior of Lochleven, who wrote a metrical chronicle which was edited—so far as it treated of Scottish history—by David Macpherson in 1795. The historical value of this work is great; its literary merits are sufficiently humble. Another Scottish poet of this age was Henry the Minstrel, commonly called Blind Harry, the author of a poem on the life of Sir William Wallace, which in a modernised text was long a favourite book among the middle and lower classes of Scotland.

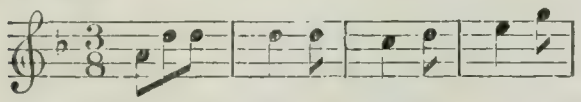
The closing years of this century, and the first half of the next, were distinguished by poets of still higher name. Foremost of these is William Dunbar (q. v.), author of *The Thistle and the Rose*, *The Golden Terge*, and many smaller poems, both serious and satirical, of very high merit. The only complete edition of his works is that by Mr David Laing, which was published in 1834. Gavin Douglas (q. v.), a son of the Earl of Angus, and Bishop of Dunkeld, was contemporary with Dunbar. He wrote several original poems, but his principal work is the translation in which he first gave 'rude Scotland Virgil's page.' The last remarkable writer of this age is Sir David Lindsay (q. v.), who died about 1557, and whose poetical works were published in 1806 by George Chalmers. The 16th c. also produced the first Scottish prose-writers. Among these is the anonymous author of *The Complaint of Scotland*, and John Bellenden, Archdeacon of Moray, the translator of Boece's *History of Scotland*, and of the first five books of Livy.

With Lindsay ceased that succession of poets which had continued without interruption from the time of Barbour. It was more than a century and a half before another poetical writer of merit made his appearance. The ecclesiastical troubles of the period were not favourable to the cultivation of literature. Most of the scholars of that time wrote in Latin; but for one prose-work of great merit as a composition, *The History of the Scottish Reformation*, we are indebted to the leader of the movement, John Knox (q. v.).

We have now reached the close of the first period. The accession of King James to the crown of England was unpropitious to the literature of Scotland. The parliament still met at Edinburgh, but the capital had ceased to be the residence of a court, and the language began to degenerate, and to be looked upon as a vulgar dialect of the English, rather than as the speech of an independent nation. The dreariest period of Scottish literary history is that between the union of the sovereigns under James, and of the kingdoms in the reign of Queen Anne. Writings in verse, called poems, continued to be published, and several of the prose-writers, such as Spalding, the Aberdeen annalist, wrote sometimes with a taste for the picturesque; but the best authors composed in English. It was in that language Drummond (q. v.) of Hawthornden wrote his verses, Archbishop Spottiswood (q. v.) and Bishop Burnet their histories, and Archbishop Leighton (q. v.) and Henry Scougal their theological works, so far as they were not in Latin.

It might have been expected that the union of the kingdoms, by which Scotland was deprived of a legislature of her own, and of the shadow of royal state, which to that time had continued to grace the Parliament House at Edinburgh, would have soon extinguished the cultivation of the native language, and left it the mere dialect of the peasantry; but as a matter of fact, it turned out to be otherwise. There was a strong popular prejudice against the Union, the advantages of which were not at first perceptible; and this roused a deep feeling of nationality, apart from the old religious divisions, but generally combined with attachment to the House of Stewart. At this time appeared the first Scottish poet of true genius since the dark age of the country's literature set in—Allan Ramsay (q. v.), author of *The Gentle Shepherd*, which was published in 1725. Ramsay had also the merit of preserving some of those songs and ballads which have since become so famous, but whose authors are quite unknown. How far these works are the productions of an earlier age, and how far they are the composition of authors living in the 18th c., has been keenly discussed. Reference may be made to *The Romantic Scottish Ballads* of Mr Robert Chambers on the one side, and to *The Lady Wardlaw Heresy* of Mr Norval Clyne on the other.

It has been remarked that the stirring-up of national feeling which marked the first half of the 18th c. was connected with Jacobitism. To the deep attachment to the exiled line of kings cherished by a large party in Scotland, and to the interest awakened by the struggles in which this resulted, we owe the Jacobite songs, in which authors, generally unknown, poured forth their whole heart in chivalrous devotion to their Prince, or in defiance and scorn of the German strangers who now filled the throne of the Stewarts.



While these feelings were dying away under the influence of the mild government of George III., the close of the century was made famous by the appearance of the most illustrious of Scottish poets. It is almost needless to say a word of Robert Burns (q. v.). Admired by all ranks, he continues to be the chosen classic of the peasantry of the Scottish Lowlands. It is as an English writer that Sir Walter Scott is famous; but many of his lyrical pieces, and the dialogues in his novels, where the speakers use their own northern tongue, entitle him to be ranked as the last and greatest of Scottish writers.

The best authority on the subject of this article is Professor Craik's *History of English Literature and the English Language*, the second edition of which was published in 1864. There is much valuable matter in David Irving's *History of Scottish Poetry* (Edin. 1861); but the author's dogmatism and love of theory frequently make him an unsafe guide.

SCOTTISH MUSIC. Scotland is famed for a class of national airs of a peculiar style and structure, possessing a wild, dignified, strongly marked, and expressive character. They are generally considered to be of great antiquity; the few notes on which the oldest of them turn, and the character of the modulation, lead to the inference, that they originated at a time when the musical scale and musical instruments of the country were in a rude state; but there is a deficiency of evidence regarding their early history. No musical MS. of Scottish airs is now known to exist of an older date than 1627; and we have no knowledge when and by whom the early Scottish melodies were composed, or how long they continued to be handed down traditionally from generation to generation. They may not improbably have been committed to notation in the 15th and 16th centuries; and their

disappearance is not wonderful, when we take into account, first, the strong measures resorted to, about 1530, by both civil and ecclesiastical authorities, to put down all ballads reflecting on the Roman Catholic hierarchy, and afterwards the fanatical proscription of music, along with every other innocent amusement, by the Puritans. The most valuable of now existing early collections of Scotch melodies is the Skene MS., in the Advocates' Library, noted down by Sir John Skene of Hallyards about the year 1630. It contains a number of native airs, mixed with some foreign dance-tunes—upwards of a hundred in all. Many of the Scotch melodies differ considerably from the more modern versions, presenting in general a ruder outline; but often exhibiting beauties which the changes which these airs have subsequently undergone have only tended to destroy.

Among the peculiarities which give its character to the music of Scotland, the most prominent is the prevalent omission of the fourth and seventh of the scale, and consequent absence of semitones, giving rise to such melodic forms as  or  . Passages of this kind occur in all the airs of Scotland which have any claim to popularity, and form one of their most recognisable features. Another characteristic is the substitution of the descending for the ascending sixth and seventh in the minor scale, as at the beginning of the air called *Adew, Dundee*, in the Skene MS.—

A very prevalent course of modulation is an alternation between the major key and its relative minor, the melody thus ever keeping true to the diatonic scale of the principal key, without the introduction of accidentals. An air will often begin in the major key, and end in the relative minor, or the reverse. The closing note is by no means necessarily the key-note, a peculiarity especially remarkable in the Highland airs, which, if in a major key, most frequently terminate in the second; if in a minor, on the seventh. Closes are also to be found on the third, fifth, and sixth. The peculiarities of modulation of the music of Scotland have something in common with the modes of ancient ecclesiastical music, to which it may be more correctly said to belong, than to the modern major and minor keys; and the avoidance of the fourth and seventh may have originated in the imperfection of the ancient wind instruments; yet these peculiarities are not to be found in the national airs of other countries where ecclesiastical music may be supposed to have had the same influence, and the early instruments to have been equally imperfect.

Among the more modern printed collections of Scottish melodies with words, the most important are George Thomson's collection, with symphonies and accompaniments by Pleyel, Kozeluch, Haydn, Beethoven, Hummel, and Weber (vols. i.—iv., 1793—1805; vol. v. 1826; and vol. vi. 1841), one distinguishing feature of which was the appearance of Burns's words conjoined with the old melodies of the country; and a more recent collection in 3 vols., published by Messrs Wood & Co., and edited, with historical, biographical, and critical notes, by Mr G. F. Graham (1848—1849).

On the subject of Scottish music generally, reference is made to Dauney's *Ancient Scottish Melodies from a MS. of the Reign of King James VI., with an Introductory Inquiry Illustrative of the History of the Music of Scotland* (Edin. 1838).

SCOTUS AND SCOTISTS. See DUNS SCOTUS.

SCOUT, a person sent out in the front or on the flank of an army to observe the force and movements of the enemy. He should be a keen observer, and withal fleet of foot, or well mounted.

SCRAP-METAL, a term applied to fragments of any kind of metal, which are only of use for remelting. Copper and brass scrap consist of the turnings from the lathe, and all useless and worn pieces, whether old or new. They are readily remelted. Scrap-tin consists of the clippings and fragments of tinned iron and worn-out tinned vessels; these are frequently dipped into hydrochloric acid, to dissolve off the tin-coating from the iron; and the muriate of tin so formed is of commercial value for dyeing purposes. Scrap-iron consists of any waste pieces of iron, although the term is usually held to mean malleable iron only; and for many purposes it is particularly valuable, as it is found that a greater strength can be obtained by welding small fragments of iron together, than is found in large masses, the fibre being much more twisted and interwoven, from the mingling of pieces in every imaginable direction.

SCREAMER (*Palamedea*), a genus of birds of the order *Grallæ*, allied to the Jacanas (q. v.). The bill is rather short, conical, curved at the extremity; there is a bare space around the eyes; the toes are long; each wing is furnished with two strong spurs. The HORNED S., or KAMICHI (*P. cornuta*), inhabits swamps in Brazil and Guiana, and feeds on the leaves and seeds of aquatic plants. It is of a blackish-brown colour, nearly as large as a turkey, and has somewhat the appearance of a gallinaceous bird. It receives its name from its loud and harsh cry. From the head, a little behind the bill, there rises a long, slender, movable horn, of which no use has been conjectured. The spurs of the wings

Horned Screamer (*Palamedea cornuta*).

are supposed to be useful in defence against snakes and other enemies.—Closely allied to this genus is the genus *Chauna*, or *Opistolophus*, to which belongs the CHAUNA, or CRESTED S. (*C.* or *O. chavaria*), a native of Brazil and Paraguay, the head of which has no horn, but is adorned with erectile feathers. The plumage is mostly lead-coloured and blackish. The wings are armed with spurs. It is very capable of domestication, and is sometimes reared with flocks of geese and turkeys, to defend them from vultures, being a bold and powerful bird.

SCREEN, in Architecture, an enclosure or partition of wood, stone, or metal work. It is of frequent

use in churches, where it shuts off chapels from the nave, separates the nave from the choir, and frequently encloses the choir all round. Such screens are often much ornamented, the lower part being solid, and the upper very often perforated. The Rood-screen (q. v.) is that on which most labour is usually bestowed. In England, many beautifully carved screens in stone, enriched with pinnacles, niches, statues, &c., remain, such as those of York, Lincoln, Durham, &c.; and specimens in wood, carved and painted, are common in parish churches. In France, the screen round the choir is sometimes the subject of beautiful sculptures, as at Amiens and Paris. In Halls (q. v.) there was usually a wooden screen at one end to separate the entrance-door and a passage from the hall. Over this was a gallery. The term 'Screen of Columns' is also applied to an open detached colonnade.

SCREW, one of the Mechanical Powers (q. v.), is a modification of the Inclined Plane (q. v.), as may be shewn (fig. 1) by wrapping a piece of

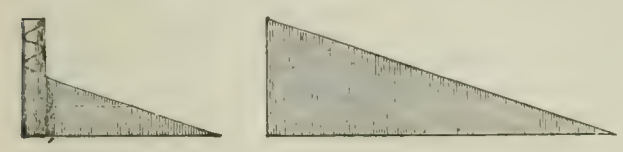


Fig. 1.

paper in the form of an inclined plane round a cylinder. In the screw, the spiral line, formed by the length or slope of the plane, is raised up in a ridge, and a lever is attached for the purpose of working it, so that the screw is really a compound machine, combining the lever and the inclined plane. It may be used as an instrument for penetration, as in the auger, gimlet, &c., or as a means of producing pressure, the latter being its most important application as a mechanical power. For this purpose, it is made to work in a 'female screw' or *nut* (a hollow cylinder grooved on the inside, so as to correspond to the threads of the screw); the nut is then firmly fixed in a massive frame (fig. 2), and the revolution within it of the screw causes the lower extremity of the latter to advance or recede. The principle of the screw's application is the same as that of an inclined plane pushed further and further under a heavy body so as to raise it up. Now in the inclined plane, P, the power or force, is to W, the weight raised or the pressure overcome, as the height of the plane to its base; that is, in the screw, as the distance between two threads is to the circumference of the cylinder. But as the twist is not applied at the circumference of the cylinder directly, but by means of a lever, it follows that the power applied, P, is to W, as the distance of two threads to the circumference described by P at the end of the lever. We see, then, that the power of the screw is increased by diminishing the distance between the threads; but as this cannot be effected without weakening the instrument, there is an evident limit to the increase of power in this way. The power can also be increased by lengthening the lever; but the best mode is that proposed by Mr Hunter (in the *Phil. Trans.* vol. 17), in which are employed two screws of different fineness, the coarser of them hollow and grooved, to act as a nut for the other. The outer and coarser screw is the one to which the power is applied by a lever, and it is adjusted in the manner before described; the inner is so fastened as to be capable of vertical motion only. When the outer screw is turned so as to move its extremity downwards, the inner screw moves upwards, but not to the same amount; thus, if the outer screw have 6 threads to the inch, and the inner one 7, one turn of the outer screw depresses it $\frac{1}{6}$th of an inch, but as the inner one rises $\frac{1}{7}$th of an inch, the whole descent of the point which produces pressure is only $\frac{1}{6} - \frac{1}{7}$, or $\frac{1}{42}$ of an inch; hence the pressure applied is 7 times greater than could be given by the outer, 6 times greater than could be given by the inner screw, and equal to what would be given by a screw with 42 threads to the inch, with the same power applied. The advantage of Hunter's screw is that the threads may be any thickness, and consequently each screw any strength, we please, provided the difference be small enough. The screw is one of the most powerful of the mechanical powers, but the friction generated by it amounts to about $\frac{1}{3}$d of the force applied.

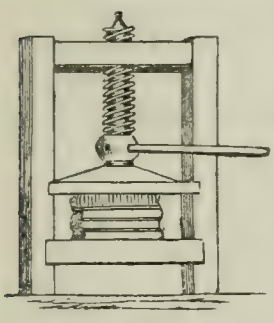

Fig 2.

SCREW-DRIVER, a chisel-shaped tool, used for turning round, and so driving in or drawing out the common joiners' screw-nails, the heads of which have a cleft made to receive the edge of the screw-driver.

SCREW PINE (*Pandanus*), a genus of plants of the natural order *Pandanaceæ*, natives of the tropical parts of the east and of the South Sea Islands. Many of them are remarkable for their adventitious roots, with large cup-like *spongioles*, which their branches send down to the ground, and which serve as props. Their leaves are sword-shaped, with spiny edges, and are spirally arranged in three rows. In general appearance, when unbranched, they resemble gigantic plants of the pine-apple, whence their popular name. *P. odoratissimus* is a widely diffused species; a spreading and branching tree of 25 feet high, much used in India for hedges, although it takes up much ground. In the south of India, it is called the Kaldera Bush. It grows readily in a poor soil, and is one of the first plants to appear on newly-formed islands in the Pacific. The male flowers are in long spikes, the female flowers in shorter branches. The flowers are frequently gathered before expanding, and boiled with meat. Their delightful and very powerful fragrance has made the plant a favourite everywhere, and it is the subject of continual allusions in Sanscrit poetry, under the name *Ketaka*. Oil impregnated with the odour of the flowers, and the distilled water of them, are highly esteemed East Indian perfumes. The seeds are eatable; and the fleshy part of the drupes, which grow together in large heads, is eaten in times of scarcity, as is the soft white base of the leaves. The terminal buds are eaten, like those of palms. The spongy and juicy branches are cut into small pieces as food for cattle. The leaves are used for thatching, and for making a kind of umbrella common in India, and their tough longitudinal fibres for making mats and cordage. The roots are spindle-shaped, and are composed of tough fibres; they are therefore split up by basket-makers, and used for tying their work. —More valuable, however, as a fibrous plant is an allied species, *P. sativus* or *P. Vacoa*, the Vacoa of Mauritius, which, if permitted, grows to a height of about 30 feet, but from continual cropping of its leaves, is usually dwarfed to six or ten feet. The fibres of its leaves are used for making the *Vacoa bags*, which constitute so considerable an article of

export from Mauritius, rivalling in cheapness and usefulness the Gunny Bags of India. The leaves are cut every second year, and each plant yields enough to make two large bags. Immediately on being cut off, the leaves are split into fillets, which are nearly an inch broad at the base, but taper to a point, and are three or four feet long. One of these will support a bag of sugar, of about 140 pounds, without breaking. The aërial roots of the Vacoa are so fibrous as to be used for making paint-brushes for coarse purposes.

SCREW-PROPELLER, The, is of the same construction as the common Screw (q. v.), but with the narrow thread exaggerated into a broad, thin

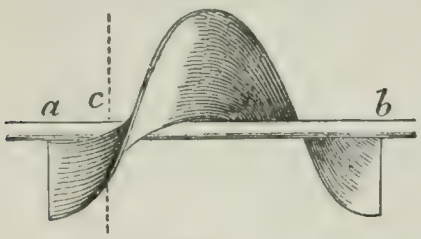

Fig. 1.

plate, and the cylinder diminished to a mere spindle. One complete turn of such a screw is shewn in fig. 1. Now, if a screw of this form were turned round in an unyielding substance, as wood, it would for each turn advance as much as the centre of the blade (or thread) had moved along the spindle in forming the screw, i. e., the distance *ab*. If the screw be fixed beneath a ship, and made to revolve in the water, the water takes the place of the wood; but as it is less stable than that substance, a certain part of the advancing power is lost, which loss is called the *slip* of the screw. In practice, this slip amounts to from 10 to 30 per cent.

It is obvious also that on the same spindle there may be more than one blade, provided that all the blades have the same pitch or rate of progression along the spindle (in fig. 1, *ab* is the *pitch* of the screw). Screws have thus been formed with two, three, four, and six blades or arms, but the form most commonly used is two blades for ships-of-war, and three blades in the merchant-service.

If the screw be cut off before attaining the length *ab* of a whole convolution, as at *c*, the portion *ac* will still retain all the properties of the screw. In the earlier attempts, screws were tried of the length of a whole convolution, or even two whole turns; but experiment has since shewn that this length is a disadvantage, and that the maximum of power is obtained from a screw whose length is $\frac{1}{6}$th of the pitch, i. e., where $ac = \frac{ab}{6}$. A screw of this length with two blades is shewn in fig. 2, being perhaps the most common form in use. The speed of a screw in a given time is equal to the pitch multiplied by the number of revolutions, and the product diminished by the slip.

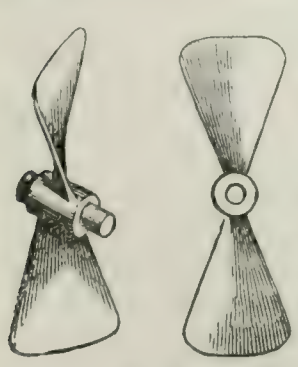

Fig. 2.

The following are the technical terms applied to the screw-propeller: The *shaft* or *spindle* is the cylindrical axis on which the screw revolves, and is the medium for communicating to it the power of the steam-engine; the *blade* is the thread of the screw; the *pitch*, the length of shaft on which the blade would make one complete turn; the *diameter* is the distance between the tips of opposite blades; the *length* is the fraction of the pitch actually employed; the *slip*, the loss of power from the yielding of the water.

The application of the screw to the propulsion of a vessel through the water is not new. In 1802, Dr Shorter, an English mechanician, produced motion by its agency; but his discovery was valueless, as the steam-engine had not then been practically applied to navigation. Those who first employed Watt's engine on board ship adopted the paddle-wheel, the success of which turned attention from the screw for nearly thirty years. At length, in 1832, Mr B. Woodcroft patented a screw-propeller with an increasing pitch; and four years later, Mr F. P. Smith patented a screw making two whole turns, which he reduced, in 1839, to one whole turn. In 1837, he and Captain Ericsson, an American inventor, brought the matter practically forward on the Thames, where a small screw-steamer, 45 feet long, 8 feet broad, and of 27 inches draught, towed the *Toronto* of 630 tons against tide at 4½ knots an hour. In 1839, an American gentleman had the *Robert Stockton* built for him by Messrs Laird, with which he reached America. The British Admiralty, however, refused any support to the new propeller until the success of the *Archimedes*, built in 1840, of 232 tons and 80 horse-power, which was exhibited at the principal ports, rendered opposition no longer possible. The Admiralty, then, as an experiment, constructed the *Rattler*, from the trials of which vessel nearly all the subsequent data for the screw have been derived. Meanwhile, in 1838, Mr James Lowe had shewn that the length of the screw should not exceed $\frac{1}{6}$th of the pitch; and after actual and successive trials, the screw of the *Rattler* was cut down from 5 feet 9 inches to 1 foot 3 inches. These experiments established the screw as a rival to the paddle-wheel; and its advantage for ships of war became incontestable, as, from the entire submergence of the propeller, and consequent lowness of its engines in the ship, the chances of injury from an enemy's shot were reduced almost to nothing. Some of the great steam-companies—notably the Peninsular and Oriental Company—also patronised it, and it was found of great value as an auxiliary in sailing-vessels. The result is that, at this time (1871), its use in the British navy is almost universal, and in the merchant-service few large vessels are built which have not a screw, at least as an auxiliary.

Several varieties of screw have been introduced, each finding many supporters. Perhaps the most efficient, under all circumstances, is Griffith's, which is shewn in fig. 3. Here the blades, in place of rising from the shaft itself, spring from a hollow sphere occupying one-third the screw's diameter. This arrangement was adopted because experiment proved that the central portions of the blades of the ordinary screw absorb about 20 per cent. of the propelling power, while they produce little useful effect, from the circumstance, that at that part (especially in screws of a coarse pitch) the blade is nearly in a line with the shaft, and acts at right angles on the water, causing only a disturbance of that portion on which the outer and more powerful end of the blade operates. The globe, on the other hand, revolves with little

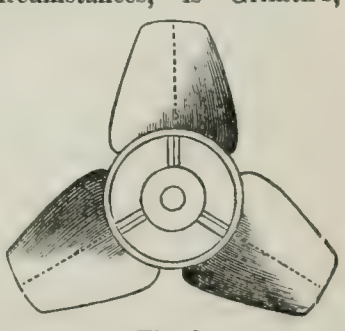

Fig. 3.

friction. The blades are also less liable to be wrenched off by the resistance of the water, and the vibration on board is considerably less than with the common screw. Of other screws may be mentioned Ericsson's, in which the sphere-principle of Griffiths is extended to the use of a ring of metal, with numerous short blades round its periphery. Messrs Carlsrund and Sorensen, of the Swedish navy, reverse this process, and have the blades within the periphery. Further in the year 1865 Mr Rig had effected additional improvements, by which a large proportion of the power is employed nearly parallel to the shaft. This is brought about by inserting behind the moving screw a fixed screw with the blades turned in an opposite direction.

One difficulty in the use of the screw as an auxiliary in sailing-ships is, that in a good wind, from the speed imparted by the sails, the ship sometimes outruns the screw; and the result is, that either the screw seriously impedes the sailing, or the blades are twisted off the shaft. To prevent this, various devices are resorted to. In some cases, the screw is disconnected from the shaft, and left to revolve freely; in others, as in most ships of war, it is disconnected and hoisted altogether out of the water by means of an iron framework worked above the screw in a sort of well. Messrs Maudslay have patented a 'feathering-screw,' which, by a simple apparatus, can, when the steam-power is not required, have the blades turned into a line with the ship's keel, and the screw (which must be two-bladed) fastened in a vertical position. When thus treated, the screw is out of danger, and forms no impediment to the ship's progress.

The usual position for the screw is in the dead-wood immediately before the stern-post, the shaft on which it revolves passing, parallel to the keel, into the engine-room. To give it full effect, the stern lines should be very fine, so that the water has a full sweep over it. In 1860, Messrs Dudgeon of London produced a steamer with twin screws, one under each quarter. These have independent action, and as one can therefore be reversed while the other goes ahead, great steering-power is imparted; so much so, that vessels constructed on this principle are said to be able to turn in their own length. In the cigar-shaped yacht built at Millwall in 1865 for Mr Winans, of Baltimore, there was a screw-propeller at each end. As the action of the screw depends on the comparative immobility of the water in which it acts, it is necessary, for the development of its full power, that it should be completely immersed, and that there should be nearly two feet of water above the top of the upper blade. It follows from this that, *ceteris paribus*, the screw-vessel will draw more water than the paddle-steamer; for in large steamers the screw is from 15 to 18 feet in diameter, and in the *Great Eastern* it reaches 24. The revolutions vary from 50 to 72 per minute.

It now only remains to notice the comparative advantages of the paddle and screw. Under favourable circumstances, in ships of equal tonnage and power, there is little difference in speed or force. Before the wind, the paddle has a slight advantage; with the wind ahead, the resistance offered by the paddle-boxes transfers the advantage to the screw. Fastened stern to stern, the screw-ship drags the paddle-ship; but fastened bow to bow, the same result is not found. This is, however, rather to be attributed to the loss of power in a paddle-ship when not in progress (see PADDLE WHEEL), than to any actual superiority of screw. In a long voyage, however, the gain is distinctly with the screw; because the weight of fuel borne at starting sinks the paddles too low in the water, and probably its exhaustion at the end of the voyage deprives them of their proper dip; whereas, with ordinary management, the screw will always be immersed. Again, rolling deprives the paddle of much power; while pitching deprives the screw of its proper matrix; but the balance of loss, in tempestuous weather, is in favour of the screw. It has been already shewn that in men-of-war the screw is the most useful agent; and, as an additional reason, may be adduced the clear broadside which it allows for the guns. On the other hand, in point of comfort to the passengers, the advantage lies unquestionably with the paddle; for the rapid revolution of the heavy screw on a shaft extending half the ship's length, produces a continuous and very unpleasant vibration; while the lower position of the engines and screw give the vessel a deep roll. The paddles in the paddle-steamers act as outriggers, and the centre of gravity being, from the position of the engines, higher (as will be understood from the outline in fig. 4), a much softer motion is imparted to

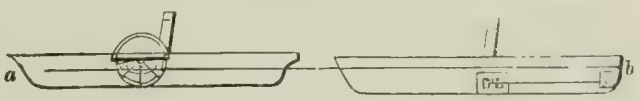

Fig. 4.
ab, water line.

the whole vessel. For lakes and rivers, where the water is smooth and the voyage short, paddles are best, and more especially so when the water becomes often shallow or is choked with weeds, which would soon clog the screw.

It is proper to observe that some eminent engineers deny that the action of the screw-propeller is to be assimilated to that of an ordinary screw making its way through wood. They assert that the motion of the ship is caused by the pressure of the solid water from behind the screw, while the action of the screw creates a void in its front. In proof of this, experiment has shewn that if a disc be placed *before* the screw and the screw still worked forwards, the ship moves backwards, while, with the same motion of the screw, a disc *behind* it causes the vessel to move forward. Others, however, think that this effect of the disc can be sufficiently accounted for on the usual theory of the screw's action.

SCREW-WRENCH, a tool used for grasping the flat sides of the heads of large screws, such as are used in engines and other large works. The heads

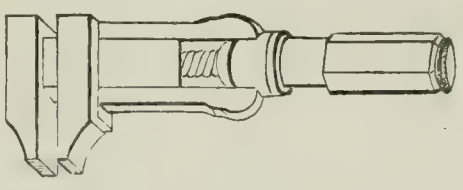

Fig. 1.

are usually octagonal laterally, and the wrench is made of two portions like hammers sliding one upon the other (fig. 1), so that screw-heads can be grasped of different sizes, and the handle forms the lever

Fig. 2.

by which they are turned round. The screw-key (fig. 2) is only a more simple kind of wrench, which will only act upon screws of two sizes, fitting the jaws at each end.

SCRIBBLER. See SPINNING.

SCRIBE (Heb. *Sofer;* Gr. *Grammateus, Nomodidaskalos*), among the Jews, originally a kind of military officer, whose business appears to have been the recruiting and organising of troops, the levying of war-taxes, and the like. At a later period, especially at the time of Christ, it had come to designate a learned man, a doctor of the law. Christ himself recognises them as a legal authority (Matth. xxiii. 2); they were the preservers of traditions, and form a kind of police in the Temple and synagogues, together with the high-priests; and the people reverenced them, or were expected to reverence them, in an eminent degree. They were to be found all over the country of Palestine, and occupied the rank and profession of both lawyers and theologians. Their public field of action was thus probably threefold: they were either assessors of the Sanhedrim, or public teachers, or administrators and lawyers. Many of these teachers had special class-rooms somewhere in the Temple of Jerusalem, where the pupils destined to the calling of a Rabbi sat at their feet. The calling of a Scribe being gratuitous, it was incumbent upon every one of them to learn and to exercise some trade. Those Scribes who were not eminent enough to rise to the higher branches of their profession, to enter the Sanhedrim, to be practical lawyers, or to hold schools of their own, occupied themselves in copying the Book of the Law or the Prophets, in writing phylacteries, contracts, letters of divorce, and the like. Their social position was naturally in accordance with their talents and their importance. The apostles, not learned enough, for the most part, to be Scribes, are promised to become 'Scribes' of the kingdom of God, &c. See PHARISEES, HALACHA, HAGGADA, MIDRASH, MISHNA, TALMUD.

SCRIBING, in Joinery, fitting the ends of pieces of wood together, so that the fibres may be at right angles, and the end cut away across the fibres.
